Chronic diſeaſes are uſually owing either to ſome natural deſect in the conſtitution, or to an irregular manner of living; and moſt of the *chronical* diſeaſes, ſays Dr. Cheyne, the infirmities of old age, and the ſhort periods of the lives of Engliſhmen, are owing to repletion: this is evident hence, that evacuation, of one kind or another, is nine parts in ten of their remedy.

The ſources of *chronical* diſtempers, ſays the ſame author, are, 1. Viſcidity in the juices, or the over-largeneſs of their conſtituent particles; which, not being ſufficiently broken by the concoctive powers, ſtop and retard the circulation. Or, 2. Too great abundance of ſharp acrimonious ſalts; whereby the juices themſelves are rendered ſo corroſive, as to burſt or wear out the ſolids. Or, 3. A relaxation, or want of due force or ſpringineſs of the ſolids themſelves.

An exceſs in the quantity of our meats and drinks begets the firſt; the bad condition of the ſame food the ſecond; and both together, with want of due exerciſe, the third.

The cauſes of all *chronical* diſorders, according to Dr. Cadogan, in his Eſſay on the Gout, &c. are indolence, intemperance, or vexation. And Dr. Fothergill obſerves, that in the cure of all *chronic* complaints, however diſtant their ſeat may be from the ſtomach, thoſe will have the greateſt ſucceſs, who attentively conſider the preſent ſtate of this organ; who remove every obſtruction to its performing the office of digeſtion with eaſe, conſtancy, and expedition. Lond. Med. Obſ. vol. i. p. 314.

CHRONICLE, CHRONICON, denotes a hiſtory digeſted in order of time; though the term is ſeldom uſed but in ſpeaking of our old Engliſh hiſtories, as Huliniſhed's *Chronicle*, Stow's *Chronicle*, &c. See ANNALS.

CHRONICLES, in the *Canon of Scripture*, are two ſacred books called by the Greeks *Paralipomena*, Παραλειπομενα, becauſe they contain many ſupplemental relations omitted in the other hiſtorical books. They are an abridgment of ſacred hiſtory, to the return of the Jews from the Babyloniſh captivity. The firſt book traces the genealogies of the Iſraelites from Adam, relates the death of Saul and gives a brief account of David's reign. The ſecond traces the progreſs of the kingdom of Judah, its various revolutions, its period under Zedekiah, and the reſtoration of the Jews by Cyrus.

CHRONOGRAM, a kind of compoſition, whoſe numeral letters, joined together, make up ſome date, or epocha. See ANAGRAM.

The word is compounded of χρονος, *time*, and γραμμα, *letter*.

CHRONOLOGICAL, belonging to CHRONOLOGY. *Chronological characters*, are characters by which *times* are diſtinguiſhed. Of theſe ſome are *natural* or *aſtronomical*; others are *artificial*, or *hiſtorical*. *Natural chronological characters* are ſuch as depend on the motion of the ſtars, as eclipſes, ſolſtices, equinoxes, the different aſpects of planets, &c. *Artificial chronological characters*, are thoſe which men have eſtabliſhed, as the ſolar CYCLE, the lunar CYCLE, &c. *Hiſtorical chronological characters* are thoſe which are ſuppoſed by the teſtimonies of hiſtorians, when they fix the dates of certain events to certain periods. We ſay alſo *chronological* tables, abridgments, machines, &c. M. Barbeu du Bourg invented a curious *chronological* machine, of which there is a particular account communicated by himſelf, in the Encyclopedie, tom. iii. p. 400. 1°.

CHRONOLOGY, the art of meaſuring and diſtinguiſhing time; or the doctrine of epochas, &c.

The word is compounded of χρονος, *time*, and λογος, *diſcourſe*.

Sturmius divides *chronology* into five diſtinct branches: viz. *metaphyſical*, *phyſical*, *political*, *hiſtorical*, and *eccleſiaſtical*; according to the various relations, or habitudes, wherein TIME is conſidered; viz. as in itſelf; as connected and ſubjected to the affections, ſtates, and alterations of natural things; as accommodated to civil uſes, as matched with events that paſs in the world; and particularly, as it relates to the celebration of Eaſter.

There is more difficulty in *chronology* than every one is aware of; it requires not only the knowlege of aſtronomy and geography, and conſequently that of arithmetic, geometry, and trigonometry, both plain and ſpherical, but alſo a laboured application to the ancient monuments. Its uſe is very great: it is called one of the eyes of hiſtory; and ſerves many good purpoſes in theology.

CHRONOLOGY, *Chineſe*. No nation has boaſted more of its antiquity than the Chineſe: but though we allow them to trace their origin as far back as the deluge, they have few, if any, authentic records of their hiſtory for ſo long a period as five hundred years before the Chriſtian æra. This, however, may probably be owing to the general deſtruction of ancient remains by the tyrant Thu-chihoang, in the year 213, or, as ſome ſay, 238, before the Chriſtian æra. We learn from a *chronological* table of the Chineſe hiſtory, for which we are obliged to an illuſtrious Tartar, who was viceroy of Canton in the year 1724, and a Latin tranſlation of which was publiſhed at Rome in 1730, that the moſt remote epocha of the Chineſe *chronology* does not ſurpaſs the firſt year of a prince called Gaei-lie-wang, who began his reign four hundred and twenty-four years before the vulgar æra. This opinion is confirmed by the teſtimony of two of the moſt approved hiſtorians of China, who admit nothing into their hiſtories previous to this period. The Chineſe in their computation make uſe of a cycle of ſixty years, called *kiatſe*, from the denomination given to the firſt year of it, which ſerves as the baſis of their whole *chronology*. Every year of this cycle is marked with two letters, which diſtinguiſh it from the others; and all the years of the emperors for above two thouſand years, have names in hiſtory common to them with the correſponding years of the cycle. Phil. Tranſ. abr. vol. viii. part iv. p. 15, &c. According to M. Freret, in his Eſſays, the Chineſe date the epocha of Yao, one of their firſt emperors, about the year 2145, or as others ſtate it, 2057 years before Chriſt; and reckon their firſt aſtronomical obſervations, and the compoſition of their famous calendar, to have preceded Yao a hundred and fifty years: and thence it is inferred, that the aſtronomical obſervations of the Chineſe and Chaldeans coincide. Later authors date the riſe and progreſs of the ſciences in China from the grand dynaſty of Tcheou, about twelve hundred years before the Chriſtian æra, and ſhew, that all hiſtorical relations of events prior to the reign of Yao are fabulous. Mem. de l'Hiſtoire des Sciences, &c. Chinois: a work compiled by the miſſionaries of Pekin, vol. i. Paris, 1776. But it may be expected that ſome new light will be thrown on this obſcure and uncertain ſubject of inveſtigation by the General Hiſtory of China, in 12 vols. 4to announced to the public by the abbé Grouſſier.

CHRONOLOGY, *Newtonian principles of*. Sir Iſaac Newton has ſhewn, that the *chronology* of ancient kingdoms is involved in the greateſt uncertainty; that the Europeans in particular had no *chronology* before the Perſian empire, which began five hundred and thirty-ſix years before Chriſt, when Cyrus conquered Darius the Mede; that the antiquities of the Greeks are full of fables, becauſe their writings were in verſe only, till the conqueſt of Aſia by Cyrus the Perſian, about which time Pherecydes, Syrus,

Syrius, and Cadmus Milesius introduced profe. After this time feveral of the Greek hiſtorians introduced the computation by generations. The *chronology* of the Latins was ſtill more uncertain: their old records were burnt by the Gauls a hundred and twenty years after the expulſion of their kings, ſixty-four years before the death of Alexander the Great, and before Chriſt 388. The *chronologers* of Gaul, Spain, Germany, Scythia, Sweden, Britain, and Ireland, are of a ſtill later date. For Scythia, beyond the Danube, had no letters, till Ulphilas, their biſhop, formed them, about ſix hundred years after the death of Alexander the Great, or about A.D. 376. Germany had none till it received them from the weſtern empire of the Latins, about A.D. 400. The Huns had none in the days of Procopius, about A.D. 526. Sweden and Norway received them ſtill later.

After a general account of the defects and obſcurity of the ancient *chronology*, ſir Iſaac obſerves, that, though many of the ancients computed by generations and ſucceſſions, yet the Egyptians, Greeks, and Latins, reckoned the reigns of kings equal to generations of men, and three of them to a hundred, and ſometimes to a hundred and twenty years; and this was the foundation of their technical *chronology*. He then proceeds to evince, from the ordinary courſe of nature, and a detail of hiſtorical facts, the difference between *reigns* and *generations*; and that, though the latter, from father to ſon, may at an average be reckoned about thirty-three years, or three of them equal to a hundred years, yet when they are taken by the eldeſt ſons, three of them cannot be computed at more than about ſeventy-five or eighty-years; and the *reigns* of kings are ſtill ſhorter, ſo that eighteen or twenty years may be allowed a juſt medium. He then fixes on four remarkable periods, viz. the return of the Heraclides into the Peloponneſus, the taking of Troy, the Argonautic expedition, and the return of Seſoſtris into Egypt, after his wars in Thrace; and ſettles the epocha of each by the true value of a generation. We ſhall confine ourſelves to his eſtimate of that of the Argonautic expedition. Having fixed the return of the Heraclides to about the hundred and fifty-ninth year after the death of Solomon, and the deſtruction of Troy to about the ſeventy-fifth year after the ſame period, he obſerves, that Hercules the Argonaut was the father of Hyllus, the father of Cleodius, the father of Ariſtomachus, the father of Ariſtodemus, who conducted the Heraclides into Peloponneſus; ſo that their return was four generations, reckoning by the chief of the family, later than the Argonautic expedition, which therefore happened about forty-three years after the death of Solomon. This is farther confirmed by another argument. Æſculapius and Hercules were Argonauts. Hippocrates was the eighteenth inclusively from the former by the father's ſide; and the nineteenth from the latter by the mother's ſide; allowing twenty-eight or thirty years to each of them, the ſeventeen intervals by the father, and the eighteen intervals by the mother, will, at a medium, give five hundred and ſeven years: and theſe, reckoning back from the commencement of the Peloponneſian war, or four-hundred and thirty-firſt year before Chriſt, when Hippocrates began to flouriſh, will place the Argonautic expedition in the forty-third year after Solomon's death, or nine hundred and thirty-ſeven years before Chriſt.

The other kind of reaſoning, by which ſir Iſaac endeavours to eſtabliſh this epocha, is purely aſtronomical. The ſphere was formed by Chiron and Muſæus at the time, and for the uſe of the Argonautic expedition, as ſeveral of the aſteriſms referring to this event plainly ſhew: and at this time the cardinal points of the equinoxes and ſolſtices were placed in the middle of the conſtellations Aries, Cancer, Chelæ, and Capricorn. Our author eſtabliſhes this point by a conſideration of the ancient Greek calendar, which conſiſted of twelve lunar months, and each month of thirty days, and which required an intercalary month. Of courſe this luniſolar year, with the intercalary month, began ſometimes a week or a fortnight before or after the equinox or ſolſtice; and hence the firſt aſtronomers were led to the above mentioned diſpoſition of the equinoxes and ſolſtices; and that this was really the caſe, is confirmed by the teſtimonies of Eudoxus, Aratus, and Hipparchus. On theſe principles, ſir Iſaac proceeds to argue in this manner. The equinoctial colure in the end of the year 1689, cut the ecliptic in 8 6° 44′, and by this reckoning the equinox was then gone back 36° 44′ ſince the Argonautic expedition. But it recedes 50″ in a year, or 1° in ſeventy-two years, and conſequently 36° 44′ in 2645 years; which counted backward from the beginning of 1690, will place this expedition about twenty-five years after the death of Solomon. But, as there is no neceſſity for allowing that the *middle* of the conſtellations, according to the general account of the ancients, ſhould be preciſely the middle between the *prima ſtrictis*, and *ultima Canibus*, this great author proceeds to examine what were thoſe ſtars, through which Eudoxus made the colures to paſs in the primitive ſphere, and in this way to fix the poſition of the cardinal points. From the mean of five places he finds, that the great circle, which in the primitive ſphere, deſcribed by Eudoxus, or at the time of the Argonautic expedition, was the equinoctial colure, did, in the end of 1689, cut the ecliptic in ♎ 6° 29′ 45″. He likewiſe, in the ſame manner, determines the mean place of the ſolſtitial colure to be ♑ 6° 28′ 46″, and as it is at right angles with the other, concludes that it is rightly drawn. Hence he infers, that the cardinal points, in the interval between that expedition, and the year 1689, have receded from thoſe coſtures 1 ſign 6° and 29′ 5″, which, allowing ſeventy-two years to a degree, amounts to 2627 years; and theſe counted backwards, as above, will place the Argonautic expedition forty-three years after the death of Solomon. Our author hath, by other methods of a ſimilar nature, eſtabliſhed this epocha, and reduced the age of the world about five hundred years. This elaborate ſyſtem hath not eſcaped cenſure. M. Freret and M. Souciet have attacked it on much the ſame ground: the former hath confounded *reigns* and *generations*, which are carefully diſtinguiſhed in this ſyſtem. The aſtronomical objections of both have been anſwered by ſir Iſaac Newton himſelf and by Dr. Halley. Phil. Tranſ. abr. vol. viii. part iv. p. 4, &c. Newton's Chronology, ch. i.

M. Gibert, in a letter publiſhed at Amſterdam in 1743, has attempted to reduce the Babyloniac, Egyptian, and Chaldean annals, to our *chronology*. He begins with ſhewing, by the authorities of Macrobius, Euſebius, Varro, Diodorus Siculus, Pliny, Plutarch, St. Auguſtin, &c. that by a year, the ancients meant the revolution of any planet in the heavens; ſo that it conſiſted ſometimes only of one day. Thus, according to him, the ſolar day was the aſtronomical year of the Chaldeans; and the boaſted period of 473,000 years aſſigned to their obſervations is reduced to 1297 years, nine months; the number of years which elapſed, according to Euſebius, from the firſt diſcoveries of Atlas in aſtronomy, to the 384th year of Abraham, to the march of Alexander into Aſia in the year 1682 of the ſame æra; and the ſeventeen thouſand years added by Beroſus, to the obſervations of the Chaldeans, reduced in the ſame manner, will give forty-ſix years, and ſix or ſeven months, being the exact interval between Alexander's march, and the firſt year of the hundred and twenty-third Olympiad, or the time to which Beroſus carried his hiſtory. Epigenius attributes 720,000 years to the obſervations preſerved at Babylon; but theſe, according to M. Gibert's ſyſtem, amount only to 1071 years, three months, which differ from Calliſthenes's period of 1903 years, allotted to the ſame obſervations, only by ſixty-eight years, the period elapſed from the taking of Babylon by Alexander, which terminated the latter account, and to the time of Ptolemy Philadelphus, to which Epigenius extended his account.

CHRONOLOGY, *ſacred*. The ſyſtems of ſacred *chronology* have been very various. Nor is this to be wondered at, ſince our three biblical copies of principal note give a very different account of the firſt ages of the world. The Hebrew text reckons about 4000 years from Adam to Chriſt, and to the flood 1656 years; the Samaritan makes this interval longer, and reckons from Adam to the flood only 1307 years; and the verſion of the Septuagint removes the creation of the world to 6000 years before Chriſt. The interval between the creation and flood, according to Euſebius and the Septuagint, is 2242 years; according to Joſephus and the Septuagint 2256 years; and according to Julius Africanus, Epiphanius, Petavius, and the Septuagint, it is reckoned at 2262 years. Many attempts have been made to reconcile theſe differences; but none are quite ſatisfactory. See EPOCHA, SAMARITAN, &c.

Walton, and I. Voſſius, give the preference to the account of the Septuagint. Walton's Prolegomena. Voſſii Chronologia ſacra. Others have defended the Hebrew text. The reader may find an abſtract of the different opinions of learned men on this ſubject, in Strauchius's Brev. Chron. tranſlated by Sault, p. 166, &c. and p. 176.

The more eminent writers on *chronology*, among the ancients, are Julius Africanus in the third century; Dionyſius Exiguus, Euſebius, and Cyril.

Among the moderns, Bede, Funccius, Mercator, Lilius, Clavius, Scaliger, Vieta, Petavius, Caſſini, Munſter, Calviſius, Hardouin, Capellus, Uſher, Newton, Marſham, Helvicus,

Helvicus, I. Voſſius, Pagi, &c. Strauchius, Perron, Freret, &c.

CHRONOMETER, or CHROMETER, as it is ſometimes written, a general name for any inſtrument uſed in the meaſuring of TIME.

The word is compoſed of χρονος, *time*, and μετρον, *meaſure*.

In this ſenſe, clocks, watches, dials, &c. are *chronometers*: though there are ſome other inſtruments peculiarly called by the name *chronometer*; particularly one deſcribed by M. Sauveur, in his Principles of Acouſtics: ſo contrived as to meaſure a ſmall part of time very exactly, even to the ſixteenth part of a ſecond.

We have a deſcription of one of theſe, made by the ingenious Mr. George Graham, in Deſaguliers's Experim. Philoſoph. vol. ii. p. 373, 374.

A *chronometer* is of great uſe for meaſuring ſmall parts of time in aſtronomical obſervations, the time of the fall of bodies, the velocity of running waters, &c. But long ſpaces of time cannot be meaſured by it with ſufficient exactneſs, unleſs its pendulum be made to vibrate in a cycloid; becauſe, otherwiſe, it is liable to err conſiderably, as all clocks are which have ſhort pendulums that ſwing large arcs of a circle.

CHRONOSCOPE, a word ſometimes uſed for a PENDULUM, or machine, to meaſure time.

The word is formed of χρονος, *time*, and σκεπτομαι, *I conſider*.

CHROSTASIMA, in *Natural Hiſtory*, a name uſed by Dr. Hill, for all pellucid gems, which have one ſimple and permanent appearance in all lights.

Of this kind are the DIAMOND, the CARBUNCLE, the AMETHYST, the SAPPHIRE, the BERYL, EMERALD, and the TOPAZ.

CHRYSALIS, a term uſed by modern writers of natural hiſtory of inſects, in the ſame ſenſe with NYMPHA and AURELIA.

The word ſeems to imply a peculiar yellow, or golden colour, uſually in the *nymphæ* of ſome ſpecies of inſects: from χρυσος, *gold*: but this is purely accidental, and is not found in all *nymphæ*.

Some confine the word *chryſalis* to the *nymphæ* of butterflies and moths. See PUPPET.

CHRYSANTHEMUM, in *Botany*. See *Corn*-MARYGOLD.

CHRYSANTHEMUM, *Baſtard*, in *Botany*, *Silphium*, a genus of the *ſyngeneſia polygamia neceſſaria* claſs. Its characters are theſe: the common empalement of the flower is oval, imbricated, and permanent; the ſcales are oval, prominent, and reflexed in the middle; the diſk of the flower is compoſed of hermaphrodite florets, which are tubulous, indented in five parts at the top; theſe have five ſhort hair-like ſtamina, terminated by cylindrical ſummits, and a ſlender taper germen, ſupporting a long hairy ſtyle, crowned by a ſingle ſtigma; theſe are barren: the rays of the flower are compoſed of a few female half florets, which are long, ſpear-ſhaped, and for the moſt part have three indentures at their points; theſe have a heart-ſhaped germen, with a ſhort ſingle ſtyle, having two briſtly ſtigmas of the ſame length, and are ſucceeded by ſingle heart-ſhaped ſeeds, with a membranaceous border, indented at the top, each point ending with a horn or tooth, and are ſeparated by linear chaff, ripening in the empalement. There are four ſpecies, natives of America.

CHRYSANTHEMUM, *Hard-ſeeded*, *Chryſanthemoides*, or *Oſteoſpermum*, in *Botany*, a genus of the *ſyngeneſia polygamia neceſſaria* claſs. The characters are theſe: the flower hath an hemiſpherical empalement, which is ſingle, and cut into many ſegments: the flower is compoſed of ſeveral hermaphrodite flowers in the diſk, which are tubulous, and cut at the brim in five parts: theſe are ſurrounded by ſeveral female flowers, which are radiated, each having a narrow tongue, which is cut into three parts at the top; the hermaphrodite flowers have each five ſlender, ſhort ſtamina, terminated by cylindrical ſummits, with a ſmall germen ſupporting a ſlender ſtyle, crowned by an obſolete ſtigma; theſe are barren: the female flowers have each a globular germen, ſupporting a ſlender ſtyle, crowned by an indented ſtigma; the germen afterwards becomes one ſingle hard ſeed. Miller enumerates five ſpecies, ſome of which are brought from America, and others from the Cape of Good Hope.

CHRYSANTHERINUS *lapis*, in *Natural Hiſtory*, a name given by old writers to a ſtone, famous for its imaginary virtues of preventing children from ſickneſſes during the time of dentition, by being worn round the neck by way of necklace: we have no farther account given us of it by authors, than that it was a very briſtle ſtone, and not eaſily worked into form.

CHRYSARGYRUM, a tribute formerly levied on courteſans, and perſons of ill fame.

Hoffman ſays, it was paid in gold and ſilver; whence its name χρυσος, *gold*, and αργυρος, *ſilver*.

Zoſimus ſays, that Conſtantine firſt ſet it on foot; though there appear ſome traces of it in the life of Caligula by Suetonius; and that of Alexander by Lampridius. Evagrius ſays, Conſtantine found it eſtabliſhed, and had ſome thoughts of aboliſhing it. It was paid every four years: ſome ſay, all petty travellers were liable to it. It was aboliſhed by Anaſtaſius.

M. Godeau thinks the *chryſargyrum* was a general tribute, levied every four years, on perſons of all conditions, rich and poor, ſlaves and freemen; nay, even on all animals, as low as dogs; for each whereof they paid ſix oboli.

CHRYSITES, a name given by the ancients to *yellow* LITHARGE, ſuch as we call litharge of gold. We diſtinguiſh this only in regard to the colour, and ſo did the ancient Greeks; but Aviſcenna and the reſt of the Arabians have uſed this word only for the name of ſuch litharge as was made from gold, or whatever colour it happened to be; the reſt they called by the name of *argyrites*, as they tell us, whether it was made of ſilver, copper, or even of the marcaſite melted, and refined by lead. See KLIMIA.

CHRYSOBALANUS, in *Botany*. See *American*, or *Cocoa* PLUM.

CHRYSOBERYL, a precious ſtone; being a kind of pale beryl, with a tincture of yellow.

CHRYSOCBRAUNUS *pulvis*, is ſometimes uſed for AURUM *fulminans*.

CHRYSOCERI, in *Antiquity*, a denomination given to oxen deſigned for ſacrifices. They were ſo called from their horns being gilded.

CHRYSOCOLLA, in the *Materia Medica of the Ancients*, the name of a fine green arſenacous powder, properly one of the *ſaburræ*, and found on the ſhores of the Red Sea, on thoſe of ſome parts of America, and in Ruſſia; and that found at this time has all the properties of that mentioned by the ancients. It ſerves to the ſoldering of gold and other metals, and given internally as a violent and dangerous emetic.

It is of a very elegant colour, ferments violently with aqua fortis, and is wholly diſſolved by it, and tinges it with a bluiſh green; and being calcined, it loſes all its green colour.

Chryſocolla is repreſented by Pliny as found in mines of gold, ſilver, copper, and lead: its colour, he ſays, was various, according to that of the matter in which it is found; yellow, if among gold, white in ſilver, green in copper, and black in lead. The Arabs, and inhabitants of Guzuratte, call the modern *chryſocolla*, which is *borax*, *tincar*, or *tincal*. The beſt is that found in copper-mines; and the worſt in thoſe of lead.

CHRYSOCOLLA is alſo the name of a ſort of precious ſtones, mentioned by Pliny, lib. xxxvii. cap. 10. who calls it alſo *amphitane*. He deſcribes it as of a gold colour, and of a ſquare figure; adding, that it has the virtue of attracting iron, and even gold. But this, in all probability, is fabulous; and the ſtone he ſpeaks of is apparently no other than the cubic pyrites.

CHRYSOCOME, in *Botany*, a name by which ſome authors calls the *flos æs citrinus*, or GOLDYLOCKS.

CHRYSOGONON, or CHRYSOGONUM, in *Botany*, a name by which ſome authors have expreſſed the moth MULLEIN, or *blattaria*. In the Linnæan ſyſtem, it is a diſtinct genus of the *ſyngeneſia polygamia neceſſaria* claſs.

CHRYSOGONUM, in the *Materia Medica*, is alſo the name of a Syrian plant, called the red turnep, the LEONTOPETALON *coſta ſimplici* of Tournefort.

CHRYSOLACHANON, in *Botany*, a name by which Pliny, and ſome other authors, have expreſſed the white garden beet.

CHRYSOLITE, with us, a precious ſtone, of a duſky green colour, with a caſt of yellow.

The *chryſolite* of the ancients was no other than the topaz of the moderns; even in its moſt pure and perfect ſtate it is a gem of ſmall beauty, and of no great value. It is found of various ſizes, and ſome of the coarſer pieces of it are vaſtly larger than any of the other gems are ever found to be; its moſt frequent ſize, however, when perfect, is about the bigneſs of a nutmeg. It is found of very various figures, but never columnar, or in the form of cryſtal; it is in ſome places found ſmall, and in roundiſh, or irregular, pebble-like maſſes, and in others generally oblong and flatted, and is always of a rude ſurface, and leſs bright than any other of the native gems. It is canaliculated, or ſtriated, lengthwiſe. Its colour is a dead green, with a faint admixture of a pale yellow; it has three different tinges in the ſeveral ſpecimens in different degrees of mixture; but its moſt uſual colour is that of an unripe olive, with ſomewhat of a braſſy colour mixt with it, and ſometimes a pale and duſky green, obſcured by a mixture of brown, and with a

A fourth kind is alſo a Jamaica fruit, with the hiſtory of which we are not yet well acquainted; nobody has ſeen it growings but the fruit itſelf is preſerved in many of the collections of the curious, and has been figured and deſcribed by Cluſius, and others, under the name of a round exotic fruit rigid with four riſing nerves.

Theſe are the principal kinds of fruit that toſſed on ſhore with us; but how the products of Jamaica, or other parts of America, ſhould be brought to the ſhores of Scotland and Ireland, ſeems difficult to determine on any certain foundation. It is eaſy to conceive, that when they grow by the ſides of rivers, they may fall off from the trees into them, and be thence conveyed into the ſea. It is likewiſe eaſy to ſee, that when they are thus floating on the ſurface of the ſea, they may be carried about by the winds and currents to a conſiderable diſtance; but their motion this way muſt naturally be ſtopped by the main continent of America, and they muſt be forced through the gulph of Florida, or the canal of Bahama, going thence conſtantly eaſt, and into the North American ſea. This is eaſily conceived by a ſimilar fact which happens every day; which is, that a kind of ſea fennil, called *ſargaſſo*, which grows very plentifully on the rocks about Jamaica, is waſhed off from thence, and carried by the winds and currents, which for the moſt part go impetuouſly the ſame way, toward the coaſt of Florida, and thence into the North American Ocean; and is there found floating on the ſurface. Thus far it is eaſy to trace our fruits from their native ſoil; but how after this they ſhould be forwarded to us is unaccountable, unleſs we ſuppoſe, that as ſhips when they go ſouth expect a trade wind, and when they come north expect and generally find a weſterly wind, for at leaſt two parts in three of the year; ſo theſe fruits, being brought north by the current from the gulf of Florida, are put into the way of theſe weſterly winds, and by them conveyed to the coaſts of Scotland and Ireland. Phil. Tranſact. N° 222. p. 300.

By the ſame means that theſe *beans* came to Scotland, it is reaſonable to believe that the ſame winds and currents brought from America thoſe ſeveral things towards the Azores and Porto Santo, which are recorded by Ferdinand Columbus, in the life of his father; which gave this bold adventurer the firſt notion that there was ſuch a place as America. Among the things he mentions as waſhed aſhore in this manner, was a piece of wood very ingeniouſly wrought, but evidently without the help of iron tools. This was taken up by a Portugueſe pilot, four hundred and fifty leagues from thence, off Cape St. Vincent, after a weſt wind which had blown violently for many days: after this ſuch another piece of wood was taken up on the ſhores of Porto Santo, after ſuch another long and violent weſt wind. Large canes, vaſtly ſuperior to any of the growth of the then known parts of the world, were alſo found thrown on the ſame ſhores, and the fruits of pines which did not grow in any known part of the world: and finally, the bodies of two men appearing to be of a different nation from any of the known people, and two of their canoes, were driven on ſhore on the iſland Flores, one of the Azores. All theſe things having been found only after ſtrong and continued weſt winds, it appeared very evident, that there muſt be land ſomewhere to the weſt, where fruits and men were to be found; and that theſe men had no knowledge of our arts, by their want of iron. From theſe conjectural concluſions ſprung the greateſt diſcovery of modern times.

BEAN *caper*, *zygophyllum*, or *ſabago*, in *Botany*, a genus of the *decandria monogynia* claſs. Its characters are theſe: the complement of the flower is compoſed of five oval obtuſe leaves; the flower has five obtuſe petals, which are longer than the complement, and are indented at their points: it has a cloſed *nectarium*, which includes the *germen*, compoſed of ſeveral ſcales or little leaves, to which the baſes of the *ſtamina* are faſtened. It has ten awl-ſhaped *ſtamina*, terminated by oblong ſummits and an oblong *germen*, ſupporting an awl-ſhaped ſtyle, crowned by a ſingle *ſtigma*. The *germen* becomes an oval five-cornered capſule with five cells, containing ſeveral roundiſh ſeeds. Miller enumerates four, and Linnæus nine ſpecies.

The Syrians uſe this plant to kill worms on account of its bitterneſs.

BEAN *veſſel*, a ſmall ſailing-veſſel or pilot-boat, very common on the ſea coaſts and in the rivers of Portugal.

BEAN *trefoil*, *ſee* SHRUB TREFOIL.

BEAN *tree*, *erythrina*, *ſee* CORALLODENDRON.

BEAN *fly*, in *Natural Hiſtory*, the name given by authors to a very beautiful fly, of a pale purple colour, frequently found on *bean* flowers. It is produced from the worm or maggot called by authors *nidor*.

BEAN is alſo uſed by ſome *Anatomiſts* to denote the *glans of the penis*, on account of its figure and reſemblance to that pulſe.

BEAN is alſo improperly uſed for a weight, containing the third part of a ſcruple.

BEAN, *wyſe*, in *Phyſiology*, denotes a well-known quadruped of the cat kind, of ſome uſe in medicine, but more in commerce and ſport. *See Tab. of Quadrupeds, Sect. ſix.*

Bear, in the Linnæan ſyſtem of Zoology, makes a diſtinct genus of animals of the *firſt* kind, the characters of which are, that the fore-teeth, above and below, are ſix in number, the upper ones alternately hollow within; the cutting teeth are ſingle and conical; the grinders five or ſix; the tongue ſmooth, the noſe prominent, and the *penis* large. The common *bear* has a ſhort tail. Under this genus, the author takes in the creature called the *cani mundi*, under the name of *lotor*, or *wyſe canis aquaticus*. *See* RACKOON.

The *bear* differs, in many reſpects, from all the other beaſts of prey. Its head is much larger than their: its ſkin on the back is extremely hard, rough, and ſtrong; under the belly it is more tender: its hairs are longer, ſofter, and leſs rigid than in any other wild beaſt of prey, and reſemble wool in ſome degree: its ſkull is much thinner than that of the lion; but its brain more than twice as much in quantity: its eyes are very ſmall, and, what is very remarkable, have a nictitating membrane to cover them on occaſion. Its feet have alſo five toes, as well the hinder as the fore ones: and what is remarkable is, that the large toe, which anſwers to the thumb with us, is in the place of the little finger. It is a very common creature in Germany, Poland, Lithuania, and many other places. Ray.

The *bear* was formerly an inhabitant of the Britiſh iſland; and was tranſported from Britain to Rome. *Bear*-baiting was a favorite paſtime with our anceſtors; an inſtance of which occurs ſo lately as the time of queen Elizabeth.

The *bear* is obſerved to bear ſome analogy to man; as having hair on both eye-lids, which no other beaſt has. His ſtructure and anatomy are deſcribed by the French academiſts. Du Hamel Hiſt. Reg. Acad. Sc. lib. i. ſect. Some diſtinguiſh two kinds of *bears*, *terreſtrial* and *marine*; the former of which keep to the mountains, whereas the latter come out on the ice as far as the middle of the North Sea. Some of this kind are found in Nova Zemlia, of an incredible ſize.

Each male among the ſea *bears* has a ſeraglio to himſelf, conſiſting from fifteen to fifty females, which he poſſeſſes as his own property.

BEAR, *Polar*, *ſee* POLAR *Bear*.

BEAR, *Sea*, *ſee* SEA-*Bear*.

BEAR'S *fleſh* was much eſteemed by the ancients; even at this day, the paw of a *bear* ſalted and ſmoaked, is ſerved up at the tables of princes.

Bear's fleſh is reckoned one of the greateſt rarities among the Chineſe; inſomuch that, as Du Halde informs us, the emperor will ſend fifty or a hundred leagues into Tartary, to procure them for a great entertainment.

BEAR'S *greaſe* is eſteemed by ſome a ſovereign remedy againſt cold diſorders, eſpecially rheumatiſms. Some have alſo employed it with ſucceſs in the gout, and againſt rumors and ulcers.

To be good, it muſt be newly melted, greyiſh, glutinous, of a ſtrong diſagreeable ſmell, and a moderate conſiſtence. That which is too white, is adulterated with common tallow.

BEAR'S *ſkin* makes a fur in great eſteem, and on which depends a conſiderable article of commerce, being uſed in houſings, on couch-boxes, &c. In ſome countries, cloaths are made of it, more eſpecially bags wherein to keep the feet warm in ſevere colds. Of the ſkins of *bears* cubs are made gloves, muffs, or the like.

BEAR *garden*, a place where *bears* and other beaſts are expoſed as a public ſpectacle to be baited.

BEAR *leading*, to ſhew tricks, is an ancient practice, which we find prohibited in the canons of the church. Du-Cange.

BEAR *ward*, *urſarii*, were a kind of ſervants in great families among the Romans, who had the care of breeding and feeding thoſe animals. Pitiſc. Lex. Ant. tom. ii. p. 1110.

Our nobility had formerly officers of this kind. The annual ſalary of one of them belonging to the fifth earl of Northumberland was twenty ſhillings. Northumb. Houſhold Book.

Order of the BEAR, was a military order in Switzerland, erected by the emperor Frederic II. in 1213, by way of acknowledgment for the ſervice the Swiſs had done him, and in favour of the abbey of St. Gal. To the collar of the order hung a medal, on which was repreſented a *bear* raiſed on an eminence of earth.

BEAR, or BERE, is a ſpecies of barley cultivated in Scotland and Ireland, and the northern parts of England. It yields a large return, but is not eſteemed ſo good for malting as the common barley.

Ant BEAR, in *Zoology*, *ſee* ANT *eater*.

BEAR's *ears*, in *Botany*, see AURICULA.

BEAR's *ear sanicle*, see SANICLE.

BEAR-*bind*, see CONVOLVULUS.

BEAR's *breech*, ACANTHUS, in *Botany*, and BRANC *ursine*; a genus of the *didynamia angiospermia* class. Its characters are these: the empalement of the flower is two-leaved and bifid; the petal has but one lip, which is turned backward, and is divided into three at the end; the capsule has two cells, each containing one seed; it is of the ringent cloth of flowers, whose seeds are in a capsule. It is in the second division of Linnæus's fourteenth class. There are four species.

The common *acanthus*, whose leaves compose the ornaments of the Corinthian capital, and is used in medicine, grows naturally in Italy, Sicily, and the Levant.

The *farina* of *bear's breech*, microscopically examined, has the appearance represented in *Tab. of Microscopical Objects, copp.* 2.

BEAR's *foot*, see HELLEBORE.

BEAR, in *Astronomy*, a name given to two constellations called the *Greater* and the *Lesser Bear*; or URSA *major* and *minor*.

The pole star is said to be in the tail of the *Lesser Bear*; this star is never above two degrees distant from the north pole of the world.

BEARD, the HAIR growing on the chin, and adjacent parts of the face; chiefly of adults and males.

Various are the ceremonies and customs the *beard* has been liable to: Kingston assures us, that a considerable branch of the religion of the Tartars consists in the management of their *beards*; and that they waged a long and and bloody war with the Persians, and declared them infidels, though, in other respects, of the same faith with themselves, merely because they would not cut their whiskers after the mode or rite of the Tartars.

Athenæus, from Chrysippus, observes that the Greeks always wore their *beards* till the time of Alexander; and that the first who cut it at Athens ever after bore the addition of *κειρε, barber*, on medals. Plutarch adds, that Alexander commanded the Macedonians to be shaven, left the length of their *beards* should give a handle to their enemies; however this be, we find Philip, his father, as well as Amyntas and Archelaus, his predecessors, represented on medals without *beards*.

Pliny observes, that the Romans did not begin to shave till the year of Rome 454, when P. Titinius brought over a flock of barbers from Sicily; he adds, that Scipio Africanus was the first who introduced the mode of shaving every day.

Among that people, it became the custom to have visits made in form at the cutting of the *beard* for the first time: the first fourteen Roman emperors shaved, till the time of the emperor Adrian, who retained the mode of wearing the *beard*. Plutarch tells us he did it to hide the scars in his face.

Formerly there was a great deal of ceremony used in blessing the *beard*; and there are still extant the prayers used in the solemnity of consecrating it to God, when an ecclesiastic was shaven.

Persons of quality laid their children shaved the first time by others of the same, or greater quality, who, by this means, became god-fathers, or adoptive fathers of the children.

Anciently, indeed, a person became god-father of the child by barely touching his *beard*; thus historians relate that one of the articles of the treaty between Alaric and Clovis was, that Alaric should touch the *beard* of Clovis to become his *God-father*.

As to ecclesiastics, the discipline has been very different on the article of *beards*: sometimes they have been enjoined to wear them, from a notion of too much effeminacy in shaving, and that a long *beard* was more suitable to the ecclesiastical gravity; and sometimes again they were forbid it, as imagining pride to lurk beneath a venerable *beard*.

The Greek and Romish churches have long disputed together about their *beards*; since the time of their separation, the Romanists seem to have given more into the practice of shaving, by way of opposition to the Greeks; and have even made some express constitutions *de radendis barbis*.

The Greeks, on the contrary, espouse very zealously the cause of long *beards*, and are extremely scandalized at the beardlessimages of saints in the Roman churches.

By the statutes of some monasteries, it appears, that the lay-monks were to let their *beards* grow, and the priests among them to shave: and that the *beards* of all that were received into the monasteries were blessed with a great deal of ceremony.

To let the *beard* grow is a token of mourning in some countries, and to shave it in others. Le Comte observes, that the Chinese affect long *beards* extravagantly; but nature has balked them, and only given them very little ones, which, however, they cultivate with great care: the Europeans are strangely envied by them on this account.

The Russians were their *beards* till within these few years, when the czar Peter enjoined them all to shave; but, notwithstanding his injunction, he was obliged to keep on foot a number of officers to cut off by violence the *beards* of such as would not otherwise part with them.

Chevreau observes, that the kings of Persia had their *beards* woven or matted together with gold thread; and some of the first kings of France had, in the same manner, their *beards* knotted and buttoned with gold.

Among the Turks, it is more infamous for any one to have his *beard* cut off, than among us to be publicly whipt, or branded with a hot iron. They who serve in the seraglio have their *beards* shaven as a token of servitude; and when they are set at liberty, they permit it to grow. With them and the Persians, the *beard* is a mark of authority and liberty. There are many in that country who would prefer death to this kind of punishment. The Arabs make the preservation of the *beard* a capital article of religion, because Mahomet never cut his.

The Turkish wives kiss their husbands *beards*, and children their fathers, as often as they come to salute them. The men kiss one another's *beards* reciprocally on both sides, when they salute one another in the streets, or come off from any journey.

The Jews wear a *beard* on their chin, but not on the upper lip or cheeks.

BEARD, *touching the*, was an action anciently made use of by supplicants, and those who made vows.

BEARD, *anointing the*, with unguents, is an ancient practice both among the Jews and Romans, and still continues in use among the Turks; where one of the principal ceremonies observed in serious visits, is to throw sweet scented water on the *beard* of the visitant, and to perfume it afterwards with aloes wood, which sticks to that moisture, and gives it an agreeable smell, &c.

In *Middle Age Writers* we meet with *ustimire barbam*, used for stroking and combing it, to render it soft and flexible.

The Turks, when they comb their *beards*, hold a handkerchief on their knees; and gather very carefully the hairs that fall; and when they have got together a certain quantity, they fold them up in paper, and carry them to the place where they bury the dead.

BEARD, *shaving the*, was practised to Cynics by way of contempt.

Some authors also speak of *mortgaging the beard*, *barbam hypothecare*. Du-Cange.

BEARD, *barba falsa*, was an artificial one. In a general court of Catalonia, held in 1351, it is expressly enjoined, *Ne quis barbam falsam seu fictam audeat deferre vel fabricare*. Du-Cange.

Hottoman has given an elegant dialogue *de barba* first printed by Plantin in 1586.

BEARD *of a muscle*, oysters, or the like, denotes an assemblage of threads or hairs, by which those animals fasten themselves to stones, &c.

The hairs of this *beard* terminate in a flat spungy substance, which, being applied to the surface of a stone sticks thereto, like the wet leather-tuckers used by boys.

BEARDS, in the *History of Insects*, are two small, oblong, fleshy bodies, placed just above the trunk, in the gnats, and in the moths and butterflies.

BEARD, or *under beard*, called also *cheek*, of a horse, is that part under the lower mandible on the outside, and above the chin, which bears the curb of the bridle.

BEARD, *old man's*, in *Botany*, see CLEMATIS.

BEARD *of a comet*, denotes the rays which the comet emits towards that part of the heavens to which its proper motion seems to direct it.

In which the *beard* of the comet is distinguished from the *tail*, which is underlood of the rays emitted towards that part from which its motion seems to carry it. See TAIL.

It is called *beard*, from some fancied resemblance it bears to the *beard* of a man.

BEARDED, *barbatus*, denotes a person or thing with a BEARD, or some resemblance thereof.

In *Middle Age Writers*, this is sometimes expressed by *Multibarbis*, q. d. *barba in multis seu pernis*.

The faces on ancient Greek and Roman medals are generally *bearded*. Some are denominated *pogonati*, as having long beards, e. gr. the Parthian kings. Others have only a *lanugo* about the chin, as the Seleucid family. Adrian was the first of the Roman emperors who published

rifhed his beard: hence all imperial medals before him are *beardleſs*; after him, *bearded*.

The medals of gods, and heroes in vigorous youth, repreſent them *beardleſs*, except Jupiter, and a few others.

The Romans paid their worſhip to a *bearded* Venus, *Veneri barbatæ*, ſuppoſed to have been of both ſexes: a ſtatue of whom was alſo found in the iſle of Cyprus.

The reaſon of repreſenting the goddeſs of beauty with a *beard* is variouſly gueſſed at by the learned.

BEARDED *women* have been all obſerved to want the menſtrual diſcharge: and ſeveral inſtances are given by Hippocrates, and other phyſicians, of grown women, eſpecially widows, in whom the *menſes* coming to ſtop, *beards* appeared. Euſebius Nieurembergius mentions a woman, who had a *beard* reaching to her navel. Bartholin ſpeaks of a *bearded* woman at Copenhagen, who, partly in virtue thereof, paſſed for an hermaphrodite.

BEARDED *brothers, fratres barbati*, are more particularly uſed in *Eccleſiaſtical Writers* for thoſe otherwiſe called *fratres converſi* in the order of Grammont and the Ciſtercians.

They took this denomination, becauſe allowed to wear their *beards*, contrary to the rules of profeſſed monks.

BEARDED *hoſe*, among *Florifts*, a huſk which is hairy on the edges, as is that of the roſe, &c.

BEARDING *of wool*, ſee WOOL.

BEARER, in *Architecture*, a poſt, or brick wall, trimmed up between the two ends of a piece of timber, to ſhorten its bearing, or to prevent its bearing with the whole weight at the ends only.

BEARERS, *eccleſiaſtes*, in *Middle Age Writers*, are ſometimes uſed for a child's goſſips, becauſe they hold the infant in their arms, and preſent him to the prieſts in the ceremony of baptiſm. Du-Cange.

BEARERS *of a* BILL *of* EXCHANGE, denote the perſons in whoſe hands it is, and in favour of whom the laſt order or indorſement was made.

When a bill is ſaid to be *payable to bearer*, it is underſtood to be payable to him, who firſt offers himſelf after it becomes due. To be paid a bill of this kind, there needs neither order nor tranſfer; yet it is good to know to whom it is paid.

BEARERS are more peculiarly uſed among us for thoſe who carry the dead to their graves.

In a ſenſe ſomewhat different from this, we alſo ſay *pall-bearers*, *Vide* PALL.

The ancients had peculiar orders or officers of *bearers*, called by the greeks *acrobatæ*; by the Romans, *bellatores*. The *veſpillones*, or *ſpoli*, were a lower ſort of *bearers*, appointed for perſons of inferior rank.

BEARERS, in *Horticulture*, denote the fruit branches, or ſuch as bear fruit.

The *bearers*, or bearing branches of an apple-tree, and the like, are found to be rougher, and fuller of aſperities in their bark, than the other branches.

BEARERS, in *Heraldry*, ſee SUPPORTERS.

BEARER, *Croſs*, ſee CROSS.

BEARING, in *Geography*, and *Navigation*, the ſituation of one place from another, with regard to the points of the compaſs; or the angle which a line drawn through the two places makes with the meridians of each.

The *bearings* of places on the ground are uſually determined from the magnetic needle: on the managing of theſe lies the principal part of ſurveying, ſince the *bearing* and diſtance of a ſecond point from the firſt being found, the place of that ſecond is determined; or the *bearings* of a third point from two others, whoſe diſtance from each other is known, being found, the place of the third is determined: inſtrumentally we mean; for to calculate trigonometrically, there muſt be more *data*. Mr. Collins gives the ſolution of a problem in the Philoſophical Tranſactions, where the diſtances of three objects on the ſame plane being given, and the *bearings* from a fourth place in the ſame plain obſerved, the diſtances from the place of obſervation to the reſpective objects are required.

BEARING, in the *Sea-Language*. When a ſhip ſails towards the ſhore, ſhe is ſaid to *bear in with the land*. When a ſhip that was to windward comes under another ſhip's ſtern, and ſo gives her the wind, ſhe is ſaid to *bear under her lee*. If a ſhip ſails into a harbour with the wind large, or before the wind, ſhe is ſaid to *bear in with the harbour*, &c.

In conding they ſay, *bear up the helm*, that is, let the ſhip go more large before the wind—*bear up round*, that is, let the ſhip go between her two ſheets, directly before the wind—*bear a hand*, i. e. make haſte.

They alſo ſay, a ſhip *bears*, when, having too ſlender a quarter, ſhe will ſink too deep into the water with an over light freight, and therefore can carry but a ſmall quantity of goods.

To BEAR *ſail well* is ſaid of a ſhip, when ſhe is a ſtiff-guided ſhip, and will not couch down on a ſide with a great deal of ſail.

When a ſhip is ſaid to *bear but her ordnance*, it is meant, that her ordnance lie ſo high, and ſhe will go ſo upright, that in reaſonable fighting weather, ſhe will be able to keep out her lower tier, and not be forced to ſhut in her ports.

A ſhip is ſaid to *weather-bear*, when it is able, in a great gale of wind, to carry out more ſails, viz. a top-ſail more, or the like.

BEARING *off* is alſo uſed by *Seamen*, generally in buſineſs belonging to ſhipping, *for thruſt off*.

Thus, in hoiſting any thing into the ſhip, if it hath hold by any part of the ſhip or ordnance, or the like, they ſay, *bear it off from the ſhip's ſide*.—So, if they would have the breech or mouth of a piece of ordnance, or the like, put from one, they ſay, *bear off*, or *bear about* the breech.

BEARING *up*, or *bearing away*, is improperly uſed to denote the act of changing the courſe of a ſhip, in order to make her ſail before the wind, after ſhe had ſailed ſome time with a ſide-wind, or cloſe-hauled.

BEARING alſo expreſſes the ſituation of any diſtant object, eſtimated from ſome part of the ſhip, according to her poſition. In this ſenſe, the object muſt be either a-head, a-ſtern, a-breaſt, on the bow, or on the quarter.

BEARING *of a piece of timber*, in *Carpentry*, denotes the ſpace either between the two fixt extremes thereof, when it has no other ſupport; which is called *bearing at length*: or between one extreme, and a poſt, brick, wall, or the like, trimmed up between the ends to ſhorten its *bearing*.

Joiſts are not to *bear* above ten feet length: nor ſingle rafters more than nine feet. 19 Car. II. c. 3.

BEARING *of an arch or vault*, denotes the effort which the ſtones make to burſt open the piers, or *pieds-droits*.

This amounts to the ſame with what the French call *pouſſée*.

BEARINGS, in *Heraldry*, a term uſed to expreſs a coat of arms, or the figures of armories, by which the nobility and gentry are diſtinguiſhed from the vulgar, and from one another. Theſe ſigns of nobility with us are evidently a copy of the ſtatues and images among the ancient Romans, which they uſed to expoſe before their houſes on public days, and carried before the body at a funeral of a great perſon. Theſe ſtatues among them were the reſemblances of their noble anceſtors. And as our coats of arms evidently were brought up in the place of theſe, it ſeems very natural to date the riſe and origin of heraldry in England as now practiſed, from the time of the ſubverſion of the Roman empire by the Goths and Vandals; who, as they deſtroyed many liberal arts, ſo they ſeem in return, to have given birth to this of heraldry.

Theſe warlike nations, having ſubdued the mighty Roman empire, and raiſed their glory by military ſervice, became very fond of the atchievements of their anceſtors and great men, and derived their enſigns and titles of honour from what concerned a ſoldier. They firſt, therefore, diſtinguiſhed the whole community into three ranks; which they named, according to the different orders of military men, *miles*, *eques*, and *pedites*; and their poſterity, willing to commemorate their honours, reſerved to themſelves their ſeveral military enſigns; and theſe became what we call *bearings*, or arms, the marks of gentility, or of houſes, ſome one of which had once deſerved an elevation above the common rank of men. While the direct deſcendant of this honourable perſon carried his enſigns of honour for his diſtinction, the collateral branches alſo were ambitious of preſerving the memory of their having belonged to ſuch an honourable houſe; and therefore aſſumed the ſame figure, but with ſome difference, to diſtinguiſh the diſtance from the original claim. In proceſs of time, other families, who had deſerved as well of their prince and country, whether in civil or military affairs, became deſirous of the ſame ſort of diſtinction, by way of perpetual memorial of their ſervices; and upon this occaſion many other devices were formed into arms, and continued down to poſterity in the ſeveral families.

Armorial bearings, in the tenth and eleventh centuries, were ſingle and plain, conſiſting only of few figures. Charges, differences, quarterings, &c. are the inventions of later times.

BEARING *of an organ pipe*, denotes an error or variation from the juſt ſound it ought to yield. See TEMPERATURE.

BEARING *down of the matrix*, a diſorder in pregnant women, being a ſenſation of a weight at the bottom of the *abdomen*, or preſſure on the neck of the womb, ſo as to hinder the perſon from walking without pain; and ſometimes

sometimes also occasioning difficulty of urine, numbness of the hips, uneasiness in going to stool, and in the end abortion.

BEARING *down*, among *Cock-fighters*, denote the foremost toes, on which the bird goes; and if they be hurt or gravelled, he cannot fight.

BEARING *of a stag*, is used in respect of the state of his head, or the crotches which he bears on his horns.

If you be asked what a stag *bears*, you are only to reckon the crotches, and never to expect an odd number: as, if he have four crotches on his near horn, and five on his far, you must say he bears ten; a fair right on his near horn: if but four on the near horn, and six on the far horn, you may say he bears twelve; a double taste right on the near horn.

BEARN *done*, see PHOSPHORUS.

BEAST, see BRUTE. Authors make this difference between *beasts of the forest*, and *of chase*, that the first are *silvestres tantum*, the latter *campestres tantum*. *Beasts of the forest* make their abode all the day time in the great coverts and secret places of the woods; and in the night season, they repair into the lawns, meadows, pastures, and pleasant feeding places: whence their denomination *silvestres*, q. d. *beasts of the wood*.

Beasts of the chase reside all the day time in the fields, and on the mountains clear of, or present surprize; but on night's approach, they feed in the rail in meadows, &c. whence their appellation *campestres*, q. d. *beasts of the field*.

BEASTS *of* CHASE, in our *Statute-books*, are five; the buck, doe, fox, martin, and roe.

BEASTS *of the forest* are, the hart, hind, hare, boar, and wolf.

BEASTS and *fowls of the warren* are, the hare, coney, pheasant, and partridge. See GAME.

No other, according to Manwood, are accounted *beasts* or fowls of warren, than hares, coneys, pheasants, and partridges. Lord Coke is of another opinion, distinguishing *beasts* on the warren from fowls of the warren. Under the former, he includes, hares, coneys, and roes: the latter he divides into *silvestres*, *campestres*, and *aquatiles*. To the first belong the pheasant, woodcock, &c. to the second the partridge, quail, rail, &c. to the third the mallard, heru, &c. Coke on Littleton, p. 233.

BEAST *of burden* is understood of all quadrupeds employed in carrying goods on their backs.

BEAST *at ombre*, is, where the player, or person that undertakes the game, loses it to the other two; the penalty of which is a forfeiture equal to the stake played for.

BEAST, *le bête*, is also the name of a French game at cards.

BEASTS, *rother*, see ROTHER.

BEAT, or UNDULATION, in *Music*, see UNDULATION.

BEAT, in *Fencing* denotes a blow or stroke given with the sword.

There are two kinds of *beats*; the first performed with the foible of a man's sword on the foible of his adversary's which in the schools is commonly called *battery*, from the French *batre*, and is chiefly used in a pursuit, to make an *open* upon the adversary. The second and best kind of *beat* is performed with the fort of a man's sword upon the foible of his adversary's, not with a *fring*, as in binding, but with a jerk, or dry *beat*; and is therefore most proper for the parades without or within the sword, because of the rebound a man's sword has thereby from his adversary's, whereby he procures to himself the better and surer opportunity of ripposting.

BEAT, in the *Manege*. A horse is said to *beat the duft*, when, at each stroke or motion, he does not take in ground or way enough with his fore-legs.

He is more particularly said to *beat the duft* in *terra a terra*, when he does not take in ground enough with his shoulders, making his strokes or motions too short, as if he made them all in one place.

He *beats the duft* in curvets, when he does them too precipitantly, and too low.

He *beats upon a moth*, when he walks too short, and thus ride but little ground, whether it be in straight lines, rounds, or pillings.

BEAT *upon the hand*, in the *Manege*, see CHACK.

BEAT *of the drum*, in the *Military Art*, is differently performed, according to the purposes designed by it. Notice is hereby given of any sudden change; soldiers are summoned to repair to their arms and quarters: and the various movements before and after, and during the engagement, are denoted by different *beats* of the drum.

The chief *beats* or beatings on the drum are, the *general*, the *assembly*, the *march*, the *reveille*, the *retreat*, &c.

BEATA, see MAID *of the Bath*.

BEATER is applied, in *Matters of Commerce*, to divers sorts of workmen, whose business is to hammer or flatten certain matters, metals, or the like.

In this sense we meet with *plaster beater*, *cement-beater*, *mortar-beater*, &c.

BEATERS, *gold*, are artisans, who, by beating gold and silver with a hammer on a marble, in moulds of vellum and bullocks guts, reduce them to thin leaves fit for gilding, or silvering of copper, iron, steel, wood, &c.

Gold-beaters differ from *flatters* of gold and silver, as the former bring their metal into leaves by the hammer; whereas the latter only flatten it by passing it through a mill, preparatory to beating.

There are also *Tin-*BEATERS employed in the looking-glass trade, whose business is to beat tin on large blocks of marble, till it be reduced to thin leaves, fit to be applied with quicksilver behind LOOKING-GLASSES. See FOLIATING, and GOLD-*beating*.

BEATER is also used for an instrument wherewith to gravel walks and alleys in gardens even.

It is a piece of wood half a yard long, six inches thick, and eight or nine broad, having a handle fixed obliquely in the middle.

BEATIFIC *vision*, see VISION.

BEATIFICATION, in *Electricity*, a term used by professor Boze to denote an electrical experiment, by which he incircled the head of a person strongly electrified, and standing on a large cake of pitch, with a luminous glory, resembling that with which painters ornament the heads of saints. The secret of this experiment, which occasioned many fruitless and expensive trials to the first electricians in Europe, consisted in the use of a suit of armour, checked with steel, in various figures; and the glory was produced by rays issuing from the edges of the helmet.

BEATIFICATION, in the Romish *Church*, the act whereby the pope declares a person happy after death.

Beatification differs from *canonization*; in the former, the pope does not act as a judge in determining the state of the *beatified*, but only grants a privilege to certain persons to honour him by a particular religious worship, without incurring the penalty of superstitious worshippers: but, in canonization, the pope speaks as a judge, and determines, *ex cathedra*, upon the state of the *canonized*.

Beatification was introduced, when it was thought proper to delay the canonization of saints, for the greater assurance of the truth, and manifestation of the rigorous steps taken in the procedure.

It is remarkable, that particular orders of monks assume to themselves the power of *beatification*.

Thus Octavia Malchiorita was *beatified* with extraordinary ceremonies by the Dominicans, for a legacy of 7000 dollars to the order.

BEATING, among *Sportsmen*, denotes the noise which hares make in RUTTING-*time*.

The hare is said to *beat*, the hart to *bell*, &c.

BEATING, PULSATION, in *Medicine*, is applied to the reciprocal agitation or palpitation of the heart and pulse.

Some physicians distinguish eight-and-one different kinds of simple *beatings*, and fifteen compound ones. They compute sixty beats in the space of a minute, in a temperate man. But, in fact, we generally find a greater number.

BEATING *of the heart*. Divers fystematists have been trained to account for the *beating* of the heart. Some have doubted whether it be mechanical, that is, derivable from any known laws or powers of nature. See Ray's Wisdom of God, part 1. p. 48.

BEATING *flax*, or *hemp*, is an operation in the dressing of these matters, contrived to render them more soft and pliant.

When hemp has been swingled a second time, and the bands laid by, they take the strikes, and dividing them into dozens, and half dozens, make them up into large thick rolls, which being broached on long staves, are let in the chimney-corner to dry; after which they lay them in a round trough made for the purpose; and there, with beetles, beat them well, till they handle both softnest and whiteness as plant as possible, without any hardness, or roughness to be left: that done, they take them from the trough, open and divide the strikes as before, and if any be found not sufficiently beaten, they roll them up, and beat them over as before.

Beating hemp is a punishment inflicted on loose or disorderly persons.

BEATING, in *Book-Binding*, denotes the knocking of a book in quires on a marble block, with a heavy broad-faced hammer, after folding, and before binding or stitching it. On the *beating* of it properly, the elegance and excellence of the binding, and the easy opening of the book, principally depend.

BEATING, in the *Paper Works*, signifies the *beating* of paper on a stone with a heavy hammer, with a large, smooth head, and short handle, in order to render it more smooth and uniform, and fit for writing.

BEATING *the wind*, was a practice in use in the ancient method of trial by combat. If either of the combatants did not appear in the field at the time appointed, the other

other was to *beat the wind*, or make so many flourishes with his weapon; by which he was intitled to all the advantages of a conqueror. Du-Cange.

BEATING *the hands or feet*, by way of praise or approbation. See APPLAUSE.

BEATING *time*, in *Music*, a method of measuring and marking the time for performers in concert, by a motion of the hand or foot up and down successively, and in equal times.

The general rule is, to contrive the division of the measure so, that every down and up of the *beating* shall end with a particular note, on which very much depends the distinctness, and, as it were, the sense of the melody. Hence the beginning of every time, or *beating* in the measure, is reckoned the accented part thereof. Malcolm.

Beating time is denoted, in the Italian music, by the term *battuta*, which is usually put after what they call *ritirata*, where little or no time is observed, to denote, that here they are to begin again to mark or beat the time exactly.

The Romans timed at first somewhat of harmony in the strokes of their oars, and had an officer called *pertficulator* in each galley, whole business was to *beat* time to the rowers; sometimes by a pole or mallet, and sometimes by his voice alone.

The ancients marked the rhythm in their musical compositions; but to make it more observable in the practice, they *beat* the measure or time, and this in different ways. The most usual consisted in a motion of the foot, which was raised from, and struck alternately against the ground, according to the modern method.

To make the beats or strokes more audible, their feet were generally shod with a sort of *sandals*, either of wood or iron, called by the Latins *pedicæ*, *scabella*, or *scabilla*, because like to little stools, or foot-stools. Sometimes they beat upon sonorous foot-stools, with the foot shod with a wooden or iron sole.

They beat the measure not only with the foot, but also with the right hand, all the fingers whereof they joined together, to strike into the hollow of the left. He who thus marked the rhythm, was called *numerator*. The ancients also beat time or measure with shells, and bones of animals, which they struck one against another, much as the moderns now do castanets, and the like instruments. Burette, Mem. Acad. Inscr. tom. vii. p. 243, 247.

BEATING, in *Navigation*, the operation of making a progress at sea against the wind, in a zigzag line, or traverse. See TACKING.

BEATING, *drubbing*, or *stripes*, make one of the most ancient, as well as universal species of punishment. Among the Romans it obtained, under the denomination of *verberare*, *fustigare*, *flagellare*, *pulsare*, &c. In the East it still prevails under the name of BASTONADO.

Some distinguish between *pulsation* and *verberation*, as if the latter imported a *beating* with pain, the former without; but this distinction is not always kept to.

BEATING, in the English Law. See BATTERY.

BEATING *in the flanks*, a distemper to which black cattle are subject, and is an inflation of a great inflammation in the bowels.

BEATING, in *Husbandry*. See BURNING *of Land*.

BEATITUDE imports the supreme good, or the highest degree of happiness human nature is susceptible of.

In which sense, it amounts to the same with what we otherwise call *happiness* and *sovereign felicity*; by the Greeks εὐδαιμονία; and by the Latins *summum bonum*, *beatitudo*, and *beatitas*.

BEATITUDE, among *Divines*, denotes the beatific vision, or the fruition of God in a future life or all eternity.

BEATITUDE is also used in speaking of the *theses* contained in Christ's sermon on the mount, whereby he pronounces *blessed the poor in spirit, those that mourn, the meek*, &c.

BEATITUDE was also a title anciently given to all bishops; but of later days restrained to the pope.

It appears to have been sometimes also given to laymen.

BEATS, in a watch or clock, are the strokes made by the fangs or pallets of the spindle of the balance; or of the pals in a royal *perpetuum*.

To find the *beats* of the balance in any watch, or in one turn of any wheel.—Having found the number of turns, which the crown-wheel makes in one turn of the wheel you seek for (by the direction given under the word TURN), those turns of the crown-wheel, multiplied by its notches, give half the number of *beats* in that one turn of the wheel: for the balance or swing has two strokes to every tooth of the crown-wheel; inasmuch as each of the two pallets has its blow against each tooth of the crown-wheel: whence it is, that a pendulum which beats seconds, has in its crown-wheel only 30 teeth. To explain this, suppose the numbers of a fixteen-hour watch where-

$$\begin{array}{l} 4)32(8 \\ \quad 32 \\ \hline 5)55(11 \\ \quad 55 \\ \hline 5)45(9 \\ \quad 40 \\ \hline \quad 5 \end{array}$$

in the pinion of report is 4, the dial-wheel 32, the great wheel 55, the pinion of the second wheel 5, &c. The number of the notches in the crown-wheel 15, being multiplied into 6336 (the product arising from the continual multiplication of the quotients 8, 11, 9, 8) gives 107712, for half the number of *beats* in one turn of the dial-wheel; for 8 times 12 is 120, which is half the number of *beats* in one turn of the contrate-wheel 40, and 9 times 120 is 1224, the half-*beats* in one turn of the second wheel; and 11 times 1224 is 13464, the half-*beats* in one turn of the great wheel 55; and 8 times 13464 makes 107712. If you multiply this by the two pallets, i. e. double it, it gives 215424, which is the number of *beats* in one turn of the dial wheel, or 12 hours.

To know how many *beats* this watch has an hour, divide the *beats* in 12 hours into 12 parts, and it gives 17952, which is called the *train* of the watch, or the *beats* in an hour. If this be divided into 60 parts, it gives 299, and a little more, for the *beats* in a minute; and so you may proceed to seconds or thirds.

By the *beats* and turns of the fuse, the hours that any watch will go, may be found thus. As the *beats* of the balance in one hour, are to the *beats* in one turn of the fuse; so is the number of the turns of the fuse 1, to the continuance of the watch's going. Thus, 20160: 26928 :: 12: 16.

To find the *beats* of the balance in one turn of the fuse, say, As the number of turns of the fuse, to the continuance of the watch's going in hours; so are the *beats* in one hour, to the *beats* of one turn of the fuse; i. e. 12: 16 :: 20160: 26928.

To find the *beats* of the balance in an hour, say, As the hours of the watch's going, to the number of turns of the fuse; so are the *beats* in one turn of the fuse, to the *beats* of an hour. Thus, 16: 12 :: 26928: 20160. Derham's Artificial Clock Maker, p. 124, &c. and 251.

BEAVER, CASTOR, in the Linnæan *System of Zoology*, makes a distinct genus of animals, of the order of *glires*, and class of *mammalia*, the characters of which are, that the upper fore-teeth are truncated, and hollowed obliquely, and that the lower are oblique at the apex, with a thin rib; and with feet which have five toes on each, and palms adapted for swimming. Under this genus are comprehended, 1. The *beaver*, properly so called, or fiber, with a black, flat, and oval tail, with palmated feet: this species produces the CASTOREUM. 2. The *coffor*, with a flat lanceolated, or oblong tail, called by Clusius, the exotic *water-rat*. 3. The *ondatra*, with a long, flat, lanceolated tail, with cleven feet, called *zibethicus*.

The *beaver*, diftinctively so called, has two very different forts of hair, the one very fast and fine, the other long and thick; the first serves to defend the creature from the cold, the other to receive the mire in which it often wallows, and to prevent its getting to the skin. The teeth of this creature are formed in a very particular manner, and are extremely fit to cut trees, with which they build themselves lodging to defend them from the weather, and to breed their young in. The fore-feet are formed like the human hand, and by this means they are able to carry their materials, and work at their habitations: the hinder feet, which are destined to be of use to them in swimming, are on the contrary webbed like those of a goose. Their address and contrivance in constructing their habitations, would scarcely obtain credit, were they not well attested.

Beavers were formerly found in Great Britain; but the breed has been long extirpated. Giraldus Cambrensis's account of them is the latest in 1188. See 1564, 579.

The bladders in this animal destined for receiving the medicinal substance called *castor*, are distinct from the testicles, and are four large ones, placed about the lower part of the *os pubis*; two of these stand above the other two, but chiefly joined to one another, the two upper being to prepare the matter, and the two other to bring it to the greater perfection and maturity. The reader is of a stronger scent and deeper colour, as it is always found with this difference in these bags from what it is in the upper ones. The lower bags, for this reason, are of a glandular structure; and under these lower bags there is another long one full of a matter, more yellow and liquid, and seeming more elaborated than any of the others. This is of a different smell from the former, and more than any thing else resembles the yolk of an egg. It is said that the creature uses this liquor to get itself an appetite, and that it gets it out by squeezing the bag that contains it with its paws. The people of Canada set gins for these creatures, and catch many of them that way; and, knowing how fond they are of this liquor, they always anoint the gins with some of it.

It has been generally said that the testicles of this crea-

ture were fastened to the back-bone, but they are, in reality, not so, but placed on the sides of the *os pubis*, about the groin, and are altogether bull, not appearing at all any more than the paps, till the bull is castrated; and the *stones*, contrary to that of a *dog*, which goes from the *stones* to the navel, descends in this animal downwards to the root of the *yard*, at which place it terminates.

BEAVER, *Fiber*, the fur or skin of an amphibious animal, called the *ostor*, or *bever*, sometimes found in France, Germany, and Poland, but most abundantly in the province of Canada in North America.

In chief use is the for the composition of hats, furs, &c. Before this, in 1666, an attempt was made to employ it in fulling cloths; but experience soon found that the *beaver* cloth lost more dye when wet, and that when dry again, they were hard and stiff to wear.

The merchants distinguish three kinds of *castor*, though all equally the skins of the same animal; these are *castor*, *dry castor*, and *fat castor*, or *new castor*, called also *castor castor*, and *Upsala castor*, because ordinarily received to send into Muscovy; this is that taken in the winter huntings. This is the best and most esteemed for wear furs, as having left none of its hair by moulting. *Dry castor*, or *new castor*, is the refuse of the summer huntings; when the beast is moulted, and has left part of its hair: this being much inferior to the former, is little used in furs, but chiefly in hats. *Fat castor*, usually called *old-coat*, or *coat-beaver*, is that which has contracted a certain fat, unctuous humour, by sweat exhaled from the bodies of the savages, who have worn it for some time: this, though better than the *dry*, is yet only used for hats.

After the hair is cut off the skin to be used in hats, the pelt or thin hide is used in various works, as for the covering of trunks, in harness, &c.

Beaver is chiefly imported by the Hudson's-bay company, from the northern parts of America; where the animal abounds.

BEAVER is also used to denote a hat made of *beaver's hair*.

BEAUFET, BUFFET, or BUREL, was anciently a little apartment separated from the rest of a room by frames of wooden columns, for the disposing china and plate ware, &c. called also a *cabinet*.

It is now, properly, a large table in a dining-room, called also a *side board*, for the plate, glasses, bottles, bafons, &c. to be placed, as well for the service of the table as for magnificence.

The *buffet*, among the Italians called *credenza*, is enclosed within a balluster, elbow-high.

BEAUMAS. See MASS.

BEAU-PLEADER, or BEAU-PLEADER, a writ on the statute of Marlebridge, whereby it is provided, that no fine shall be taken of any man in any court for *fair-pleading*, i. e. for not pleading aptly, and to the purpose.

BEAUTY is a term whereby we express a certain relation of some object, either to an agreeable sensation, or to an idea of approbation.

When, therefore, I say a thing is *beautiful*, I either mean that I perceive something that I approve, or that something gives me pleasure: whence it appears, that the idea annexed to the word *beauty* is double; which renders the word equivocal, and this is the source of most of the disputes on the subject of *beauty*.

We must therefore distinguish between *ideas* and *sensations*. Ideas occupy the mind, sensations interest the heart. Though we see nothing in an object to interest us, we may yet discover something in its idea to merit our approbation. Such an object therefore pleases, and does not please, i. e. it pleases the understanding, and not the sense. On the contrary, there are some objects, whose ideas do not offer any thing laudable, which yet excite agreeable sensations. There is therefore *beauty* of two sorts. It is exceeding hard to fix any general characters of *beauty*: for, as the ideas and sensations of different persons differ according to the habitudes of the body, and the turn of the mind, so do the relations of objects to those ideas and sensations vary, whence what we call *beauty*, results. Hence arise those different opinions of a *beautiful* thought, a *beautiful* woman, a *beautiful* painting, &c. The principles of *beauty*, according to Mr. Hogarth, are *fitness*, *variety*, *uniformity*, *simplicity*, *intricacy*, and *quantity*. Analysis of *Beauty*. The line of *beauty*, according to this writer, is the waving line, or a curve bending backwards and forwards, somewhat in form of the letter S. This he observes, is often found in *shells*, *flowers*, and such other ornamental works of nature: and it is common also in the figures deligned by painters and sculptors, for the purpose of decoration.

Dr. Hutcheson makes uniformity amidst variety the source of *beauty*; and he refers our ideas of it merely to an implanted sense. Inquiry into the Original of our Ideas of Beauty and Virtue. See SENSE.

Mr. Perrault distinguishes two kinds of *beauty* in architecture, which correspond with the two species of *beauty* above-mentioned, he calls *positive* and *convencional*; such as the richness of the materials, grandeur of the structure, ornaments of the workmanship, symmetry, &c. The other he calls *arbitrary*, which depend on the will, and which would admit of having their proportions changed without deformity. These only please by the connexions or associations of their ideas with objects of a different kind which please of themselves; they owe their *beauty* to that prepossession of the mind, whereby a thing, whose value we do know, insinuates an esteem for others which we do not know.

Thus, he observes, there are many things in architecture, which reason and good sense would judge deformed, and which, however, custom has not only made tolerable, but even *essential*, by their being always joined with other *beauties* that are positive. Thus, being at first pleased with viewing them in company, and merely on account of their company, at length we become pleased with them alone; and thus we frequently grow fond of faults, and fall in love with DEFORMITY.

BEKAH, or BEKAU, a Jewish coin, being half a SHEKEL. In Dr. Arbuthnot's table of reductions, the *bekah* amounts to 15*d.* In Dr. Prideaux's computation to 11*d.* 2*q.* Every Israelite paid an hundred *bekahs* a head every year for the support of the temple. Calmet.

BECALMING, in the *Sea Language*, is when any thing keeps the wind off or away from a veſſel.

Thus one ship is said to *becalm* another, when she comes up with her on the weather-bow: the ship is said of the ſhore, when it keeps the wind away. A ship is likewiſe ſaid to be *becalmed*, when there is no wind ſtirring.

BECASSE, in *Natural Hiſtory*. See WOODCOCK.

BECASSINE, in *Ornithology*, a name given by many to the *rusticola major*, or, as we commonly call it, the *woodcock*.

BECCA, in the *Materia Medica of the Ancients*, a name given to a fine kind of ſtring, collected from the turpentine trees of Greece and Aſia, and mixed by them for uſe. It was much eſteemed formerly, and not only uſed in the country where it was produced, but carried in great quantities to Mecca, and other parts of the Turkiſh dominions, where it was valued as a very great rarity.

BECCA *Bunca*. See BROOKLIME.

BECCIFAGO, in *Ornithology*, the name of a ſmall bird, ſcarce ſo large as the common linnet, and with a very remarkable thorn body. Its head, neck, back, wings, and tail, are of a greeniſh grey, and in ſome of the birds of a greeniſh brown. It feeds on vegetables, berries, &c. and is common in the north of England, where it is called the *petty-chaps*. Ray.

BECHICS, BECHICA, medicines proper for relieving coughs. The word is formed of the Greek, βηξ, *tuſſis*, a cough.

Bechics amount to much the ſame with what we otherwiſe call *pectorals*, *thoracics*, EXPECTORANTS, and RECTORALS.

BECHIC *pills*. See PILL.

BECK, a little river or brook, called alſo rivulet, or rill.

According to Verſtegan, the original word is *bec*, which properly ſignifies a ſmall ſtream of water flowing from ſome bourn or ſpring.

Hence *becksands*, little brooks ſo called, on account of their ſhallowneſs and depth, or rather from their being covered, or much concealed. See HILL.

Beck is chiefly uſed among us in the compoſition of names of places originally ſituate on rivulets, hence Welbeck, Bourneback, &c.

The Germans uſe *bach* in the ſame manner.

BECKETS, in the *Marine*, ſignify large hooks, or circular wreaths of rope, or wooden brackets, uſed to confine ropes, tackles, oars, or ſpars, in a convenient place, till they are wanted. And, *to put the oars and ſpars in the beckets*, is to hang up the weather-main and fore-ſheet, and the lee-main and fore-tack, to a little knot and eye-*becket* on the foremoſt main, and fore-ſhrouds, when the ſhip is cloſe-hauled, to prevent them from hanging in the water.

BECTASSE, a ſect among the Turks, denominated from their founder Bectash, preacher to Sultan Amurath.

All the Janizaries belonging to the Porte are of the religion of *Bectash*, and are ſaid to have derived their origin from the founder of this ſect.

BED, a place prepared to ſtretch and compoſe the body on, for reſt and ſleep; made chiefly of feathers incloſed in a ticken caſe.

We ſay a feather *bed*, a down *bed*, a ſtanding *bed*, a ſacking *bed*, a tent *bed*, a truckle *bed*, &c.

No *beds* are to be ſold, except filled with one ſort of ſtuffing only; i. e. no feather *beds* with only ſtreet ſcuttled feathers; and down *beds* with cheap down alone. No ſcuttled

feathers are to be mixed with the former; nor feathers with the latter, on pain of forfeiture; the measure of such things being conceived as corruptions for man's body to lie on. Stat. 1 Hen. VII. cap. 19.

Arbor bed is a mattrass, and cushions stuffed with horse-hair, fea-drawn, goats-hair, and rems-hair, which are dressed in time; and which the heat of man's body will cause to exhale and yield a noxious smell, whereby many of the king's subjects have been destroyed, are prohibited by the same statute.

The ancient Romans had various kinds of *beds* for repose; as their *cubicularis*, or *chamber-bed*, whereon they slept; their *accubitorium*, or *lectus discubitorius*, whereon they eat (for they always eat lying), there being usually three persons to one *bed*, wherein the middle place was accounted the most honourable, as well as the *middle bed*.—These *beds* were unknown before the second Punic war: the Romans, till then, sat down to eat on plain wooden benches. As for the ladies, it did not seem at first consistent with their modesty to adopt the mode of lying; accordingly they kept to the old custom all the time of the common meal; but, from the first Cæsars, they eat on their *beds*. As to the youth, who had not yet put on the *virile toga*, they were long kept to the ancient discipline. When they were admitted to table, they only sat on the edge of the *beds* of their nearest relations. Never, says Suetonius, did the young Cæsars, Caius and Lucius, eat on the raised. Augustus; but they were set *in imo lecto*, or, as Tacitus expresses it, *ad lecti pedes*. From the greatest simplicity, the Romans, by degrees, carried their dining *beds* to the most inspiring magnificence. Many affairs in, it was no new thing to see them covered over with plates of silver, adorned with the richest mats, and the richest counterpanes. Hist. Nat. lib. xxxiii. cap. 12.—They had also their *lectus funebris*, whereon they flourished; and a *lectus funebris*, or *funeralis*, whereon the dead were carried to the pile. See FUNERAL.

BED *of state*. See PAVILION.

BED *of justice*, *lit de justice*, in the French *Laws*, denotes a throne whereon the king is seated in parliament.

In this sense, the king is said to hold his *lit de justice*, when he goes to the parliament of Paris, and holds a solemn session, under a high canopy erected for the purpose.

The *bed of justice* is only held on affairs relating to the state; on which occasion all the officers of the parliament appear in red robes; at other times they wear black ones. Several authors have treated expressly on the ceremonies of the *bed of justice*.

BED *of a great gun*, is a piece of plank laid within the cheeks of the carriage, on the middle transom, for the breech of the gun to rest on.

BED *or bed of a mortar*, is a solid piece of oak, in form of a parallelepiped, bigger or less, according to the dimensions of a mortar, hollowed a little in the middle to receive the breech, and half the trunnions.

On the sides of the *bed* are fixed the cheeks or brackets by four bolts of iron.

In ships, when the decks lie too low from the ports, so that the carriages of the pieces, with the trucks, cannot mount the orlop or gallicoening, but that they lie too near the gun-wales; the method is to make a falfe deck for so much as the piece will require for her traversing to mile it higher; and this they call a *bed*.

BED, in *Gardening*, a piece of ande-ground, raised above the level of the adjoining ground, usually square or oblong, and enriched with dung, or other amendments; intended for the raising of herbs, flowers, feeds, roots, or the like.

BEDS for raising melons, mushrooms, and the like, are commonly denominated *ridges*.

Mushrooms raised on *beds* are not so good as those which grow at large on the natural foil.—See HOT-*bed*.

BED, in speaking of hops, denotes the floor whereon they are spread to dry.

BED *of corn* is a heap, flat at top, three or four feet high, otherwise called a *couch*.

Corn, in granaries, keeps beft in *beds* or couches.

BED-*starre*, a name given by the Arab aftronomers to a fixed ftar of the firft magnitude in the right fhoulder of ORION.

Bed-starre is of a ruddy colour, by which it is eafily diftinguifhed.

BED, in *Mafonry*, denotes a COURSE or range of ftones.

BED, *joint of the*, is the mortar between two ftones placed over each other.

BED, in *Sea Language*, a flat, thick piece of timber, laid under the quarters of cafks, containing any liquid, and placed in the fhip's hold.

BED *of a river*, the bottom of the channel in which the ftream flows.

BEDS, in fpeaking of minerals and foffils, fignify certain STRATA, or layers of matter difpofed over each other.

BEDS, in the *New Hufbandry*, denote the fpaces occupied by the rows of corn, in contradiftinction from the open fpaces between them, which are called ALLEYS.

BED-CHAMBER.—*Lords of Gentlemen of the* BED-CHAMBER, are perfons of the firft rank, fourteen in number; whofe office is, each in his turn, to attend a week in the king's *bed-chamber*, lying by the king on a pallet-bed all night, and to wait on the king when he rifes in private.

The firft of thefe is called *groom of the ftole*.

BED-MOULDING, or BEDDING-*moulding*, in *Architecture*, is a term ufed by the workmen of thofe members in a cornifche, which are placed below the cornice.

A *bed-moulding* ufually conftfts of thefe four numbers, an ogee, a lift, a large cimatium, and another lift under the cornice.

BEDALACH, in the *Materia Medica*, a name given by fome writers to the gum bdellium; but particularly to that kind of it which was brought from Arabia, and was of a yellowifh colour, like wax.

BEDAUDE, in *Natural Hiftory*, a name given by French authors to a fort of prickly CATERPILLAR found on the elm.

BEDDING, *littering*, in refpect of horfes and other cattle, denotes ftraw or litter fpread under them in its ftall.

Bedding, in fpeaking of a roe, is ufed by fportfmen, for the lodging of that beaft.

A roe is faid to *bed*, a hart to *harbour*, a fox to *kennel*.

BEDENEGIAN, in *Botany*, a name given by Avicenna and Serapion to the *fomen veneris*, or *teratophyllon*, a fort of leaf ufed in food by the Italians, and fome other nations, and feeming to be the third kind of the *gramen*, or *fcanum*, mentioned by Theophraftus. That author firft defcribes two kinds of this plant, the one of which occafioned fleepy diforders, and the other threw people who eat of it into paralytic fits. After thefe, which he properly accounts poifonous kinds, he mentions a third, which was cultivated in gardens, for the ufe of the ftalk, which, he fays, is large and efculent. This is certainly the fame with *bedenegian*, or *fomen aquatic*.

BEDOARA, in *Botany*, a name ufed by the Arabians, and fome other authors, for the white thorn.

BEDRIP, or BEDRETE, or BEDERARE, the ceftuary fervice which inferior tenants anciently paid their lords, by cutting down his corn, or doing other work in the field.

The word is formed from the Saxon *bedere*, *to pray*, and *rape*, *a rent*, or *out corn*.

BEDSTRAW, fee LADY'S *Bedftraw*.

BEE, in *Phyfiology* and *Hufbandry*, a winged, fcalloous inſect, bred from maggots or worms, that are *apous*, or without feet; remarkable for its ſkill and induſtry in collecting honey and wax from flowers, &c. and on that account frequently preſerved in gardens. In the linnæan ſyſtem, it is a genus of inſects belonging to the claſs of *hymenoptera*, and comprehending fifty-ſix different ſpecies. Beſide the common *honey-bee*, Mr. Ray reckons nine other ſpecies, which are found wild about the fields. To this ſpecies of *bees-bees* belong the common *working-bee*, the *drones*, and the *queen-bee*.

BEE, *age of*. The large drones live but a little while, being deſtroyed without mercy by the working bees, probably to ſave honey. But there is another ſort of drones, lately diſcovered, no larger than the working *bees*, and not eaſily to be diſtinguiſhed from them, the age of which has not yet been aſcertained. See DRONE.

Writers are not agreed as to the age of the honey-*bees*. Some maintain that they are annual, and others ſuppoſe that they live many years. Many of them, it is well known, die annually of hard labour; and though they may be preſerved by ſucceſſion in hives, or colonies, for ſeveral years, the moſt accurate obſervers are of opinion, that their age is but a year, or, at the longeſt, no more than two ſummers.

BEE, *anatomy and ſtructure of*. This inſect is divided by two ligaments into three principal parts; viz. the head, the breaſt, and the belly. The head is furniſhed with two eyes of an oblong figure, and black colour, which are guarded by a ſtarry tunicle, not eaſily penetrated. Between the eyes, near the middle of the head, are placed the *antennæ*, or pair of horns, which are the principal inſtruments of feeling, eſpecially in a dark hive. The jaws open on the right and left, and ſerve to carry out of the hives any thing that incommodes or offends them. Theſe are armed with teeth, which they make uſe of in their wars with each other, and the wounds of which are always mortal. The trunk, or tongue, is long and taper, and extremely pliant and flexible, adapted to the purpoſe of penetrating to the bottom of the flowers, and exhauſting them of their meliflurous ſaliva. This part is porous, and compoſed of circular fibres, ſo that it may be contracted and folded up, when it is not uſed; and it is likewiſe fortified againſt injury by four ſtrong ſcales, two of which ſheath it, and the other two, which are larger, encompaſs the whole. Leeuwenhoeck calls this

part the wiser, and Dr. Garden describes it under the name of the *hacker*, or *prickfoot*. Phil. Trans. N° 94, and N° 175.

The breast of the *bee* is of a cylindrical, or rather a spheroidical form; on each side of the breast there are two wings, and underneath six legs of unequal length, three on the right, and three on the left, the paws of which are furnished with small hooks, that may be seen with the microscope, whereby they fasten themselves together in living and swarming, and also with a spungy substance, which preserves their claws from injury. The belly of the *bee* is formed by six rings, which are capable of extension or contraction, as occasion requires, and within those joints they fix and carry their wax. The belly, beside the intestines, contains a bag or bladder, in which are lodged the juices collected from flowers, and out of which it is afterwards discharged, by the two canals which it is also watched and conveyed, into the cells of the honey-comb for winter supply. The sting of the *bee* is a very curious weapon, and, when examined by the microscope, appears of a very surprising structure. It has a horny sheath, or scabbard, which includes two bearded darts. That sheath ends in a sharp point, near the extremity of which a slit opens, through which, at the time of stinging, the two bearded darts are protruded beyond the end of the sheath; one of these is a little longer than the other, and fixes its barbed end, and the other instantly following, they penetrate alternately deeper and deeper, taking hold of the flesh with their beards or hooks, till the whole sting is buried in the flesh; and then a venomous juice is injected through the same sheath, from a little bag at the root of the sting, which occasions an acute pain, and a swelling of the part, that sometimes continues several days. But this is best prevented by forcing the wound directly to give it a discharge. Dr. Derham counted on the sting of a wasp eight beards on the side of each dart, some of which like the beards of fishhooks; and the same number are to be counted on the *darts* of the *bee* sting. Derham's Phys. Theol. p. 242. Ruler's Miscellan. Rem. p. 210.

When these beards are struck deep in the flesh, if the wounded person starts, or disimposes the *bee* before it can discharge them, the sting is left behind sticking in the wound; but if he hath patience to stand quiet, the *bee* will bring the hooks close to the sides of the darts, and withdraw the weapon; in which case, the wound is always much less painful. A wasp is not so liable to leave its sting in the wound as a *bee*; the beards of it being shorter, and the insect more vigorous and nimble in its operations. The *bee* is covered with a fine hair, smooth and shining like velvet.

BEES, *artificial bees of*. See HONEY-*comb*.

BEES, *blown of*. See HIVE.

BEES, *preservation of*. These insects begin to breed in the upper part of the hive, in the empty cells adjoining to those that are filled with honey; and they defend gradually from the lower parts, as the flowers which furnish them with the means of subsistence increase; and the brood is carried to the outermost part of the combs.

The queen-*bee* lays an egg, of an oblong figure, and larger at one end than the other, at the bottom of each cell; fixing it to one of the angles by its smaller end, whilst the other end points exactly to the opposite angle. Sometimes more than one egg has been deposited in the same cell; when this is the case, the working *bees* remove the supernumerary eggs, and leave only one in each cell. On the first or second day after the egg is lodged in the cell, the drone-*bee* injects a small quantity of whitish liquid, in which it may be absorbed by the egg. On the third or fourth day is produced a worm or maggot, which, when it is grown so as to touch the opposite angle, coils itself up in the shape of a serpentine, and floats in a proper liquid, whereby it is nourished and enlarged in its dimensions: this liquor is of a whitish colour, of the thickness of cream, and of an insipid taste like flour and water. Naturalists are not agreed as to the origin and qualities of this liquid; some have supposed, that it consists of some generative matter, injected by the honey-*bee* into each cell, in order to give fecundity to the egg; but the most probable opinion is, that it is the same with what some writers have called the *bee*-bread; and that it is a mixture of water with the juices of plants and flowers collected merely for the nutrition of the young, which they are in their weak and helpless state. Whatever be the nature of this aliment, it is certain that the common working *bees* are very industrious in supplying the worms with a sufficient quantity of it. The worm is fed by the working *bees* for about eight days, till one constructs, the other in the form of a ring; and when it begins to feel itself uneasy in its first posture, it ceases to eat, and begins to unroll itself, thrusting that end forward towards the mouth of the cell, which is to be the head. The attendant *bees*, observing these symptoms of approaching transformation, desist from their labours in carrying proper food, and employ themselves in fastening up the top of the cell with a lid of wax, formed in concentric circles, and by their natural heat in cherishing the brood, and hastening the birth. In this concealed state the worm extends itself at full length, and prepares a web of a sort of silk, in the manner of the silk-worm; this web forms a complete lining for the cell, and affords a convenient receptacle for the transformation of the worm into a nymph, or chrysalis. Some naturalists suppose, that, as each cell is destined to the successive breeding of several worms, the whole web, which is composed of many coats or doubles, is, in reality, a collection of as many webs as there have been worms. M. Maraldi apprehends, that this lining is formed of the skin of the worm thrown off at its entrance into the nymph state; but it is urged, that if the cells are opened when newly covered by the *bees*, the worm within will be found in its own form, and stretched in the act of spinning its web; and by means of glasses it will be found composed of fine threads, regularly woven together, like those of other spinning animals.

In the space of eighteen or twenty days the whole process of transformation is finished, and the *bee* endeavours to discharge itself from confinement by forcing an aperture with its teeth through the covering of the cell: the passage is gradually effected, so that one hour first appears, then the head, and afterwards the whole body: this is usually the work of three hours, and sometimes of half a day. The *bee*, after it has disengaged itself, stands on the surface of the comb, till it has acquired its natural complexion, and full maturity and strength, in order to become fit for labour. The cell of the *bee* farther round it in this state, easily distinguishes its birth, and odder it brown out of their own mouths. The coarser, and feculent pieces of wax which are left in the cell, are removed by the working *bees*; and the *matrix* is so sooner cleansed, and fit for new fecundation, but the queen deposits another egg in it; insomuch that, Mr. Maraldi says, he has seen five *bees* produced in the same cell, in the space of three months. The young *bees* are easily distinguished from the others by their colour; they are grey, inclined of the yellowish brown of the common *bees*. The reason of this is, that their body is black, and the hairs that grow upon it are white, from the mixture of which form together results a grey; but this colour forms itself into a brownish yellow by degrees, the rings of the body becoming more brown, and the hairs more yellow.

The *drones* owe their original to the same cause with the honey-*bees*; they are generated after the same manner, only in different cells designedly prepared for them in the drone-comb; of which there is one in each hive, often two, and sometimes three: the circumstances that attend the production of the *drones* are more peculiar. See DRONE and QUEEN-*bee*.

BEES, *government of*. See QUEEN-*bee*.

BEES, *hiving of*. See HIVE and HIVING.

BEES, *economy of*. Naturalists relate wonders on this subject. The moral virtues have been all, at one time or other, attributed to the *bees*; and they have been particularly celebrated for their prudence, industry, mutual affection, unity, loyalty to their sovereign, public spirit, sobriety, and cleanliness. The sagacity of *bees* in foreseeing rain has been often mentioned; but it is very questionable. Though some of the accounts that have been given of these insects are fabulous, yet intimate acquaintance with them in their domestic operations hath furnished many real facts that are as surprising as those which are groundless. It must not however be omitted, that in certain times, when they think their stores will fall short, they make no scruple to throw out of the hives their own offspring, the nymphs and young *bees* of the drone kind, scarce extricated from their covering, have been carried away, and left to perish. Though they are just in their own kingdom, and to those who may properly be called their fellow-subjects, they rob and plunder strangers and foreigners whenever they have power and opportunity; and they have frequent battles in committing depredations on neighbouring colonies and hives, or in self-defence, which end fatally to many of their number. But it should be observed that this never happens, unless in the spring or autumn, when the weather is warm, and honey scarce, and there are no flowers to produce it. In this case, when they have ranged the fields without success, they endeavour to supply themselves, at the hazard of their lives, from the flocks of other *bees*. However, if the queen of either hive that happens to be engaged is killed, the contest is finished, and both parties unite under the survivor.

The industry and activity of *bees* in their domestic labours afford a very instructive and amusing spectacle; all are busily engaged in their several departments; whilst some are employed in gathering honey in wax, others repair

rotten combs; others carry out the dead, and cleanse the filth: others keep guard, placing themselves in five or six files, eight or ten deep, upon the floor of the hive. So that all the bees at entrance must pass between them; some are even said to serve for bridges, or ladders, for others to pass over, and when they are tired with labour, they recruit themselves with reft. For this purpose they form *chaplets* or larger clusters in the following manner: each *bee*, with its two fore-legs, lays hold of the hinder legs of the *bee* that is next above it, and thus a chain is made by the successive application of one to another, and the firſt bee ſupports the weight of all the reſt to the bottom of the chain. The larger clusters are only a multiplicity of theſe chains, of which there are ſometimes many hundreds together. The *bees* never lay hold of any part of one another, except the legs. In this way they likewiſe guard themſelves from the effects of cold, and continue for ſeveral weeks in a torpid ſtate.

BEE, *preſervation of*. The preſervation of this induſtrious and uſeful inſect is an object of great importance; and it chiefly depends on ſupplying them with a ſufficient quantity of food, on guarding them from their enemies, and collecting the produce of their labour, without deſtroying them. Beſides the attention which ſhould be paid in the neceſſities of *bees*, in chuſing the ſituation of an APIARY, it may be neceſſary to feed them towards the cloſe of autumn, and again in the ſpring, if they appear to have conſumed their winter ſtock. This ſhould be done, eſpecially in cloudy miſty weather, when they go little abroad, and when ſeveral days of bad weather immediately follow their ſwarming. Mr. Thorley directs, that no hive ſhould be kept which does not weigh twenty pounds; and that the ſupply ſhould be given in quantities of honey, which is their proper food, not leſs than a pound and a half, or two pounds, at a time. The honey ſhould be firſt ſtirred with water, or ſmall beer, and then poured into an empty comb: a thoſe comb is the ſtrongeſt, and the beſt for the purpoſe; and for the evening, when the *bees* are quiet, the hive ſhould be gently raiſed on one ſide, and the comb put under it; the contents will be conveyed away the next day into the ſeveral magazines.

Reaumur recommends a plate of liquid honey, unmixed with water, ſeveral with ſtraws, and covered with a paper full of holes, through which the *bees* will ſuck the honey, without daubing themſelves. But care ſhould be taken that the hive be well guarded from robbers, whenever it is provided with a freſh ſupply. The winter-quarters of *bees* ſhould likewiſe be well ſecured both againſt the weather, and againſt other enemies that would annoy them. Mild winters, as well as ſevere cold, are injurious; for a mild winter tempts them to go abroad, and expoſes them to the fatal effects of ſudden changes, either of cold or rain. *Bees*, it has been remarked, are moſt likely to ſurvive in ſnowy winters, becauſe they are then in a torpid ſtate, and require little nourihment, provided the apiary be well ſecured from northerly and eaſterly winds; whereas a ſmall degree of warmth enlivens them, and they conſume their winter ſtock, and are left deſtitute in a cold, wet ſpring. When they are chilled, and apparently dying by cold, and the clutters of them are broken, ſo that they drop down in the hive, they may be recovered by a ſmall degree of heat. Varro and Columella adviſe hot aſhes to be laid about the hive, or ſprinkled over cluſters of *bees* which lie ſeemingly dead at the bottom. But a ſufficient warmth may be given them by putting them into a ſtrainer-cloth, and treading upon them, or by placing them in the fun-beam, and laying them before the fire. This precaution ſhould be uſed in time; otherwiſe, when their vitals are ſcorched, it is impoſſible to recover them. However it is much to be wiſhed, that a method could be found of preſerving all the hives from injury, without removing them out of the places where they ſtand during the ſummer. Reaumur made many attempts for this purpoſe. Some hives he covered over with ſtraw, by means of ſticks fixed round them, and reaching a few inches above the top; but the moſt ſucceſsful method was that of preſerving them in large tubs with earth or hay; contriving, at the ſame time, to convey air to them through a ſquare tube of wood, two inches in width and half an inch in depth, which paſſed through the ſide of the tub, and of ſuch a length as to reach the mouth of the hive, and to project three or four inches from the ſides of the tub. After all, the common ſtone covering, which is generally uſed in England, is ſufficient for the purpoſe.

There are other enemies, beſide hunger and cold, againſt which the proprietors of *bees* ſhould be cautioned. It has been obſerved already, that different colonies of *bees* ſometimes plunder each other; and theſe rovers make their attacks chiefly in ſpring and autumn. The moſt effectual way to guard againſt their incurſions is to leſſen the entrance into the hive, ſo as to leave room only for two or three *bees* to paſs abreaſt; or to ſtop up the hives that are attacked till the rovers diſappear; or if ſtrangers have gained admittance, the proper inhabitants of the hive may be roufed to ſelf-defence by diſturbing them with a bunch of ſtinking madder, faſtened to the end of a ſmall ſtick of a convenient length; thus their enemies will be roufed, and they will inſtantly fetze the robbers. This, indeed, is neceſſary, if the queen is loſt. However, if the hives that are attacked have but few *bees*, and little honey, it is better to take them than to ſtand a trial.

Hornets and waſps are alſo very formidable enemies; their neſts ſhould be carefully deſtroyed. Mice ſhould be guarded againſt, by diminiſhing the entrance into the hives as the cold comes on, ſo that the *bees* are leſs able to defend themſelves; and the hives may be placed in ſuch a manner, that it will be impoſſible for the mice to reach them. Spiders and caterpillars are very deſtructive to *bees*; a ſpecies of the latter, called the wax-worm, or wax-moth, becauſe it feeds on wax, lays its eggs in the hive, which turn to maggots that are very noiſome and prejudicial. Hives of *bees* that have ſwarmed more than once, and ſuch as contain little honey, are moſt expoſed to theſe inſects: for the empty combs ſerve them for ſhelter, and the wax ſupplies them with food. Theſe hives ſhould be cleaned at leaſt once a week; and the ſtools on which they reſt, where the moths are laid by the *bees*, ſhould be cleaned every morning. But they cannot be entirely deſtroyed, without taking away the infected hive, removing the *bees*, and cleanſing it of the moths, before it is reſtored to its former occupants. *Bees* are often troubled with lice, which may be deſtroyed by ſtrewing tobacco over them. The depredations of birds, and particularly of the houſe-ſwallow, ſwallow, ſhould be carefully prevented.

Theſe inſects are ſubject to a kind of purging in the ſpring, which is often very fatal. Madame Vieu, in the Memoires, &c. of the Berne Society for 1780, aſcribes this diſtemper to the honey which the colt has candied in the hive. Columella ſuppoſes that it was unuſual diſtemper, occaſioned by ſpring bloſſoms and elm ſeeds; and he adviſes giving them rainwater and honey, diluted with water. The moſt effectual cure is that preſcribed by Ariſtomachus, which is the removal of the infected combs, or of thoſe in which there are open cells containing candied honey. Others attribute this diſeaſe to their feeding on pure honey, and recommend their being fed with a honey-comb taken out of another hive, the cells of which are filled with crude wax, or *bee-bread*. Perhaps the true cauſe, and the effectual remedy of this diſeaſe are ſtill unknown.

For the method of preſerving *bees* in hives and hives, and of collecting the produce of their labours without deſtroying them, ſee HIVE, HONEY, and WAX.

BEES, *ſort of*. There are in every hive or colony three ſorts of *bees*, viz. the ſovereign or queen, the working or honey *bees*, and the drones. The working *bees* have generally been ſuppoſed to be neutral, or of neither ſex; but M. Schirach, in his Hiſtoire Naturelle de la Reine des Abeilles, &c. publiſhed in 1772, has advanced a new and ſingular opinion on this ſubject. He ſuppoſes that all the common, or honey-*bees*, are females in diſguiſe; in which the organs that diſtinguiſh the ſex, and particularly the *matrix*, are obliterated, or, at leaſt, through their extreme minuteneſs, they have not yet been obſerved: and that every one of theſe *bees*, in the earlier period of its exiſtence, was capable of becoming a queen-*bee*, had it been lodged and fed, and brought up, when in the worm-ſtate, with that deſign. He adduces a great variety of experiments in confirmation of this hypotheſis; in one inſtance two ſpoonfuls of common *bees* were ſhut up in a ſmall box, four inches ſquare, with a piece of brood-comb of the ſize of a crown piece, containing worms of three days. This ſmall colony, upon examining it four days afterwards, had completed two royal cells, which was a certain indication that one or more queens was to be produced. He likewiſe challenges any perſons to chooſe a piece of the common brood-comb, as ſmall as they pleaſe, and to deſtroy all the eggs, worms, and nymphs, contained in it, reſerving only one worm of their own choice, and leaving it in its cell, and he undertakes by the aſſiſtance of the working *bees*, to produce this worm metamorphoſed into a queen-*bee*. M. Schirach has more than once fulfilled his engagement. M. Bonnet, the celebrated naturaliſt of Geneva, was profelyted to this opinion.

The drones have been ſuppoſed by many to be the males; and later experiments and diſcoveries have confirmed this opinion. See DRONES and QUEEN-*bee*.

There is in ſome parts of America a very different ſpecies of *bees* from ours; and the manner of erecting their combs, and lodging their honey, is not leſs different than their form. Their combs are compoſed of a ſeries of

small bottles or bladders of wax, of a dusky brown, or blackish colour; and each of these is much of the size and shape of a Spanish olive. They hang together in clusters, almost like a bunch of grapes, and are so contrived, that each of them has its aperture, while the *bees* are at work upon it; but as soon as it is filled with honey, this aperture is closed, and the *bee* leave it, and go to work upon another vessel. Their lodgings are usually taken up in the hollow of an old tree, or in some cavity of a rock by the sea side. They are ingenious in chusing the most secure retreats, because their honey is so delicious a bait, that they are hunted after by many animals; and they have no power of defending themselves, having no stings, as our *bees* have. The combs are brittle; and the honey is clear and liquid like rock-water. It is used by the natives rather as a drink with their food, than as honey. They use it also in medicine as a purge, drinking half a pint of it in the morning, fasting. Phil. Transf. N° 172.

Mr. Dudley speaks of a method of hunting *bees*, for finding their nests, practised of late years in the woods in New England. It consists in catching a *bee*, then letting it fly, and observing the way it steers; this shews the hunter the course or bearing of the nest. To find the distance, he takes an object of a hundred perches, and lets fly another *bee*, belonging to the same nest; the angle or point wherein these two courses intersect, is the place of the nest. Phil. Transf. N° 376; or Abr. vol. vii. part iii. p. 403.

BEES, *swarming of.* See SWARM.

BEES, *writers on.* Many authors have written on *bees*. Among the ancients, Aristomachus is said to have studied them sixty years; Philiscus retired into a desert wood, that he might have the opportunity of observing them to better advantage. Aristotle made a great number of curious observations on this insect, which Virgil has put into Latin verse: they have been enlarged and confirmed by Pliny and others. Theophrastus has a fragment still extant, *Περι μελιτων, concerning bees*; or as entitled in Laertius, *Περι μελιττης, of honey*.

Among the moderns, prince Frederic Cesi, institutor of the Roman Academy of Sciences, wrote expressly on *bees*; but it is not known what became of the MS. no more than of that promised by Swammerdam on the anatomy of the *bee*, the want of which has been much regretted among the French.

Maraldi, and Reaumur in his hist. Insects have largely treated of *bees*.

Among the English, Butler, Gurnay, Mills, Levett, Thorley, Southern, Remnant, Hartlib, Rusden, Warder, White, Wildman, and others, have discourses expressly on *bees*. Phil. Transf. N° 257. p. 365.

BEE, in *Heraldry*; see APIS.

BEE is also used figuratively to denote sweetness, industry, &c. Thus Xenophon is called the Attic *bee*, on account of the great sweetness of his style. Antonius got the denomination *mellifluus*, or *bee*, on account of his collection of common places.

Leo Allatius gave the appellation *apes urbanæ* to the illustrious men at Rome from the year 1630 to the year 1632.

BEE-*bird.* See COLIBRI.

BEE-*bread.* See HIVE.

BEES-*bread.* See PAIN *d'Abeilles*.

BEE-*eater*, in *Zoology.* See APIVORUS *buto*.

BEE-*flower*, OPHRYS. See TWYBLADE.

BEE-*fly.* See DRONE-*fly*.

BEE-*glue*, a *soft*, unctuous matter, employed by *bees* to cement the combs to the HIVES, and to close up the cells.

BEE-*hive.* See HIVE.

BEE, *humble.* See BOMBYLIUS.

BEECH-*tree*, *Fagus*, in *Botany*, a tree of the mast-bearing kind, the characters of which are these. It hath male and female flowers on the same tree; the male flowers are collected into globular heads, and have no petals, but have several stamina included in an empalement of one leaf. The female flowers have a one-leaved empalement, cut into four parts, but have no petals; the germen is fixed to the empalement, which afterwards becomes a roundish capsule, armed with soft pines, opening in three cells, each containing a triangular nut. This genus belongs to the *monœcia polyandria* class of plants in the Linnæan system, and comprehends the common CHESTNUT-*tree.* See *Tab.* X. *of Botany Class* 19.

This tree will grow to a considerable stature, though the soil be stony and barren; as also upon the declivities of hills, and chalky mountains, where it will resist the winds better than most other sorts of trees: but then the nurseries for the young plants ought to be made on the same soil. For if they are raised in a good ground, and a warm exposure, and afterwards transplanted into a bleak and barren situation, they seldom thrive, which holds true in most other trees. The nursery therefore ought to be made upon the same soil with the intended plantation; and the plants annually drawn, that the plantation may be extended.

These trees are very proper to form large hedges to surround plantations, or wilderness quarters; and may be kept to a regular figure, if cut once a year, especially if they shoot strong; in which case, if they are neglected for a season or two, it will be difficult to reduce them again. The shade of this tree is very injurious to most sorts of plants which grow near it; but is generally believed to be very salubrious to human bodies.

Beech-wood is whitish, hard, and dry. It crackles in the fire, and is used in building and furniture; also to make utensils, as shovels, ladles, bellows, stools, shoes, dishes, trays, trenchers, dresser-boards, follies of carts, &c.

If *beech*-timber be kept altogether under water, it is little inferior to elm; but if kept dry, or partly wet, partly dry, it is liable to the worm.

That of the mountain-*beech* is whitest, and most fit for the turner's use; that of the field-*beech* is blacker, but more durable. In turning *beech*, it yields a well-scented effluvia, not unlike roses.

The scale of *beech* wood serves to make scabbards and hand boxes. The bark is used as floats for fishers nets, instead of cork. Its shavings are of use for fining wine.

Its ashes, according to Cenforinus, with proper mixtures, are excellent to make glass.

Its leaves, gathered about the fall, before they are much frost-bitten, afford the best materials to lay under quilts, instead of straw, as being very soft, and continuing sweet for seven years. When chewed, they are held good for the gums and teeth.

The stagnant water gathered on the hollow of the *beech*-tree, is said to cure tetter-scabs and scurfs in man and beast, by fomentation.

BEECH-*gall*, in *Natural History*, the name of a species of GALLS or protuberances found on the *beech*-tree, and serving for the lodgment of insects.

These galls are found on the leaves of the *beech*, and are sometimes only one upon a leaf, sometimes more: they always grow from the same point, owing, no doubt, to the fly's having laid so many eggs in the same spot.

These galls are of an oblong figure, and somewhat flatted. They resemble the stone of a plum in shape, and are so hard, that they are not to be broken between the fingers: their substance seems of the same nature with that of a nut-shell. In each gall there is only one cavity, inhabited by a white worm, which in time passes through the nymph state into that of the fly, to which it owed its origin.

BEECH-*mast*, the fruit of the *beech*-tree. It fattens hogs and deer, and has sometimes supplied men instead of bread. Chios is said to have endured a memorable siege by means of it.

BEECH-*oil*, an oil drawn from the fruit, or mast, of the *beech*-tree.

The *beech*-*mast* is a kind of triangular *seed*, in form of a nut, or rather acorn, containing a whitish, oleaginous pith, of a very agreeable taste; whereof is made an oil much valued for falladay, &c.

It is very common in Picardy, and other places, where the mast abounds. They draw it cold by expression, after the mast has been shelled, and pounded.

An attempt was made, a few years ago, to introduce the manufacture of *beech*-oil in England, and a patent granted to the proprietor, but without success; the country people, it seems, turning their mast to better account in feeding the hogs with it, than in selling to the patentee, and his co-proprietors, for oil.

BEELE, in *Mining*, an instrument used by the workmen to break and pick out the ore from the rocks in which it lies. This instrument is called by the tin men in Cornwall a *tobber*. It is an iron instrument of eight or ten pounds weight, made sharp, and steeled on both ends, and having a hole in the middle, where the handle is fixed in. When the ore lies in hard rocks, this instrument wears out so fast, that it must have new points made to it every fortnight. The miners, who dig up the ore in the mines, are, from the use of this instrument, called *beele*-men; and those who attend them, and whose business it is to take up the matter the others loosen or break up, are, from their instrument, which is a broad and hollow iron shovel, or a wooden one, with a very strong iron lip, called the *shovellers*. In Cornwall, when the ore lies in a hard bed, they allow two shovellers to three *beele*-men; and when it lies in a soft or earthy matter, two *beele*-men and three shovellers are the proportion. Phil. Transf. N° 69. p. 2104.

BEEMEN, or SHEEMEN, in *Astronomy*, seven stars of the fourth magnitude, following each other, in the fourth departure of the constellation ERIDANUS.

BEER,

BEER, a popular drink, prepared from MALT and HOPS. The word is Saxon, formed from the German *bier*, of the Latin *bibere*.

Matthiolus takes the *zythum* and *cervisa* of the ancients to be the same with the *beer* and ALE of our days; and thinks the only difference between *zythum* and *cervisa* to have consisted in some circumstances of the preparation, which rendered the one stronger than the other.

Tacitus, in speaking of the ancient Germans, as also Dioscorides, Galen, &c. condemn *beer*, as prejudicial to the head, nerves, and membranous parts, as occasioning a more lasting and more uneasy drunkenness than wine, and as promoting a putrefaction of urine, and sometimes a leprosy.

Mess. Perrault, Rohault, and others, defend the modern *beer*; urging, that the hops used with us, and which the ancients were strangers to, having a faculty of purifying the blood, and removing obstructions, serve as a corrective, and free our drink from the inconveniencies objected to that of the ancients.

For the manner of preparing *beer*, see HOPS, and BREWING. For its qualities, MALT-LIQUOR.

In New England they make *beer* from maize, or even the bread made thereof. Some physicians recommend *beer* made of nuts and birch-water, as preferable, in nephritic cases, to that made of barley. Phil. Trans. N° 97. p. 6135. N° 138.

Sour or decayed *beer* may be restored divers ways; as by salt made of the ashes of barley-straw, put into the vessel, and stirred; or by three or four handfuls of beech-ashes thrown into the vessel, and stirred: or, where the liquor is not very sour, by a little put in a bag, without stirring; chalk calcined, oyster-shells, egg-shells burnt, sea shells, crabs eyes, alcalized coral, &c. do the same, as they imbibe the acidity, and unite with it into a sweetness.

Beer, it is said, may be kept from turning sour in summer, by hanging into the vessel a bag containing a new-laid egg, pricked full of little pin-holes, some laurel-berries, and a few barley-grains; or by a new-laid egg and walnut-tree leaves. Laurel berries alone, their skin being peeled off, will keep *beer* from deadness; and the throwing FIXT AIR into it will restore it. Glauber commends his sal mirabile and fixed nitre, put in a linen bag, and hung on the top of the cask, so as to reach the liquor, not only for recovering four *beer*, but preserving and strengthening it.

Beer falling of the cask, may be freed from it, by putting a handful of wheat in a bag, and hanging it to the vessel. The grounds of *beer* form a very rich manure.

Beer, as a malt liquor, is of so great antiquity in this kingdom, that in the year 1292, we meet with a licence from Henry VII. to a Fleming, to export fifty tons of ale, called *beer*.

BEER-*posset*. See ZYTHOGALA.

BEER, *sager*, is used by callico-printers, chemists, lapidaries, scarlet-dyers, vinegar-merchants, white-lead-men, &c.

BEER-*measure*. See MEASURE.

BEER-*vinegar*. See VINEGAR.

BEES-WAX. See WAX.

BEESTINGS, or BREASTINGS, denote the first milk taken from a cow after calving.

The *beestings* are of a thick consistence, and yellow colour, seemingly impregnated with sulphur. Dr. Morgan imagines them peculiarly fitted and intended by nature to cleanse the young animal from the excrements gathered in its stomach and intestines during its long hibernation in *utero*. The like quality and virtue he supposes in women's first milk after delivery; and hence infers the necessity of the mother's suckling her own child, rather than committing it to a nurse whose first milk is gone.

BEET, BETA, in *Botany*, the name of a genus of plants of the *pentandria digynia* class, of which the characters are these: the flower hath a five-leaved empalement, which is permanent, but no petal, and five stamina placed oppolite to the leaves of the empalement; the germen is situated below the receptacle, which afterward becomes a capsule with one cell, having a single seed wrapped up in the empalement. There are three species.

All the species of this plant are propagated by sowing their seeds in February or March in a loose deep soil, not over dunged. When they are come up they must be hoed out, so as to leave them ten or twelve inches asunder: for, if they have not room, the roots seldom grow large. It is a custom with the gardeners about London to sow carrots on the same ground with their *beets*. The carrots are drawn off in the summer time, and the *beets* have then sufficient time to grow to their size. *Beets* are more used as a pot herb, and to eat with salt meat, than physically. They loosen the belly, and attemperate hot colic humours. The juice of the roots is sometimes used as an errhine, being snuffed up the nose to clear the head of phlegm, and mucous humours; and by that means to help old head-achs.

The *beet* is one of the five emollient herbs.

BEET, *bore's*, *beta leporina*, a name given by some of the old Latin writers to a small green plant of an acrid taste.

BEET-*fly*, a very small fly, found always among the flowers of the *beet*.

BEET-*yellow-spot*. See GALL-*insect*.

BEETLE, in *Zoology*. See SCARABÆUS.

BEETLE, *Capricorn*, in *Zoology*, the English name for the CERAMBYX. The generical character of these insects are these: they have long and slender bodies; their horns are long and jointed; and they are fond of places in the neighbourhood of rivers. There are six different species of this insect described by Lister, in his treatise De Scarabæis, published at the end of Mr. Ray's History of Insects.

BEETLE, *oil*, *Meloe*, in *Zoology*, the name of a genus of four-winged flies, whose *antennæ* are slender and filiform; and the exterior wings are dimidiated. It is called in English the *oil-beetle*, as being soft and mucous to the touch. It is black, but not at all glossy, and has been described by authors under the names *scarabæus mollis*, *cantharus mollipes*, and *proscarabæus*. See SCARABÆUS.

BEETLE, *flinting*, *Tenebrio*, in *Zoology*, the name of a genus of beetles, the *antennæ* of which are oblong, slender, and filiform.

It has no interior wings, in which singular deficiency it differs widely from all other beetles; but the form and structure of all its other parts refer it to this class. See SCARABÆUS.

Mouffet has called it the *blatta fœtida*. There are several species of it.

BEETLE, *water*, *Dytiscus*, in *Zoology*, the name of a genus of four-winged flies, the *antennæ* of which are slender and setaceous. They have likewise feet formed for swimming, and their habitation is generally in the water, whence they have been called in English, *water-beetles*.

BEETLE, in a mechanical sense, denotes a large wooden instrument, formed after the manner of the mallet, having each face bound with a strong iron hoop, to keep it from spreading, and used for driving piles, flakes, palisades, wedges, and the like.

In this sense, the word is also corrupply written in some places *beyle*. Skinner derives it from the English *beating*.

For the military use, *beetles*, called also *stampers*, are thick round pieces of wood, a foot and a half long, and eight or ten inches in diameter, having a handle of about four feet long. Their use is for beating or ramming the earth of a parapet, or about pallisades; which is done by lifting up the *beetle* a foot or two, and letting it fall with its own weight.

The name *beetle* is also given to the pavious's rammer, or instrument, wherewith the stones are beaten down, and fastened.

BEEVES, a general name for oxen.

BEG, or BEY, is a Turkish title, properly signifying *lord*. The word is also written *begh*, *or beig*, sometimes *bee*, or *bei*, or *beh*; but pronounced BEY.

BEGS, or BEGHS, of Egypt, denote twelve generals, who have the command of the militia, or standing forces of the kingdom, and are to secure the country from the insults of Arabs, as well as to protect the pilgrims in their annual expeditions to Mecca.

The *begs*, several of whom are descended from the ancient race of the Mamalukes, are very rich and powerful, maintaining each five hundred fighting men for their own guard, and the service of their court. On discontents, they have frequently risen in rebellion. They are often at variance with the *bashaw*, whom they have more than once plundered and impriloned.

BEGGAR. *Beggars* pretending to be blind, lame, &c. found begging in the streets, are to be removed by the constables; and refusing to be removed, shall be whipped, &c. Stat. 12 Anne; and our statutes have formerly been strict for punishing of *beggars*, that in the reign of king Henry VIII. a law was enacted, that sturdy *beggars* convicted of a second offence, should be executed as felons. But this statute was afterwards repealed. See ROGUE and VAGABOND.

BEGGING *order*. See MENDICANT.

BEGHARDI, BEGGARDI, or BEGGHARDI, called also in Italy *bizochi*, and in France *beguins*, derive their name from the old German word *beggen*, *beggen*, which signifies to *ask any thing with zeal and importunity*. This was a general appellation given to no less than thirty sects, or orders, that sprung up in Europe in the thirteenth century, which differed widely from each other in their opinions, their discipline, and manner of living. It was at first indiscriminately applied to all persons, who embraced, with resignation and free choice, the horrors of absolute poverty; begging their daily bread from door

to

to door, and renouncing all their worldly possessions and occupations. It was afterwards restricted to those, who distinguished themselves by an extraordinary appearance of devotion, and was used much in the same sense with the term *Methodist* among us. These persons formed a sort of intermediate order between the monks and citizens, resembling the former in their manner of living, without assuming their name, or contracting their obligations. They were divided into two classes, which observed their different denominations of *perfect* and *imperfect* from the different degrees of authority that they discovered in their manner of living. The *perfect* lived upon alms, obtained from wedlock, and had no fixed habitations. The *imperfect* conformed in the customs of the rest of their fellow citizens in their respects. The name was at first honourable, but by degrees it sunk into reproach; being adopted by many, who, under the mask of religion, concealed the most abominable principles, and committed the most enormous crimes.

The *beghards* of Flanders is a denomination, by which certain unmarried persons, both bachelors and widowers, are distinguished, who formed themselves into communities of the same kind with those of the female *beguines*, reserving to themselves the liberty of returning to their former method of life. The first society of these *beghards* was established at Antwerp in the year 1228, and continues still; though the brethren of which it is composed have long since departed from their primitive rule of discipline and manners. This first establishment was succeeded by many others in Germany, France, Holland, and Flanders. These fraternities long enjoyed the tolerance of the Roman pontifs; but most of their convents are now either demolished, or converted to other uses. See BRETHREN *of the Free Spirit*. Mosheim's Eccl. Hist. vol. iii. p. 25. 8vo. 1758.

BEGINNING *of an office*. See ECLIPSE.

BEGINNING *of the action*. See ACTION.

BEGLERBEG, a Turkish title for the chief governor of a province, who has under him several *begs*, or *sangiacs*, that is, subgovernors.

The word is also written *beglerbey*, *beglerbeg*, *beghlerbeghi*, and *beglerbeg*.—It is compounded of *begler*, *lords*; the plural of *beg*, *lord*, with the word *beg* subjoined; importing as much as *lord of lords*.

The next to the visir *azem*, or the first viziers, are the *beglerbegs* in Turky, who, according to Ricaut, may be compared to archdukes in some other countries, being the next immediate below the prime vizier, and having under their jurisdiction many *sangiacs* of provinces, and their *begs*, *agas*, &c.

To every *beglerbeg* the grand signior gives three ensigns or flowers, trimmed with a horse-tail, to distinguish them from the bashaws, who have but two, and from simple *begs*, or *sangiacbegs*, who have but one.

The province or government of a *beglerbeg* is called *beglerbeglick*, or *beglerbeglik*. These are of two sorts; the first called *beglerbeglik-ziamet*, which have a certain rent assigned out of the rents, rewenues, and signories allotted to the principality; the second called *timiots beglerbeglik*, for maintenance of which is reserved a certain salary or rent, collected by the grand signior's officers with the treasure of the empire.

The *beglerbegs* of the first sort are in number twenty-two, viz. those of Anatolia, Caramania, Diarbekir, Damascus, Aleppo, Tripoli, Trebizond, Buda, Temiswar, &c.

The *beglerbegs* of the second sort are in number six, viz. those of Cairo, Babylon, &c.

Five of the *beglerbegs* have the titles of viziers, viz. those of Anatolia, Babylon, Cairo, Romania, and Buda.

The *beglerbegs* appear with great state, and a large retinue, especially in the coup, being obliged to bring a tribute for every five thousand aspers rent which they enjoy.

The *beglerbegs* of Romania brought ten thousand effective men into the field.

BEGLERBEGO is also a title given to the chief governors of provinces, in the Persian empire, having the command over all kans, sultans, &c. in their respective districts.

BEGONIA, in *Botany*, the name of a genus of plants of the *polygamia monoecia* class; the characters of which are these: the flowers are of two kinds; the one kind is the barren, or male flower; this is composed of four leaves, some broader, and others narrower; the other kind, which produces the embryo-fruit, is of the roseaceous sort, and is composed of several petals, arranged in a circular form, and placed on a foliated cup, which finally becomes a trigonal aluted fruit, divided into three cells, and containing small seeds. There is one species.

BEGUINS, devout societies of young women, established in several parts of Flanders, Picardy, and Lorrain; who maintained themselves by the work of their own hands; leading a middle kind of life, between the secular and religious, but make no vows. The poor and distressed were supported by the pious liberality of such opulent persons as were friends to the order.

These societies began at Nivelle, in Brabant, A. D. 1226, though others say in the year 1207, and soon spread into France, Germany, Holland, and Flanders, where a considerable number of them still subsist. Their habit was particular, but modest; they lived in common, and had men of great piety for their governors.

BEHEADING, a capital punishment, wherein the head is severed from the body by the stroke of an ax, sword, or other cutting instrument.

Beheading was a military punishment among the Romans, known by the name of *decollatio*. Among them the head was laid on a *cippus* or block, placed in a pit dug for the purpose; in the army, without the *vallum*; in the city without the walls; or a place near the *porta Esquilina*. Preparatory to the stroke, the criminal was tied to a stake, and whipped with rods. In the early ages the blow was given with an ax; but in after-times with a sword, which was thought the more reputable manner of dying. The execution was but clumsily performed in the first times; but afterwards they grew more expert, and took the head off clean, with one circular stroke.

In England and France, *beheading* is the punishment of nobles; being reputed not to derogate from nativity, as hanging does.

In Scotland they do not behead with an ax, as in England; nor with a sword, as in Holland and France; but with an edged instrument called the MAIDEN.

BEHMISTS, BOHMENISTS, or BOHMISTS, a kind of mystic philosophers and followers of Jacob Behmen, commonly called the Teutonic Philosopher.

The *Behmenists* are attached to that motley species of philosophy first introduced by Paracelsus, under the name of THEOSOPHIA.

Behmen, or Bohmen, from whom the sect takes its denomination, was born in 1575 near Gorlitz, and bred up to the trade of a shoemaker, or taylor, having just learned enough to read and write a little, which he acquired in ten years of age. He derived the greatest part of his mystical doctrine from the writings of Robert Fludd, a native of England. Wood's Athenæ Oxonienses, v. i. p. 610.

In 1600 he was seized with a spiritual rapture, and ten years after began to compose a book on the light he then received, entitled Aurora, being a mixture of *astrology*, *philosophy*, *chemistry*, and *divinity*, written in a quaint obscure style; seven years after he wrote divers others on the same models; the chief is the *Mysterium Magnum*. He died in 1624. All his works have been published together at Amsterdam in 1682, 8vo. His tenets are, that there is a great darkness among the stars, where the devil holds his principality; that all arts and sciences flow from the liberal spirit of this world; that the seven liberal arts proceeded from seven spirits of nature; that all human things are composed of the four first properties, bitter, sour, heat, and pain. (Angore).

Quistius, Kuhlman, Abr. Frackenberg, and Dunermann, are the most eminent ranked among the *Behmenists*. Mr. William Law, an English visionary, was an industrious and zealous disciple of Behmen; and he prepared a new edition and translation of his works, which have been published in two vols. 8vo. since his decease.

Gilbert Ichtelshius, and Antagonius, were great opposers of *Behmenism*.

Dr. Henry More has also a piece against *Behmenism*, Censura Philosophiæ Tentonicæ, printed in his works p. 330.

BEHEMOTH, a huge animal mentioned in scripture, concerning which interpreters are much divided.

BEHEN. See BEN.

BEHENIAN *Stellæ*, a name given by some astronomers to the principal fixed stars in each constellation.

The appellation is more particularly given to the stars of the first magnitude, otherwise called the *honors*, *cardia*, of the several constellations; though some would distinguish between *cardia*, and *behenian stellæ*, restraining the former to stars only of the first magnitude, and extending the latter to several of the second, or even third.

Hermes has a treatise expres De Stellis Beheniis, published by Junctinus, in his Speculum Astrologicum, and also in his Commentaries upon Jo. de Sacrobusco's book De Sphæra.

BEIDELSAR, in *Botany*, a name by which some authors call the Syrian DOG'S-*bane*, or *apocynum Syriacum*, a poisonous plant.

BEISSKER, in *Ichthyology*, a name given by Gesner and others to the fish commonly called *mustela fluviatilis*: this is a species of the COBITIS, distinguished by Artedi by the name of the bluish COBITIS, with nine black longitudinal lines on each side. Schoenefeldt calls this the *fascia*, and Johnston the *fasciis fluviis*.

BEIZA, or BEZIATH, a Hebrew word, fignifying an *egg*, in Jewiſh *Antiquity*, a certain meaſure in uſe among the Jews: they ſay that the *homa* contains the ſixth part of a *log*. The *homa* is alſo a ſort of gold coin common among the Perſians: it weighs forty *drachmas*, and from this word, not from the city Byzantium, the *bezant* was formed. A *bezant* is worth two *almars*, and every *almar* twenty of ſtone and twenty *drachmas*.

BEKKERANISM, or BEKKERIANISM, the ſyſtem or ſentiments of Balth. Bekker, who denied that ſpirits can act or operate on bodies.

The author of this ſyſtem was a Dutch divine, towards the cloſe of the ſeventeenth century, ſtrongly impreſſed with the Carteſian principle, that the eſſence of ſpirit conſiſts in thinking; hence he was led to conclude, that ſpirits cannot act, either on bodies, or on other ſpirits; and therefore he underſtood the declarations of Scripture concerning the operations of ſpirits, in a metaphorical ſenſe. He attributed the poſſeſſions recorded in the Goſpel to bodily diſeaſes, or mental diſorders. Budd. Elem. Phil. Theor. p. 5. cap. 2. § 1—12. See DEMONIAC.

BEL, in *Botany*, the name of a plant called by ſome the *cucumis ſepparis*, or *anguria*, or *cucumis anguinus*. This plant is very imperfectly deſcribed to us: and we find among the Arabian writers, that the fruit was called by this name as well as the whole plant. Avicenna, who gives the fulleſt account we have of it, ſays that it was an Indian plant, reſembling in growth the common cucumber-plant, but bearing a fruit like the capers: he tells us that this fruit was the only part of the plant uſed in medicine, and that it was very hot and bitter, being ſomewhat like ginger in the fiery heat of the taſte, and in qualities hot and dry in the ſecond degree, as they expreſſed it; or, according to Dioſcorides, in the third.

BELATUCADRUS, the name of an ancient Britiſh idol, recorded in old inſcriptions; and ſuppoſed by Selden and Vollius, to be the ſame with BELENUS.

BELAY, on board a ſhip, ſignifies the ſame as *faſten*. Thus they ſay, *belay* the ſheet, or rack, that is, faſten it to the keel, by winding it ſeveral times round a bolt, &c.

BELCHING. See RUCTATION.

BELEMNITES, or BELEMNITE, in *Natural Hiſtory*, a kind of figured *ſtone*, uſually hollow, and a little tranſparent, ſhaped ſomewhat like an arrow, formed of ſmall *ſtriæ*, or threads, radiating from the axis to the ſurface of the ſtone; and which when burnt, or rubbed againſt another, or ſcraped with a knife, yields an odour like raſped horn. See its figure repreſented in *Tab.* III. *of Foſſils, Claſs* 10. The word is formed from the Greek βελεμνον, *a dart*. The *belemnites* in other wiſe denominated *dactyloi*, or *dactylus idæus*, on account of its bearing a reſemblance to the figure of a finger; by the ancients, *lomentus lapis*, or *lapis lyncis*, as being ſuppoſed to be generated of the urine of the *lynx*.

Among us, popularly, it is called the thunderbelt, or thunder-ſtone, as having been ſuppoſed to fall in time of thunder. Dr. Woodward, and a great many other authors, ſuppoſe the *belemnites* to be a native foſſil in its own proper figure; but it is more probably ſuppoſed by others to owe its preſent form to ſome animal body: and to be, like the other formed ſtones, the *echinites*, &c. a ſubſtance caſt in a mould. Phil. Tr. vol. xlviii. art. 97. and vol. liv. art. 5. The general diſtribution of the *belemnites* is into three kinds; viz. the cylindric, conic, and fuſiform, of which the latter are moſt rare.

The *belemnites* are all of an alcalious nature, making a ſtrong efferveſcence with acids. Hence alſo they become abſorbent and reſolvent, and, on theſe accounts, are ranked by phyſicians among aplenephritic medicines.

The German writers ſpeak much of the virtue of this foſſil, and it is kept in their ſhops, and ſometimes enters into extemporaneous preſcription. They give it in caſes of the gravel, and all nephritic complaints; and ſay, that it has great virtues againſt the ſtone. With us it is not uſed at all, except among farriers; but, in all probability, it will anſwer the purpoſe of lyme in any other form; and lyme has at all times been celebrated for its virtues as a lithontriptic, whether given under the form of the LAPIS JUDAICUS, or that of the OSTRACITES, or, finally, as diſſolved in the water of certain ſprings, which form incruſtations on things that fall into them.

BELENNUS, in *Ichthyology*, the name of a ſmall anguilliform fiſh, called by others BLENNIUS. It is a ſea-fiſh, and very ſcarce. It approaches much in figure to the Engliſh bull-head, or miller's thumb, the COTTUS of authors.

BELENUS, in *Mythology*, a name which the Gauls gave to the ſun, which they alſo called *Abellio*; and, as ſome ſuppoſe, the ſame with the *Baal* of Scripture, and the *Belus* of the Aſſyrians.

BELFRY, BELFREDUS, is uſed by military writers of the middle age for a ſort of tower, erected by beſiegers to overlook and command the place beſieged.

They were alſo called *berfredi*, *berfredi*, *verfredi*, and *belfragia*. Their ſtructure and uſe are deſcribed in verſe by a poet of thoſe days.

Belfrey originally denoted a high tower, wherein centinels were placed to watch the avenues of a place, and prevent ſurpriſe from parties of the enemies, or to give notice of fires by ringing a bell. Du-Cange.

In the cities of Flanders, where there is no *belfrey* on purpoſe, the tower of the chief church ſerves the ſame end. The word *belfry* is compounded of the Teutonic *belf* and *freid*, *peace*, becauſe the bells were hung for preſerving the peace.

BELFRY is alſo uſed for that part of a ſteeple wherein the bells are hung.

This is ſometimes called by middle-age writers *campanile*, *clocarium*, and *triſtegum*. Du-Cange.

BELFRY is more particularly uſed for the timber-work, which ſuſtains the bells in a ſteeple; or that wooden ſtructure, in which the bells in church-ſteeples are faſtened.

BELIDES, in *Antiquity*. See DANAIDES.

BELIEF, in its general and natural ſenſe, denotes a perſuaſion, or a ſtrong aſſent of the mind to the truth of any propoſition.

In which ſenſe, *belief* has no relation to any particular kind of means or arguments, but may be produced by any means whatever. Thus we are ſaid to *believe* our ſenſes, to *believe* our reaſon, to *believe* a witneſs, &c. And hence, in rhetoric, all ſorts of proofs, from whatever topics deduced, are called *fides*, becauſe apt to get *belief*, or perſuaſion, touching the matter in hand.

BELIEF, in its more reſtrained and technical ſenſe, invented by the ſchoolmen, denotes that kind of aſſent which is grounded only on the authority, or teſtimony, of ſome perſon or perſons, aſſerting or atteſting the truth of any matter propoſed.

In this ſenſe, *belief* ſtands oppoſed to knowledge and ſcience. We do not ſay we *believe* that ſnow is white, or that the whole is equal to its parts; but we *ſee* and *know* them to be ſo: that the three angles of a triangle are equal to two right angles, or that all motion is naturally rectilinear, are not ſaid to be things *credible*, but *ſcientifical*; and the comprehenſion of ſuch truths is not *belief*, but *ſcience*.

But, when a thing propounded to us is neither apparent to our ſenſe, nor evident to our underſtanding; neither certainly to be collected from any clear and neceſſary connexion with the cauſe from which it proceeds, nor with the effects which it naturally produces; nor is taken up upon any real arguments, or reaſon thereof to other acknowledged truths; and yet, notwithſtanding, appears as true, not by a manifeſtation, but by an atteſtation of the truth, and moves us to aſſent, not of itſelf, but in virtue of a teſtimony given to it—this is full to be properly *credible*; and an aſſent to this is the proper notion of *belief* or FAITH.

BELIEVERS, an appellation given towards the cloſe of the firſt century, to thoſe Chriſtians who had been admitted into the church by baptiſm, and inſtructed in all the myſteries of religion: they had alſo acceſs to all the parts of divine worſhip, and were authoriſed to vote in the eccleſiaſtical aſſemblies. They were thus called in contradiſtinction to the *catechumens*, who had not been baptized, and were debarred from theſe privileges.

BELINGELA in *Botany*, a name given by ſome authors to the *mala inſana*, or *mad apples*. See MAD-*apple*.

BELL, a popular machine, ranked by muſicians among the number of muſical inſtruments of percuſſion. See MUSIC. The parts of a *bell* are the body or barrel, the *clapper* within ſide, and the ear or *cannon*, whereby it is hung to a large beam of wood. Its uſual matter is a kind of compound metal, called *bell-metal*. The thickneſs of its edges is uſually $\frac{1}{9}$ of the diameter, and its height twelve times its thickneſs. The *bell* founders have a diviſion, or *bell*-ſcale, wherewith they meaſure the ſize, thickneſs, weight, and tone, of their *bells*. For the method of caſting *bells*, ſee FOUNDERY.

The uſes of *bells* are ſummed up in the Latin diſtich:

Laudo Deum verum, plebem voco, congrego clerum,
Defunctos plango, peſtem fugo, feſta decoro.

The firſt *bells* are ſaid to have been made about the year 400, at Nola, in Campania, whereof St. Paulinus was biſhop; at leaſt, it is aſſured, he was the firſt who brought them into uſe in the church. And hence, it is added, they had their Latin names, *Nolæ* and *Campanæ*: but others ſay, they take theſe names, not from their being invented in Campania, but becauſe it was here the manner of hanging and balancing them, now in uſe, was firſt practiſed; at leaſt, that they were hung on the model of a ſort of balance invented or uſed in Campania. For in Latin writers we find *Campana ſtatera*, for a *ſteel yard*; and in the Greek καμπανιζειν, *for ponderare, to weigh*.

Polydore Virgil aſcribes the inventim of church *bells* to pope Sabinian, St. Gregory's ſucceſſor; but by miſtake: for St. Jerom, contemporary with Paulinus, makes men-

tion of one. In effect, pope Sabinian did not invent *bells*; but he was the first who appointed the canonical hours to be distinguished by them.

We even find mention made of *bells* in Ovid, Tibullus, Martial, Statius, Manilius, and the Greek authors under the appellations of *tinnimabile*, and *sounding brass*. Suetonius, Dion, Strabo, Polybius, Josephus, and others, mention them under the names of *petasus*, *tintinnabulum*, *arcimbalum*, *cymbalum*, *sagum*, &c. But these appear to have been no more than bubbles, and little like the huge *bells* in use among us.

Hieronymus Magius, who has a treatise on *bells* (written when in chains, in Turky, and which is accounted very remarkable), puts them in memory, without the assistance of any books; makes large *bells* a modern invention. Indeed, we do not hear of any before the fixth century: in 610, we are told, Tetricus, bishop of Orleans, being at Sens, then beſieged by the army of Clotharius, frighted away the beſiegers by ringing the *bells* of St. Stephen's. The firſt large *bells* in England are mentioned by Bede towards the latter end of that century. They ſeem to have been pretty common in the next *Sth*. The Greeks are uſually ſaid to have been unacquainted with them till the ninth century, when their conſtruction was firſt taught them by a Venetian.

Indeed, it is not true, that the uſe of *bells* was entirely unknown in the ancient eaſtern churches, and that they called the people to church, as at preſent, with wooden mallets. Leo Allatius, in his Diſſertation on the Greek Temples, proves the contrary from ſeveral ancient writers. It is his opinion that *bells* firſt began to be diſuſed among them, after the taking of Conſtantinople by the Turks; who, it ſeems, prohibited them, leſt their ſound ſhould diſturb the repoſe of fouls, which, according to them, wandered in the air. He adds, that they ſtill retain the uſe of *bells* in places remote from the intercourſe of the Turks; particularly, very ancient ones in Mount Athos. F. Simon thinks the Turks rather prohibited the Chriſtians the uſe of *bells* out of political than religious reaſons; inaſmuch as the ringing of *bells* might ſerve as a ſignal for the execution of revolts, &c.

The city of Bourdeaux was deprived of its *bells* for rebellion; and, when it was offered to have them reſtored, the people refuſed it, after having raiſed the caſe and conveniency of *being* freed *from the conſtant din and jangling of* bells.

Matthew Paris obſerves, that anciently the uſe of *bells* was prohibited in the time of mourning; though, at preſent, they make one of the principal ceremonies of mourning. Mabillon adds, that it was an ancient cuſtom to ring the *bells* for perſons about to expire, to adverſiſe the people to pray for them; whence our *paſſing-bells*.

Loobman obſerves, that the cuſtom of ringing *bells*, at the approach of thunder, is of ſome antiquity; but, that the deſign was not ſo much to ſhake the air, and ſo diſſipate the thunder, as to call the people to church, to pray that the pariſh might be preſerved from miſchief from it.

The cuſtom of chriſtening, or bleſſing *bells*, is very ancient. Some ſay it was introduced by pope John XIII. in 972, but it is evidently of an older ſtanding; there being an expreſs prohibition of the practice in a capitular of Charlemagne in 789. See Heſpanian de Origine Templorum, p. 113, where there is a particular account of all the ridiculous ceremonies practiſed about *bells*.—See Dr. Franklin's Obſervations on conſecrated Bells, and and the form in conſecrating them, Experiments, Obſervations, &c. p. 448. ed. 1769.

Nankin, a city of China, was anciently famous for the largeneſs of its *bells*; but their enormous weight having brought down the tower, in which they were hung, the whole building fell to ruin, and the *bells* have ever ſince been diſtreſſed. One of theſe *bells* is near twelve Engliſh feet high, the diameter ſeven and a half, and its circumference twenty-three; its figure almoſt cylindric, except for a ſwelling in the middle, and the thickneſs of the metal about the edges, ſeven inches. From the dimenſions of this *bell*, its weight is computed at 50000 pounds, which is more than double the weight of that at Erfort, ſaid by father Kircher to be the greateſt *bell* in the world. Theſe *bells* were caſt by the firſt emperor of the preceding dynaſty, about three hundred years ago. They have each their name, the hanger *tchuen*, the eater *che*, the ſleeper *chuy*, the will *ſi*. Father le Compte adds, that there are ſaid other *bells* in Pekin, caſt in the reign of Youlo, each of which weighs 120,000 pounds. But the founds even of their biggeſt *bells* are very poor; being ſtruck with a wooden inſtead of an iron clapper.

The Egyptians have none but wooden *bells*, except one brought by the Franks into the monaſtery of St. Anthony. The ſound of a *bell* ariſes from a vibratory motion of the parts thereof, much like that of a muſical chord. The ſtroke of the clapper, it is evident, muſt change the figure of the *bell*, and of round make it oval: but the metal having a great degree of elaſticity, that part which the ſtroke drove fartheſt from the centre will fly back again, and this even ſomewhat nearer to the centre than before: ſo that the two points, which before were the extremes of the longer diameter, now become thoſe of the ſhorter. Thus, the circumference of the *bell* undergoes alternate changes of figure, and by means thereof gives that tremulous motion to the air, wherein SOUND conſiſts.

M. Perrault maintains, that the ſound of the ſame *bell* or chord, is a compound of the ſounds of the ſeveral parts thereof; ſo that where the parts are homogeneous, and the dimenſions of the figure uniform, there is ſuch a perfect mixture of all the ſounds, as conſtitutes one uniform, ſmooth, even ſound: and the contrary circumſtances produce harſhneſs. This he proves from the *bells* differing in tune according to the part you ſtrike; and yet ſtrike it any where, there is a motion of all the parts. He therefore conſiders *bells* as compoſed of an infinite number of rings; which, according to their different dimenſions, have different tones, as chords of different lengths have; and, when ſtruck, the vibrations of the parts immediately ſtruck determine the tone; being ſupported by a ſufficient number of conſonant tones in the other parts. Mr. Hauksbee, and others have found by experiment, that the ſound of a *bell* ſtruck under water is a fourth deeper than in the air: though Merſenne ſays, it is of the ſame pitch in both elements.

Bells are obſerved to be heard farther, placed on plains, than on hills; and ſtill farther, in valleys, than on plains: the reaſon of which it will not be difficult to aſſign, if it be conſidered that the higher the ſonorous body is, the rarer is its medium; conſequently, the leſs impulſe it receives, and the leſs proper vehicle it has to convey it to a diſtance. There is a curious obſervation in a paper of M. Reaumur's in the Memoirs of the Paris Academy, relating to the ſhape moſt proper for *bells*, to give them the loudeſt and cleareſt ſound. He obſerves, that as pots, and other veſſels more immediately neceſſary to the ſervice of life, were doubtleſs made before *bells*, it probably happened, that the obſerving of theſe veſſels to have a ſound when ſtruck, gave occaſion to making *bells*, intended only for ſound, in that form: but that it does not appear that this is the moſt eligible figure; for lead, a metal which is, in its common ſtate, not at all ſonorous, yet becomes greatly ſo on its being caſt into a particular form, and that very different from the common ſhape of *bells*. In melting lead for the common uſeſulness of caſting in ſmall quantities, it is uſually done in an iron ladle; and as the whole is ſeldom poured out, the remainder, which falls to the bottom of the ladle, cools into a maſs of the ſhape of that bottom. This is conſequently a ſegment of a ſphere, thickeſt in the middle, and thinner towards the edges: nor is the ladle any neceſſary part of the operation, ſince if a maſs of lead be caſt in that form in a mould of earth or ſand, in any of theſe caſes it is found to be very ſonorous. Now, if this ſhape alone can give ſound to a metal which in other forms is perfectly mute, how much more muſt it neceſſarily give it to other metals naturally ſonorous in whatever form. It ſhould ſeem, that *bells* would much better perform their office in this than in any other form, and that it muſt particularly be a thing of great advantage to the ſmall *bells* of common houſe-clocks, which are required to have a ſhrill note, and yet are not allowed any great ſize. M. Reaumur very judiciouſly obſerves, that had our forefathers had opportunities of being acquainted with the ſound of metals in this ſhape, we ſhould probably have had all our *bells* at preſent of this form. Mem. Acad. Par. 1726.

BELL, *bearing the*. See RACING.

BELL, *founding of*. See FOUNDERY.

BELL, *ringing*. See DIVING.

BELLS, *electrical*, are uſed in a variety of entertaining experiments by electricians. The apparatus, which is originally of German invention, conſiſts of three ſmall *bells* ſuſpended from a narrow plate of metal (*Plate, Electricity, fig.* 2.) the two outermoſt by chains, and that in the middle, from which a chain paſſes to the floor, by a ſilken ſtring. Two ſmall knobs of braſs are alſo hung by ſilken ſtrings, one on each ſide of the *bell* in the middle, which ſerve for clappers. When this apparatus is connected with an electrified conductor, the outermoſt *bells* ſuſpended by the chains will be charged, attract the clappers, and be ſtruck by them. The clappers becoming electrified likewiſe will be repelled by theſe *bells*, and attracted by the middle *bell*; and diſcharge themſelves upon it by means of the chain extending to the floor. After this, they will be again attracted by the outermoſt *bells*, and thus, by ſtriking the *bells* alternately, occaſion a ringing, which may be continued at pleaſure. Flaſhes of light will be ſeen in the dark between the *bells* and the clappers; and if the electrification be ſtrong, the diſcharge will be made without actual contact, and the ringing will ceaſe. An apparatus of this kind, connected

with one of those CONDUCTORS that are erected for securing buildings from lightning, will serve to give notice of the approach and paſſage of an electrical cloud.

BELL, in *Chemiſtry*, denotes a glaſs veſſel placed over ſome matter in a ſtate of exhalation, either to collect the vapour, or gather the flowers.

Chemical *bells* are a ſort of receptacles chiefly uſed in preparing the oil or ſpirit of ſulphur, for gathering and condenſing fumes into a liquor.

BELL, in *Building*, is uſed to denote the body of the Corinthian and Compoſite capital, by reaſon of its reſemblance to the figure of a *bell* inverted.

In this ſenſe, *bell* is the ſame with what we otherwiſe call *vaſe* and *tambour*, ſometimes alſo *corbeil*.

The naked of the *bells* always to be even and perpendicular with the bottom of the ſtutings of the column.

BELL *flower*, in *Botany*. See CAMPANULA.

BELL, *hair*, in *Botany*. See HYACINTH.

BELL-*metal* is a compoſition of tin and copper melted together in due proportion; which has this property, that it is more ſonorous than any of the ingredients taken apart.

The ordinary proportion is about twenty-two or twenty-three pounds of tin to one hundred weight of copper; though the proportion varies according to the uſe of the *bells*; a greater quantity of copper being uſed in the greater *bells* than in the ſmaller ones. Some add lead and braſs, others zinc or ſpelter, to the compoſition.

It has long been obſerved, that though tin is ſpecifically lighter than copper, yet the gravity of the compound *bell-metal* is greater than that of copper itſelf. Notice has been frequently taken of this not uncommon phenomenon in chemiſtry, from which it appears that Archimedes's propoſition and tables, calculated upon that principle, for determining the proportion of two metals in any given compound, by hydroſtatical experiments, are leſs to be depended upon than has hitherto been ſuppoſed. Some alſo ſpeak of a native mineral under the denomination *bellmetal*, or *bismuth*, from which Becher affirms he procured ſilver and gold.

BELL-*animal*, a name given by the writers on microſcopical diſcoveries to a very ſmall animal found at the roots of the common duck-weed. The bodies of theſe animals are ſhaped like *bells*; and they have very long and ſlender tails, by which they faſten themſelves to the roots of theſe little plants. They are uſually found in great numbers together, in a form of cluſters or bunches; and all of the ſame bunch have always the ſame motion, very frequently contracting themſelves, and afterwards expanding all together to the full length of their tails. They uſually contract and expand themſelves again. Baker's *Microſc.* p. 90.

BELL-*muſhroom*, in *Botany*, a name given by ſome authors to the pileus called *boletus muſcharius*, and muſch-food.

BELL-*pepper*, in *Botany*. See CAPSICUM.

BELL-*ſhrimp*, in *Zoology*, a particular ſpecies of POLYPE, the extremities of whoſe branches reſemble *bells*. See *Tab. of Microſcopical Objects, Claſs* 2.

BELL-*weed*, an Engliſh name uſed by ſome authors for the *lucca nigra*, or common knop-weed, called alſo by many Engliſh writers MATFILON.

BELLADONA *lily*. See AMARYLLIS.

BELLADONA, in *Botany*, a name given by the Italians to the *deadly* NIGHTSHADE, becauſe the ladies make a coſmetic of the juice, or diſtilled water, which they uſe to make their complexion fair and white. Ray.

Others derive the name from the intoxicating quality of this plant: *Sumpſi infoeliſſimi poſthoras ſphondas vaſtiores frenſuſque.* Bod. Comment. in Theophraſt. p. 1078.

BELLATRIX, in *Aſtronomy*, a ruddy, glittering ſtar of the ſecond magnitude, in the left ſhoulder of ORION.

It takes its name from *bellum*, as being anciently ſuppoſed to have great influence in kindling wars, and forming warriors.

BELLE *de nuit*, in *Botany*, a name which the French give to the flower of the JALAP.

BELLICA *columna*, in *Antiquity*, a *column* near the temple of Bellona, from which the conſuls or feciales caſt javelins towards the enemy's country, by way of declaration of war.

BELLICULI, or BELLERICI *Marini*, among *Naturaliſts*, denote a ſpecies of ſea-ſhells of an umbilical figure, ſometimes of a white colour, ſpotted with yellow; and ſometimes of a yellow, ſtreaked with black lines, after the ſnail-faſhion.

BELLING *of hops*, denotes their opening and expanding to their cuſtomary ſhape, ſuppoſed to bear ſome relation to that of a bell.

Hops blow towards the end of July, and *hell* the latter end of Auguſt, or beginning of September.

BELLIS, in *Botany*. See DAISY.

BELLON, or BELLARD, in *Medicine*, a diſtemper very common in Derbyſhire, and other counties, where they *ſmelt* lead ore; to which beaſts, and even poultry, as well as men, are ſubject; and for this reaſon, a certain ſpace round the ſmelting houſes is called *bellon-ground*, where it is dangerous for any animal to reſt. This diſorder is attended with langours, weakneſs, and intolerable pains, tenſion, or gripings in the belly, and generally coſtiveneſs. It frequently proves fatal.

The method of cure which has been found moſt ſucceſsful in this diſtemper, is, to give *cremor*, or cryſtals of tartar, in ſmall doſes, and to repeat them frequently, as two or three times a day.

BELLONA, in *Mythology*, *a bella*, the goddeſs of war, ſiſter to Mars. Before her temple the herald ſet a ſpear on a pillar, when any war was proclaimed.

BELLONARII, in *Antiquity*, prieſts of Bellona, the goddeſs of war and battles.

The *Bellonarii* cut and mangled their boſſes with knives and daggers in a cruel manner, to pacify the deity. In this they are ſingular, that they offered their own blood, not that of other creatures, in ſacrifice. In the fury and enthuſiaſm wherewith they were ſeized on theſe occaſions, they ran about raging, uttering prophecies, and foretelling blood and ſlaughter, devaſtations of cities, revolutions of ſtate, and the like; whence Martial calls them *turba enthuſa Bellonæ*. Lactant. Inſt. lib. i. cap. 7. Lucan. lib. 1. Tertull. Apol. cap. 9. Minut. Felix. p. 298. In after-times they ſeem to have abated much of their zeal and tranſport, and to have turned the whole into a kind of farce, contenting themſelves with making ſigns and appearances of cutting and wounds. Lampridius tells us, the emperor Commodus, out of a fancy of cruelty, turned the farce again into a tragedy, obliging them actually to cut and mangle their bodies. Lamp. in Commod. cap. 9.

BELLONIA, ſo called after the name of M. Bellon, a phyſician of Caen, in *Botany*, a genus of the *pentandria monogynia* claſs. The characters of this plant are, that the flower is wheel-ſhaped, of one leaf with a ſhort tube, but ſpread open above, and cut into five obtuſe ſegments; that it hath five ſtamina which cloſe together; that the germen is ſituated under the receptacle of the flower which afterwards becomes an open unbilicated ſeed-veſſel, ending in a point, having one cell filled with ſmall round ſeeds.

We have but one ſpecies of this plant, viz. ſcrubby *bellonia*, with a rough hairy leaf. This plant is very common in ſeveral of the warm iſlands in America.

BELLOWING, among *Sportſmen*, is uſed for the noiſe which roes make in BUTTING-time.

BELLOWS, a machine uſed to give a brisk agitation to the air, by enlarging and contracting its capacity, and thus expiring and inſpiring the air by turns.

Bellows are of various kinds, as *domeſtic bellows*, *chamelers*, *bellows*, *ſmiths bellows*, &c.

There are ſome *bellows* triangular, which only move on one ſide; others, called *lantern bellows*, from their reſembling a paper lantern: theſe move every way, and yet ſtill continue parallel.

Mr. Triewald, engineer to his Sweediſh majeſty, has contrived a kind of *water-bellows*.—This is not the firſt time that water has been employed to blow the fire. The ſame is done at Tivoli, and other parts of Italy, where the contrivances for this purpoſe are called *feux d'eaux*.—Phil. Tranſ. N° 448. p. 234.

Mr. Sterling has given the deſcription of a *water-bellows*, or machine to blow fire by the fall of water. Phil. Tranſ. N° 475. § 19. Dr. Lewis's Com. Ph. Techn. p. 269, &c. Where may be ſeen an account of *bellows*, and of BLOWING *machines*, of various conſtructions, for all kinds of furnaces; and many curious and important remarks on the various quantity of air afforded by them, &c.

The action and effect of *bellows of every kind*, whether leathern or wooden, wrought by water or men, depend on this, that the air which enters them, and which they contain when raiſed, is again compreſſed into a narrower ſpace when they are cloſed. And, as the air, like all other fluids, runs to that place where it meets the leaſt reſiſtance, the air muſt of conſequence fly out of the pipe or aperture with a velocity proportional to the force whereby the air is compreſſed, and muſt of conſequence blow ſtronger or weaker, as the velocity with which the top and bottom of the *bellows* meet is greater or leſſer. The blaſt alſo will laſt in proportion to the quantity of air that was drawn into the *bellows* through the valve or wind-clap.

The Heſſian *bellows* are a contrivance for driving air into a mine for the reſpiration of the miners. This M. Papin improved, changing its cylindrical form into a ſpiral one; and, with this, working it only with his foot, he could make a wind to raiſe two pound weight.

Anacharſis the Scythian is recorded as the inventor of *bellows*. Strabo, lib. vii. p. 209.

The action of *bellows* bears a near affinity to that of the lungs; and what we call blowing in the latter, affords a good

good illustration of what is called respiring in the former. There are *bellows* made wholly of wood, without any leather upon them; one of which is preserved in the repository of the Royal Society; and Dr. Plot describes another used in the copper-works at Ellaston, in Staffordshire. Nat. Hist. Staff. chap. 4. sect. 18.

We are also told of a new sort of *bellows* to work in vacuo. Some have even pretended to effect a perpetual motion by a new-contrived *bellows*. Boyle's Works, abr. tom. ii. p. 503. Phil. Trans. N° 182.

Smiths and founders *bellows*, whether single or double, are wrought by means of a rocker, with a string or chain fastened thereto, which the workman pulls. The *bellows*-pipe is fitted into that of the tewel. One of the boards is fixed, so as not to play at all. By drawing down the handle of the rocker, the moveable board rises, and by means of a weight on the top of the upper board, sinks again.

The *bellows* of forges and furnaces of mines usually receive their motion from the wheels of a water-mill. Others, as the *bellows* of enamellers, are wrought by means of one or more flaps or treddles under the workman's feet.

Acosta says, that the metal of the Peruvian mines of Porco is easily refined with *bellows*; but that of the mines of Potosi cannot be fused with them, but only by the breath of their small furnaces built upon the sides of mountains, and directed where the wind lies.

The *bellows* of an organ are six feet long, and four broad; each having an aperture of four inches, that the valve may play easy. There should likewise be a valve at the nose of the *bellows*, that one may not take the air from the other. To blow an organ of fifteen feet, there are required four pair of these *bellows*.

The *bellows* of organs are wrought by a man called the blowers, and, in small organs, by the foot of the player.

BELLOWS, *bow*, *spelgen vena*, occur in Herodotus for those applied by the Scythians to the genitals of mares, in order to distend the *uterus*, and by this compression, make them yield a greater quantity of milk.

BELLOWS, *Hydrostatic*, see HYDROSTATIC.

BELLUCE, in *Zoology*, the fifth order of the *mammalia*, the character of which is, that their fore-teeth are obtusely truncated, their feet hoofed, their walk heavy, and their food vegetables. The genera of the *horse*, hippopotamus, hog, and rhinoceros, belong to this order.

BELLUGA *fine* in *Natural History*, the name of a *cetaceous* or fhone found in the *beluga*, a large fish, accounted a species of flurgeon, and called by Artedi *acipenser rubicundus curvus*.

The fish is much like the flurgeon in fhape; but its fnout is fhorter and thicker. Of its roe or fpawn is made caviar; and fome of them are fo large as to yield two hundred weight of it. The fifh is very common and very large in the Volga, near the city of Aftrican. It has been caught there thirty-fix feet long, and eighteen thick. It is alfo found in the Don, and other rivers, and in the Baltic and Caſpian feas. See ACCIPENSER.

It is not certainly known in what part of this fifh the ſtone is found. It is found in both ſexes, but moſt frequently in the male; and is found in fifh of all ages and ſizes. It is fat from being common, however; for in a thouſand fiſhes, there ſometimes is not found one ſtone. It is hence evident, that theſe ſtones are no natural part of the fifh; but are mere morbid concretions like the bezoar ſtones in the animal which produces them, or like the ſtones in human bladders. The ſituation of the parts in which it is found, and other circumſtances, may allot it its particular appearances.

This ſtone is of various ſhapes and ſizes; but its moſt uſual figure is either globular or oval. It is of a yellowiſh white colour, and of a ſmooth and naturally poliſhed ſurface; and it is found from the ſize of a pigeon's egg to that of a gooſe. They are uſually compact, ponderous and ſolid, not friable, but requiring a ſtrong blow to break them. They yield eaſily to the file; but this defaces their internal texture, which is naturally very elegant and regular. The ſtones conſiſt of ſeveral concentric coats, firmly adhering to one another, formed about a *nucleus*, which generally appears to be ſome heterogeneous ſubſtance.

But another very obvious circumſtance there is in its ſtructure, which makes it greatly different from all other ſtones of this kind, that is, its radiated ſtructure, it being compoſed of a number of regular and even *ſtriæ* running from the centre to the circumference, repreſenting, both in colour and form, the flakes of the *terra foliata tartari*, or the ſtriated *piſtillus* of antimony.

If the ſtone be ſcraped to powder, and ſprinkled upon a hot iron, it gives a faint urinous ſmell, and calcines into a light, inſipid, greyiſh earth.

The people about the Volga eſteem it greatly, and account it to have great virtues; they ſay it promotes delivery and give it conſtantly in caſes of the ſtone, and diſorders of the urinary parts. Its doſe is from ten grains to a dram. Phil. Tranſ. vol. xliv. part ii. N° 4.

BELLUA *lupi*, in *Ichthyology*, a name given by Paulus Jovius to that ſpecies of the ray fiſh, which was called by the old Greek and Latin writers *lus marinus*, and by the latter authors *cepia aureorubus*. It is diſtinguiſhed by Artedi by the name of the variegated ray, with ten prickly tubercles on the middle of the back.

BELLY, in a general ſenſe, denotes the whole ABDOMEN, or that region of the body contained between the *ſcapulæ tranſverſæ*, the *hypochondria*, and *pubes*.

BELLY is alſo uſed, in a more confined ſenſe, for the inteſtines alone, as containing the *feces*.

In this ſenſe we ſpeak of the looſeneſs or coſtiveneſs of the *belly*, &c.

BELLY is alſo uſed ſometimes for a pregnant woman.

In this ſenſe we are to underſtand the phraſe among *Civil Lawyers*, to put the *belly* in poſſeſſion of an eſtate.

BELLY is alſo uſed in ſpeaking of the bodies of beaſts. Thus, we ſay a light *belly*, meaning a ſlender or lank one; a *cow-belly*, that where the ribs being unable to hold the *viſcera*, they preſs downwards, and bulge diſagreeably.

Feeding horſes with graſs, or much hay, and few oats, makes them grow cow-bellied. It is a maxim, that horſes which are light bellied, and fiery, ſoon deſtroy themſelves.

The *belly* of a horſe ſhould be of an ordinary bigneſs, except in draught horſes, where the larger the better, provided it be round, and well incloſed within the ribs; rather extending upon the ſides than downwards. Thoſe horſes are apt to be cow-bellied, which, having ſtraight ribs, are great feeders.

The *belly* is ſometimes alſo denominated the body, cheſt, gut, or flank.

A horſe is ſaid to be thick-bellied, well-bodied or flanked, when he has large, long, and well-made ribs, neither too narrow nor too flat. A horſe again is ſaid to have no *belly*, or body, or to be ſhin-flanked, when his ribs are too narrow or ſhort, and the flank turns up; ſo that his body looks flankleſs, like a greyhound. Such horſes are called by the French *epinés*, and generally prove fine and tender, not fit for travelling or fatigue, unleſs they feed very heartily. Coach-horſes are rejected when they are not well-bellied, or well-bodied, but narrow or thin-gutted, ſeeming to have the ſkin of their flanks ſtitched on their ribs. But a hunter is not the worſe liked for being light-bellied. Horſes pained, or weak in their hind-quarters, are commonly light-bellied. Such as have painful ſcratches in their hind-legs are found to loſe their *bellies* extremely.

BELLY *of a* MUSCLE, in *Anatomy*, denotes the body thereof; as conſtituſtinguiſhed from the two extremities, or tendons.

From the conditions of this, muſcles are divided into monogaſtric, or ſingle-bellied; and digaſtric, or double-bellied. Phil. Tranſ. N° 238.

Lower will have all the muſcles to be digaſtric, or double-bellied; in which he is ſeconded by Hoffman, and others.

BELLY-*ache* *uſed*, a name given in America to a ſpecies of the *ſatyriaſis*. See CASSADA.

BELLY, *Dragon's*, *winter dragonis*, is uſed by ſome *aſtronomers* to denote the point in a planet's orbit, wherein it has its greateſt latitude, or is fartheſt diſtant from the ecliptic; more frequently called its ſimir.

BELOAR, a name given by ſome to a ſtone, otherwiſe called WIDARA.

BELOMANCY, BELOMANTIA, a kind of divination by means of *arrows*, practiſed in the Eaſt, but chiefly among the Arabians.

The word is of Greek origin; compounded of βελος, *arrow*, and μαντια, *divination*.

Belomancy has been performed in different ways: one was, to mark a parcel of arrows, and put eleven, or more of them, into a bag; theſe were afterwards drawn out, and according as they were marked, or not, they judged of future events.

Another way was, to have three arrows, upon one of which was written, *God orders it me*; on another, *God forbids it me*; and upon the third, nothing at all. Theſe were put into a quiver, out of which they drew one of the three at random; if it happened to be that with the firſt inſcription, the thing they conſulted about was to be done; if it chanced to be that with the ſecond inſcription, it was let alone; and if it proved to be that without inſcription, they drew over again.

Belomancy is an ancient practice, and probably that which Ezekiel mentions, chap. xxi. ver. 21. At leaſt St. Jerom underſtands it ſo, and obſerves that the practice was frequent among the Aſſyrians and Babylonians. Something like it is alſo mentioned in Hoſea, chap iv. only that *ſtaves* are there mentioned inſtead of *arrows*, which is rather *rhabdomancy* than *belomancy*.—Grotius, as well

well as Jerom, confounds the two together, and shews that they prevailed much among the Magi, Chaldeans, and Scythians; whence they passed to the Sclavonians, and thence to the Germans, who, as Tacitus observes, made use of *belmanny*.

BELONE, in *Ichthyology*, a name by which some of the old naturalists have called the ACUS *Oppiani*, called in English the horn-fish, or gar-fish, a species of the ESOX. The name is retained by Linnæus.

BELSEBUL, a species of the *simia*, with a bearded black tail.

BELT, BALTHEUS, properly denotes a kind of military girdle, usually of leather, wherewith the sword or other weapons are sustained.

Belts are known among the ancient and middle-age writers by divers names, as ζωνη, ζωστηρ, *zona*, *cingulum*, *renunculum*, *rinca*, or *ringa*, and *baldrellus*.

The *belt* was an essential piece of the ancient armour; insomuch that we sometimes find it used to denote the whole armour. Pott. Arch. Græc. tom. ii. lib. iii. cap. 4. In later ages, the *belt* was given to a person when he was raised to knighthood; whence it has also been used as a badge or mark of the knightly order.

The denomination *belt* is also applied to a sort of BANDAGES in use among surgeons, &c.

Thus we meet with quicksilver *belts*, used for the itch. A late writer describes a *belt* for keeping the belly tight, and discharging the water in the operation of TAPPING. Medic. Eff. Edinb. tom. i. p. 218.

BELT, or BELTIE, in *Ecclesiastical Writers of the Middle Age*, denotes a sort of string of beads.

BELT is also a frequent disease in sheep, cured by cutting their tails off, and laying the sore bare; then calling mould on it, and applying tar and goose-grease.

BELTS, *Fasciæ*, in *Astronomy*, two zones or girdles surrounding Jupiter's body, more lucid than the rest, and terminated by parallel lines; being sometimes broader, and sometimes narrower, nor constantly taking up the same places in his disk.

Dark spots have been frequently observed on Jupiter's *belts*. Cassini has also discovered a permanent one in the most northern part of the most southern *belt*: by this he has determined the length of Jupiter's day; that is, the time of his revolution on his axis, which is finished in 9 hours 56 minutes. Phil. Trans. N° 10. and vol. lxiii. part i. N° 11. p. 73.

Some astronomers take the *belts* to be seas, which alternately cover, and leave bare large countries of the Jovial world. The spots are by these writers conjectured to be gulfs in those seas, perhaps as big as our ocean, and sometimes full, sometimes dry. M. Amont rather imagined the spots to be protuberances of the *belts*. Hist. Acad. Sc. 1708. 1692. Phil. Trans. N° 34. i. 15.

But the generality of astronomers take the spots, we mean the transparent and moveable ones, for the shadows of Jupiter's satellites.

The *belts* of Jupiter were first observed, and described by Huygens, in his Syst. Saturnin. p. 7.

Cassini also speaks of *belts* of Saturn; being three dark, straight, parallel bands, or *fasciæ*, on the disk of that planet.

Saturn's *belts* do not appear to be inherent on his globe, as those of Jupiter are; but rather to be large dark rings at a distance from the planet, and surrounding his body. Some imagine them to be clouds in his atmosphere. The middlemost seems to be the shadow of Saturn's ring. Hist. Acad. Sc. 1715.

BELTS, in *Navigation*, denote certain streights near the sound, through which ships must pass going between the Baltic and the German ocean.

The *Belts* belong to the king of Denmark, who exacts a toll of all ships which pass them excepting the Swedes, who are exempt from it.

BELVIDERE, an Italian term, denoting a fine prospect. The name is more peculiarly given to a pavilion on the top of a building, or an eminence in manner of a platform in a garden, sustained by a terrace-wall, or a massive of turf, contrived for the sake of commanding a large or beautiful prospect.

BELVIDERE, in *Botany*, a species of the CHENOPODIUM.

BELULCUM, a chirurgical instrument of various figures, contrived for extracting darts, arrows, or the like, from wounds.

Hence also the denomination *belulcum*; *quasi* τὸ βελος ελκων.

BELUS, in *Mythology*, the principal deity of the Babylonians; and if, as some suppose, the tower of Babel was his temple, one of the most ancient among the pagans. The kings of Babylon amassed immense treasures in this place, which were pillaged by Xerxes on his return from the expedition into Greece. Herod. lib. i.

BEMA, βημα, in *Antiquity*, denotes a step or pace.

The *bema* made a kind of itinerary measure among the Greeks, whose length was equivalent to one cubit, or two thirds, or ten palms.

Whence also the term βεματιζειν, *to measure a road*.

BEMA, in *Ecclesiastical Writers*, denotes the altar-part, or sanctuary, in the ancient churches.

In which sense, *bema* made the third, or innermost part of the church, answering to the chancel among us.

BEMA was also used for the bishop's chair, seat, or throne, placed in the sanctuary. It was called *bema* from the steps by which it was to be ascended.

BEMA was also used for the reader's desk.

This in the Greek church was denominated βημα ψαλτου, in the Latin church AMBO.

BEMA is more peculiarly used for the *Manichees* altar, which was in a different place from that of the catholics.

BEMA was also a denomination given by this sect to the anniversary of the day when *Manes* was killed, which with them was a solemn feast, and day of rejoicing.

One of the chief ceremonies of the feast consisted in setting out and adorning their *bema*, or altar, with great magnificence.

BEMETRE, in *Ornithology*, a name by which the Portuguese in the Brasils call a greenish black-bird of the starling kind, common there, and more generally known by its Brasilian name PITANGUA-GUACU.

BEMILUCIUS, in *Mythology*, a surname of Jupiter, represented young and beardless.

BEN, or BEHEN, in *Pharmacy*, denotes a medicinal root, celebrated, especially among the Arabs, for its aromatic, cardiac, and alexiterial virtues.

There are two kinds of *ben*, viz. the *white ben*, which is insipid, making little impression on the tongue, besides that of a little bitterness which it leaves behind it, and supposed by some modern botanists to be the same with our *pabois terrestris*, by others called the *papaver spumeum*. *Red ben*, is fibrous, brown without, and reddish within; supposed to be the root of a species of *limonium*, or *sea-lavender*.

They are both brought from the Levant, and have much the same virtues, being substituted for each other; they must be chosen dry, and of an aromatic astringent taste.

BEN, or BEN-*nut*, a fruit about the size of a filbert, the product of a middle-sized tree, said to resemble the birch, and to grow spontaneously in the East Indies, and in America. It is the *guilandina moringa* of Linnæus; and the same, the wood of which is called the *lignum nephriticum*. Lemery, in his Dictionnaire des Drogues, mentions several kinds of this fruit. It is called *glans unguentaria*, because it yields an oil by expression, which is used by perfumers in perfuming other oils, and never turns rancid; as being a detergent, it is thought proper in cutaneous diseases, &c. Geoffroy.

To impregnate oil of *ben* with the odour of flowers, dip some fine carded cotton in the oil, and put it in the bottom of some proper vessel; on this spread a thick layer of fresh flowers, and above them more cotton dipped in oil, and thus alternately *stratum super stratum*, till the vessel be full; and then by DIGESTION, during twenty-four hours in a *water-bath*, the oil will receive the odour of the flowers. As the oil of *ben* does not become rancid, at least for years, it is the best *menstruum* for extracting the odoriferous parts of roses, jonquils, and many other flowers, which yield little or no essential oil by *distillation*, but impart their fragrance to expressed oils.

BENÆ *lapis*, in the *Natural History of the Ancients*, the name given by the earliest writers to that fossile body, afterwards called THRACIUS *lapis*.

BENCH. See BARE, BANK, &c.

BENCH, *King's* See COURT of *King's Bench*.

BENCH, *free*. See FREE-*Bench*.

BENCH-*widow*. See WIDOW.

BENCHERS, in an INN of *court*, the seniors of the house, who have the government and direction thereof; and out of whom is yearly chosen a treasurer, &c.

BEND, in *Heraldry*, an ordinary or bearing, formed by two lines, drawn diagonally, or athwart, from the dexter chief of the shield to the sinister base; being supposed to represent a shoulder belt, or scarf, worn over the shoulder.—See *Tab. Herald. fig.* 7.

The *bend* is one of the ten honourable ordinaries, containing a third part of the field when charged, and a fifth when plain.—It is sometimes indented, ingrailed, &c. Heralds speak of a *bend dexter*, and a *bend sinister*.

A *bend* is subdivided into a *bendlet*, or *bendelet*, which is the sixth part of the field; a *garter*, which is the moiety of a *bend*; a *cost*, which is the fourth part of a *bend*; and a *riband*, which is the moiety of a *cost*.

BEND *dexter*, is that properly and absolutely called a *bend*, as above defined.—The word *dexter* is usually annexed to prevent mistakes, and distinguish it from the

BEND *sinister*, which is the same with what is otherwise called after the French heralds, a BAR, *barre*.

The *bend sinister* is subdivided into the *scarf*, or *scarp*, and the *baston*: which latter is the fourth part of the *bend*,

and the moſt uſual mark of illegitimacy; but then it never extends itſelf quite athwart the ſhield, but is cut off a little at each end. See BASTON, and *fig.* 6.

When two ſtraight lines drawn within the *bend* run nearly parallel to the outward edges of it, this is called *wedding*; and, he that bears it, is ſaid *to bear a bend wedded*.

Party per BEND. *ancter.* See PARTY.

Pointin BEND. See POINT.

BENDIDIA, *bendidiæ*, in *Antiquity*, ſolemn feaſts held by the Athenians on the twenty firſt day of the month Tragelion, in honour of the goddeſs Diana.

The word is formed of *Bendis*, a denomination of Diana, according to Strabo, or of the moon, according to Suidas, which amounts to the ſame.

The *bendidia* were held in the Piræus, and bore ſome reſemblance to the BACCHANALIA.

BENDING. M. Bernouilli has a diſcourſe on the *bending* of ſprings, or elaſtic bodies. M. Amontons gives ſeveral experiments concerning the bending of ropes. The friction of a rope *bent*, or wound round an immoveable cylinder, is ſufficient, with a very ſmall power, to ſuſtain very great weights. Mem. Acad. Sc. 1703. 1705. 1699.

Divers methods have been contrived for *bending* timber, in order to ſupply crooked planks, and pieces for building ſhips: M. Duhamel ingeniouſly enough propoſed to have the young trees bent, while growing in the foreſt. The method of *bending* planks by a fire-heat, now uſed in the king's yards at Deptford, was invented by captain Cumberland. Phil. Tranſ. N° 371. p. 75.

The *bending* of boards, and other pieces of timber for curved works in joinery, is effected by holding them to the fire, then giving them the figure required, and keeping them in this figure by tools for the purpoſe.

A method has been lately invented and practiſed for *bending* pieces of timber, ſo as to make the wheels of carriages without joints. See WHEELS.

BENDING, in the *Sea Language*.—They ſay, *bend the cable*, when it is to be made faſt to the ring of the anchor.—To *bend two cables*, ſignifies to tie them together with a knot, which, though leſs ſure than ſplicing, is ſooner done.

To *unbend the cable*, is to looſen it from the ring of the anchor; which is done when a ſhip deſigns to be long at ſea.

To *bend a main ſail*, is to make it faſt to the yard in its proper place.

BENDS, in a ſhip, are the ſame with *wales*, or *wales*, which are the outermoſt timbers of a ſhip, on which men ſet their feet in climbing up.

They are reckoned from the water, the *firſt*, *ſecond*, and *third bend*: they help much to ſtrengthen the ſhip, and have the beams, knees, and foothooks bolted into them.

BENDY, BANDE, in *Blaſonry*, denotes an eſcutcheon's being divided bend-wiſe into an even number of partitions, varying in metal and colour.—If they be odd, the field muſt firſt be named, and then the number of bends. In England, the number is always made even; in other countries this is not regarded.

They *ſay bendy* of four, *bendy* of ſix, &c.

*Barry-*BENDY. See BARRY.

*Counter-*BENDY. See COUNTER.

Pale BENDY. See PALY.

BENE. See DE *Bene eſſe*.

BENEAPED, in the *Sea Language*, is ſaid of a ſhip, when the water does not flow high enough to bring her off the ground, out of the dock, or over the bar.

BENEDICITE is a name given to the hymn, or ſong of the three children in the fiery furnace; by reaſon of its beginning with the words *Benedicite omnia opera Domini*.

The uſe of the *benedicite* is very ancient, it appearing to have been ſung in all the Chriſtian churches, as early as St. Chryſoſtom's time.

BENEDICTINS, or BENEDICTIN *order*, is an order of monks, who profeſs to follow the rule of St. Benedict, or Benoit, of Nurſia, who was born about the year 480. The *Benedictin* are thoſe properly called *monks*, monk; the other orders are better denominated *friers*, or *religieux*.

In the canon law, the *Benedictins* are called *Black Monks*, being diſtinguiſhed from the other orders by the colour of their habit: and not by the name of their patriarch, St. Benedict.—Among us they were formerly alſo denominated *Black Friers*.

The *Benedictins* wear a looſe black gown, with large wide ſleeves, and a capuche on their heads, ending in a point behind.

The liſt of ſaints of the *Benedictin* order is very ample; but they are acculed by Baronius, and many other writers, of putting many in the liſt who were never of the order.

For ſix hundred years after the erection of the *Benedictin* order, moſt of the European monks were followers of this rule: whatever other names they went by, Carthuſians, Ciſtercians, Grandimontenſes, Premonſtratenſes, Cluniacs, &c. they were but *different* branches of the *Benedictins*, till about the year 1220, when the Dominicans and Franciſcans took new rules.

Helyot in fact reckons no leſs than twenty-three religious orders that ſprang from this one.

According to the *Benedictin* computation, there have been of this order 24 popes, 200 cardinals, 7000 archbiſhops, 15,600 biſhops, 15,700 abbots, 4000 ſaints, 40,000 confeſſors, above 3000 martyrs and apoſtles, who have converted 30 provinces to the Chriſtian faith, beſides emperors, kings, &c.

The *Benedictins*, though but one order, are divided into ſeveral congregations, which have their peculiar cuſtoms and obſervances different from the reſt.

Each of theſe are ſubdivided into provinces, which have their general chapters. This order is ſaid to have been brought into England about the year 596.

The Engliſh congregation, which had ſubſiſted from the time of the miſſion of St. Auſtin, was deſtroyed under Henry VIII. and by degrees reduced to one ſingle man; father Buckley, who in 1607, procured a re eſtabliſhment of the congregation, at Doway, in the Netherlands, where it ſtill ſubſiſts in a kind of dependency on that of St. Valladolid in Spain.

At the general chapters they chuſe provincials, with their aſſiſtants, for each of the provinces of Canterbury and York, who have juriſdiction over the miſſionaries employed therein. They are governed by a preſident-general, and three DEFINITORS, choſen every three years.

At their admiſſion they make a fourth vow, viz. that they will go to the miſſion in England, and return when their ſuperiors think fit.

BENEDICTIN *nuns*, are religious women who embrace the rule of St. Benedict.

BENEDICTION, in a general ſenſe, the act of bleſſing, or giving praiſe to God, or returning thanks for his favours.

Hence alſo *benediction* is ſtill applied to the act of ſaying grace before or after meals.

Neither the ancient Jews, nor Chriſtians, ever eat without a ſhort prayer.

The Jews are obliged to rehearſe a hundred *benedictions* per day; of which, eighty are to be ſpoken in the morning. Vitring. de Synag. Vet. lib. iii.

Rabbi Nehemiah Boruch, in 1685, publiſhed a diſcourſe on the manner wherein the facerdotal *benediction* is to be pronounced. In the Synagogue of Ferrara, it is rather ſung than ſpoken.

The cuſtom of receiving *benediction*, by bowing the head before the biſhops, is very ancient, and was ſo univerſal, that emperors themſelves did not decline this mark of ſubmiſſion.

Under the name *benediction*, the Hebrews alſo frequently underſtand the preſents which friends make to one another, in all probability becauſe they are generally attended with bleſſings and compliments both from thoſe who give, and thoſe who receive them.

BENEDICTION, *nuptial*, the eccleſiaſtical ceremony performed by the prieſt in the office of matrimony.

The *nuptial benediction* is not eſſential to, but the confirmation of a marriage in the civil law.

BENEDICTION, *extra*, *benedictio beatæ*, is the *maximum* given to dying perſons.

The pope begins all his bulls with this *form*: *Salutem & apoſtolicam benedictionem.*

BENEDICTION, *regular*, that conferred by abbots on their monks, or by a ſenior monk on a junior.

BENEDICTION *privative*, to be deprived of benediction, was a kind of puniſhment inflicted on monks, whereby, when the reſt received the abbot's bleſſing, the offenders were diſmiſſed without it.

BENEDICTION is alſo uſed for an eccleſiaſtical ceremony, whereby a thing is conſecrated, ſacred, or conſecrable.

In this ſenſe *benediction* differs from conſecration, as in the latter unction is applied, which is not in the former. Thus the chalice is conſecrated, and the pix bleſſed, as the former, not the latter is anointed: though in the common uſage theſe two words are applied promiſcuouſly.

The ſpirit of piety, or rather of ſuperſtition, has introduced into the Romiſh church *benedictions* for almoſt every thing.—We read of forms of *benediction* for wax-candles, for bouches, for altars, for church-veſſels, and ornaments; for flags or enſigns, arms, firſt-fruits, houſes, ſhips, paſchal eggs, *alleluia*, or the hair-cloth of penitents, church-yards, &c.

BENEDICTION *of arms* was a ſort of public conſecration of the weapons, and enſigns, before the entering on a war, by a *formula* of words, and ceremonies appointed for that purpoſe.

BENEDICTIONALIS *liber*, an ancient church book, containing the forms of the divers ſorts of *benedictions* given by biſhops, prieſts, &c.

Such

Such was the *benedictionalis liber* of Gregory the Great, described by Lambecius.

BENEDICTUM, an epithet formerly given to lenient, or gently operating medicines; more especially rhubarb.

In this sense we find, in some dispensatory writers, *benedictum laxativum*, used for lenitive electary. Though in others, *benedicta laxativa*, or the *blessed laxatives*, denotes another easy purge, made up of turbith, *diagrydium*, spurges, hermodactyls, anile-seeds, fennel-seeds, *fal-gemma*, and honey.

Schroder also gives the appellation *aqua benedicta* to his emetic; and Mynsicht does the same to his *aqua serpylli*, or water of wild thyme.

Some have called the philosopher's stone *lapis benedictus*.

BENEDICTUM vinum. See VINUM.

BENEDICTUS, *carduus*. See THISTLE.

BENEDITTO *sacco*. See SAN BENITO.

BENEFICE, BENEFICIUM, in an ecclesiastical sense, a church endowed with a revenue for the performance of divine service; or the revenue itself, assigned to an ecclesiastical person for life, in return for his performing the service of the church.

All church preferments, except bishoprics, are called *benefices*; and all *benefices* are, by the canonists, sometimes called *dignities*: but we now ordinarily distinguish between *benefice* and *dignity*, by applying the word *dignity* to bishoprics, deaneries, archdeaconries, and prebends; and *benefice* to parsonages, vicarages, and donatives.

The term *benefice* comes to us from the old Romans who using to distribute part of the lands they had conquered on the frontiers of the empire to their soldiers; those who enjoyed such rewards, were called *beneficiarii*, and the lands themselves *benefices*, as being held on the pure beneficence and liberality of the sovereign. These *benefices* at first were given for life only; but afterwards they became hereditary and patrimonial.

From the Romans, both the name and the thing passed into France and England: with this difference, as Mr. Blount observes, that *benefices* were not given as mere gratuities for past services, but as warrants for future ones: and were accordingly held by the tenure of serving, on occasion, in the wars, &c. So that what was before a *benefice*, became now converted into a FEE, and SERVICE.

There is no obvious reference in the term *benefice* to the feudal system, which was incorporated in all the governments of Europe. As the lands of all private proprietors were holden of the prince, and because they were originally gratuitous donations, denominated *beneficia*, the pope assumed the privileges of a feudal lord, and claimed the authority of distributing the preferments of the church at pleasure; and hence the cure of the souls of a parish came to be called a *benefice*. Blackstone's Comm. vol. iv. p 106. ed. 1769.

Hence, doubtless, came the term *benefice* to be applied to church livings: for, beside that the ecclesiastics held for life like the soldiers, the riches of the church arose from the beneficence of princes.

As to the origin of ecclesiastical *benefices*, it is hard to determine when the revenues of the church were first divided: it is certain, till the fourth century, all the revenues were in the hands of the bishops, who distributed them by their œconomy; they consisted principally in alms, and voluntary contributions.—As the church came to have lands, parts thereof were assigned for the subsistence of the clerks, and called *benefices*; of which we find some traces in the fifth and sixth century: but then there does not appear to have been any certain partition, nor any precise quota allotted to each particular; but the allotments were absolutely discretional till about the twelfth century.

At first, each was contented with a single *benefice*, but pluralities were, by degrees, introduced, on pretence of equity: for, a single *benefice* being sometimes found enough for a competency, the priest was allowed two; as his quality, or occasions, increased, so the number of *benefices* that were to support him were increased too. Hence time, affording to equal priests in quality, pretend to revenues answerable to it.

The canonists distinguish three ways of vacating a *benefice*, viz. *de jure*, *de facto*, and *by the sentence of a judge*.—A *benefice* is vacated *de jure*, when the person enjoying it is guilty of certain crimes, expressed in laws, as hereſy, simony, &c.—A *benefice* is vacated *de facto*, as well as *de jure*, by the natural death, or the resignation of the incumbent; which resignation may be either express, or tacit; as when he engages in a state, &c. inconsistent with it; as among the Romanists, by marrying, entering a religious order, or the like.—A *benefice* becomes vacant by the *sentence of a judge*, by way of punishment for certain crimes, as concubinage, perjury, sorcery, &c. See DEGRADATION.

Benefices are divided by the canonists into *simple*, and *sacerdotal*: in the first, there is no obligation but to read prayers, sing, &c. Such are canonries, chaplainships, chantries, &c.—The second are charged with a cure of souls, or the direction and guidance of consciences. Such are the vicarages, rectories, &c.

The Romanists again, distinguish *benefices* into *regular* and *secular*.

Regular or *titular* BENEFICES, are those held by a religious, or a regular, who has made profession of some religious order. Such are abbeys, priories conventual, &c.

Or rather, *regular benefice* is that which cannot be conferred on any but a religious; either by its foundation, by the institution of some superior, or by prescription: for prescription, forty years possession by a religious, makes the benefice regular.

Secular BENEFICES, are those which are only to be given to secular priests, i. e. to such as live in the world, and are not engaged in any monastic order.

All *benefices* are reputed secular, till the contrary is made appear. They are called *secular benefices*, because held by seculars. Of which kind are almost all cures.

Some *benefices* regular in themselves, have been secularised by the pope's bull. See REGULAR and SECULAR.

A BENEFICE, *in commendam*, is that, the direction and management whereof, upon a vacancy, is given, or recommended to an ecclesiastic for a certain time, till it may be conveniently provided for. See COMMENDAM.

BENEFICE, *Consistorial*, in the *French Customs*, are those of royal foundation, which were elective before the concordat, and are now nominated by the king of France.

They are called *consistorial*, because, on the king's nomination, they are to be proposed in the papal consistory, that is, in the congregation of cardinals, where the pope presides.

To this class belong archbishoprics, bishoprics, and abbies. These *benefices* were formerly elective; but by the concordat, which abolished all elections, they are to be conferred by the pope, on the king's nomination. Annates are to be paid, and the pope's bulls obtained, for *consistorial benefices*.

BENEFICE, *Non-consistorial*, are either elective, or collative, or in patronage.

BENEFICE, *Elective*, are those which are to be filled or supplied in the way of election; only this election to be confirmed by the proper superior.

BENEFICE, *Collative*, are those in the free disposal of the collator, and which need no confirmation; provided the party have the qualifications required.

BENEFICE *in patronage*, are those which the collator is obliged to confer upon those presented by the patron.

BENEFICE *tenant in curia*, are those, whose incumbents or beneficiaries die *in curia*, that is, within ten leagues round Rome.

BENEFICE, *manual*, is that depending on an abbey, and served by a religious sent thither, who is removeable at pleasure by the superior.

We also meet with *manual benefices*, *beneficia manualia*, used for those, where the daily allowances of provisions were only distributed to the residents.

These are also denominated *victual benefices*, *beneficia victualia*.

Possession of a BENEFICE; see POSSESSION.

BENEFICIARII, in *Roman Antiquity*, denote soldiers who attended the chief officers of the army, being exempted from other duty.

Beneficiarii were also soldiers discharged from the military service or duty, and provided with *benefices* to subsist on.

These were probably the same with the former, and both might be comprised in the same definition. They were old, experienced soldiers, who having served out their legal time, or received a discharge, as a particular mark of honour were invited again to the service, where they were held in great esteem, exempted from all military drudgery, and appointed to guard the standard, &c.

These, when thus recalled to service, were also denominated *evocati*; and before their recall, *emeriti*.

BENEFICIARII was also used for those raised to a higher rank by the favour of the tribunes, or other magistrates. The word *beneficiarius* frequently occurs in the Roman inscriptions found in Britain, where *consulis* is always joined with it; but besides *beneficiarius consulis*, we find in Gruter *beneficiarius tribuni*, *prætorii*, *legati*, *præfecti*, *proconsulis*, &c.

BENEFICIARY, in a general sense, something that relates to BENEFICES.

Rebuffe has collected six volumes on *beneficiary* matters. F. Paul has also a treatise on them.

BENEFICIARY, *beneficiarius*, is more particularly used for a benefited person, or him who receives and enjoys one or more benefices.

BENEFICIARY is more particularly uſed, among *Roman Writers*, for a perſon exempt from public offices.

In which ſenſe, BENEFICIARII ſtand contradiſtinguiſhed from *munificati*.

BENEFICIARY is alſo uſed, in *Middle Age Writers*, for a feudatory or vaſſal.

BENEFICIARY is alſo uſed for a clerk or officer, who kept the account of the *beneficia*, and made the writings neceſſary thereto.

The ſame denomination was alſo given to the officers who collected the rents and duties belonging to the *fiſcus*.

BENEFICIO; ſee DEPRIVATION *à beneficio*.

Suſpenſio à BENEFICIO; ſee SUSPENSION.

Privatio BENEFICIO *eccleſiaſtico ſubtrahit*; ſee PRIMO.

BENEFIT is uſed for a privilege granted to ſome perſon, as of an immunity, or the like.

BENEFIT *of ceſſion*, in the *French Laws*, is when a debtor is admitted to ſurrender all his effects to his creditors, and in conſequence thereof ſet at liberty.

BENEFIT *of age*, in France, is when a minor obtains the king's letters, whereby he is emancipated, and impowered to manage his own income from eighteen years to his full majority.

BENEFIT *of clergy*; ſee CLERGY.

BENENAIM, BENENATH, BENENASCH, or BENENAT, in *Aſtronomy*, the outermoſt ſtar, of the ſecond magnitude, in the tail of the URSA *minor*.

This is ſometimes alſo called *alkaiſath*.

BENEVOLENCE, *Univerſal*, in *Ethics*, denotes a hearty deſire of the good of mankind, evidencing itſelf, as ability and opportunity offer, in the chearful and diligent practice of whatever may promote the well-being of all. Some have traced the origin of this affection in ſelf-love: others again in ſome INSTINCT or determination of our nature, antecedent to all reaſon from intereſt, which influences us to the love of others, and they have accordingly made it the foundation of univerſal VIRTUE: others more properly aſcribe it to the *intelligent* conſtitution of human nature, and obſerve, that it ariſes not from inſtinct, but from the natures and neceſſity of things. Hutcheſon's Inquiry concerning Moral Good and Evil. Price's Review, &c. chap. iii.

BENEVOLENCE is uſed, both in our ſtatutes and chronicles, for a voluntary gratuity given by the ſubjects to their ſovereign, to which each perſon contributes in proportion to his eſtate: and as *benevolences* had been extorted under many ſucceeding princes, without a real and voluntary conſent, it was made an article in the petition of right, 3 Car. I. that no man ſhall be compelled to yield any gift, loan, or *benevolence*, &c. without common conſent by act of parliament.

In this ſenſe, *benevolence* amounts to much the ſame with what in other nations is called *ſubſidium charitativum*, given ſometimes by tenants to their lords, by the clergy to their biſhops, &c.—In France it is called *free gift*, excepting that this latter is reſtrained to the act of the clergy.

Among us, there are ſeveral ſtatutes againſt charging he people with *benevolences*; ſee 1 Rich. III. c. 2. 13 Car. II. ſtat. 1. c. 4.

BENJAMIN, in *Pharmacy*, a *reſin*. See ASA *dulcis*, and BENZOIN.

BENJAMIN *tree*, in *Botany*, a ſpecies of the BAY.

BENISH *Days*, among the Egyptians, a term for three days of the week, which are days of leſs ceremony in religion than the other four, and have their name from the *beniſh*, a garment of common uſe, not of ceremony.

In Cairo, on Sundays, Tueſdays, and Thurſdays, they go to the hathaw's divan; and theſe are the general days of buſineſs. Fridays they ſtay at home, and go to their *moſques* at noon; but though this is their day of devotion, they never abſtain from buſineſs. The three other days of the week are the *beniſh* days, in which they throw off all buſineſs and ceremony, and go to their little ſummer-houſes in the country.

BENLOJA, in *Ichthyology*, the name by which the Swedes call that ſpecies of CYPRINUS, which we call the *bleak*. It is the ALBURNUS of authors.

BENNET *Herb*, in *Botany*; ſee HERB *Bennet*.

BENZOIN, a medicinal kind of reſin, imported from the iſlands Siam and Sumatra, and ſeveral other parts of the Eaſt Indies.

Benzoin is the ſame with what is popularly called *benjamin* or *benjoin*, ſometimes alſo ASA *dulcis*.

It is procured by a wound, or inciſion made in a tree, whoſe leaves reſemble thoſe of the lemon-tree, the *croton benzoe* of Linnæus. The *benzoin*-tree is plentiful in Virginia and Carolina, and has been brought from thence into England, where it grows with vigour in the open ground. The bark and leaves yield with rectified ſpirit a reſin like *benzoin*, though this tree diſcharges none naturally in our clime nor in America. It is of a yellowiſh colour, of an agreeable ſcent, and melts eaſily. There are three ſorts of *benzoin*. The firſt is called *amygdaloides*, becauſe of its being interſperſed with ſeveral white ſpots, which reſemble broken almonds: this comes from Siam, and is eſteemed the beſt. The ſecond is black, and very odoriferous; it drops from young trees, and comes from Sumatra; it is called *benzoinum de Boninas*. The third ſort is alſo black, but leſs odoriferous; this is found on the iſlands of Java and Sumatra. See Geoffroy, p. 354.

Benzoin is uſed in phyſic, as a pectoral, and anti-aſthmatic; and thrown on live coals, it ſerves to perfume houſes, &c.

Some recommend *benzoin* diſſolved in ſpirit of wine as a cephalic. It makes a tincture, commended for taking away freckles. It alſo enters the compoſition of ſome plaiſters, as a diſcutient and ſtrengthener.

Pharmaceutic writers ſpeak of a watry and tincture of *benzoin*, drawn with the ſpirit of wine, ſaid to be good againſt aſthmas, &c. Flowers of *benzoin*, procured by ſublimation, are eſteemed a powerful pectoral, and, ſnuffed up the noſe, are ſaid to be a powerful errhine. Spirit of *benzoin* is uſed as a diuretic; and oil of *benzoin* is accounted a good vulnerary.

If two or three pounds of *benzoin* be diſtilled dry in a retort, with a mixture of a little ſand, there will ariſe ſpirit, oil, and flowers. This ſpirit being ſeparated from the reſt by filtration, and mixed with *ſal ammoniac*, two parts of the ſpirit of *benzoin* to one part of the other, though both are ſeparately clear and colourleſs, the mixture will become red. Phil. Tranſ. N° 225.

The principal uſe of this fragrant reſin, is in perfumes, and as a coſmetic for ſuſtening and ſmoothing the ſkin. For this laſt purpoſe it is diſſolved in ſpirit of wine, with an addition ſometimes of ſtorax, and the ſolution mixed with water, makes a white liquor, which is called VIRGIN'S *milk*.

BER, in *Botany*, a name uſed by ſome authors for the Indian *jujube*; that ſpecies of the jujube-tree, on which the gum *lacca* of the ſhops is uſually found.

BERBENGINE, a name given by the *Arabian Phyſicians* to the *pomum amoris*, or *love-apple*, a kind of eſculent nightſhade; and by ſome to a tree producing the nut *mateï*, becauſe of its likeneſs to the plant which produces the *anthongena* in the ſhape of its leaves.

BERBERII, in *Medicine*; ſee PALSY.

BERBERIS; ſee BARBERRY-*tree*.

BERCARIA, BERQUERIA, or BERKERIA, in *Middle Age Writers*, denotes a ſheep-fold, ſheep-cote, ſheep-pen, or other incloſure, for the ſafe-keeping of a flock of ſheep. The word is abbreviated from *berbicaria*; of *berbex*, detorted from *vervex*. Hence alſo a ſhepherd was denominated *berbicarius*, and *berquarius*.

BERCHEROIT, or BERCKOVS, a weight uſed at Archangel, and in all the Ruſſian dominions. It is equal to about 364 pounds Engliſh avoirdupois.

BERDASH, in *Antiquity*, was a name formerly uſed in England for a certain kind of neck-dreſs; and hence a perſon who made or ſold ſuch neck-cloths was called a *berdaſſher*, from which is derived our word HABERDASHER.

BERDIN, in *Natural Hiſtory*, a name given the PATELLA, or limpet, in Normandy, and other places. In ſome it is pronounced *berſin*.

BERENGARIANS, a religious ſect, adhering to the opinions of Berengarius, archdeacon of Anjou, who, in the latter part of the eleventh century, a conſiderable time before Luther, oppoſed the doctrine of tranſubſtantiation, and the real preſence, ſtrenuouſly maintained by Lanfranc and Anſelm.

He is further charged by the Romaniſts with decrying marriage, and maintaining the common uſe of all ſorts of women, and aſſerting infant-baptiſm of no effect.

His followers were divided on the head of the euchariſt: though they all agreed, that the bread and wine were not eſſentially changed, yet ſome allowed, that the body and blood of Chriſt were contained in them, though concealed under an impanation, which was the opinion of Berengarius himſelf: others denied any change at all, and reſolved the whole into figure; others again allowed a change in part; and others an entire change with this reſtriction, that to thoſe who preſented themſelves unworthily it was changed back again. See Moſheim's Eccl. Hiſt. vol. ii. p. 328, &c.

Mabillon has a diſſertation expreſs on the manifold condemnations of Berengarius, his retractions, relapſes, and repentance.

BERENICE'S *Hair*; ſee COMA *Berenices*.

BEREWICHA, or BEREWICA, in our *Old Writers*, denotes a village or hamlet belonging to ſome town or manor, ſituate at a diſtance therefrom.

The word frequently occurs in Doomſday-book: *Iſta ſunt* berewichæ *ejuſdem manerii*.

BERVISCH, in *Ichthyology*, a name given by the Germans to the common PEARCH, or *perca*.

BERYL, *prasius*, in *Natural History*, the name of an earth used in painting, and properly called *green ochre*, though not known among the colour men under that name. It is found in many parts of Germany, Italy, and England, commonly in the neighbourhood of copper-mines, from particles of which metal it receives its colour. The characters by which the native kind is known from other green earths, are these: it is a dense, compact substance, considerably heavy, and of a pale, but not disagreeable green; of a rough and uneven, but not dusty surface, and somewhat unctuous to the touch. It adheres firmly to the tongue: does not break easily between the fingers; nor at all stain the hands. It is of a brackish disagreeable taste, and does not ferment with acids.

BERGAMOT gives the denomination to a kind of essence, drawn from a fruit, produced by ingrafting the lemon-tree on the *bergamot* pear-stock. It is properly the oily fluid of the peels of these lemons, expressed by the fingers.

There is likewise a kind of snuff of the same name, which is only clean tobacco, with a little of the essence rubbed into it.

BERGAMOT is also the denomination of a coarse tapestry, manufactured with flocks of silk, wool, cotton, hemp, ox, cow, or goat's hair, and supposed to be invented by the people of Bergamo in Italy.

BERGANDER, in *Ornithology*, a name by which some have called the Shield-drake, or Burrough-duck, a very beautiful species of duck, common in the coasts of Lancashire; but not much esteemed for eating, called TADORNA.

BERGHMOT, or BERGHMOOTE, vulgarly BARMOTE, a court held on a hill for deciding pleas and controversies among the Derbyshire miners.

The word is formed from the SAXON *berg*, *mont*; and *mote*, *conventus*, *assembly*, or *meeting*.

BERIBERI, the name of a disease among the Indians, being a species of PALSY.

BERICARIA, BERCARIA, or BERQUARIA, a sheep-down, or ground whereon to feed sheep.

BERITH, a simple mentioned in Scripture, used for cleansing or taking out spots. Jerem. chap. ii. ver. 22. Some will have it to be the *kali*, or *salt-wort*, from the ashes of which soap is made; and in our version it is rendered *soap*: others, after Rudbeck, make it to be the dye of the purple fish.

BERLIN, a sort of vehicle, of the chariot kind; taking its name from the city of Berlin, in Germany: though some attribute the invention of it to the Italians, and derive the word from *berlina*, a name given by them to a sort of stage, whereon persons are exposed to public shame.

The *berlin* is a very convenient machine to travel in, being lighter, and less apt to be overturned, than a chariot. The body of it is hung high, on straps, by leathern braces; there being a kind of stirrup, or footstool, for the convenience of getting into it: instead of side windows, some have screens to let down in bad weather, and draw up in good weather.

BERLIN, in *Natural History*; see LIMPET.

BERLUCCIO, in *Ornithology*, the name of a small bird of the *bernicula* kind, and much resembling the *yellow-hammer*; but something smaller, and longer bodied.

BERME, in *Fortification*, a small space of ground, four or five feet wide, left without the rampart, between its foot and the side of the moat, to receive the earth that rolls down from the rampart, and prevent its falling into, and filling up the moat.

This is also called *liziere*, *relais*, *retraite*, *pas de souris*, *fore-land*, &c.

Sometimes for greater security, the *berme* is palisadoed.

BERMUDIANA, in *Botany*; see SISYRINCHIUM.

BERNACLE, in *Ornithology*; see BARNACLE.

BERNARD *the hermit*, in *Ichthyology*; see SOLDIER.

BERNARDINS, or BERNARDITES, the name of a religious order, differing very little from the CISTERCIANS. Their usual habit is a white gown, with a black scapulary; but when they officiate, they put on a large white cowl with great sleeves, and a hood of the same colour.

BERNHARDIA, in *Botany*, a name given by Houstoun to a genus of plants, characterised by Linnæus under the name of CROTON.

BERNICLE, in *Natural History*, the name of a species of shell-fish, called by authors CONCHA *anatifera*.

This is composed of five shells or valves, and agrees, according to Lister, with the *pholas*, as well in the disposition as in the number of the valves. Lift. Hift. Nat. p. 560.

BERNICLE is also a name given by the people of many parts of France to the *percebe*, or LIMPET.

BEROE, in *Natural History*, is a marine animal found on the coasts of a gelatinous transparent nature, and of an oval or spherical form, about half an inch to an inch diameter, striated like a melon into longitudinal ribs, each of which is furnished with rows of minute fins, by means of which this animal, like the *animalcula infusoria*, can swim in all directions with great swiftness. The excellent Linnæus, says Mr. Ellis (who gives the above mentioned description of this animal), have joined the *beroe* to the *volvox*, one of the *animalcula infusoria*.

BERRY, *bacca*, a grain, fruit, or seed, produced by several herbs, trees, and shrubs, thence called BACCIFEROUS, for the conservation, and reproduction of their kind.

Some define *berries* as a fruit smaller than apples, growing in bunches, but not so thick or close as grapes. Others a soft, fleshy, succulent fruit, having stones or kernels within them.

Such are the fruits of laurels, olives, currants, and the like.

Berries are of various sizes, forms, properties, and uses, according to the plants wherein they grow.—Some are used in medicine, as juniper *berries*, buckthorn *berries*, &c.—Others in dying, as French or yellow *berries*, &c.

The yellow *berry* wash may be thus prepared: take a pound of the French *berries*, and put them to a gallon of water, with half an ounce of alum; boil them an hour in a pewter vessel, and filter off the fluid: put them again into the boiler, and evaporate the fluid till the colour appear of the required strength.

BERRY likewise denotes a pulpy *parisarpium*, without valves, in which the seeds are naked.

BERRY, *Avignon*; see AVIGNON.

BERRY, *Ale*; see ALE.

BERS, in *Ancient Medicine*, an electuary used by the Egyptians to excite deliriums.

BERSARII, in *Writers of the Middle Age*, a kind of hunters or sportsmen, who pursued wild beasts in forests and chases.

The word seems derived from the barbarous Latin *berfare*, *to shoot with a bow*. On which principle, it should properly denote archers only, or bowmen. Or it might be derived from *berfa*, the *fence* or *pales of a park*. In which view, it should primarily import those who hunt or poach in parks or forests.

Hincmar speaks of a kind of inferior officers in the court of Charlemagne, under the denomination of *berjarii*, *bestiarii*, and *bearnarii*. Spelman takes the first to denote those who hunted the wolf; the second, those who had the superintendency of the hounds for that use; and the third, those who hunted the beaver.

BERSE, in *Botany*, the name given by the French writers to the *sphondylium*, or COW-PARSNEP, a species of umbelliferous plants common in our meadows, and known by its large rough leaves and remarkable height.

BERTH, in the *Sea-language*, denotes a convenient distance or room to moor a ship in.

To take a good BERTH, signifies to go some distance to sea-board off any point, rock, or other thing which the seamen would go clear of.

BERTHING, in the *Sea-language*, denotes the raising or bringing up of ship-sides. Thus they say, a clincher hath her sides *berthed* up before any beam is put into her.

BERTONA, BERTORIA, BERTHONA, BERTOR, or BARTON, properly denotes that part of a country farm where the barns and other inferior offices stand, and wherein the cattle are fostered, and other business is managed.

BERTON is also used to signify a farm, as distinct from a manor. Du Cange.

In some parts of the West of England, they call a great farm a *berton*; and a small one a *tenure*.

Hence also *bertonarii* was anciently used for those we now call farmers, or tenants of *bertons*.

BERULA, in *Botany*, a name given by some authors to the common upright water-parsnep, or *sium erectum* nobilatum. See SKIRRET.

BERUS, a species of the COLUBER.

BERY, BERIA, or BERIE, in *Middle Age Writers*, denote a fair, wide champaign.

In which sense, the word differs from *bury* or *borough*, *a town*, though usually confounded with it by glossographers. Hence *Berie S. Edmundi*, mentioned by Matt. Paris under the year 1274, is not to be understood of the town, but of the adjoining plain.—And hence the denomination *berry-field*, and *berry-meadow*, is still retained in divers flat and wide meads, and open grounds. Hence also *berra effaturire* is to dry or plow up heaths or downs. And hence our warrens are called *conyberies*.

Bery is either used separately, or in composition with the names of divers places; as *Minsbery*, *shewsbery*, &c.

BERYL, or BERYLL, *beryllus*, in the *Ancient Physiology*, denotes a transparent stone, or gem, brought from India,

of a light, or pale green colour; insomuch that some have represented it as it were two colours, the one green, the other pale.

The *beryl* of the ancients is the same with what in later times has been denominated AQUA *marina*, by reason of its glassiness, or sea-green colour.

The *beryl* differs from the *chrysoberyll*, which is somewhat paler, and partakes more of the yellow: and from the *chrysoprasus*, which partakes more of the green.

Some authors take the *beryl* to be the diamond of the ancients.

The *beryl* is sometimes found in pieces large enough to form fine vases. It is said there are many of these in Cambaya, Mazandran, Pegu, and Ceylon.

The *beryl*, in its finest kind, approaches to the hardness of the garnet; but it is often much softer, and consequently of the less value. There is, however, a common error which gives our jewellers an idea of this and other of our gems, being much softer than they really are, which is, the mistaking of the common tinged crystals frequent in mines and called by authors *pseudoberylli*, &c. for the genuine gems of those names. It is easy to conceive these cannot be any harder, and it is natural enough to suspect they cannot be so hard as crystal in its common colourless state.

The *beryl* parts with its colour in a very small fire; but in, when coloured, greatly inferior to the amethyst or sapphire. It is found in great abundance in the island of Ceylon, and in many other parts of the East Indies, as also in America; many of these are found also in Bohemia, and some other parts of Europe, but in this, as in all other gems, the oriental are vastly superior to those of any other part of the world in hardness, as well as in lustre, and the beauty of their colour.

Guarinus gives a list of eight sorts of *beryls*, distinguished only by the diversity of their colours.

Mr. Boyle who speaks of a white kind *of beryl*.

BERYL I. also a name given by foreign or our jewellers to a species of brown long crystal, with a remarkably long pyramid.

This is the brightest of all the brown crystals, and is essentially different from the species commonly known by that name. It is found in Italy, and some parts of Germany. The Italians call it, by way of eminence, *the beryl crystal*; but our jewellers drop the word crystal, and call it simply the *beryl*. Hence any tolerably clear brown crystal was some time ago cut, to supply its place; and good brown crystal was generally accounted the *beryl* of the ancients.

BERYL, *beryllus*, is also a name given to a kind of crystal looking glass, superstitiously consecrated to the purposes of conjuring and divination.

Hence also the term *beryllistica*, used for the mysterious art of seeing future or distant events in such glasses.

BERYTTUM, in the *Ancient Physic*, an opthalmic medicine or collyrium, invented by Berytus against the severest ophthoras.

The same denomination is also given to a sort of pastil, of use in dysenteries.

BES, or BESSIS, an ancient Roman weight, containing two thirds of the *as*; that is, eight *uncia*.

The *as* originally weighed two *asses*; whence the origin of the word *assis binis as*. Though Scaliger conjectures it to have been formed from *duo*; as *bidum* from *biduum*, or *binum* from *binarium*.

BES was also used in the mensuration of lands, to denote two thirds of a *jugerum*, or acre.

BESAILE, in the *Common Law*, a writ that lies where the great-grandfather or great-grandmother was seised of the day that he or she died of any lands or tenements in fee-simple; and after his or her death, a stranger entered the same upon him, and keeps out the heir.

The word is French, *besaïle*, *or bisayeul*, a *great-grandfather*.

BESANT, or BEZANT, BYZANT, or BYZANT, a sort of coin, struck at Byzantium, in the time of the Christian emperors.

The *besant* was pure gold, or twenty-four carats fine; but writers are not generally agreed with respect to its value.

Hence also the gold offered by the king at the altar, on festivals, is still called *besant*, or *besant*.

Thirteen *besants*, or *bizantines*, are presented at the mass at the coronation of the kings of France. Henry II. had that number coined on purpose.

BESANTS, or BEZANTS, in *Heraldry*, are representations of round, flat pieces of money or bullion, without stamp or impress, introduced into coat-armour by those who went at the holy war.

Besants are ever of metal, and when blazoned, should be expressly said to be of *or*, or *argent*. The English heraldry knows only the gold; but foreigners have also the silver kind.

When a field or charge contains above eight *besants*, so placed as to fill the same equally on all sides, and representing a promiscuous strewing of pieces over the whole, some blazon the field or charge *besanté*, *bezanté*; but if there be ten, twelve, fifteen, or more, ranged in any particular form or position, the number and form must be particularly mentioned. Chart's Dict. Herald.

Cross BESANTED, *bezanté*, denotes a cross made up of *besants*, or pieces of money.

This answers to the same with what Upton calls a *cross bezanted*, *cross talentata*, or made up of talents.

BESENE, in the *Materia Medica*, a name given by the Arabian writers to Scorpion and Arisæma to mean; but as the names *besena* and *mour* are very much alike in sound, though different in sense, they have confounded these two things under the same term *besena*; the one denoting the covering of the nutmeg, and the other the bark of a tree used as an ingredient; so that this word *besena* is to be understood as meaning the one or the other of these according to the various circumstances.

BESD, a term often used by Arabian writers for the plant called MARUBIUM.

BESLERIA, in *Botany*, the name given by Plumier, but afterwards by Linnæus, in honour of the *botanical writer* of Nuremberg of that name.

This is a genus of plants the characters of which are these: the flower is of the lip kind, and of one leaf: it has four *stamina* in the tube of the flower, two of which are longer than the other; with an oval *germen*, which afterward becomes an oval berry, with one cell filled with small seeds. There are three species which grow naturally in the warm parts of America, but are too tender to live in this country, without artificial heat.

BESORCH, a term of art, or of some alloyed metal, current at Ormus, at the rate of about $\frac{7}{8}$ parts of a sterling sterling.

BESSIS *centesimæ*, denotes two thirds of centesimal interest, or usury at eight *per cent.*

BESTAIL, or BESTIAL, in *Ancient Statutes*, is used for CATTLE. 5 Ed. III. c. 2.

BESTARCHA, a dignity in the courts of the emperors of Constantinople, supposed to answer to that of the *master of the ceremonies* among us.

The word *bestarcha* seems to have been formed from *vestarcha*, by a change of the *v* into *b*.

BESTIARII, among the *Ancient Romans*, those who were hired to combat with beasts, or those who were exposed to them, by sentence of law.

We usually distinguish two kinds of *bestiarii*; the first were those condemned to the beasts either as being enemies, traitors, prisoners, or as being thieves, and guilty of some enormous crime—These were all exposed naked, and without defence, to the beasts; nor did it ought avail to conquer and kill the beast, fresh ones being continually let loose on them, till they were dead. But it seldom happened, that two were required for the same man; on the contrary, one beast frequently dispatched several men. Cicero mentions a lion, which alone dispatched two hundred *bestiarii*.—Those who succeeded the first were called *postulati*, and the last *postulatitii* among the Romans, *novitiani*.

The Christians were *bestiarii* of this kind; even some of them who were Roman citizens; though it was the legal right of such to be exempt from it.

The second kind of *bestiarii*, Seneca observes, consisted of young men, who, to become expert in managing their arms, fought sometimes against beasts, and sometimes against one another; and of heavies, who, to show their courage and dexterity, exposed themselves to this dangerous combat. Augustus encouraged this practice in young men of the first rank; Nero exposed himself to it; and it was for the killing beasts in the amphitheatre, that Commodus acquired the title of the *Roman Hercules*.

Vigenere to these adds two kinds of *bestiarii* more: the first were those who made a trade of it, and fought for money; the second was where several *bestiarii*, armed, were let loose at once, against a number of beasts.

BETA, in *Botany*, the BEET.

BETEL, in *Botany*, an Indian plant, in great use and esteem throughout the East, where it makes a considerable article of commerce.

The *betel* bears some resemblance to the pepper-tree. Its leaves are like those of ivy, only softer, and full of red juice, which, among the Orientals, is reputed of wonderful virtue for fortifying the teeth, and rendering the breath sweet. The Indians are continually chewing these leaves, which renders their lips so red, and teeth black, a colour by them vastly preferred to the whiteness affected by the Europeans.

The consumption of *betel* leaves is incredible, no body, rich or poor, being without their box of *betel*, which they present to each other by way of civility, as we do snuff. In many places they chew the areca nut, either alone or mixt with the *betel* leaf and lime, and the leaves of this plant

plant are sometimes chawed alone; but they are too sharp, and usually injure the teeth, and it is not uncommon to find men of twenty-five wholly toothless in the part of the world, merely from their having chewed this plant to an excessive degree. The prepared *betel* is a very common present among the poorer sort; and, on taking leave of a friend, it is always the custom to make him a present of a parcel of the leaves prepared for use. When the head or feet are to appear before the rich, they always chew a large quantity of *betel*, to give them a sweet breath; and the women, on certain occasions, never fail to take largely of it as a provocative. On all visits, the company is regaled with prepared *betel*. The principal time of using it is after dinner, at which time they lay it presents to rests at the monarch; and they never abstain from it, except on the solemn occasions of the funerals of their relations, and their days of fasting. Moderately used, it strengthens the gums, corroborates the heart and stomach, dissipates flatulencies, and purges both the stomach and brain. If chewed after breakfast, it makes the breath sweet for the whole day. The Portuguese women are as fond of the *betel* as the Indians themselves, and cannot live a day without it.

BETELGEUSE, or BEDELGAZE, a fine star of the first magnitude in Orion's right-shoulder.

BETH, in *Literary History*, makes the title of a multitude of books in the Hebrew language; e. gr. *beth auth*, or *the house of the fathers*; *beth Elohim*, or *the house of God*; *beth Israel*, or *the house of Israel*, &c.

BETHLEHEM *star*, in *Botany*, the STAR *of Bethlehem*.

BETHLEHEMITES, or BETHLEMITES, in *Church History*, a sect of monks introduced into England in the year 1257, habited like the Dominicans, except that, on their breast, they wore a star with five rays, in memory of the star or comet which appeared over Bethlehem at the nativity of our Saviour. They were called at Cambridge, and had only one house in England.

There is also an order of *Bethlehemites* still subsisting in Peru, who have convents at Lima; one called of the Incurables, the other of our Lady of mount Carmel.

These *Bethlehemites* came originally from the city of Guatimala in Mexico, where they were instituted by the venerable Peter Joseph of Betancur, for the service of the poor. Innocent XI. in 1687, approved the institution. They have already nine convents in Peru.

The *Bethlehemites*, though outwardly of great simplicity, pass for the most refined politicians; insomuch as to be called the quintessence of the Carmelites and Jesuits. They are all friars. For their almoner they choose a secular priest, whom they hire, and who has no vote in the chapter.

BETON, a name given by the French engineers to a kind of mortar, which they use in rolling the foundations of masonry under water. It consists of twelve parts of pozzolana, or Dutch terrafs, six of good sand, nine of unslaked lime, thirteen of stone splinters about the size of an egg, and three of the dust, or cinders, or scales of iron out of a forge; this being well worked together, is left to stand for about twenty-four hours, or till it becomes so hard as not to be separated without a pick ax.

BETONY, BETONICA, in *Botany*, a genus of plants, of the *didynamia gymnospermia* class; the characters of which are these: the flower is of one leaf, of the lip kind, with a cylindrical incurved tube: the upper lip is roundish, plain, erect, and entire; the lower lip is cut into three parts. It hath four *stamina*, two long, and two shorter, which incline to the upper lip. The *pericarpium* is quadripartite, which afterward becomes four naked oval seeds, lodged in the cup-compliment. Linnæus enumerates four and Miller seven species.

The officinal *betony* has been celebrated for abundance of medicinal virtues, but does not promise to have any considerable activity. Its principal use is in herb drafts, and as a substitute for tea. Its root, like the root of hellebore, operates both upwards and downwards.

Betony is esteemed a good cephalic, vulnerary, cardiac, diuretic, and aperient. Some also make *betony* a good splenetic, hepatic, thoracic, uterine, &c.

The Italians, when they would praise any body, say, *tu hai più in testa che non ha betonica*; that is, *you have more virtues than betony*: and proverbially desire, *vende la camisa per comprar la betonica*; that is, *sell your coat and buy betony*. Ant. Musa, physician of the emperor Augustus, wrote a treatise expressly, *De Betonica*, still extant; wherein he commends it greatly as a vulnerary, especially in wounds of the head, and enumerates its uses in the cure of no less than forty-seven diseases.

Betony is chiefly administered in the way of decoction, sometimes of tisane, sometimes as an ingredient of a cerat or plaster, hence called *emplastrum de betonica*. Some also give its juice, boiled to the consistence of honey, mixt with a little balsam of Peru, as a pectoral healer.

Foreign dispensaries also give the preparations of a *betony* water, a syrup, conserve, and extract of *betony*.

BETONY, *Water*, in *Botany*, the *Scrophularia*.

BETONICE *Pauli*, in *Botany*, a name given by many to some of the species of the *veronica*, or SPEEDWELL.

BETROTHMENT, a mutual promise or compact between two parties for a future marriage.

The word imports as much as giving one's troth; that is, your faith, or word.

Betrothment amounts to the same with what is called by civilians and canonists *sponsalia*, or *espousals*; sometimes *stipulationes*, and by the French *fiançailles*.

Betrothment is either solemn, made in the face of the church, or private, made before witnesses out of the church. *To betroth by giving earnest*, or earnest, is called by *Middle Age writers*, *subarrare*.

The nuns of the *Annunciade* hold an annual feast, in honour of the betrothment, or espousal of the Virgin Mary to Joseph.

BETULA, in *Botany*, the BIRCH.

BEVEL, in *Masonry*, and among *Joiners*, a kind of square, one leg whereof is frequently straight, and the other crooked, according to the sweep of an arch, or vault; being withal moveable, on a point, or center, so that it may be set to any angle.

The make and use of the *bevel* are pretty much the same as those of the common square and miter, except that these latter are fixed; the first at an angle of ninety degrees, and the second at forty-five; whereas the *bevel*, being moveable, may, in some measure, supply the office of both, and yet, which is to chiefly intended for, supply the deficiencies of both, serving to fix off, or transfer angles, either greater or less than ninety, or forty-five degrees.

Bricklayers have also a *bevel*, by which they cut the under sides of the bricks for arches straight or circular, to such oblique angles, as the arches require, and also for other uses.

BEVEL, *Graduated*, is that which has about the centre of one of its arms a semicircle graven, and divided into 180 degrees, whose diameter stands square with the other end of the same arm; so that the end of the other arm, being divided at right angles, almost to the centre, shews by its motion the number of degrees contained in the angle to be measured.

This is also called *sexagenary*, and *semicentry*.

BEVEL *angle* is used among the workmen, to denote any other angle beside those of ninety or forty-five degrees.

BEVELLING, in *Ship-building*, the act of hewing timber with a proper and regular curve, according to a mould which is laid on one side of the surface.

BEVERAGE, in a general sense, signifies a drink. Hence nectar is said to be the *beverage* of the Gods. In *Writers of the Middle Ages*, *beverage*, *bevenagium*, or *bevragium*, denotes money given to an artificer, or other person, to drink over and above his hire or wages. Du-Cange.

BEVILL, in *Heraldry*, denotes a thing broken, as appearing like a carpenter's rule.—Thus he beareth argent a chief *bevill* vert, by the name of *Bevill*. Vide *Leg. Herald. Eg.* 8.

BEWTIS, in *Falconry*, denote pieces of leather to which a hawk's bells are fastened, and buttoned to his legs.

BEXDQUILLO, in the *Materia Medica*, a name given to the white *Ipecacuanha*, which the Spaniards bring from Peru, as the Portuguese do the known from Brasil.

BEY, or BEG, denotes a governor of a country, or town, in the Turkish empire.

The Turks write the word *begh*, or *Ith*, but they pronounce it *bey*: properly it signifies *lord*, but is particularly applied to a *lord of a banner*, whose in the same language they call *sanjakbeg*, or *beg sanjaki*, which among them signifies *banner*, or *standard*, being the badge of him who commands in an inferior place of some province, having under him a considerable number of spahis, or horse.

Each province in Turky is divided into seven of these *sanjaks*, or banners, each of which qualifies a *bey*; and these are all commanded by the governor of the province, whom they also call *beghlar-begh*, or *beglar-bey*, i. e. *Lord of the lords or bey of the province*.

These *beys* are, in a great measure, the same that *baronets* formerly were in England.

BEY, of Tunis, denotes a *prince*, or *king* thereof: answering to what at Algiers is called the *dey*.

In the kingdom of Algiers, each province is governed by a *bey*, or vice-roy; who is appointed and removed at pleasure by the dey; but has a despotic power within his jurisdiction; and at the season for collecting the tribute from the Arabs, is attended by a body of troops from Algiers.

BEZANT, see BESANT.

BEZANTLER, among *Sportsmen*, that branch of a deer's horn next below the brow antler.

BEZOAR, or BEZOARD, primarily denotes an antidote, or counter-poison.

The word is formed from the Persian *pa-zahar*, which denotes the same; *pa* signifying *against*; and *zahar*, *poison*.

In this sense the name is applied to divers chemical compositions of that intention; as the *mineral*, *solar*, and *perpetual bezoards*.

Some have also given the appellation *animal bezoard*, to a powder, made of the heart and lives of *vipers*, pulverized together.

BEZOAR, or BEZOARD, in a more proper sense, denotes a medicinal stone, brought from the East or West Indies, composed of several coats, or *lamina*, laid one over another, like an onion, generated in the stomach of an animal of the goat kind, and esteemed a powerful antidote and cardiac. See ÆGAGROPILUS.

This is sometimes also called the *true bezoar*, and is of two kinds, *oriental* and *occidental*.

BEZOAR, *Oriental*, is in the most esteem, and is brought from several parts of the East Indies, chiefly Golconda and Cananor: it is there found mingled with the dung of an animal of the goat kind, called *pasan*; in the belly whereof this stone is found.

These is generally, if not always, some foreign body in the centre of the *bezoar*, around which, as a *nucleus*, the bezoartic coats, or *strata*, are ranged; as straws, hair, matcasses, pebbles, talc, sand, &c. and stones like cherry-stones; but the common *nucleus* is the pod of a fruit much like that of the ACACIA *vera Ægyptiaca*; though at first sight it resembles a *cassia*, or tamarind-stone. This fruit being taken into the stomach, causes, by its astringency, a condensation of the liquors it there meets with, from which in time arises the *bezoar*. Phil. Trans. N° 282. p. 1284.

In some of the stones also found on this *nucleus*, the outer membrane of the bean having perished, and the bean thereby in drying, there remains a swelling between it, and the next coat of the *bezoar*; so that it rattles within, when shaken, in the manner of an *addle*.

The formation of the *bezoar* seems to be this, that the undigested matter, be it what it will, remaining in the stomach of the animal, irritates the glands, and makes them discharge their contents, which, mixing with the juices of the stomach, impregnated with the virtues of the aromatic plant on which the animal feeds; these may together collect, and harden by degrees about this substance. In fine, their coats surrounding one another; the consequence of which must be, that the whole *bezoar* must be of the shape of the accidental matter, on which it was formed. If it be a straw, the *bezoar* will be long; if a small pebble, the *bezoar* will exactly be of its shape, however irregular that be; and, if a kidney bean, there will be seen on the *bezoar* the several lineaments of that fruit. Mem. Acad. Paris 1711.

The stones produced by each animal may be felt and numbered on the outside, by which in trade the price of the animal is regulated.

Bezoar ordinarily grows to the bigness of an acorn, sometimes to that of a pigeon's egg: it is composed of several thining skins, or coats, like an onion, sometimes of a blood colour, sometimes a greenish yellow, a brownish red, and honey colour.—The number of *bezoars* produced by each animal is various, some yielding one, two, &c. to six, and others none at all.

The larger the stone, the more valuable it is held; its price increasing like that of the diamond.—A stone of one ounce is sold in the Indies for 100 livres, and one of four ounces and a quarter for 2000 livres.

The genuine *bezoar* stones are so scarce even in the *Indies*, that few, if any of them, are brought into Europe. The greater number are no other than artificial compounds made there. These, which are supposed to be genuine, Mr. Neumann observes, are compounded of plaister of Paris, chalk, or other earths, impregnated with a vegetable green tincture: those which are acknowledged to be counterfeit, are formed chiefly of resinous substances, and are distinguishable by their liquefying in the fire, and dissolving in spirit of wine. He never could discover in either of these any mark of an animal nature. Chemical Works, by Dr. Lewis, p. 533, &c.

Oriental *bezoar* must be chosen glossy, of a smell like that of ambergrise, smooth to the touch, and in large pieces; its figure is indifferent, its colour usually olive.

Bezoar is easily sophisticated; but the deceit is as easily discovered. The methods of proving it are, 1st. To steep it three or four hours in luke-warm water; if the water be not tinged, nor the *bezoar* lose of its weight, it is pure. 2dly. To try it with a sharp, red-hot iron; if it enters the stone, and the heat makes it fey and shrivel, it is factitious. 3dly. To rub it over a paper smeared with chalk, or quick-lime; if it leave a yellow teint on the former, or a green one on the latter, it is good.

We are, however, told of *artificial bezoars* in the *isle of Crimea*, made so dexterously, as not to be discernible from the *natural*, unless they be first broken. *Bezoar* is said to be adulterated among us with powders, soaps, and mucilage. Le Mort describes a factitious *bezoar*, resembling the native one, and shows how it may be prepared, from the magistery of alexipharmic herbs.

The true oriental *bezoars*, were, about eighty years ago, by common in Cananor, that those of the bigness of a pigeon's egg were frequently brought to market at six or seven rials a piece, and those of the bigness of a hen's egg at twelve rials. The method of trying the genuineness of the *bezoar* by water, was first brought into use in that place.

Bezoar is given in vertigoes, epilepsies, palpitations of the heart, jaundice, colic, and to many other diseases, that were its real virtues answerable to its reputed ones, it were doubtless a *panacea*. Indeed, its rarity, and the peculiar manner of its formation, have contributed as much to its reputation, as any intrinsic worth. At present it begins to be prized less, and a great many able physicians regard it, as of no use or efficacy at all.

BEZOAR, *Occidental*, is heavier, more brittle, of a dirtier green colour, as also less glossy, and generally held much inferior in virtue to the oriental kind.—It is said to be found in the belly of several animals, especially in Peru; as the *guanaco*, *sasbee*, *vicunna*, and *taruguna*; the *bezoar* of which last is the most esteemed, this animal being much like the goat that produces the oriental. But that of the first is more common, viz. the *guanaco*, a creature about the size of a horse, by some described as a species between a camel and a wild goat.

In some, this stone is of the bigness of a nut, in others of a pullet's egg: in some it is oval, in others flat, in others round; it is usually of an ash colour, sometimes dusky; and formed of scales, like the oriental, but much thicker; it is smooth and even without-side, but when broken, looks as if it had been sublimated, by reason of the little shining needles wherein it appears to be compoled.

This kind of *bezoar*, *Mr. Neumann* apprehends, is more likely to be an animal production than the former, as it yields in distillation some small portion of volatile urinous matter. Chem. Works, p. 537.

BEZOAR, in a more extensive sense, includes all animal substances formed *circum fuper stratum*, in the stomachs or intestines of animals. Gentil. in Mem. Acad. Scienc. 1712. p. 268.

In which sense, pearls, the stones found in *oesterens*, &c. belong to the class of *bezoars*. Fontan. Hist. Acad. Scienc. 1717. p. 32.

Human *bezoars* are stony substances found in the intestines of several persons, formed from the stones of plums, or other fruits, retained in the *cecum*, or other guts, and growing coated over; of which we have an instance given by Dr. Cole, Philos. Transact. N° 235. p. 30.

To this kind also belong the *lapis lithius*, or *bezoar equinum*, a sort of stone sometimes voided by these creatures by siege. Ibid. N° 250. p. 99.

BEZOAR, *German*, which some call *ecua's egg*, is said to be found in the stomach of some cows, but more frequently in that of the *chamois*, a sort of *rupicapra*, or wild goat.

These *bezoars* are supposed to be nothing else but the hair of those animals, which being occasionally licked off by the tongue, is swallowed down, and being impregnated with the *fabrica*, &c. is condensed into balls.

Some of them weigh eighteen ounces; but they are not much esteemed, though they are used in some medicines, and by the painters in miniature, to make a yellow colour.

Besides these, there are other kinds, viz.

The *Hog* or *Boar* BEZOAR, called by the Dutch, *pedra de porco*; and by the Portuguese, who first brought it into Europe, *pedra de porquis*, found in the gall-bladder of a boar in the East Indies.

In figure and size it resembles a *filbert*, though more irregular; its colour not fixed, but most commonly white, with a teint of green; it is smooth and shining; and is valued at ten times its weight in gold.

The Indians attribute infinite virtues to this *bezoar*: they call it *muffra de felle*, and prefer it to the *goat bezoar*; not so much on account of its being supposed the best preservative in the world against poisons, as on account of its being sovereign in the cure of the *murdoxi*, a disease they are very liable to, and which is not less dangerous than the plague in Europe. Other properties which they ascribe to it are, that it is admirable against malignant fevers, small-pox, and most diseases of women not with child; experience shewing, that it promotes

moter abortion in those who are, if they use it indiscreetly. To use it, they infuse it in water, or wine, till it has communicated a little bitterness to it. To facilitate the infusion, and at the same time preserve so precious a stone, they usually set it in a gold case pierced with holes.

The *Porcupine* and *Monkey* BEZOARS only differ from those of the dog, in that they are found in the gall-bladders of those animals; unless we say with Tavernier that these two, which he calls *Malacca-stones*, are not taken from the gall bladders, but from the heads, of the monkey and porcupine, and that they are held in such esteem by the natives of Malacca, that they never part with them, unless as presents to ambassadors, or the greatest princes of the East.

The *bezoar* of the ape, and that of the porcupine, called *piedra del puerco*, have been valued much. Single stones have been sold for sixty and eighty pounds sterling. Neumann.

Some add, that they are likewise found in Siam.—Indeed, the form, colour, and properties of these three *bezoars* are so near akin, that it is more than probable, they are all the same stone under three different names.

The *cow bezoar*, in the Chinese cabinet, in the repository of the Royal Society, though composed of *laminæ* or coats, is apparently factitious, because it melts, when applied to the candle. Sloane, Phil. Trans. N° 250. p. 70.

The forms in which *bezoars* appear, when genuine, are very different; the most frequent figure is round, but many are oblong; some of the shape of a kidney, and some perfectly irregular: they are of a greenish, or olive colour, and are spotted with pale, or whitish spots in different places; when tried by burning, they are found to be easily inflammable, and to contain a volatile salt, and an oil; and the *residuum* much resembles the *caput mortuum* left in the retort, after the distillation of different animal substances; a gentle heat will often make the several beds or *laminæ*, of which a *bezoar* is composed, separate from one another. If *bezoar* stones are put to infuse in spirit of wine, or in common water, both liquors will thoroughly penetrate their substances, but neither will receive any change from them.

BEZOAR *goat*, in *Zoology*, a name used for the Indian ANTELOPE, on account of the *bezoar* stone found in its stomach.

BEZOAR is also applied to a kind of fossile figured stone, formed like the animal *bezoar* of several coats, or *strata*, ranged round some extraneous body, which forms a *nucleus*, and is supposed to have the same virtues with the other. Mem. Acad. Scienc. an. 1710. p. 316.

It is found in Italy, especially Sicily; and in France, especially Languedoc. We have also instances of it in England. Woodw. Nat. Hist. Eng. Foss. tom. ii. p. 9.

The fossile, or mineral *bezoar*, is a crustated ferruginous body.

The Sicilian *bezoar*, or *bezoar minerale Siculum*, is by some, with Boccone, taken for a species of *pyrites*, from which Dr. Woodward distinguishes it, as well as from the *echytes* and *aetites*, in that it has properly no cavity with matter in it, as those bodies have. Phil. Trans. N° 311. p. 456. and N° 249. p. 151.

Boccone mentions *nuclei* of different matters, as flints, gravel, wood, metal, coal, &c. M. Geoffroy even found rock crystal in the middle of a mineral of this species, called *perapalites*.

BEZOARDIC is applied to certain medicinal powders, stones, &c. wherein *bezoar* is an ingredient.

To the class of *bezoardic* powders belong the Cadogan's, and countess of Kent's *powders*, and others formed thereof. Among *bezoardic* stones is found the *lapis de Goa*, or Goa stone. We also meet with *bezoardic* tinctures given in fevers, &c.

BEZOARDIC is more generally applied to all medicines endowed with a powerful alexipharmic virtue, used for expelling poisons, and other malignities.

In this sense, *bezoardics* are either simple or compound, and derived either from the vegetable or animal kingdoms. The chief in the vegetable kind is the root of *ambora*, or *contrayerva*; and in the animal kingdom, hartshorn, or, according to some, the unicorn's horn.

Among the compound kind, the *modern bezoardica Millandi* is in much request, as well abroad, salt of hartshorn is by some called *bezoar japonicum*. Willis has a poem on the use and abuse of the *northern bezoar*.

BEZOARDICA *terra*, a name used by some authors for a medical earth dug in the pope's territories, and more frequently called TERRA *sigillata*.

BEZOARDICUM *Mineriale*, or *Minerale* BEZOAR, is a preparation of antimony corrected with spirit of nitre, and purified by repeated lotions, which carry off the purgative virtue, and substitute a diaphoretic one; by which it promotes sweat, like the stone of that name, [illegible] of ANTIMONY.

It appears to have been the invention of Basil Valentine, though later chemists have given other processes for preparing it. It is much adulterated, by adding to it half, or two thirds, the quantity of *sal ammoniac*.

Sylvius first ventured to introduce it into medicine, and frequently gave it with very bad success. Yet many are to this day persuaded with him, that it is possessed of wonderful antidotal virtues, as being obtained innocent and harmless from that violent poison, butter of antimony; whence they conclude, it must needs have a magnetical power of attracting to itself, like the *bezoar* stone, all the poison in the body.

Boerhaave, however, controuls all its virtues, chiefly from the manner of preparing it. The acid of the antimony, he argues, being driven away by the violence of the fire, nothing remains but the sluggish and calcined metalline part, which, though dignified with the name of *mineral bezoar*, is destitute of all medicinal virtues, and only serves to oppress the body by its gravity, being *perfectly* indigestible therein. Mem. Chym. P. iii. p. 318.

From the *bezoar mineral*, mixed with other metals in various ways, with or without detonation, arise other compound *bezoardics*, which is a common appellation in Germany, &c. for all medicines supposed to be of alexipharmic powers. Neumann, p. 533.

BEZOARDICUM *solare*, a name given by the chemists to a preparation of gold. It is made by dissolving plates of gold in the *spiritus nitri bezoardicus*, and fixing it by pouring it on butter of antimony. It is said to be a great sudorific, and of great use in the pox, the plague, the gout, the dropsy, fevers, and obstructions of the spleen. Its dose is from three to eight grains.

BEZOARDICUM *Veneris*, *bezoar* of copper, a name given by the chemists to a preparation of copper, made by extracting a tincture from the filings of copper with rectified butter of antimony, and fixing it according to art with spirit of nitre. It is given by some in leprosies, and diseases of the head and brain. Its dose is six grains. Externally its use is as of the rest, in ulcers, fistulæ, and impetigines.

BEZOARDICUM *Saturni*, *bezoar* of lead, the name given by the chemists to a preparation of lead: it is made by extracting a tincture from glass of lead, prepared from red lead and flints, and mixing this with rectified butter of antimony, and fixing it by means of spirit of nitre. It is esteemed an anti-hysteric, and is said to be good in disorders of the spleen; the dose is six grains.

BEZOARDICUM *Jovialis*, or BEZOAR *of Jupiter*, is a regulus made by melting three ounces of regulus of antimony, and two of block-tin, powdered and mixed with six ounces of corrosive sublimate, and distilled off in a kind of butter, and that dissolved in spirit of nitre, and the solution distilled three times; the *bezoar* remaining at the bottom is to be powdered, washed, and mingled with spirit of wine, till it grow unripid. See ANTIMONIUM *Potens*.

BEZOARDICUM *lunale*, or of silver, is made by mixing rectified butter of antimony with fine silver, dissolved in spirit of nitre: upon which, a powder falls to the bottom, which is the *bezoar*.

It is esteemed a specific in epilepsies, convulsions, and apoplexies; and is said to be anodyne and sudorific, and of great use against the erysipelas. The dose is from six to ten grains.

BEZOARDICUM *martiale*, is a dissolution of *crocus Martis* by reverberation in butter of antimony, with spirit of nitre poured on it: commended by some against hysterical, hypochondriacal, and ictherical disorders.

BEZOLA, in *Ichthyology*, the name of a tenacious fish of the *alosa* kind, and called by Gesner the *alosa carinata*. It resembles the herring in shape, is of a dusky bluish colour, and does not essentially differ from the SAVARETUS.

BIA, a name given by the Siamese, to a sort of little white shells brought from the Maldive islands, and used throughout most part of the East Indies for small money. Nine of these are equal in value to the French *denier*.

These are otherwise called *cauris*, or *cowries*.

BIÆUM, from *Bia*, *ratiocinium*, in *Rhetoric*, denotes a kind of counter-argument, whereby something alledged for the adversary is retorted against him, and made to conclude a different way: for instance, *Occidisti, quia occidisti interfectum.—Immo quia occidi interfectus, non occidi; nam si occidi, ego fugam non corripuissem.* "You killed the person," because you were found standing by his body." (*Boerem.*) "Rather I did not kill him, because I was "found standing by his body; since, in the other case, "I should have fled away."

BIÆUM, in the *Grecian Laws*, was an action brought against those who ravished women, or used violence to any man's person. Potter, Archæol. lib. i. c. 24.

BIBLUM also denotes a kind of saline or sea-wine, used by the ancient Greeks in various disorders. It was made of grapes gathered a little before ripe, and dried in the sun; then pressed, the juice put up in casks, and mixed

with a large proportion of sea-water; though Dioscorides seems to determine it as made of grapes steeped in sea-water, and then pressed. Gorr. Def. Med. p. 75.

BIAFORA, is the *Customs of the Middle Age*, a form of cry, *or alarm to arms*; on the hearing whereof, the inhabitants of towns or villages were to issue forth, and attend their prince. *The word seems originally* from Gascoyn; and the Italians even now, on a sudden insurrection of the people, commonly cry, *Via fora*, by an usual change of the letter B into V.

BIARCHUS, an officer in the court of the emperors of Constantinople, intrusted with the care and inspection of the provisions of the soldiery.

The word is formed from βία, *annona*, *victuals*, and ἀρχὴ, *chief*.

The *biarchus* was the same with what the Latins call *præfectus annonæ*. His function was called *biarchia*; by the Latins, *præfectura annonæ*. He belonged to the *scholæ scriniorum et votivi*. See ARCHIVES.

BIARUM, in *Botany*, a name by which the people of Egypt at this time call the root of the SELLOAR, or *Jatha Ægyptia* growing on the Nile.

BIAS, or BIASS, the tendency or propensity of a thing towards one side more than the other; particularly the deviation of a body, or a plane, from its rectilinear course, or its level. See INCLINATION.

The word is French, *biais*, which signifies the same. Menage deduces this further from the Italian *biaco*; and that again from the Latin *obliquus*.

BIAS *of a bowl*, is a piece of lead put into one side, to load and make it incline towards that side.

BIATHANATI, *Suicides*, from βία, *violence*, and θάνατος, *death*: the same with suicides, or those who kill themselves. Dr. Donne, dean of St. Paul's, has a work under the title of *Biathanatos*; wherein he undertakes to prove this position, or paradox: "That suicide is not so naturally sin, "as that it may never be otherwise." *Lond. 4to.* 1644.

BIBIO, the *ursaculus*, in the *History of Insects*, a very small fly, found frequently among empty wine-casks. It is produced from a small reddish, red worm, very common in the sediments of wine. See WINE-FLY.

BIBITORY *Statute*, see ANNUITOR Oculi.

BIBLE, a book, by way of eminence so called, containing the Scriptures, i. e. the writings of the Old and New Testament.

The word *Bible* comes from the Greek βιβλία, or βιβλος, used to denote any book; but, by way of eminence, applied to the book of Scripture. Βιβλος again comes from βύβλος, the Egyptian *reed*, from which the ancient paper was procured. See BYBLUS.

The *Bible* is known by various other appellations, as the *sacred books*, the *inspired writings*, *holy word*, *sacred text*, &c. By the Jews it is called *mikra*, that is, *lectures*, or *reading*; by the Christians usually *Scripture*, q. d. *writing*; sometimes also the *book of God*, the *canon*, *rule of faith*, &c.

Bibles are distinguished, according to their language, into Hebrew, Greek, Latin, Chaldee, Syriac, Arabic, Coptic, &c. Some account of each, and their several editions, &c. we shall here subjoin.

The list of the books contained in the *Bible* is called the CANON of Scripture.

The books of the *Bible* are said to be *canonical*, by way of contradistinction from others called *deutero-canonical*, *apocryphal*, *pseudo-apocryphal*, &c.

For the authors of the *Bible*, the names of most of them are prefixed to the books supposed to be written by them; as the Pentateuch by Moses; Joshua, by the general of that name, &c. though many objections have been made to divers of them.

Aben Ezra, followed by Hobbes, Pereyra, Spinoza, and some others, deny the five first books to have been written by Moses. P. Simon in particular affirms, that the books, as we now have them, are not the originals written by the inspired penmen, but abridgments of them, made in after-times by a kind of college or order of public actuaries or scribes appointed for that end.

The original language of the Old Testament was doubtless the old Hebrew, at least the greatest part; for all the books do not appear to have been written in the same. Some chapters of Ezras and Daniel are judged to have been composed in Chaldaic; and other chapters of this latter writer, as also the apocryphal books of Maccabees, of Wisdom, &c. in Greek; Tobit and Ecclesiasticus either in Greek or Syriac. Du Pin, Diff. Prel. § 3. Calmet's Dict. Bib. tom. i. p. 203.

As for the New Testament, it was written in Greek, except the Gospel of St. Matthew, which is thought by many to have been composed in the later Hebrew, that is, the Syriac. Some will have Mark's Gospel to have been written in Latin; and the Epistle to the Hebrews in Hebrew. Calmet.

Divers of the ancient *Bible* books appear to have been irrecoverably lost, whether it be that the copies of them perished, or that Esdras threw them out of his canon. Hence it is that, in the books still extant, we find diverse citations of, and references to others, which are no-where more; as the book of Jasher, the book of the wars of the Lord, annals of the kings of Judah and Israel, part of Solomon's three thousand Proverbs, and his thousand and five Songs, besides his books on plants, animals, fishes, insects, &c. To which may be added, a book of Jeremiah, wherein he enjoined the captives who went to Babylon to take the sacred fire and conceal it; also the precepts which that prophet gave the Jews to preserve themselves from idolatry, and his lamentations on the death of king Josiah.

In the time of Josiah, through the impiety of the two preceding reigns of Manasseh and Ammon, the book of the law was to totally lost, that, besides a copy of it, found by Hilkiah in the temple, none other appears to have been known; at least, the surprise which Hilkiah threw'd at the finding of it, and the grief which Josiah expressed at the hearing of it read, shew that neither of them had ever seen it before. 2 Kings, chap. xxii. ver. 8—13. 2 Chron. chap. xxxiv.

Copies were now made and dispersed; yet, within a few years after, the authentic copy preserved in the temple, was burnt, with the temple, by the Babylonians. It was restored again after the return of the Jews from the Babylonian captivity by Nehemiah, or rather by Ezra; some say by divine inspiration; others, with greater probability, by collecting the fragments and copies which were still remaining, comparing them together, and, out of them all, framing one complete copy, where the readings were adjusted, and the several books ranged in their proper order. Prid. Conn. P. I. lib. v. Du Pin, Diff. Prel.

Ezra made additions in several parts of the book, among which is to be reckoned the last chapter of Deuteronomy, wherein Moses seems to give an account of his own death and burial, and of the succession of Joshua after him. To the same canon are to be attributed many other interpolations in the *Bible*, which created difficulties and objections to the authenticity of the sacred text, but will be solved without allowing them. Hidden.

The present Samaritan and Jewish copies of the *Bible* differ in many respects, chiefly in the chronology of the patriarchs, where the Samaritan comes nearer to the Septuagint. Other variations may be resolved into the errors of transcribers, interpolations for explication's sake, and, perhaps, the designed corruption of the Samaritan.

The books of the *Bible* are divided by the Jews into three classes, viz. the law, the prophets, and the hagiographers; a division which they are supposed to borrow from Ezra himself.

The Jews, at first, were very reserved in communicating their scripture to strangers: despising and shunning the Gentiles, they would not disclose to them any of the treasures concealed in the *Bible*. We may add, that the people bordering on the Jews, as the Egyptians, Phœnicians, Arabs, &c. were not very curious to know the laws or history of a people, whom in their turn they hated and despised. Their first acquaintance with their books was not till after the several captivities of the Jews, when the singularity of the Hebrew laws and ceremonies induced several to desire a more particular knowledge of them. Josephus seems surprised to find such slight footsteps of the scripture-history interspersed in the Egyptian, Chaldean, Phœnician, and Grecian history; and accounts for it hence, that the sacred books were not as yet translated into Greek or other languages, and consequently not known to the writers of those nations. Contra Appion. p. 1038. Calmet.

The first version of the *Bible* was that of the SEPTUAGINT into Greek, in the time of Ptolemy Philadelphus; though some maintain that the whole was not then translated, but only the Pentateuch; between which and the other books in the version called of the Seventy, the critics find a great diversity in point of style and expression, as well as of accuracy.

Divers kinds of books have been composed on the *Bible*, either to explain the texts, or make its doctrine more obvious, to facilitate the remembrance of it, or to establish particular opinions from it; as introductions, apparatuses, summaries, manuals, histories, expositions, concordances, harmonies, &c.

BIBLES, *Hebrew*, are either manuscript, or printed.—The best *manuscript bibles* are those copied by the Jews of Spain. Those copied by the Jews of Germany are less exact, but more common. The two kinds are easily distinguished from each other; the former being in beautiful characters, like the Hebrew *Bibles* of Bombergs, Stephens, and Plantin; the latter in characters like those of Munster and Gryphius.—F. Simon observes, that the oldest manuscript Hebrew *Bibles* are not above six or seven hundred years old; nor does rabbi Benjamin, who

quotes

quotes a vaſt number of them, preſcnt that any of them exceed ſix hundred years.

Dr. Kennicott, in his Diſſertatio Generalis, prefixed to his Hebrew *Bible*, p. 21. obſerves, that the moſt ancient MSS. were written between the years 900 and 1100: but though thoſe that are the moſt ancient are not more than 800 or 900 years old, they were tranſcribed from others of a much more ancient date. The MS. preſerved in the Bodleian library is not leſs than 800 years old. Another MS. not leſs ancient is preſerved in the Cæſarian library at Vienna.

The moſt ancient *printed* Hebrew *Bibles* are thoſe publiſhed by the Jews of Italy, eſpecially of Peſaro and Breſcia. Thoſe of Portugal alſo printed ſome parts of the *Bible* at Liſbon, before their expulſion.—This may be obſerved in the general, that the beſt Hebrew *Bibles* are thoſe printed under the inſpection of the Jews: there being ſo many *minutiæ* to be obſerved, that it is ſcarce poſſible for any other to ſucceed in it.

The Complutenſian *Bible* was printed in 1515. See BIBLES, *Greek*.

In the beginning of the ſixteenth century Dan. Bomberg printed ſeveral Hebrew *Bibles* in folio and quarto at Venice, moſt of which are eſteemed both by the Jews and Chriſtians: the firſt in 1517, which is the leaſt exact and generally goes by the name of Felix Pratenſis, the perſon who reviſed it. This edition contains the Hebrew text, the targum, and the commentaries of ſeveral rabbins. In 1528, the ſame Bomberg printed the folio *Bible* of rabbi Benchajim, with his preface, the maſoretical diviſions, a preface of Aben Ezra, a double *maſora*, and ſeveral various readings. The third edition was printed in 1618; it is the ſame with the ſecond, but much more correct. From the former editions it was, that Buxtorf, the father, printed his rabbinical Hebrew *Bible* at Baſil, in 1618; which, though there are many faults in it, is more correct than any of the former. In 1623 appeared at Venice a new edition of the rabbinical *Bible* by Leo of Modena, a rabbin of that city, who pretended to have corrected a great number of faults in the former editions; but, beſides that it is much inferior to the other Hebrew *Bibles* of Venice, with regard to paper and print, it has paſſed through the hands of the inquiſitors, who have altered many paſſages in the commentaries of the rabbins.

As to Hebrew *Bibles* in 4to. that of R. Stephens is eſteemed for the beauty of the characters; but it is very incorrect. Plantin alſo printed ſeveral beautiful Hebrew *Bibles* at Antwerp: one, in eight columns, with a preface by Arias Montanus in 1571, which far exceeds the Complutenſian in paper and print, and contents; this is called the Royal *Bible*, becauſe it was printed at the expence of Philip II. of Spain: another at Geneva, in 1619; beſides many more of different ſizes, with and without points. Manaſſah Ben Iſrael, a learned Portugueſe Jew, publiſhed two editions of the Hebrew *Bible* at Amſterdam; the one in 4to. in 1635; the other in 8vo. in 1639: the firſt has two columns; and for that reaſon is commodious for the reader. In 1659, R. Jac. Lombroſo publiſhed a new edition in 4to. at Venice, with ſmall literal notes at the bottom of each page, where he explains the Hebrew words by Spaniſh words. This *Bible* is much eſteemed by the Jews at Conſtantinople: in the text they have diſtinguiſhed between words where the point *camets* is to be read with a *camets-katoph*, that is, by *o* and not an *a*.

Of all the editions of the Hebrew *Bible* in 8vo. the moſt beautiful and correct are the two of Jo. Athias, a Jew of Amſterdam. The firſt, of 1661, is the beſt paper; but that of 1667, is the moſt exact: that, however, publiſhed ſince at Amſterdam by Vander Hooght, in 1705, is preferable to any of them.

After Athias, three Hebraizing proteſtants engaged in reviſing and publiſhing the Hebrew *Bible*; viz Clodius, Jablonſki, and Opitius.—Clodius's edition was publiſhed at Frankfort, in 1677, in 4to. At the bottom of the page it has the various readings of the former editions; but the author does not appear ſufficiently verſed in the accenting, eſpecially in the poetical books; beſides, as it was not publiſhed under his eye, many faults have crept in. That of Jablonſki in 1699, in 4to. at Berlin, is very beautiful as to letter and print; but, though the editor pretends he made uſe of the editions of Athias and Clodius, ſome critics find it ſcarce in any thing different from the 4to. edition of Bomberg.—That of Opitius is alſo in 4to. at Kiel, in 1709; the character is large and good, but the paper bad: it is done with a great deal of care; but the editor made uſe of no manuſcripts but thoſe of the German libraries; neglecting the French ones, which is an omiſſion common to all three.—They have this advantage, however, that beſides the diviſions uſed by the Jews, both general and particular, into *paraſhas* and *peſukim*, they have alſo thoſe of the Chriſtians, or of the Latin *Bibles*, into chapters and verſes; the *keri kreik*, or various readings, Latin ſummaries, &c. which made them of conſiderable uſe, with reſpect to the Latin editions, and the concordances. See CHAPTERS.

The little *Bible* of R. Stephens, in 1610, is very much prized for the beauty of the character. Care, however, muſt be taken: there being another edition of Geneva, exceedingly like it, excepting, that the print is worſe, and the text leſs correct.—To theſe may be added ſome other Hebrew *Bibles* without points, in 8vo. and 24to. which are much coveted by the Jews; not that they are more exact, but more portable than the reſt; and are uſed in their ſynagogues and ſchools: of theſe there are two beautiful editions, the one of Plantin, in 8vo. with two columns, and the other in 24to. reprinted by Raphalengius at Leyden, in 1610. There is alſo an edition of them by Lauricius at Amſterdam, in 1631, in a larger character; and another in 12mo. at Frankfort, in 1694, full of faults, with a preface of M. Leuſden at the head of it.

Houbigant publiſhed an elegant edition of the Hebrew *Bible* at Paris, in 1753, contained in four volumes, folio. The text is that of Van der Hooght, without points, to which he has added marginal notes, ſupplying the variations of the Samaritan copy. Dr. Kennicott, after almoſt twenty years laborious collation of near ſeven hundred copies, manuſcript and printed, either of the whole, or of particular parts of the *Bible*, did, in 1776, publiſh the firſt volume of his Hebrew *Bible*, in folio. The text is that of Everard Van der Hooght, already mentioned; ſuffering from it only in the diſpoſition of the poetical parts, which Dr. Kennicott has printed in hemiſtichs, into which they naturally divide themſelves; however the words follow one another in the ſame order as they do in the edition of Van der Hooght. This edition is printed on an excellent type; the Samaritan text, according to the copy in the London Polyglot, is exhibited in a column parallel with the Hebrew text; thoſe parts of it only being introduced, in which it differs from the Hebrew. The numerous variations both of the Samaritan manuſcripts from the printed copy of the Samaritan text, and of the Hebrew manuſcripts from the printed text of Van der Hooght, are placed ſeparately at the bottom of the page, and marked with numbers referring to the copies from which they are taken. The editor regrets, that the Diſſertatio Generalis, which would help much to enrich this article, is not to be publiſhed till the ſecond volume is ready.

BIBLES, *Greek*.—There is a great number of editions of the *Bible* in Greek; but they may be all reduced to three or four principal ones, viz. that of Complutum, or Alcala de Henares, that of Venice, that of Rome, and that of Oxford.—The firſt was publiſhed in 1515, by cardinal Ximenes, and inſerted in the *Polyglot Bible*, uſually called the *Complutenſian Bible*: this edition is not juſt, the Greek of the Old Teſtament being altered in many places according to the Hebrew text.—It has, however, been reprinted in the *Polyglot Bible* of Antwerp, in that of Paris, and in the 4to. *Bible*, commonly called, *Walton's Bible*.

The ſecond Greek *Bible* is that of Venice, printed by Aldus, in 1518. Here the Greek text of the Septuagint is reprinted juſt as it ſtood in the manuſcript, full of faults of the copyiſts, but eaſily amended.—This edition was reprinted at Strasburg, in 1526, at Baſil, in 1545, at Frankfort, in 1597, and other places, with ſome alterations to bring it nearer the Hebrew. The moſt commodious is that of Frankfort; there being added to this little *ſcholia*, which ſhew the different interpretations of the old Greek tranſlators: the author of this collection has not added his name; but it is commonly aſcribed to Junius.

The third Greek *Bible* is that of Rome, or the Vatican, in 1587, with Greek *ſcholia* collected from the manuſcripts in the Roman libraries by Pet. Morin. It was firſt ſet on foot by cardinal Montalbo, afterwards pope Sextus Quintus. This fine edition has been reprinted at Paris in 1628, by J. Morin, prieſt of the Oratory, who has added the Latin tranſlation, which in the Roman was printed ſeparately with *ſcholia*.—The Greek edition of Rome has been printed in the *Polyglot Bible* of London; to which are added, at bottom, the various readings of the Alexandrian manuſcript. This has been alſo reprinted in England in 4to. and 12mo. with ſome alterations. It has been again publiſhed at Frankfort in 1709, by Bos, who has added all the various readings he could find.

The fourth Greek *Bible* is that done from the Alexandrian manuſcript, begun at Oxford by Dr. Grabe in 1707. In this the Alexandrian manuſcript is not printed ſuch as it is, but ſuch as it was thought it ſhould be; i. e. it altered whatever there appeared any fault of the copyiſts, or any word inſerted from any particular dialect: this ſome think an excellence, but others a fault; urging, that the manuſcripts ſhould have been given abſolutely and entirely of itſelf, and all conjectures, as to the

the readings, should have been thrown into the notes. See SEPTUAGINT.

BIBLES, *Latin*, how numerous soever, may be all reduced to three classes; the *ancient* VULGATE, called also *Italica*, translated from the Greek *Septuagint*: the *modern* VULGATE, the greatest part of which is done from the Hebrew text; and the *new Latin translations*, done also from the Hebrew text in the fixteenth century.—We have nothing remaining of the *ancient Vulgate*, used in the primitive times in the Western churches, but the Pfalms, Wisdom, and Eccleſiaſtes. Nobilius has endeavoured to retrieve it from the works of the ancient Latin fathers; but it was impoſſible to do it exactly, becauſe moſt of the fathers did not keep cloſe to it in their citations.

As to the *modern* VULGATE, there are a vaſt number of editions very different from each other. Cardinal Ximenes has inſerted one in the *Bible of Complutum*, corrected and altered in many places. R. Stephens, and the doctors of Louvain, have taken great pains in correcting the modern Vulgate.

The beſt edition of Stephens's Latin *Bible* is that of 1540, reprinted in 1545, in which are added, on the margin, the various readings of ſeveral Latin manuſcripts, which he had conſulted. The doctors of Louvain reviſed the modern Vulgate after R. Stephens; and added the various readings of ſeveral Latin manuſcripts. The beſt of the Louvain editions are thoſe, at the end of which are added the critical notes of Francis Lucas of Bruges.

All theſe reformations of the Latin *Bible* were made before the time of pope Sixtus V. and Clement VIII. ſince which, people have not dared to make any alterations, excepting in comments, and ſeparate notes. The correction of Clement VIII. in 1592, is now the ſtandard throughout all the Romiſh churches: that pontiff made two reformations; but it is the firſt of them that is followed. From this the *Bibles* of Plantin were done, and from thoſe of Plantin all the reſt; ſo that the common *Bibles* have none of the after-corrections of the ſame Clement VIII.—It is a heavy charge that lies on the editions of pope Clement, viz. that they have ſome new texts added, and many old ones altered, to countenance and confirm what they call the Catholic doctrine; witneſs that celebrated paſſage of St. John, *tres ſunt*, &c.

There are a great number of Latin *Bibles* of the third claſs, comprehending the verſions from the originals of the ſacred books made within theſe two hundred years.—The firſt is that of Santes Pagninus, a Dominican, under the patronage of pope Leo X. printed at Lyons in 4to. in 1527, much eſteemed by the Jews. This the author improved in a ſecond edition. In 1542, there was a beautiful edition of the ſame at Lyons in folio, with *ſcholia*, publiſhed under the name of Michael Villanovanus, i. e. Michael Servetus, author of the *ſcholia*. Thoſe of Zurich have likewiſe publiſhed an edition of Pagninus's *Bible* in 4to. And R. Stephens reprinted it in folio, with the Vulgate, in 1557, pretending to give it more correct than in the former editions. There is alſo another edition of the ſame columns, under the name of *Tremellius*; and we find it again in the Hamburgh edition of the *Bible* in four languages.

In the number of Latin *Bibles* is alſo uſually ranked the verſion of the ſame Pagninus corrected, or rather rendred literal, by Arias Montanus; which correction being approved of, by the doctors of Louvain, &c. was inſerted in the *Polyglot Bible* of Philip II. and ſince in that of London. There have been various editions of this in folio, quarto, and octavo; to which have been added the Hebrew text of the Old Teſtament, and the Greek of the New. The beſt of them all is the firſt, which is in folio, 1571.

Since the Reformation, there have been ſeveral Latin verſions of the *Bible* from the originals, by proteſtants. The moſt eſteemed are thoſe of Munſter, Leo Juda, Caſtalio, and Tremellius: the three laſt whereof have been reprinted various times. Munſter publiſhed his verſion at Baſil in 1534, which he afterwards reviſed; he publiſhed a correct edition in 1546.—Caſtalio's fine Latin pleaſes moſt people; but there are ſome who think it too much affected; the beſt edition thereof is that in 1573. Leo Juda's verſion, altered a little by the divines of Salamanca, was added to the ancient Latin edition, as publiſhed by R. Stephens with notes, under the name of *Vatablus's Bible*, in 1545. It was condemned by the Pariſian divines, but printed with ſome alterations by the Spaniſh divines of Salamanca. That of Junius and Tremellius is preferred eſpecially by the Calviniſts, and has undergone a great number of editions.

One may add a fourth claſs of Latin *Bibles*, comprehending the *Vulgate* edition corrected from the originals. The *Bible* of Iſidorus Clarus is of this number: that author, not being contented with reſtoring the ancient Latin copy, has corrected the tranſlator in a great number of places, which he thought ill rendered. Some proteſtants have followed the ſame method; and, among others, Andrew and Luke Oſiander, who have each publiſhed a new edition of the whole, corrected from the originals.

BIBLES of *Oriental*.—At the head of the Oriental verſions of the *Bible* muſt be placed the Samaritan; as being the moſt ancient of all, though neither its age nor author have been yet aſcertained, and admitting no more for holy Scripture but the Pentateuch, or five books of Moſes.—This tranſlation is made from the Samaritan Hebrew text, which is a little different from the Hebrew text of the Jews. This verſion has never been printed alone; nor any where but in the *Polyglots* of London and Paris.

BIBLES, *Chaldee*, are only the glooſes or expoſitions made by the Jews in the time when they ſpake the Chaldee tongue. Theſe they call by the name of *Targumim*, or *paraphraſes*, as not being any ſtrict verſions of the Scripture. They have been inſerted entire in the large Hebrew *Bibles* of Venice and Baſil; but are read more conveniently in the *Polyglot*, being there attended with a Latin tranſlation.

BIBLES, *Syriac*.—There are extant two verſions of the Old Teſtament in the Syriac language: one from the Septuagint, which is ancient, and made probably about the time of Conſtantine; the other called *antiqua & ſimplex*, made from the Hebrew, as ſome ſuppoſe, about the time of the apoſtles. This verſion is printed in the *Polyglots* of London and Paris.

In the year 1562, Widmanſtadius printed the whole New Teſtament in Syriac, at Vienna, in a beautiful character; after him there were ſeveral other editions; and it was inſerted in the *Bible* of Philip II. with a Latin tranſlation. Gabriel Sionita alſo publiſhed a beautiful Syriac edition of the Pſalms, at Paris, in 1525, with a Latin interpretation.

BIBLES, *Arabic*.—In the year 1516, Aug. Juſtinian, biſhop of Nebio, printed at Genoa an Arabic verſion of the Pſalter, with the Hebrew text, and Chaldee paraphraſe, adding Latin interpretations. There are alſo Arabic verſions of the whole Scriptures in the *Polyglots* of London and Paris; and we have an edition of the Old Teſtament entire, printed at Rome in 1671, by order of the congregation *de propagandâ fide*; but it is of little eſteem, as having been altered agreeably to the *Vulgate* edition. The Arabic *Bibles* among us are not the ſame with thoſe uſed with the Chriſtians in the Eaſt.—Some learned men take the Arabic verſion of the Old Teſtament, printed in the *Polyglots* to be that of Saadias, who lived about the year 900; at leaſt in the main. Their reaſon is, that Aben Ezra, a great antagoniſt of Saadias, quotes ſome paſſages of his verſion, which are the ſame with thoſe in the Arabic verſion of the *Polyglots*; yet others are of opinion, that Saadias's verſion is not extant. In 1622, Erpenius printed an Arabic Pentateuch, called alſo the Pentateuch of Mauritania, as being made by the Jews of Barbary, and for their uſe. This verſion is very literal, and eſteemed very exact. The four evangeliſts have alſo been publiſhed in Arabic, with a Latin verſion, at Rome in 1591, folio. Theſe have been ſince reprinted in the *Polyglots* of London and Paris, with ſome little alteration of Gabriel Sionita. Erpenius publiſhed an Arabic New Teſtament, entire, as he found it in his manuſcript copy, at Leyden, in 1616.

There are ſome other Arabic verſions of late date mentioned by Walton in his Prolegomena; particularly a verſion of the Pſalms preſerved in Sion College, London, and another of the Prophets, at Oxford; neither of which have been publiſhed.

BIBLES, *Coptic*.—There are ſeveral manuſcript copies of the Coptic *Bible* in ſome of the great libraries, eſpecially in that of the French king.

Dr. Wilkins publiſhed the Coptic New Teſtament in 4to. in the year 1716, and the Pentateuch alſo in 4to. in 1731, with Latin tranſlations. He reckons theſe verſions to have been made in the end of the ſecond, or the beginning of the third century.

BIBLES, *Ethiopic*.—The Ethiopians have alſo tranſlated the *Bible* into their language.—There have been printed ſeparately the Pſalms, Canticles, ſome chapters of Geneſis, Ruth, Joel, Jonah, Zephaniah, Malachi, and the New Teſtament; all which have been ſince reprinted in the *Polyglot* of London.—As to the Ethiopic New Teſtament, which was firſt printed at Rome in 1548, it is a very inaccurate work, and is reprinted in the Engliſh *Polyglot* with all its faults.

BIBLES, *Armenian*.—There is a very ancient Armenian verſion of the whole *Bible*, done from the Greek of the Septuagint, by ſome of their doctors about the time of St. Chryſoſtom. This was firſt printed entire in 1664, by one of their biſhops at Amſterdam in 4to. with the New Teſtament in 8vo.

BIBLES, *Perſian*.—Some of the fathers ſeem to ſay, that all the Scripture was formerly tranſlated into the language of the Perſians; but we have nothing now remaining of the ancient verſion, which was, certainly, done from the Septuagint. The Perſian Pentateuch printed in the Lon-

don *Polyglot* is, without doubt, the work of Rabbi Jacob, a Persian Jew. It was published by the Jews at Constantinople, in the year 1551. In the same *Polyglot* we have likewise the four Evangelists in Persian, with a Latin Translation; but this appears very modern, incorrect, and of little use. Walton says this version was written above four hundred years ago. Another version of the Gospels was published at Cambridge by Wheloo in the last century: there are also two Persian versions of the Psalms made in the last century from the vulgar Latin.

BIBLES, *Gothic*.—It is generally said, that Ulphilas, a Gothic bishop, who lived in the fourth century, made a version of the whole *Bible*, excepting the book of Kings, for the use of his countrymen. That book he omitted, because of the frequent mention of the wars therein; as fearing to inspire too much of the military genius into that people. We have nothing remaining of this version, but the four evangelists, printed in 4to. at Dort, in 1665, from a very ancient MS.

BIBLES, *Muscovite*.—An entire *Bible*, in the Sclavonic tongue, was printed at Ostravia in Volhinia, in the year 1581, and this is what we commonly call the *Muscovite* BIBLE. It was printed at the expence of Constantine, duke of Ostravia, for the common service of all Christians, who make the Sclavonic language, whereas the Muscovitish is a dialect.

BIBLES, *Spanish*.—There are two translations of the *Bible* into this language; one done by the Jews, and first printed at Ferrara in 1553; the other by Cassiodore, printed at Basil in 1569. A corrected edition of it was printed at Amsterdam in 1602.

BIBLES, *Italian*.—There are four Italian versions: the first towards the close of the thirteenth century, by James de Voragine, archbishop of Genoa; the second by Brucciolus, in 1530; the third by Malermi, printed at Venice in 1531; and the fourth by Diodati, a protestant, which is much esteemed, and has been often printed.

BIBLES, *French*.—There are nine French versions. There are also Dutch, Flemish, Polish, Hungarian, and Croatian versions. Luther, with the assistance of Melancthon, and others of his disciples, translated the *Bible* into the German tongue in 1524, and the publication of it very much contributed to the progress of the Reformation.

BIBLES, *Saxon*.—The whole scripture is said by some to have been translated into the Anglo-Saxon by Bede, about the year 701; though others contend he only translated the Gospels.

We have certain books or parts of the *Bible* by several other translators; as, 1. The Psalms, by Adelm bishop of Shireborn, contemporary with Bede; though by others this version is attributed to king Alfred, who lived two hundred years after. Another version of the Psalms in Anglo-Saxon was published by Spelman in 1640. 2. The Evangelists, still extant, done from the ancient Vulgate, before it was revised by St. Jerom, by an author unknown, and published by Matth. Parker in 1571. An old Saxon version of several books of the *Bible*, made by Elfric abbot of Malmsbury, several fragments of which were published by Will. Lilly in 1638, the genuine copy by Edm. Thwaites in 1699, at Oxford.

BIBLES, *Indian*.—A translation of the *Bible* into the North American Indian language, by Elliot, was published in 4to. at Cambridge, in 1685.

BIBLES, *English*.—The first English *Bible* we read of was that translated by J. Wickliffe about the year 1360; but never printed, though there are MS. copies of it in several of the public libraries. J. de Trevisa, who died about the year 1398, is also said to have translated the whole *Bible*: but whether any copies of it are remaining, does not appear.

BIBLES, *Tindal's*.—The first printed *Bible* in our language was that translated by Will. Tindal, assisted by Miles Coverdale, printed abroad in 1526; but most of the copies were bought up and burnt by bishop Tunstal and Sir Thomas More. It only contained the New Testament, and was revised and republished by the same person in 1530. The prologues and prefaces added to it, reflect on the bishops and clergy; but this edition was also suppressed, and the copies burnt.

In 1532, Tindal and his associates finished the whole *Bible*, except the Apocrypha, and printed it abroad: but while he was afterwards preparing for a second edition, he was taken up, and burnt for heresy in Flanders.

BIBLE, *Matthew's*.—On Tindal's death, his work was carried on by Coverdale and JOHN ROGERS, superintendant of an English church in Germany, and the first martyr in the reign of queen Mary, who translated the Apocrypha, and revised Tindal's translation, comparing it with the Hebrew, Greek, Latin, and German, and adding prefaces and notes from Luther's *Bible*. He dedicated the whole to Henry VIII. in 1537, under the borrowed name of Thomas Matthews; whence this has been usually called *Matthew's Bible*. It was printed at Hamburgh, and licence obtained for publishing it in England by the favour of archbishop Cranmer, and the bishops Latimer and Shaxton.

BIBLE, *Cranmer's*.—The first *Bible* printed by authority in England, and publicly set up in churches, was the same Tindal's version, revised, compared with the Hebrew, and in many places amended, by Miles Coverdale, afterwards bishop of Exeter, and examined after him by archbishop Cranmer, who added a preface to it; whence this was called *Cranmer's Bible*. It was printed by Grafton, of the largest volume, and published in 1540; and, by a royal proclamation, every parish was obliged to set one of the copies in their church, under the penalty of forty shillings a month; yet two years after, the popish bishops obtained its suppression of the king. It was restored under Edward VI. suppressed again under queen Mary, and restored again in the first year of queen Elizabeth; and a new edition of it given in 1562.

BIBLE, *Geneva*.—Some English exiles at Geneva in queen Mary's reign, Coverdale, Goodman, Gilbie, Sampson, Cole, Whittingham, and Knox, made a new translation, printed there in 1560; the new Testament having been printed in 1557; hence called the *Geneva Bible*, containing the various readings, marginal annotations &c. on account of which it was much valued by the puritan party in that and the following reign.

BIBLE, *Bishop's*.—Archbishop Parker resolved on a new translation for the public use of the church, and engaged the bishops and other learned men to take each a share or portion. These being afterwards joined together, and printed, with short annotations, in 1568, in a large folio, made what was afterwards called the *Great English Bible*, and commonly the *Bishop's Bible*. The following year it was also published in 8vo. in a small but fair black letter: and here the chapters were divided into verses; but without any breaks for them, in which the method of the Geneva *Bible* was followed, which was the first English *Bible* where any distinction of verses was made. It was afterwards printed in large folio, with corrections, and several *prolegomena*, in 1572; this is called *Matthew Parker's Bible*. The initial letters of each translator's name were put at the end of his part, e. gr. at the end of the Pentateuch, W. E. for William Exon; that is, William bishop of Exeter, whose allotment ended there: at the end of Samuel, R. M. for Richard Menevensis, or bishop of St. David's, to whom the second allotment fell: and the like of the rest. The archbishop overlaw, directed, examined, and finished the whole. This translation was used in the churches for forty years, though the Geneva *Bible* was more read in private houses, being printed above thirty times in as many years. King James bore it an inveterate hatred on account of the notes, which, at the Hampton-court conference, he charged as partial, untrue, seditious, &c. The *Bishop's Bible* too had its faults, the king frankly owned he had yet seen no good translation of the *Bible* in English; but he thought that of Geneva the worst of all.

BIBLE, *Rhemish*.—After the translation of the *Bible* by the bishops, two other private versions had been made of the New Testament; the first by Laur. Thomson, made from Beza's Latin edition, together with the notes of Beza, published in 1582, in 4to. and afterwards in 1589, varying very little from the Geneva *Bible*; the second by the papists at Rheims in 1582, called the *Rhemish Bible*, or *Rhemish translation*. These finding it impossible to keep the people from having the scriptures in the vulgar tongue, resolved to give a version of their own, as favourable to their cause as might be. It was printed on a large paper, with a fair letter and margin. One complaint against it was retaining a multitude of Hebrew and Greek words untranslated, for want, as the editors express it, of proper and adequate terms in the English to render them by; as the words *azymes, tunike, rational, holocaust, pasque, paske*, &c. However, many of the copies were seized by the queen's searchers, and confiscated; and Th. Cartwright was solicited by secretary Walsingham to refute it; but, after a good progress made therein, archbishop Whitgift prohibited his further proceeding therein, as judging it improper the doctrine of the church of England should be committed to the defence of a puritan, and appointed Dr. Fulke in his place, who refuted the Rhemists with great spirit and learning. Cartwright's refutation was also afterwards published in 1618, under archbishop Abbot. About thirty years after their New Testament, the Roman catholics published a translation of the Old at Douay, 1609 and 1610, from the Vulgate, with annotations, to that the English Roman catholics have now the whole *Bible* in their mother-tongue: though, it is to be observed, they are forbidden to read it without a licence from their superiors.

BIBLE, *Liber Sanctus*.—The laſt Engliſh *Bible* was that which proceeded from the Hampton-court conference in 1603, where many exceptions being made to the Bishops' *Bible*, king James gave order for a new one; or, as the preface expreſſes it, for a tranſlation altogether new, not yet to make of a bad one a good one, but to make a good one better, or of many good ones one beſt. Fifty-four learned perſons were appointed for this office by the king, as appears by his letter to the archbiſhop, dated in 1604; which being three years before the tranſlation was entered upon, it is probable ſeven of them were either dead, or had declined the talk, ſince Fuller's liſt of the tranſlators makes but forty-ſeven; who being ranged under ſix diviſions, entered on their province in 1607. It was publiſhed in 1613, with a dedication to James and a learned preface, and is commonly called *King James's Bible*. After this, all the other verſions dropped, and fell into diſuſe, except the Epiſtles and Goſpels in the Common Prayer Book, which were ſtill continued, according to the biſhops tranſlation, till the alteration of the liturgy in 1661, and the Pſalms and Hymns, which are to this day continued as in the old verſion.

There was a Welch tranſlation of the *Bible* made from the original in the time of queen Elizabeth, in conſequence of a bill brought into the houſe of commons for this purpoſe in 1563. It was printed in folio in 1588. Another verſion, which is the ſtandard tranſlation for that language, was printed in 1620. It is called Parry's *Bible*. An impreſſion of this was printed in 1690, called Biſhop Lloyd's *Bible*. Theſe were in folio: the firſt 800. impreſſion of the Welch *Bible* was made in 1630.

There is alſo a verſion of the *Bible* in the Iriſh language.

BIBLIA, or BIBLIA *pauperum*, in a military ſenſe, denotes a machine uſed by the ancients for throwing ſtones or darts.

BIBLIOGRAPHIA, a branch of ARCHITECTONICA, employed in the judging and peruſing of ancient manuſcripts, whether written in books, papers, or parchment.

The ſenſe of it is now extended, and it ſignifies a work, intended to give information concerning the firſt, or beſt editions of books; and the arts of diſtributing and claſſifying them properly. In this, it is uſed for a *treatiſe* or deſcription of printed books, either in the order of the alphabet, of the times when printed, or of the ſubject-matter.

In which ſenſe, *bibliographia* amounts to much the ſame with what is otherwiſe called BIBLIOTHECA.

Literary journals alſoo alſo a kind of *bibliographia*.

BIBLIOMANCY, a kind of divination performed by means of the BIBLE.

This amounts to much the ſame with what is otherwiſe called *ſortes biblicæ*, or *ſortes ſanctorum*.

It conſiſted in taking paſſages of ſcripture at hazard, and drawing indications thence concerning things future; as in Auguſtin's *tale & lege*. It was much uſed at the conſecration of biſhops.

F. J. Dorbilius, a jeſuit, has publiſhed a *bibliomancy*, under the borrowed name of *Theodorus Chriſtianus*.

BIBLIOMANIA, an extravagant paſſion for books, to a degree of madneſs; or a deſire of accumulating them beyond all reaſon and neceſſity.

BIBLIOTHECA, from βιβλος, *book*, and θηκη, *repoſitory*, from τιθημι, *I put*, properly ſignifies a LIBRARY, or repoſitory of books.

It is alſo uſed for a compilation of all that has been written on a certain ſubject, or a digeſt of all the authors who have treated of it.

In this ſenſe, we have hiſtorical *bibliotheca*, as that of Diodorus Siculus; mythological *bibliotheca*, as that of Apollodorus; theological and ſacred *bibliotheca*, as thoſe of Bauvenſius, &c.

It is alſo uſed for a catalogue of the books in a library; ſuch are the *Bibliotheca Ciſſiana*, *Bibliotheca Gudiana*, *Bibliotheca Thuana*, *Bibliotheca Bigotiana*, *Bibliotheca Boſſiana*, &c.

L'Abbe has publiſhed a *Bibliotheca of Bibliotheca*, or a catalogue of the names of thoſe who have written *bibliotheca*, which has ſince been continued, and improved under another title by Teiſier, from 800 writers to the number of no leſs than 2500. Schrammius has alſo publiſhed a *programma* on the writers of theological *bibliotheca*.

BIBLIOTHECA is a name given to the books of the Old and New Teſtament, in reſpect of their excellency, and ſufficiency for the uſes of the Chriſtian life; and it is alſo a title given to divers journals, or a periodical accounts in French of new books.

BIBLIOTHECA *patrum*, or *of the fathers*, is a collection of the writings of the latter fathers, printed in one or more volumes. The firſt of this kind was publiſhed at Paris by Margo, de la Bigne, in 1576.

BIBLIOTHECARIAN, a library-keeper, otherwiſe called LIBRARIAN.

The word is alſo uſed for the author of a BIBLIOTHECA, or a catalogue of books.

In this ſenſe, P. L'Abbe has given a *bibliotheca*, or catalogue of *bibliothecarians*. Geſner, Lipenius, Struvius, Fabricius, &c. are celebrated *bibliothecarians*.

BIBLISTS, *biblici*, an appellation given by ſome Romiſh writers to thoſe who profeſs to adhere to ſcripture alone as the ſole rule of faith, excluſive of all tradition, and the ſuppoſed authority of the church.

In which ſenſe, all proteſtants are, or ought to be, BIBLISTS.

Biblicſts, among Chriſtians, anſwer nearly to SAMARITES or TEXTUARIES among the Jews. The Chriſtian ſectaries were diviſed, towards the cloſe of the twelfth century, into two claſſes: viz. the *traditors*, and the *biblicſts*: the former were called *traditors of the ſacred page*, becauſe they explained the doctrines of Chriſtianity in their manner by the ſacred writings: however, their opinions declined, and the ſcholaſtic theology prevailed in all the European colleges till the time of Luther.

BIBLUS, in *Botany*, an aquatic plant in Egypt, called alſo PAPYRUS; of the ſkin whereof the ancient Egyptians made their PAPER.

Hence alſo the Greeks gave the denomination BIBLOS, to books made thereof.

BICAUDA, *from bis, double, and cauda, tail, in Ichthyology*, the name of a fiſh of the *ſcirpus* or SWORD-FISH kind.

It is five feet long, or more, and a foot and half broad at the breaſt, tapering gradually towards the tail. It is covered with a thick and rough ſkin, and is brown on the back and ſides; and has three ſeveral rows both pectoral: its belly is white: its fins are all a browniſh grey, and the back one has ſeveral beautiful black ſpots. It is very well taſted fiſh.

BICAUDALIS, in *Anatomy*, an appellation given by ſome to a muſcle of the external ear, on account of its having two tails; but which is ſubject to great variety, having ſometimes only one, and ſometimes three tails: in which caſe, it is called *tricaudalis* and *tricaudati*.

BICE, or BISE, among *painters*, a blue colour, prepared from the ASHES ARMENIA, formerly brought from Armenia, but now from the other parts in Germany. This Travel Nieuhof, p. 98.

The word comes from the barbarous Latin *biſe*, or *biſetus*; and that, perhaps, from the French *bis gris*, *grey*, or *ſadneſs of colour*. Vide Du Cange, Gloſſ. Latin. tom. i. p. 960. Skin. Etymol. voc.

Bice bears the beſt body of all bright blues, uſed in common work; but it is the palleſt, or thickeſt. It works indifferently well; but muſt have a little to be ſaved, and therefore requires good grinding on a very hard ſtone and ſhould be waſhed before it is uſed. It has beſt near the eye of any blue now in uſe, except ULTRAMARINE.

We have alſo a green *bice*, made of the blues, with the addition of verjuice.

BICEPS, from *bis*, and *caput*, *head*, in *Anatomy*, is a name common to ſeveral muſcles, which are ſeparated into two diſtinct portions called *heads*.—Such is the

BICEPS *cubiti*, or *humeri*, a muſcle of the arm, one of whoſe heads ariſes from the upper edge of the cavity of the head of the *ſcapula*, and is round and tendinous, and encloſed in the channel in the head of the *humerus*: the other ariſing from the *proceſſus coracoides*, is broad and tendinous: and both unite about the middle and fore-part of the arm, and make one belly, which is inſerted by a ſtrong and round tendon into the tuberoſity at the upper end of the *radius*.—See *Tab. Anat. Libro* i. fig. 1. e. e. fig. 2. e. e. fig. 3. e. e.

Some of the fibres of the tendon form a large and thin *aponeuroſis*, which covers all the muſcles of the *cubitus* and fingers externally.—Care ought to be taken in bloodletting, not to cut a-croſs, but according to the length of the fibres of this *aponeuroſis*.—This muſcle, with the BRACHIUS *internus*, bends the arm.

BICEPS *externus*, is called alſo GEMELLUS.

BICEPS *fibræ*, or *femoris*, a muſcle made up of two portions, one long, the other ſhort, and ending in one common tendon. Both portions are fleſhy, and conſiderably thick, and are ſituated on the back and outſide of the thigh, between the buttock and the ham. The great portion is fixed above by a ſtrong tendon, in the poſterior and lower part of the tuberoſity of the *iſchium*, under the inſertion of the inferior *gemellus*, and cloſe behind that of the *ſemitendinoſus*: from thence it runs down towards the lower extremity of the thigh, where it meets the other portion, and joins with it, forming a common tendon. The ſmall portion is tied by fleſhy fibres to the outſide of the *linea aſpera*, below its middle, and to the *foſſula ante*, where it forms a *ſulcus* between the *triceps* and *vaſtus externus*; from thence the fibres run down a little way, and then meeting the great portion, a common tendon is formed between them. This ſtrong tendon runs down to the ſide and back part of the knee

and

and is inserted in the lateral ligament of the joint, and in the head of the *fibula*, by two very short tendinous bunches. It sometimes sends off a tendinous expansion, which is often unskilfully cut off with the fat. As they run down they become contiguous, and afterwards closely united by one common broad tendon.

Both the fleshy bodies of the *biceps* contribute to the formation of the *aponeurosis*, each of the two portions, of which the common tendon is made up, furnishing a series of tendinous fibres, which covering the fore-part of the true tendon, unite near the internal condyle by a particular kind of inter-texture, and thus form the *aponeurosis* Winslow.

Its use is to help to bend the *tibia*, and it is likewise employed in turning the leg, together with the foot and toes, outward, when we sit down.—See *Tab. Anat. Myol. Fig.* 6. *n.* 40.

BICHET, a corn measure, containing about a Paris *minot*, chiefly used in Burgundy and the Lyonnois.

BICHET denotes also a certain quantity of land, as much as may be sown by a *bichet* of corn.

BICINIUM, from *bis*, and *canto*, *I sing*; in *Church Affairs*, the singing of two, either together or alternately.

In which sense, the word stands opposed to MONODY.

BICKERN *is an* ANVIL, the pike or beak-iron.

BICLINIUM, from *bis*, and *κλινη*, *bed*, in *Antiquity*, two beds about a table; or, as some say, rather a BED whereon two persons lay to eat.

BICORNES, from *bis*, and *cornu*, *horn*, in *Botany*, plants whose *anthers* have the appearance of two horns. The term likewise expresses an order of plants in the Fragments Method Naturalis of Linnæus.

BICORNE *is*, or *two-horned bone*, in *Anatomy*, the same with the OS HYOIDES.

BICORNIS, in *Anatomy*, an extensor muscle of the arm, otherwise denominated RADIUS *externus*, and EXTENSOR *carpi radialis*.

BICORNIS *pollicis manus*, is the proper extensor muscle of the thumb: sometimes also, from the number of its horns, called *tricornis*.

It takes its rise from the posterior and middle part of the *radius* and *ulna*, and is inserted in the first, second, and third phalanx.

BICORPOREA *signa*, from *bis*, and *corpus*, *body*, those signs of the zodiac which have two bodies, or consist of two figures.

Such are *Gemini*, or the Twins; also *Pisces*, and *Sagittarius* consisting of a man and a horse.

BICUBA, in *Botany*, the name of an Indian nut, used for relieving colics; and from which an oil is extracted for the cure of cancers.

BIDAL, or BIDALE, in our *Ancient Customs*, denotes the invitation of friends to drink ale at some poor man's house, who, in consideration hereof, expects some contribution for his relief.

This custom still obtains in the west of England, and is mentioned in some of our ancient statutes, 26 Hen. VIII. c. 6.

BIDALDI, an ancient kind of foot-soldiers mentioned by the French historians, armed with two darts.

Hence the origin of the word, which seems to be a corruption for *bidardi* or *a blais dardis*. They are also called *bidarii*, *bidaes*, *bidenes*, *bidauti*, and *pitauti*.

BIDDING, is used for proclaiming or hoisting; also for offering a price for goods put up by auction.

BIDDING *of the beads*, a charge or warning which the parish-priest gave to his parishioners at certain special times, to pray for many *benefactors*, &c. on their beads.

BIDENS, in *Botany*, see *Water-hemp* AGRIMONY.

BIDENTAL, in *Antiquity*, a place struck with a thunderbolt, and on that account consecrated to the gods, and forbidden to be trod on. *Bidental* only differs from *puteal*, as in the latter the thunderbolt was supposed to be hidden, or buried with ceremony under the ground. The fall of lightning, or a thunderbolt, on any place, was judged by the Romans an indication that Jupiter demanded it for himself. Hence they surrounded it with a wall, rail, palace, or even a rope; and explored it, by the sacrifice of a *bidens*, or sheep of two years old. Festus represents the *bidental* as a temple, where sheep of two years old were offered in sacrifice. But by temple he here means no more than a place enclosed, and consecrated to the gods.

BIDENTALES, priests among the ancient Romans, instituted for the performance of the ceremonies of a *bidental*.

The *bidentales* constituted a college, or society, who had the service and procuration, or interpretation of thunder and lightning.

The first and principal part of their office was the sacrificing a sheep of two years old, which in their language was called *bidens*, as having only two teeth, one on each side; or rather from *bidentes*, anciently written for *binenes*, *two years old*.

BIDENTES, in *Middle Age Writers*, denote two yearlings, or sheep of the second year.

The wool of these *bidentes*, or two year old sheep, being the first shearing, was sometimes claimed as a heriot to the king, on the death of an abbot.

Among the ancient Romans, the word was extended further to any sorts of beasts used for victims, especially those of that age whereon we meet with no *tokens*.

BIDET, a nag, or little horse, formerly allowed each trooper, and dragoon, for his baggage, and other occasions.

Bidets are grown into disuse, on account of the expences thereof, and the disorders frequently arising from those who rode on them.

BIDIAEI, an order of magistrates at Sparta, five in number, whose business was to superintend the *agoræ*, and be present at their exercises, wrestlings, &c.

BIDON, a liquid measure of about five quarts English measure; seldom used except among ship's crews.

BIER, a kind of wooden carriage, on which the bodies of the dead are borne to their grave. See BARE.

The word comes from the French *biere*, which signifies the same. It is called in Latin *feretrum*, *a ferendo*.

Among the Romans, the common *bier*, wherein the poorer sort were carried, was called *sandapila*; that used for the richer sort, *lectica*, *lectus funebris*, sometimes *lectus*. The former was only a sort of wooden shell, *vilis arca*, which was burnt with the body; the latter was enriched and gilded for pomp. It was covered here, or uncovered, when the person died a natural and easy death; when he was much disfigured or mutilated, it was veiled or covered over.

BIER is more peculiarly used for that whereon the bodies of saints are placed in the church to rest, and exposed to the veneration of the devout.

BIFARIA, *Fish*, in *Botany*, are such as point two ways.

BIFFA, in *Middle Age Writers*, a machine for casting Bones and Earth, having a moveable counterpoise, which turned round its yard.

BIFID *leaf*, in *Botany*, a leaf cleven into two parts.

BIFOLIUM, in *Botany*, see TWAYBLADE.

BIFRONS, a person double fronted, or two-faced.

BIFRONS is more particularly an appellation of JANUS, who was represented by the ancients with two faces, as being supposed to look both backwards and forwards; though other reasons for it are assigned by Plutarch. Sometimes he was painted with four faces, *quasi prisci*, as respecting the four seasons.

BIGA, a chariot for racing, drawn by two horses abreast. The word ought rather to be written *bigæ*, in the plural, q. d. *jugæ*, two horses being joined by a yoke or yoke.

Biga stand contradistinguished from *trigæ*, *quadrigæ*, &c. *Bigæ* are of very ancient standing: all the heroes in Homer, Hesiod, Virgil, &c. fought in them.

The invention of *bigæ* is attributed by Pliny to the Phrygians; by Isidore, to Cynisthes of Sicyon, who first yoked two horses together.

Bigæ were the CHARIOTS first used in the Circensian games; then *trigæ*, and afterwards *quadrigæ*.

The moon, night, and the mornings, are by mythologists supposed to be carried in *bigæ*, the sun in *quadrigæ*.

STATUES in *bigæ* were at first only allowed to the gods, then to conquerors in the Grecian games; under the Roman emperors, the like statues, with *bigæ*, were decreed and granted to great and well-deserving men, as a kind of half-triumph, being erected in most public places of the city.

Figures of *bigæ* were also struck on their coins, and are termed BIGATI.

The drivers of *bigæ* were called *bigarii*; a name half of one Flavius a *bigarius* is still seen at Rome.

BIGA, or BIGATA, in *Writers of the Middle Ages*, a cart with two wheels, drawn often with one horse. It was more frequently called *birota*.

BIGAMY, a double marriage, or the possession of two wives at the same time.

Among the ancient Romans, those convicted of bigamy were brought into a state of ignominy; and, in France, they were anciently punished with death. See POLYGAMY.

BIGAMY, in the Canon Law, is also where a person either marries two women successively, or only marries one woman who had been married before. Each of which the canonists account impediments to be a *clerk*, so to hold a benefice without a dispensation; a point of discipline founded on that of St. Paul, *Let a bishop be the husband of one wife*, 1 Tim. chap. iii. ver. 2. Apost. Const. 17. 28.

Bigamy they make of two kinds; *real*, as where a party actually marries twice; and *interpretative*, where he marries a widow, or woman called before, which is esteemed a kind of second marriage.

The

The Romanists make a third kind of *bigamy, by interpretation*; as, when a person in holy orders, or that has taken on him some monastic order, marries.—This the bishop can dispense withal, at least on some occasions.

There is also a kind of *spiritual bigamy*; as, when a person holds two incompatible benefices, v. gr. two bishopricks, two vicarages, two canonries *sub eodem tecto*, &c.

BIGATI, in *Antiquity*, a kind of ancient Roman silver coins, on one side whereof was represented a *biga*, or chariot drawn by two horses.

The *bigatus* was properly the Roman *denarius*, whole impression, during the times of the commonwealth, was a chariot driven by Victory, and drawn either by two horses or four, according to which it was either denominated *bigatus* or *quadrigatus*.

Bigati therefore were of different values, according to the species of *denarii*, &c.

Several of these called *consulate* medals are also *bigati*.

In lieu of horses, the chariot is represented on some *bigati*, as drawn by two deer, especially in the medals of the family of Axia; on those of the family of Crepereia, by two *hippocampi*, who draw, or rather bear Neptune on their backs.

BIGGEL, in *Natural History*, a quadruped much about the colour and bigness of a rein-deer; its head is said to be like that of a horse; in main like that of an ass, with black cloven feet, and two black horns on his head.

This animal is found in the East Indies, according to Mandelsloe, in Harris's Collection of Voyages.

BIGHT, in the *Sea-language*, denotes any part of a rope, as it is taken compassing, coiled up; or the double part of a rope, when it is folded in contradistinction to the end. It fignifies also a *small* bay between two points of land.

BIGNONIA, in *Botany*, TRUMPET-*flower*.

BIGOT, a perfon foolifhly obftinate, or perverfely attached to an opinion.

The word comes from the German *by*, and *Gott*, or the *Englifh by-God*.

Camden relates, that the Normans were firft called *Bigots*, on occafion of their duke Rollo; who receiving Gifla, daughter of king Charles, in marriage, and with her the inveftiture of the dukedom, refufed to kifs the king's foot in token of fubjection, unlefs he would hold it out for that purpofe: and being urged to it by thofe prefent, anfwered haftily, *Ne by God*; whereupon the king, turning about, called him *Bigot*; which name paffed from him to his people.

BIGOT, in Italian, *bigotto*, is ufed to denote a Venetian liquid meafure, containing the fourth part of the *amphora*, or half the *laft*.

BIGOURNEAU, in *Natural Hiftory*, a name given by Bellonius to that genus of *cochlea*, called the femi-circular mouthed, or femi-lunar kind, including the NERITA.

BIJUGUM *folium*, in *Botany*, denotes a winged leaf, bearing two pair of *foliola*.

BIL, in *Ichthyography*, a name given in fome parts of England to a particular fpecies of cod-fifh, called by Willughby *afellus luteus*. It is diftinguifhed from the cod by its fmallnefs, by its being fhorter and broader in its fhape, by the palenefs of its colour, and largenefs of its fcales; though it agrees with it, in having a beard under the chin.

BILANCIIS *deferendis*, a *writ* directed to a corporation, for the carrying of weights to fuch a haven, there to weigh the wool, which perfons by our ancient laws were licenfed to tranfport.

BILANDER, in *Navigation*, a fmall merchant-fhip with two maits; diftinguifhed from other veffels of the fame kind by the form of the main-fail. Few veffels are now rigged in the manner of *bilanders*; the name has been variouſly applied in different countries.

BILARIUS PORUS, BILARY *pore*, or *hepatic duct*, a conſiderable appendage of the liver, formed from the concurrence of a multitude of fmall ramifications fpringing from the glands of the liver, which unite into feveral trunks equal in magnitude to the branches of the hepatic arteries; and accompany them branch for branch through the whole fubftance of the liver; being wrapped up in the fame *capſula* with the *porta*. *See Tab. Anat. (Splanch.) fig. 5. lit. ſ.*

Thefe branches are about the fize of a wheat-ſtraw, the biggeſt large enough to admit the ſmall finger; and are diſtinguiſhable from the *porta* by their contents, being always full of bile. Beſides the *capſula* common to theſe and the *porta*, each has a thick white coat proper to itſelf, like the muſculous coat of an artery.

On the concave ſide of the liver the ſeveral ramifications meet, and form one trunk, or channel, properly called the *bilary pore*, about the bigneſs of a gooſe quill, which deſcending about two inches, meets with the cyſtic duct, and together with it forms what we call the *ductus communis*; which deſcending in a right line, about four inches, diſcharges itſelf into the *duodenum*, by an oblique inſertion, oftentimes at the ſame aperture with the pancreatic duct.

The *porus bilarius* communicates with the gall-bladder, by a duct firſt deſcribed by Dr. Gliſſon, and afterwards by Bianius and Perrault, who gave it the name of the *cyſtohepatic duct*. Verheyen, in exen, found two, three, or four of theſe *cyſt-hepatic ducts*; and the like has been obſerved in a dog, and a man.

BILATERAL COGNATION, denotes kinſhip, or kindred, on both ſides; that of the father as well as the mother.

Such is the relation of brothers, and ſiſters. *Bilateral* ſtands contradiſtinguiſhed to *unilateral*.

BILBERRY, *in Botany*, WHORTLE-BERRY.

BILBOWS, in *Sea-phraſe*, a puniſhment anſwering to the STOCKS at land.

BILCOCK, in *Ornithology*, a name given by ſome to the water-rail, a bird of the moor-hen kind, but ſmaller than the common moor-hen. *See* RALLUS.

BILDGE, or BILGE *of a ſhip*, denotes the bottom of her floor; or the breadth of that part which ſhe reſts on, when ſhe is a-ground.

BILDGE-*water*, is that which, by reaſon of the *flatneſs* of the ſhip's bottom, lies on her floor, and cannot go to the well of the pump.

The Dutch, whoſe ſhips are often of this form, uſe a ſort of pumps called *bildge-pumps*; or, as we call them, *burr-pumps*, to carry off the *bildge-water*.

When a ſhip ſtrikes on a rock, they alſo ſay, ſhe is *bilged*, or *bilged*.

BILE, BILIS, a yellow bitter juice, ſeparated from the blood in the liver, collected in the *porus bilarius*, and gall-bladder, and thence diſcharged by the common duct into the *duodenum*.

The word *bile* comes from the Latin *bilis*, which ſome derive further, from the Greek βια, *violence*; becauſe bilious people are inclined to anger: others derive it from the Latin *bullire*, *to boil*.

Bile is of two kinds; *hepatic*, and *cyſtic*.—The firſt, moſt properly called *bile*, is ſeparated immediately from the glands of the liver into the *porus* BILARIUS.—The ſecond, more properly called *gall*, is ſeparated likewiſe from the glands of the liver into the gall-bladder, by roots or ducts proper to itſelf. *See* GALL.

The *cyſtic bile* is thicker, of a deeper yellow, and bitter; though it has varied in colour and taſte in different ſubjects, and different circumſtances; is not evacuated continually, but only when its receptacle is replete; in which caſe, the contraction of the irritated fibres propels it into the *duodenum*.—The *hepatic bile* is greener, thinner, more mild and pellucid, reſembling lymph, ſubalcaline, and rather oily, and is continually oozing out; being expelled by the ſole action of the neighbouring parts. The *cyſtic bile* reſiſts acids, and, mixed with other fluids, gives them the like property: it abſterges like ſoap, and renders oils capable of mixing with water; it reſolves and attenuates reſins, gums, and other tenacious bodies, rendering them homogeneal to itſelf. It is neither alcalious nor acid, but ſeems a concretion of oil, ſalt, and ſpirits diluted with water. By a chemical analyſis, Dr. Drake obſerves it affords ſome ſulphur, or oil, ſome volatile ſalt, a good deal of fixt ſalt (in which particular it differs from all other animal liquors), and a moderate quantity of *ſaput nurtum*, or earth: the baſis is phlegm.

Dr. Mackay obſerves, that the mixture of the mineral acids with the *bile* produces a fine green colour, which he attributes to the union of the phlogiſton of the *bile* with the acid: and that the action of the concentrated mineral acids upon the *bile*, whereby they change and decompoſe it, depends on their violent attraction for the principle of inflammability: and that the neutrum which extracts the colour of the *bile*, extracts at the ſame time its bitterneſs; ſo that it no longer exhibits the phenomena depending on its phlogiſton. The vegetable acids do not decompoſe the *bile*, which, he ſuppoſes, is owing to their weaker attraction of the phlogiſton. As the brown colour of the *cyſtic bile* is reſtored by the addition of an alcali, he infers, that this colour depends on an alcaline nature acquired by the *bile* during its ſtagnation in the gall-bladder. He concludes alſo, that there is fixed air in the *bile*, becauſe the cauſtic alcali, diſſolving its coagulum, becomes mild, and capable of effervescence. From other experiments he infers, that the antiſeptic principle of the *bile* cannot reſide in the part to which it owes its coagulability, and which is exactly analogous to the lymph of the blood; but that it is probably connected with its bitterneſs, and that both are qualities of the coloring matter. Of all the animal fluids, Dr. Mackay thinks, that the milk and the *bile* are moſt analogous to one another, and to the BLOOD. See Mackay's Exp. on the Human Bile.

The

The principal use and effect of the *bile* are, by mixing with the chyle and *faces*, to attenuate, resolve, abbreige, and stimulate the *villous motions* of the intestines; as also to mix together things very different, to bruise and blunt those that are sharp and saline, to divide those that are coagulated, to open the passages for the chyle, to excite appetite, to aid the part of a ferment, and to assimilate crude things to things concocted. These effects the *cystic bile* has in a greater, the *hepatic* in a less degree.

Dr. Quincy thinks the principal use of both sorts of *bile*, is to sheathe and blunt the acids of the chyle, entangling them with its sulphur, so as to prevent their being sufficiently diluted by the pancreatic juice to enter the lacteals: which seems confirmed by this, that, notwithstanding the great quantity of acid *bile* in the aliment in the stomach, there are never any found in the chyle after it has passed the *duodenum*, and being impregnated with the *bile* continually oozing out of the ROADS *biliaries*. See ACID, and BLOOD.

Boerhaave asserts, that part of the *bile*, discharged into the intestines, re-enters the meserale veins, and, uniting with the blood of the *vena porta*, is again percolated through the liver; and Boerhaave seems of the same opinion on which footing the *bile* has its circulation, as well as the BLOOD.

Some will have the *cystic bile* brought to its receptacle three different ways, and that it is even composed of three different kinds of *bile*, whence its different properties. Though Boerhaave takes those properties rather to result from its stagnating in the gall-bladder; and, with Mahright, thinks the bitter part may probably become so in the glands, between the coats of the gall-bladder, which are furnished from the cystic arteries; whereas it proceeds bitter, and mixes with the rest in the bladder.

The influence of *bile* upon the animal economy is allowed to be very great. By its fermentative quality, it promotes digestion, in which respect, it differs widely from vegetable bitters, which are retarders of fermentation. However, in one thing it agrees with them, viz. as a corrector of acidities.

Bile speedily corrupts, but not to such a high or offensive degree as the blood or fibrous parts of the body. To this corruption of the *bile*, as one cause, Dr. Pringle attributes the paroxysms in bilious fevers: nay, all bilious disorders, as the *cholera morbus*, dysentery, &c. are thought to be chiefly owing to a redundance or corruption of the *bile*. Hence, the reason why these disorders are most frequent in hot countries, and in armies when much exposed to the sun, is, that the *bile*, if not more abundant, is in such circumstances more corrupted than usual.

The *bile* is a juice of great importance, with regard to the good or ill-habitude of the animal. Dr. Woodward has traced its effects throughout the body very minutely, and makes no scruple to ascribe most of the diseases thereof to some disorder of the *bile*. This he takes to be the chief spring in the animal machine, and from this accounts for most of the phenomena of a body, whether healthy or diseased: and yet the ancients generally took it to be no more than an excrement, for which they could not find any use.

Many of the moderns, from the small quantity of *bile* secreted, have been led into a mistake, that this secretion is not the sole end of so considerable a *viscus* as the liver.

Dr. Keil observes, that in a dog, whose common thirst was near as big as that of a man, he gathered at the rate of about two drachms an hour; though, in a human body, there is reason to think the quantity secreted to be greater.

The *bile* is a part found in all animals; even pigeons, &c. which have no gall-bladder, yet have *bile* in their liver being found very bitter. Mr. Lauvry observes, that the *bile* becomes one of the principle causes of THIRST, by mixing with the salival juice.

Sometimes the *bile* from yellow becomes greenish, like verdigrise, and frequently pale, like the yolks of eggs, and that without any other apparent cause than a little motion, a convulsion, or a violent passion of the mind. This occasions many and terrible diseases; as nausea, an abhorrence of food, anxiety, sighing, cardialgias, wind, diarrhœas, dysenteries, acute diseases, fevers, and convulsions.

Sometimes it becomes black, and takes the name of *chalor*: in this case it sometimes tastes like a very sharp vinegar; sometimes like putrefied blood; gnawing, burning, disturbing, consuming, occasioning inflammations, gangrenes, mortifications, violent pains, and terrible fermentations.

Of ATRA *bilis*, or *black bile*, Boerhaave distinguishes three kinds: first, the mildest, arising from the matter of the blood, put in too great a motion, which hence takes the name of the *adust*: the second is an aggravation of the first, arising from the same cause only heightened: the third is a corrupt, parched *bile*, which is it more from a greenish or pallish sort, is still worse.

Too great an evacuation of the *bile*, either upwards or downwards, robs the chylefaction of its main instrument; hence it prevents digestion, fecession, excretion of the *faces*, and produces an acid temperament, coldness, weakness, faintness, swoonings, &c. When the stomach is full, the *cystic bile* is more copiously discharged into the *duodenum*; when it is empty, the *hepatic bile* is more freely secerned in the gall-bladder. If the *bile*, when purposed, be prevented its discharge into the intestines, it produces a JAUNDICE, and an overflowing of the GALL.

BILE, *secretion of the*.—For the manner in which the *bile* is separated in the liver, there are various opinions. Some maintain, that the pores of the secretory glandules of the liver have a certain configuration and magnitude, to which the particles of the *bile* floating in the blood being all subservient, both in bulk and figure, are admitted in, and all the rest excluded. Others, with Silvius and Lister, not allowing any difference in the configuration, as knowing that the pores of all the vessels are circular, and that particles of all kinds will be admitted, if small enough, have recourse to a ferment, which they suppose to reside in the liver, by means whereof the particles of the blood, in their passage through the secretory ducts, assume the form of *bile*. But, as this is little else than begging the question, others have recourse to another hypothesis; maintaining, that the fluids contained in the blood of the *vena porta*, while that enters the substance of the liver in its way to the extremities of the *vena cava*, indifferently apply to the apertures of the secretory tubes contiguous to the extreme branches of the *porta*, which are wide enough, and to the roots of the *cava*, which are not wide enough to receive them; by which means, being separated from the society and the intestine motion of the other and essential part of the blood, and being no longer agitated by the vital action of the blood-vessels, and becoming exposed to the actions of the biliary vessels, they constitute a new humour, different from the blood, called *bile*, &c. Dr. Keil accounts for the secretion of the *bile* from the strong attraction between the particles whereof it is composed. He observes that the heart and liver being so near each other, were the coeliac artery to have carried all the blood to the liver, considering the velocity of the blood, to effect a secretion as the *bile* could never have been effected. Nature, therefore, forms a vein for the purpose; viz. the *porta*; and by it sends the blood from the branches of the mesenteric and coeliac arteries to the liver; by which the blood is brought a great way about, passing through the intestines, stomach, spleen, and *pancreas*, before it arrives at the liver: thus its velocity is exceedingly diminished, and the particles that are to form the *bile* have a sufficient time to attract one another, and unite, before they come to their secerning vessels. But, as if this diminution of velocity were not sufficient for the purpose, nature has gone farther, having made the cavities of all the arteries increase as they divide: thus the sum of the branches, arising from the *aorta*, is to the *aorta* itself, as 102740 to 100000. And yet, as if that proportion were too little for the present purpose, nature has here taken a further step, and increased the branches springing from the mesenteric artery in a greater ratio. Thus, in a body which he examined, he found the sum of the branches more than double that of the trunk; and therefore the velocity of the blood, in the former, must be less than half that of the latter. He further shews, from a just calculation, that the time the blood now takes, in its passage from the *aorta* to the liver, is at least seven-six minutes; whereas, had an artery gone directly from the *aorta* to the liver, it would have passed in less than half a second; viz. 2437 times in the space it now takes up in its passage. Whence it appears, that the blood was not in a state fit to yield *bile*, had it gone directly from the *aorta* to the liver; and that a longer time, and more languid motion, was necessary to have the bilious particles in a readiness to be separated. He adds, that did the humours exist in the glands the same as they are found after fecretion, nature would not, on this occasion, have been at so much expence to retard the blood's velocity; besides, that the *bile* has another advantage from the use of the *porta*: for, by running through so many parts before it reaches the liver, it leaves behind it most of its *lymph*; by which means the particles being brought nearer each other, are, by their mutual attraction, sooner united. But it has been objected, that this account is too systematical. See GALL, SECRETION, &c.

BILIARY *concretions*, found in the passage of the *bile*, or in the gall-bladder, commonly called gall-stones, are not of a cretaceous nature, but are merely coagula of the

fale formed by an acid; which, being allowed to ſtagnate, acquire a ſtony hardneſs.

BILGE, *ſee* BILGE.

BILIMBI, in *Natural Hiſtory*, the name of an Eaſt India tree, very famous throughout that part of the world for its uſes in medicine. European botaniſts have called it MALUS *Indica fructu pentagono*, or the India apple-tree, with the five-cornered fruit.

It ſeldom grows to above twelve feet high, and is not commonly wild, even in the Eaſt Indies, but is carefully cultivated in gardens, where it flowers all the year round. The juice of the root is drank as a cure for fevers. The leaves boiled, and made into a cataplaſm *with rice*, are famed in all ſorts of tumors, and the juice of the fruit is uſed in almoſt all external heats, dipping linen rags in it, and applying them to the parts. It is drunk, mixed with arrack, to cure diarrhœas: and the dried leaves, mixed with betel leaves, and given in arrack, are ſaid to promote delivery. The fruit is pleaſant to the taſte when fully ripe, and is commonly eaten, when ſmaller, and unripe, it makes a very pleaſant pickle.

BILINGUIS, *in Law*, *ſee* MEDIETAS *Linguæ*.

BILINGUIS *properly denotes a perſon who has two tongues in his mouth*: an inſtance of which is given by Dr. Hunt. It is alſo uſed for a perſon who ſpeaks two languages.

BILIOUS *complexion*, &c. CHOLERIC, COMPLEXION, TEMPERAMENT.

BILIOUS *colic*, *ſee* COLIC.

BILIOUS *fever*, a term uſed by medical writers to expreſs ſuch fevers as ariſe from an immoderate effuſion of the bile. Theſe often ariſe from violent fits of anger in the patient. Of this nature are the *cholerica febris*, and *cauſus*.

Dr. Pringle, in his Obſervations on the Diſeaſes of the Army, remarks, that the *bilioſa* or putrid fever is epidemic in camps, eſpecially in low and marſhy countries, where the air, being moiſt and full of putrid effluvia, tends to relax the fibres and promote putrefaction. As to the ſymptoms of the *bilioſa* fever, it always begins with *chilliness* and laſſitude, pains of the head and bones, and a *diſguſt* at the ſtomach. At night the fever runs high; the heat and thirſt are great; the tongue is parched; the head aches violently; the perſon gets no reſt, and often becomes delirious; but generally in the morning an imperfect ſweat brings on a remiſſion of all the ſymptoms. In the evening the paroxyſm returns, but without any cold fit, and is commonly worſe than the former: on the ſecond morning it remits as before. Theſe periods go on daily, till the fever changes inſenſibly, either into a confirmed, or into an intermitting ſtate. Sometimes looſe ſtools carry off the *fit*, and ſupply the place of ſweat: however, though it reſembles an ague in many particulars, yet it is rare to meet with a real ague in the camp, unleſs the perſon has been ill of it before he took the field. The remiſſions uſually appear from the beginning, eſpecially if the patient has been plentifully bled: but ſometimes there are no remiſſions for the laſt two or three days. Hæmorrhages of the noſe happen frequently in the height of the paroxyſm, and always bring on the remiſſion ſooner, and make it fuller. Vomiting and purging have the like effects. The fits are ſeldom preceded by ſhiverings, or any ſenſe of cold after the firſt attack; the pulſe is always full and quick during the paroxyſms, and in the remiſſions it ſtill indicates ſome degree of fever. The blood is fluid, the *craſſamentum* is firm, in large quantity, and ſinks in the *ſerum*. Whilſt the weather continues warm, the *bilioſa* ſymptoms are moſt frequent, but as winter approaches, the INFLAMMATORY ones prevail.

The doctor enumerates other ſymptoms, as cruſtineſs of the urine, *bilioſa* ſtools, coſtiveneſs, &c. and further obſerves, that the infantry are more liable to it than the cavalry.

As to the cure of the *camp-fever*, before it becomes confirmed, it depends upon the proper uſe of evacuations, the nouriſhing diet, and the bark. Bleeding he judges indiſpenſible; which he would have repeated once or oftener, according to the urgency of the ſymptoms. After bleeding it will be neceſſary to give an emetic, the beſt time for doing which is in the remiſſion of the fever, and rather ſooner after a paroxyſm than before one. He adds, however, that vomits do harm when the ſtomach is much inflamed; in which caſe they ought never to be given. Ipecacuanha is the faſeſt and eaſieſt, but antimonials make the moſt effectual vomit. If the body remains coſtive, it is neceſſary to open it with ſome lenient phyſic; and eſpecially if the bowels are affected with pains, or a *tenſmus*. He likewiſe recommends ſalt of wormwood, lemon juice, *ſpiritus Mindereri*, and the bark; which laſt ought not to be given till the urine breaks, and the intermiſſions take place. Bleeding and purging are alſo neceſſary before the bark ought to be given: it anſwers beſt in ſubſtance, adminiſtered in Rheniſh wine, after ſtanding a night in infuſion.

If, after remiſſions, or intermiſſions, the diſeaſe changes into a continued fever, bleeding becomes neceſſary, unleſs other ſymptoms forbid it; but whether there be room for bleeding or no, bliſters are not only uſeful, but the beſt remedy. To theſe may be joined the neutral ſalts and diaphoretic powders. But, though a ſweat be the proper *criſis*, it ought never to be promoted by *cordials*, or the like hot medicines; unleſs the pulſe ſhould ſink, and the *lethargic* or other bad ſymptoms appear: in which caſe, the warmer alexipharmics are neceſſary, as the diſeaſe is changed into a MALIGNANT FEVER. *See Malignant catarrhal* FEVER.

BILL, in *Huſbandry*, denotes an edge-tool, of the ax kind, with a hooked point, fitted to a handle, and uſed to lop boughs of trees, &c.—When ſhort, it is called an *hand-bill*; when long, an *hedge-bill*.

BILL, in *Commerce*, denotes a ſecurity for money under the hand, and ſometimes ſeal, of the debtor, without any condition or forfeiture, in caſe of non-performance.—In which it is diſtinguiſhed from a bond or obligation. It has been uſually defined a writing, wherein one man is bound to another to pay a ſum of money, on a day that is future, or preſent upon demand, according to the agreement of the parties at the time when it is drawn, and the dealings between them.

BILL, in *Law*, denotes a declaration in writing, expreſſing a wrong, or grievance, which the complainant hath ſuffered by the party complained of; or elſe ſome offence committed by him againſt ſome law or ſtatute of the realm. This *bill* is commonly addreſſed to the lord chancellor, eſpecially for unconſcionable wrongs done ſometimes to others having juriſdiction, according as the law they are grounded on directs. It contains the fact complained of, the damages ſuſtained, and the petition of proceſs againſt the defendant for redreſs.

BILL, in PARLIAMENT, denotes a paper containing propoſitions offered to the houſes, to be paſſed by them, and then to be preſented to the king to paſs into an act or law.

BILL *of attainder*, *ſee* ATTAINDER.

BILL *of appeal*, *ſee* APPEAL.

BILL *of* EXCHANGE, a ſhort note, or writing, ordering the payment of a ſum of money in one place to ſome perſon aſſigned by the drawer, or remitter, in conſideration of the like value paid to him in another place. *See* REMITTANCE.

The whole eſtate and effects of merchants often conſiſt in *bills of exchange*.

A *bill of exchange* is an inſtrument ſo noble and excellent, that though it want thoſe formalities required by the common laws as ſeal, delivery, and witneſſes; and ſo cannot be deemed a ſpecialty; yet is it ſuperior to any bond or ſpecialty by the reſpect that is paid it, and the punctuality and preciſeneſs of the payment.

There is ſome diſpute about the nature and function of a *bill of exchange*: ſome take it to be a contract of permutation, or exchange; but the more general opinion is, that it is a mere contract of buying and ſelling; that the money given the perſon who draws the bill is the price of ſale; and that paid at the appointed place, the thing bought and ſold.

Bills of exchange were unknown in the ancient Roman commerce, as well as juriſprudence. According to the common opinion, they are the invention of the Jews: who, being baniſhed France, for ſome enormous crimes charged on them, retired into Lombardy about the twelfth century, and found means to withdraw their effects, which they had lodged in the hands of friends, by ſecret letters and *bills* conceived in ſhort preciſe terms, like the modern *bills of exchange*; and this, by the aſſiſtance of merchants and travellers.—The faction of the Gibellins, being expelled Italy by the Guelphs, retired to Amſterdam, and uſed the ſame means, for the recovery of their effects in Italy, as the Jews had done; hence the Dutch merchants took the hint of negotiating *bills of exchange*; and ſoon ſpread the practice throughout all Europe.—The ſame Gibellins are ſaid to be the inventors of the *exchange*, on account of damages and intereſts, when *bills of exchange*, which they call *lettres de combat*, are not paid, but returned on proteſt. *See* RE-EXCHANGE.

That which conſtitutes the form and eſſence of a *bill of exchange*, is, the ceſſion, or tranſferring of a ſum of money made by the drawer, to him on whoſe account it is drawn, to be received of a correſpondent in another place; which ceſſion, or tranſfer, is made, in the mercantile terms, *for value received*, i. e. for a like ſum given by the perſon for whoſe ſake the *bill* is drawn, to the drawer, in money, merchandize, or other effects.

There are therefore three things neceſſary to conſtitute a *bill of exchange*. 1ſt, That it be drawn in one city on another. 2dly, That there be three perſons concerned; the

the drawer, the preſenter, or the perſon for whom it is drawn, and the ACCEPTOR, or he on whom it is drawn. 3dly, That it make mention, that the value which the drawer has received, is either in *bills of exchange*, in money, merchandize, or other effects, which are to be expreſſed; otherwiſe it is no *bill of exchange*.

When a *bill of exchange* is expreſſed to be *value in myſelf*, it is not ſuppoſed the drawer has received the ſum; but the perſon for whom it is drawn ſtands debtor to him for it.—When a *bill of exchange* bears, *for which ſum I promiſe to furniſh bills of exchange* to ſuch a place, the perſon for whom the *bill* is drawn may compel him to give the *bills*, or to return the money.

Bills of exchange may be divided into *inland* and *outland*. *Outland*, or *foreign bills*, are thoſe made for money taken up in ſome other country and to be paid in England; or *vice verſa*.—*Inland bills* are thoſe made for money taken up in one part of the kingdom, and to be repaid in another.—By the ſtat. 9 and 10 Will. III. theſe latter are made equally binding with the former: and the method of proceſſing ſuch *bills* is farther regulated by 3 and 4 Anne. See NOTE.

BILLS, *Lombard*, are inſtruments of an uncommon kind and figure, uſed in Italy and Flanders, and of late alſo in France; conſiſting of a piece of parchment, cut to an equal angle, about an inch broad at top, and terminating in a point at bottom; chiefly given, where private perſons are concerned in the ſitting out of a ſhip on any long voyage.

The manner is this: the party who is deſirous to be concerned in the cargo or venture, carries his money to the merchant, who fits out the ſhip, where it is entered down in a regiſter; at the ſame time the merchant writes down on a piece of parchment, upwards of an inch broad, and ſeven or eight inches long, the name of the lender, and the ſum lent, which being cut diagonallwiſe, or from corner to corner, each party retains his half. On the return of the veſſel, the lender brings his moiety to the merchant, which being compared with the other, he receives his dividend accordingly. Much the ſame is practiſed in Holland, by thoſe who lend money on pledges: the name of the borrower, and the ſum, are written on a like ſlip of parchment, which is cut in two, and half given to the borrower, and the other half ſtitched to the pledge; that, upon comparing them together again, the borrower may receive his goods on paying the money ſtipulated.

BILL, *to vote a*. See VOTE.

BILL, *to proteſt a*. See PROTEST.

BILLS, *bank*, are notes or obligations ſigned on behalf of the company of the BANK, by one of their caſhiers, for value received. See NOTE.

BILL *of parcels*, an account of the particular ſorts and prices of goods bought, given by the ſeller to the buyer.

BILL *of lading*, an inſtrument ſigned by the maſter of a ſhip, acknowledging the receipt of a merchant's goods, and obliging himſelf to deliver them at the place to which they are conſigned, in good condition.

Of ſuch *bills* there are uſually three; the *firſt*, the merchant keeps; the *ſecond* is ſent to the factor to whom the goods are conſigned; and the *third* is kept by the maſter of the ſhip.

BILL *of ſale*, is when a perſon wanting a ſum of money, delivers goods as a ſecurity to the lender, to whom he gives this *bill*, impowering him to ſell the ſaid goods, in caſe the ſum borrowed is not repaid, with intereſt, at the time appointed.

BILL *of ſtore*, a kind of licence granted at the cuſtom-houſe to merchants to carry ſuch ſtores and proviſions as are neceſſary for their voyages, outwards.

BILL *of ſufferance*, a licence granted at the cuſtom-houſe to a merchant, to ſuffer him to trade from one Engliſh port to another, without paying cuſtom.

BILL *of entry*, an account of goods entered at the cuſtom-houſe, both inward and outward; wherein is expreſſed, the merchant importing or exporting, the quantity of goods, and the ſorts, and from whence imported, or to what place exported.

BILLS *of mortality* are weekly liſts compiled by the pariſh-clerks in and about London, containing the numbers of ſuch as die of each diſeaſe, as well as of thoſe that are born, every week. See MORTALITY.

BILL *of rights*. See RIGHTS.

BILL, in *Phyſiology*, is a cartilaginous ſubſtance covered with a ſkin or *cutis*, which forms the beak, or *roſtrum*, of a BIRD.

The *bill* does the office of teeth in ſome birds; alſo of weapons of offence. In the parrot kind it is hooked, and ſerves to climb, and catch hold of boughs. The upper *bill* of this bird is filled with rows of croſs bars; and the under bill, which is much ſhorter, ſhuts within the upper, and draws againſt the roof of the mouth; by which means a kind of maſtication is effected, before the meat paſſes into the craw. The PHOENICOPTER's *bill* is a true *hyperbole*, poiſed at the end like a ſword: and what is remarkable, the upper *bill* of this bird moves in eating, the lower being fixed, which is the contrary of what is found in all other kinds. The wood-pecker's *bill* is ſtrong, and ſharp enough to dig holes, and build in the heart of the hardeſt timber. See PHOENICOPTERUS and PICUS. Phil. Tranſ. N° 211. p. 353. N° 350. p. 509.

In the iſland of Fero, a fixed reward is given for the *bills* of ravenous birds: all watermen are obliged to bring a certain number yearly to the country court, at the feaſt of St. Olaus; when they are thrown into a heap, and burnt in triumph. Plott gives divers inſtances of monſtrous irregularities in the *bills* of birds; particularly of a raven, whoſe mandibles graſped each other, the lower chap running upwards, and the other downwards. Plott's Nat. Hiſt. Oxfordſh. ch. viii. § 4.

BILL, *crane's*, among *Chemiſts*, the beginning of the fineſt proceſs of the philoſopher's ſtone, diſcovered by the Rhodians of the matter, called alſo the *crane's head*.

BILLYARA, *the bill is true*. The grand jury indorſing a *bill* when by any crime puniſhable in that court is preſented to them, with the words *billa vera*, finally cherries, that the preſenter has furniſhed his preſentment with probable evidence, and worthy of further conſideration; whereupon the party preſented is *laid to ſtand indicted* of the crime, and bound to make anſwer thereto, either by confeſſing or traverſing the indictment.

BILLARD, in *Ichthyology*, an Engliſh name for the young of the cod-fiſh, or rowling-pollack, up to a certain ſize, as the cod to a certain ſize is called a *codling*. Willoughby.

BILLES, in *Trade*, a name given by the French, and afterwards by other nations, to the maſſes of raw ſilk, or ſuch as has been tempered for ſale, and is ready to be wrought into cloth, &c. This in working loſes its temper, but it recovers it again by plunging it into cold water.

BILLET, in *Heraldry*, a bearing, in form of a long ſquare. See *The Herald. fig. 9.*

Billets are ſaid to be couched, or inverted, when their longeſt ſide is parallel to the top of the *eſcheld*, and the ſhorteſt perpendicular.

They are ſuppoſed to repreſent pieces of cloth of gold or ſilver, longer than broad, placed as a diſtance by way of ornament, on coaths, and afterwards tranſlated to their coat-armour; though Guillim takes the *billet* to repreſent a letter folded up.

A coat is ſaid to be *billeted*, when it is charged with *billets*; thus, he bears *argent billettée* a croſs engraiſed gules by the name of *Heathe*. Bloom ſays, the number of the *billets* muſt be expreſſed when they are not above ten.

BILLET, *Billette*, in the *French Cuſtoms*, a little ſign in form of a cake, hung up at places where toll is to be paid, to adverriſe paſſengers and carriages, that before they advance farther, the dues are to be paid to the king, or the lord who is charged with the care of repairing the highways.

BILLETS *for fuel*, are to be three feet four inches long, and the bund twenty-four inches round.

BILLETING *of ſoldiers*, is the lodging or quartering of them in the houſes of the inhabitants of a place.

BILLETINS. See BROTHERS *of Charity*.

BILLIARDS, an ingenious kind of game played with two ſmall ivory balls, on an oblong table, covered with green cloth, and placed exactly level, which balls are driven by ſticks, made on purpoſe, alternately againſt each other with a view to puſh the paſſive ball into hazards or holes, on the edges and corners, according to certain laws, or conditions of the game.

The word comes from the French, *billard*, of *bille*, the ball made uſe of; and that from the Latin *pila*, a *ball*.

BILLON, BILLO, in *Coinage*, a kind of baſe metal, either of gold or ſilver, in whoſe mixture, copper predominates.

The word is French, formed according to Menage, from the Latin *billa*, or *bulla*, *bullion*.—We do not find it is naturalized among us; but the neceſſity we are frequently under of uſing it in the courſe of this work, required its being explained.

According to M. Boutteroue, *billon of gold* is any gold beneath ſtandard, or twenty-one carats; and *billon of ſilver*, all below ten penny-weights. But, according to others, and amongſt the reſt, M. Bolzard, gold and ſilver beneath the ſtandard, as far as twelve carats, and ſix penny-weights, are properly baſe gold and ſilver; and all under thoſe, *billon of gold* and *billon of ſilver*, in regard copper is the prevailing metal.

BILOCULAR, in *Botany*, a term applied to a CAPSULE having two cells.

BILUR, in *Natural Hiſtory*, a name given by many of the Arabian writers to a gem, which, though they often mention, yet they leave no where given us a deſcription of. Some have imagined it the ruby, and others the *beryl*; but it appears more probably to have been a ſpecies of cryſtal; probably the pebble-cryſtal of the Eaſt Indies, which is conſiderably finer than the common ſpeig-cryſtal,

tal, and is often sold under the name of the white sapphire; though confiderably inferior, both in luftre and hardneſs, to the true white ſapphire.

BIMEDIAL, in *Mathematics*. When two medial lines, as AB and BC, commenſurable only in power, and containing a rational rectangle, are compounded, the whole AC ſhall be irrational, with reſpect to either of the two, and is called a *firſt bimedial* line. Euck. lib. x. prop. 38.

BINACLE. See BITTACLE.

BINARY *number*, that compoſed of two units. See NUMBER.

BINARY *arithmetic*, a method of computation, firſt propoſed by M. Leibnitz; wherein, in lieu of the ten figures in the common arithmetic, and the progreſſion from 10 to 10, he has only two figures, and uſes the ſimple progreſſion from two to two.

Joſ. Peliſon of Prague has more largely explained the principles and practice of the *binary* arithmetic, in a book entitled, Arithmeticus ſeptenarius, qui tria numerorum genera. 1712.

All his characters uſed in this arithmetic are 0 and 1; and the epithet, *bene*, multiplies every thing by 2, as in the common arithmetic by 10. Thus 1 is once 1, two; 11, three; 100, four; 101, five; 110, ſix; 111, ſeven; 1000, eight; 1001, nine; 1010, ten, *&c.* which is founded on the ſame principles with the common arithmetic.

Hence immediately appears the reaſon of the celebrated property of the duplicate geometrical proportion in whole numbers; viz. that one number of each degree being had, we may thence compoſe all the other whole numbers above the double of the higheſt degree. In being binary, v. gr. as if one ſhould ſay, 111 is the ſum of 4, 2, and 1, which property may ſerve whoſoever has to weigh all kinds of maſſes with a little weight; and may be uſed in coins, to give ſeveral values with ſmall pieces. This method of expreſſing numbers once eſtabliſhed, all the operations will be eaſy: in multiplication particularly, there will be no need for a table, or getting any thing by heart.

100	4
10	2
1	1
111	7

The author, however, does not recommend this method for common uſe, becauſe of the great number of figures required to expreſs a number; adding, that if the common progreſſion were from 12 to 12, or from 16 to 16, it would be ſtill more expeditious: but its uſe is in diſcovering the properties of numbers, in conſtructing tables, *&c.*

What makes the *binary* arithmetic the more remarkable is, that it appears to have been the ſame with that uſed 4000 years ago among the Chineſe, and left, it ſeems, by Foh, the founder of their empire, as well as of their ſciences.

M. Lagni has propoſed a new ſyſtem of logarithms, on the plan of the *binary* arithmetic; which he ſays ſhorter, more eaſy and natural, than the common ones.

BINARY *meaſure*, in *Muſic*, is that which is beaten equally, or where the time of riſing is equal to that of falling. See TIME and MEASURE.

BINATED *leaf*, in *Botany*, a digitate leaf, conſiſting of two *foliola*.

BIND-*weed*. See CONVOLVULUS, and BRYONY.

BIND-*weed, ſmall*. See SMILAX.

BIND-*weed, ſea*. See SOLDANELLA.

BINDER-*reed*, the weakeſt kind of *ſun-reed*. See TARRING.

BINDING *joiſts*, in *Architecture*, are thoſe joiſts in a floor, into which the trimmers of ſtair-caſes, or well-holes of the ſtairs, and chimney-ways, are framed; they ought to be ſtronger than common joiſts.

BINDING, in the *Art of Defence*, a method of ſecuring or croſſing the adverſary's ſword with a preſſure, accompanied with a ſpring from the wriſt. See BEATING.

Unleſs a man, by ſome kind of croſs, ſecure, as it were, or render his adverſary's ſword incapable to offend him during the time of his performing a leſſon upon him, it is impoſſible for him to be certain but that he may receive from his adverſary, either a fortuitous *contretemps*, or an exchanged thruſt, before the recovery of his body, or going off after a thruſt.

The great objection made by ſome people, particularly thoſe time-catchers, againſt the frequent uſe of *binding*, is, that when a man, in performing it, cleaves too much to his adverſary's ſword, he is liable to his adverſary's ſlipping of him, and conſequently of receiving either a plain thruſt, or one from a feint.

BINDING is a term in *Falconry*, which implies ſtaring, or when a hawk ſcizes.

BINDING *leaf*. See BOOK-*binding*.

BINN, *bina*, a ſort of cheſt or cupboard, wherein to lock up bread, meat, or other proviſions.

The word is alſo uſed for a place boarded up to put corn in.

BINN, or BIN. The peaſe and oatmeal, uſed at ſea, are apt to ſpoil in caſks. Dr. Hales propoſes to prevent this by putting them into large *binns*, with falſe bottoms of hair cloths laid on bars, whereby freſh air may be blown upwards through them, at proper times, with ſmall VENTILATORS.

BINOCLE, or BINOCULAR *teleſcope*, from *binus*, *double*, and *oculus*, *eye*, that to which both the eyes may be applied, and conſequently the ſame object be obſerved at the ſame time by both.

It conſiſts of two tubes, with two ſets of glaſſes of the ſame power, and adjuſted to the ſame axis; and ſome have pretended that it repreſents objects much larger and clearer, than a ſingle, or MONOCULAR glaſs.

But this is only an illuſion, occaſioned by the ſtronger impreſſion, which two equal images alike illuminated make upon the eye. This method of conſtruction was invented by father Rheita, and brought into uſe by father Chereau of Orleans. There are alſo microſcopes of the ſame kind, but very ſeldom uſed.

BINOMIAL, or BINOMIAL, from *bis*, *twice*, and *nomen*, *name*, in *Algebra*, a root conſiſting of two parts, or members, connected by the ſign +, or −.

Thus $a+b$ and $x-z$ are *binomials*, conſiſting of the ſum and difference of thoſe quantities; though the latter is uſually called a RESIDUAL.

The powers of a *binomial* are found by a continual multiplication of it by itſelf, as often as unit is contained in the index of the power required. Thoſe of a *reſidual*, $a-b$, are obtained in the ſame manner, only with this difference in the reſult, that the terms in which the exponent of b is an odd number, will be negative.

If a root have three parts, as $a+b+c$, it is called a TRINOMIAL; if more, a MULTINOMIAL.

BINOMIAL, *impoſſible*, in *Algebra*, is uſed for a *binomial*, one of the terms of which is an impoſſible quantity. Thus, $a+\sqrt{a^2+b}$, is an *impoſſible binomial*.

BINOMIAL *ſurd* is uſed for a *binomial*, the terms of which are ſurds: as $\sqrt{a^2+b}+\sqrt{b}$, or a^m+b^n, if m and n be fractions. The term *binomial ſurd*, is alſo applied to any quantity having a rational part and a ſurd part, as $25+\sqrt{968}$.

For the extraction of roots of *binomial ſurds*, ſee Newton's Arithmetica Univerſalis, and Mac Laurin's Algebra, p. 124—130.

BINOMIAL *curve* is uſed for a curve, the ordinate of which is expreſſed by a *binomial*. Thus if the ordinate of a curve be

$$y=\sqrt[n]{x^m}+\sqrt[q]{x^p},$$

of this form $z+\sqrt{x^3}$, the curve is called a *binomial curve*. Stirling, Method. differ. p. 58.

BINOMIAL *theorem* is often uſed to ſignify Sir Iſaac Newton's theorem for raiſing a *binomial* to any power, or for extracting any ROOT of a *binomial*.

This *theorem* may be inveſtigated and explained in the following manner: whatever power of $a+b$ be required, it is obvious, from a continued multiplication of this quantity into itſelf, that the index of a in the firſt term is equal to the index of the power required; and that the indices of a decreaſe by the ſame difference, viz. unit, ſo as to become 0 in the laſt term; the quantity being $a^m=a$. Thoſe of b increaſe; in the firſt term it has 0 for its index, in the ſecond 1, *&c.* and in the laſt term its index is the ſame with that of a in the firſt; and the ſum of the indices of both quantities in every term is the ſame, or equal to the index of the power required. The coefficient for any term is eaſily found; that of the firſt term being unit, by multiplying the coefficient of the preceding term by the index of a in the ſame term, and dividing the product by the index of b in the given term, and continuing the operation, till the number of coefficients after the firſt be equal to the number of units in the index of the power required. Whence it appears that the coefficients increaſe, till the indices of the two quantities are equal, in a power denominated by an even number; and in a power denominated by an odd number thoſe of the two middle terms are the ſame; and then the remaining coefficients decreaſe in the ſame order. Thus, if $a+b$ is to be raiſed to a power denoted by m, $a+b^m$ will be equal to $a^m+ma^{m-1}b+m\times\frac{m-1}{2}\times a^{m-2}b^2+m\times\frac{m-1}{2}\times\frac{m-2}{3}\times a^{m-3}b^3+m\times\frac{m-1}{2}\times\frac{m-2}{3}\times\frac{m-3}{4}\times a^{m-4}b^4$, *&c.* The ſame *theorem* may be eaſily applied to the *evolution* of powers, or the *extraction* of any root; the index in this caſe being a fraction whoſe denominator is equal to the index of the root required. E. gr. $\sqrt{a+b}=a+b^{\frac{1}{2}}=a^{\frac{1}{2}}+\frac{1}{2}\times a^{-\frac{1}{2}}b+\frac{1}{2}\times\frac{-\frac{1}{2}}{2}\times a^{-\frac{3}{2}}b^2+\frac{1}{2}\times\frac{-\frac{1}{2}}{2}\times\frac{-\frac{3}{2}}{3}\times a^{-\frac{5}{2}}b^3$, *&c.* $=a^{\frac{1}{2}}+\frac{1}{2}\times a^{-\frac{1}{2}}b-\frac{1}{8}\times a^{-\frac{3}{2}}b^2+\frac{1}{16}\times a^{-\frac{5}{2}}b^3$, *&c.*

$a^{-\frac{1}{2}} \pm \frac{1}{2} \times -\frac{1}{2} x \pm \frac{1}{2} \times a^{-\frac{1}{2}} y^2$, &c. $= a^{\frac{1}{2}} \mp \frac{1}{2} a^{-\frac{1}{2}} y^2 - \frac{1}{2} \times a^{-\frac{1}{2}} y^2 \mp \frac{1}{2} \times \frac{-1}{2+1} \times a^{-\frac{1}{2}} y^2$, &c. $= a^{\frac{1}{2}} \mp \frac{y^2}{2a} - \frac{y^4}{8a^2} \mp$, &c. See ROOT, REVERSION, SERIES, &c.

BINOMIUS, from *bis* and *nomen*, *name*, in *Middle Age Writers*, denotes a person with two names.

Most Christians anciently were *binomii*, as having had other names in their heathen state, which they changed at their conversion. Besides, it was an ancient custom for parents to give names to their children immediately after they were born, and sometimes other different ones afterwards at their baptism: one of which frequently become a *cognomen*, or surname. In reality it was a constant practice to assume a new name at baptism, as the religious still do in the Romish church, on their reception into the monastic state; or the Jewish proselytes at their circumcision.

BIOCOLYTÆ, in the *Byzantine Empire*, an order of officers appointed to prevent the violences frequently committed by the soldiers.

The word is compounded of βια, *vis*, *violence* and κωλυω, *I hinder*; and should rather be written *biocolytæ*.

The *biocolytæ* appear to have been much the same with the French archers of the Marshalsea. They were suppressed by the emperor Justinian.

BIOGRAPHER, an author who writes a history, or life, of one or more persons.—Such were Plutarch, Corn. Nepos, &c.

The word is formed from the Greek βιος *life*; and γραφω, *I describe*.

BIOGRAPHY, the art of describing or writing lives.

Biography is a branch or species of history more entertaining, as well as more useful in many respects, than general history, as it represents great men more distinctly, unincumbered with a crowd of other actors, and descending into the detail of a man's actions and characters, gives more light into human nature, as well as carries us more to imitation. See an excellent paper on *biography* in the Idler, and in the Annual Register, vol. i. p. 436. an. 1759.

BIOLYCHNIUM, a substantial fire, flame, or HEAT, which some physicians suppose actually lodged, or inherent in the heart, and remaining there as long as life lasts.

The word *biolychnium* is compounded of the Greek βιος, *life*, and λυχνος, *light*.

Some will have it to have been the human soul, others the animal spirits, and others the Deity, that did the office of a *biolychnium*, and was the spring of all the actions and motions of the body. See BLOOD, &c.

Cafs. Hoffman, and Conringius have written treatises expres on the ancient doctrine of the lamp of light, or innate heat.

BIOLYCHNIUM is also a denomination of a peculiar kind of vital balsam, prepared from human blood; the process of which is described by Beguinus. J. Ern. Burgravius has a treatise expres on it.

BIOTA, in *Zoology*, a name introduced by Dr. Hill for the POLYPE.

It is of a cylindric figure, but variable; the *tentacula* are arranged in a single series, round the aperture of the mouth, at the extremity of the body. There are several species of this animal.

Linnæus calls this creature *hydra*, no doubt from the reproduction or repullulation of the parts, when cut off; and this name, *biota*, is likewise given it on the same account, being derived from βιοω, *live*.

BIOTHANATI, from βιος, *violence*, and θανατος, *death*, in some *Medical Writers*, denotes those who die a violent death.

The word is also written, and with more propriety, *biathanati*; sometimes *biaethanati*.

In a more particular sense, it denotes those who kill themselves, more properly called *autothanati*. See MURDER.

In this sense it is, that the word is used both by Greek and Latin writers. By the ancient discipline of the church, they were punished by denying them burial, and refusing all commemoration of them in the prayers and offices of the church.

BIOTHANATI, supposed by some to be derived from βιος, *life*, and θανατος, *death*, and alluding to the belief of a future life after death, was also a name of reproach given by the heathens to the primitive Christians, for their constancy, and forwardness to lay down their lives in martyrdom.

BIOTHANATOS is also used in some writers of the barbarous age for wicked, damnable, or accursed. Du-Cange

BIOUAC, BIVOUAC, or BIVAC, in the *Military Art*, a nightly guard performed by the whole army, when there is an apprehension of danger from the enemy.

The word is formed, by corruption, from the German *wey-wacht*, a *double watch* or *guard*.

BIPARTIENT, in *Arithmetic*, is a number that divides another into two equal parts without a remainder. Thus 2 is a *bipartient* to 4, &c.

BIPARTITE *leaf*, in *Botany*, signifies a leaf divided into two segments.

BIPARTITION signifies such dividing.

BIPENNIS, in *Roman Antiquity*, a two-edged ax, used anciently by the Amazons in fight; as also by the seamen to cut asunder the ropes and cordage of the enemy's vessels.

The *bipennis* was a weapon chiefly of the oriental nations, made like a double ax, or two axes, joined back to back, with a short handle. Some compare it to the figure of a pen, and suppose it hence to have acquired the name *bipennis*; the tube or barrel of the pen representing the handle, and the point or nib the head. Modern writers usually compare it to our HALBARD, or *partisan*; from which it differed in that it had no point, and that its shaft or handle was much shorter.

BIPES, *amphibium*. See SIREN.

BIQUADRATE, or BIQUADRATIC, is the next POWER above the cube, or the square multiplied by itself.

BIQUADRATIC *equation*, in *Algebra*, an equation raised to the fourth powers, or where the unknown quantity of one of the terms has four dimensions: thus $x^4 + ax^3 + bx + cx + d = 0$ is a *biquadratic* equation. See EQUATION.

BIQUADRATIC *parabola*, in *Geometry*, a curve-line of the third order, having two infinite legs tending the same way. See PARABOLA.

BIQUADRATIC *power of any number*, is the fourth power, or squared squares, of that number: thus 16 is the *biquadratic* power of 2; for $2 \times 2 = 4$ and $4 \times 4 = 16$.

BIQUADRATIC *root of any number*, is the square root of the square-root of that number: thus the *biquadratic* root of 81 is 3; for the square root of 81 is 9, and the square root of 9 is 3.

BIQUALAR, in the *Customs of the Algerines*, a cook of the divan.

The janissaries, whom the Algerines call *odabachi*, after serving a certain time as common soldiers, are preferred to be *biqualars*, or cooks of the divan, which is the first step towards arriving at higher preferments. *Biqualars* have the care of furnishing the officers and commanders of the Algerine soldiery with meat and drink in the camp, in garrison, &c. From *biqualars* they are made *oudachi*; that is, corporals of companies, or commanders of squadrons.

BIQUINTILE, an ASPECT of the planets, when they are 144 degrees distant from each other. It is thus called, because they are distant from one another by one the *fifth* part of 360 degrees.

BIRABETANE, in the *Botanical Writings of the Ancients*, a name given to *verbena*, or vervain, and to other herbs used in sacrifices. It is only the word *hierobotane*, or altered by the Æolic manner of writing and speaking it. *Hierobotane* is the common Greek name of vervain, and other sacrificial herbs, and it is probable that the Latin name *verbena* came from the Æolic manner of speaking this word. All these herbs, which were laid upon the altars on solemn occasions, such as making of peace, and other solemn contracts, and were to be taken up by the contracting parties as part of the ceremony, were called by the Greeks *hierobotanæ*, that is, *sacred plants*, and *verbenæ*, but as the plant we now particularly know by the name *verbena* was more frequent in use than any other on this occasion, it was afterwards distinguished by that name.

BIRAO, in *Botany*, the name given by the inhabitants of the Philippine islands to a plant more commonly known among botanical writers by the name TUOU, and supposed by Cornelli, who carefully observed it on the spot, to be the true AMOMUM of the ancient Greeks.

BIRCH-*tree*, *Betula*, in *Botany*, a genus of trees of the *monœcia tetrandria* class; the characters of which are these: it hath male and female flowers, at separate distances on the same tree; the male flowers collected in a cylindrical catkin. The flower is composed of three equal florets, fixed to the empalement by a single scale, having four small stamina. The female flowers grow in a catkin, in the same manner as the male, which are heart-shaped. They have no visible petals, but a short oval germen. It hath no *pericarpium*, but the seeds are included in the scales of the catkin, which are oval and winged. Linnæus reckons six and Miller four species.

The first is the common *birch*-tree, which is so well known as to need no description. This is not much esteemed for its wood, but however may be cultivated to advantage upon barren land, where better trees will not thrive; for there is no ground so bad but this tree will thrive in it; it will grow in moist springy land, or in dry gravel or sand, where there is little surface. So that upon ground which produced nothing but moss, these trees have succeeded so well, as to be fit to cut in ten years after planting, when they have been sold for near 10*l.* an acre standing, and the after-produce has been considerably increased. Many woods near London, which were chiefly

flocked with these trees, having been of late years grubbed up, the value of these plantations has advanced in proportion. Persons therefore, who are poſſeſſed of poor land, cannot employ it better than by planting it with theſe trees, eſpecially as the expence of doing it is not great. The beſt method of cultivating this tree, is to procure young plants from the woods, where they grow naturally; but where no young plants are near, they may be raiſed from ſeeds, which ſhould be carefully gathered in autumn, as ſoon as the ſcales under which they are lodged begin to ripen, otherwiſe they will ſoon fall out and be loſt; and being ſmall, ſhould not be buried deep in the ground. Autumn is the beſt ſeaſon for ſowing them; and in a ſhady ſituation they will thrive better than when expoſed to the full ſun.

The ſeeds of *birch* are ſo diſpoſed for germination, that they will even grow on the body of the mother tree when falling, and being incaſed on it, adhere ſo ſtrongly, as never to ſeparate from it; but increaſing yearly, form thoſe crouded buſhes, like birds neſts, often ſeen on *birch* trees. If the plants take kindly to the ground, they will be fit to cut in about two years; after which they may be cut every ſeventh or eighth year, when deſigned for the broom-makers only; but when they are intended for hoops, they ſhould not be cut oftener than every twelfth year.

Broom-makers are conſtant cuſtomers for *birch*, in all places within twenty miles of London, or where it is near water-carriage; in other parts the hoop benders are the purchaſers. But the larger trees are often bought by the turners; and the wood is uſed for making ox-yokes, and other inſtruments of huſbandry. In ſome of the northern parts of Europe, the wood of this tree is greatly uſed for making carriages and wheels, being hard, and of long duration. In France it is generally uſed for making wooden ſhoes, and it is good fuel. In ſome places theſe trees are tapped in the ſpring, and the ſap drawn to make *birch* wine, which has been recommended for the ſtone and gravel, as is alſo the ſap unfermented. In Sweden the houſes are covered with it, where it laſts many years. It frequently happens that the wood is entirely rotten, while the bark is perfectly ſound and good. The piercing and bleeding of *birch* is performed thus: about the beginning of *March*, when the buds begin to be proud and turgid, and before they expand to leaves, with a chiſſel and a mallet cut a ſlit almoſt as deep as the pith, under ſome branch of a well-ſpreading *birch*; cut it oblique, and not long ways, as a ſurgeon does a vein; and inſert a ſmall ſtone or chip, to keep the lips of the wound a little open; laſtly, to this orifice faſten a bottle, or other convenient veſſel, appendant, into which will exiſt a limpid and clear water, retaining an obſcure ſmack both of the taſte and odour of the tree. The wonder is, that, in the ſpace of twelve or fourteen days, as much juice will be gathered, as will outweigh the whole tree, body and roots. Phil. Tranſ. N° 43, p. 854. N° 44. p. 880. N° 46, p. 917 and 963.

The liquor or juice, thus procured, is uſed, in ſome northern countries, as a preſervative againſt the ſtone. Van Helmo: extols a drink prepared with this juice, ſaxifrage-ſeeds, and brooklime. Mr. Boyle tells us he has ſeen extraordinary medicinal effects of the juice itſelf, even when the other remedies failed; ſo that he uſually provided a quantity of it every ſpring. He ſays, it may eaſily be preſerved, by pouring a little oil on the top of it, or by diſtillation; but that the beſt way is, to impregnate it with the fumes of ſulphur. Phil. Works abr. vol. i. p. 51. and vol. iii. p. 338.

The juice is uſed both to make wine of, and for brewing; being here employed in lieu of water, a barrel of malt will afford as much, and as good ale, as four with common water. Phil. Tranſ. N° 46. p. 963.

A great difference is found between the efficacy of that liquor which diſtils from the bold, or parts of the tree nearer to the root, and that which weeps out from the more ſublime branches; the former being more crude and watery, the latter purer, and more refined. Evel. Syiv. cap. xvi. § 3. p. 71.

BIRCH-*tree of Canada*. See MASTIC-*tree*.

BIRCH-*bark* being bituminous, and conſequently warm and emollient, is uſed in fumigations to correct a diſtempered air.

The inner ſilken bark was anciently uſed for writing tables, before the invention of paper; though Ray rather aſſigns the office of paper to the cuticle, or outer ſkin, which peels off yearly. And with the outward, thicker, and coarſer part are houſes in Ruſſia, Poland, and other northern tracts, covered, inſtead of ſlates and tyle. Phil. Plant.

The Indians make pinnaces with white cedar; which they cover with large flakes of *birch*-bark, ſewing them with thread and ſpruce-roots, and pitching them; as the ancient Britons did with the willow. Pliny ſpeaks of a bitumen actually procured from the *birch-tree*. Hiſt. Nat. lib. xvi. c. 18.

BIRCH, *fungus of*, an exceſcence growing on its trunk: it is aſtringent, and good againſt hæmorrhages; when boiled, beaten, and dried in an oven, it makes excellent ſpunk, or touchwood.

BIRCH-*leaves* are of uſe in the dropſy, itch, &c. either internally or externally applied.

BIRCH-*twigs* ſerve to make rods and brooms; ſmeared with bird-lime they are uſed by fowlers, to ſay nothing of the ancient faſces carried by lictors.

BIRCH-*wine* is made by fermenting the vernal juice: formerly it was in great repute againſt all peſtilitic diſorders, but is left out in the modern London practice.

The preparation of *birch*-wine is well and amply deſcribed in a book, intituled, Venetum Britannicum. Phil. Tranſ. N° 123. p. 674.

BIRD, *Avis*, in *Natural Hiſtory*. The characters of this claſs of animals are, that they have a body covered with feathers, two legs, two wings, and a hard or bony bill; and that the females are oviparous.

Linnæus, from the conſideration of the different ſhapes and ſtructure of their beaks, has diſtributed *birds*, which form the ſecond claſs of animals, into ſix orders, viz. *accipitres*, *pice*, *anſeres*, *grallæ*, *gallinæ*, and *paſſeres*, comprehending 922 known ſpecies. Syſtema Nat. ed. 13. tom. i.

The hiſtory and deſcription of *birds* make a particular branch of ſcience called ORNITHOLOGY.

Birds are variouſly divided and denominated by naturaliſts from the places of their abode, their food, and manner of living, make of their bills, wings, feet, &c.

Birds are uſually divided into *terreſtrial* and *aquatic*.

BIRDS, *terreſtrial*, comprehending the *rapacious*, *pies*, the *gallinaceous*, the *columbine*, and the *paſſerine*, are ſubdivided into thoſe which have *crooked beaks* and *talons*; and thoſe whoſe beaks and claws are *ſtraighter*.

Of *birds* with *crooked beaks* and *talons*, ſome are carnivorous and rapacious, called *birds of prey*; others are ſugivorous, called by the general name of *parrots*.

Of *birds of prey*, ſome prey in the day-time, and are called *diurnals*; others in the night, and are called *nocturnal birds*. *Diurnal birds of prey* are either of a *greater* or a *leſſer* ſize.—The *greater* are either of a more bold and generous nature, as the eagle-kind, or of a more cowardly and ſluggiſh, as the vulture.

Concerning the carnivorous or rapacious *birds*, it is obſerved, 1. That though Ariſtotle ſays they fly ſolitary, yet that holds not in all; ſeeing that vultures have been ſeen to fly in troops fifty or ſixty together.

2. That the females of the ravenous *birds* are bigger, ſtronger, and of greater courage, than the males; nature ſeeming to have been ſo provident as to furniſh theſe females with ſuch advantages, upon the account that they muſt provide food not only for themſelves, but alſo for their young ones. Phil. Tranſ. N° 120. N° 483.

The *leſſer* diurnal *birds* of prey are either of a generous and docile, or of a cowardly, ſluggiſh, and untractable nature. The *generous* and *docile* are the hawk-kind, which are wont to be reclaimed and manned for fowling. Theſe by the falconers are diſtinguiſhed into *long-winged*, as the *falcon*, *lanner*, *ſacre*, *gerfalcon*, *baſtard*, &c. whoſe wings reach almoſt as far as the end of their train; and *ſhort-winged*, as the *goſ-hawk* and *ſparrow-hawk*, whoſe wings, when cloſed, fall much ſhort of the end of their trains.

The *cowardly* and *ſluggiſh* are neglected by our falconers, and ſo live at large.—Of theſe alſo there is a *greater* ſort, as the *buzzard-kind*; to which may be added, the *ring-tail* and *kite*; and a *leſſer*, as the *butcher-bird*, or *ſhrike*, about the bigneſs of a *blackbird*.

Of *birds* of prey with crooked beaks and talons, others are *nocturnal* as the *owl kind*, which prey by night; and theſe are either horned or eared, as the eagle-owl, horn-owl, &c. or without horns or ears, as the brown owl, white owl, grey owl, ſhower-horn-owl, or goat-ſucker, &c.

Frugivorous land-*birds*, with crooked beaks and talons, are diſtinguiſhed into three ſorts, according to their bigneſs; the *greater* ſize being called *mattaccas* and *cacatoons*; the *middle-ſized*, and moſt common, *parrots*, and *poppingays*; and the *leaſt* ſort *parrakeets*: theſe all make uſe of their beak in climbing, and move the upper jaw.

Land-*birds*, which have their bills and claws more ſtraight, are diſtinguiſhed into three ſizes; the greateſt kind are ſuch as by reaſon of the bulk of their bodies, and ſmallneſs of their wings, cannot fly at all; ſuch are the *oſtrich*, the *caſſuaway*, and the *dodo*.

The *middle-ſized* are divided into ſuch as have either *large* and *long*, or *ſmaller* and *ſhorter bills*.

Of thoſe with large, thick, ſtrong, and long bills, ſome feed promiſcuouſly on fleſh, inſects, and fruits, as the *crow-kind*, which are wholly black; and the *pye-kind*, which are party-coloured, as the *magpye*, *jay*, &c. others feed on fiſh only, as the *king's-fiſher*; and others on inſects only, as the *wood-pecker*.

As for thoſe which have a ſmaller and ſhorter bill, their fleſh

is either white, as the poultry kind; or blackish, as the *pigeon*, and *thrush kind*.

The *least-sized* kind of *land-birds*, with straight bills and claws, are called *small birds*. Small *birds* are subdivided into those with *slender bills*, as the *lark*, *swallow*, *martin*, &c. *thick and short bills*, as the *bull-finch*, *house-sparrow*, *linnet*, &c. those with a hard protuberance on the upper chap or bill, as the *bunting*, *yellow hammit*, *reed-sparrow*, &c. Among *birds* which have straight beaks and claws, Mr. Willughby observes, that the *cassowary* (as well as the *pelican*) is without a tongue; swallowing not only bits of iron, as the *ostriches*, but also red-hot coals; yet, not digesting the iron, but voiding it whole, as the *ostrich* also does.

BIRDS, *aquatics*, or *water-fowl*, comprehending the *cloven-footed*, the *fin-footed*, and *web-footed*, are distinguished into such as *wade* in the waters and such as *swim* in them.

Aquatics which *wade*, are all cloven-footed, and generally have long legs, and those naked, or bare of feathers, a good way above the knee, that they may the more conveniently wade in waters. Of these authors reckon two kinds; a *greater* and a *lesser*.—To the *greater* belong the *crane*, *ibirin*, &c.—The *lesser* are either *piscivorous*, as the *heron*, *spoon-bill*, *stork*, &c. or *muscivorous*, and *insectivorous*. Of aquatic *birds*, some have *slender bills*, sharp-pointed, as the greatest *gull*, *siver*, *grey gull*, &c. others *toothed bills*, as the *gossander*, &c. others *broad bills*, as the *swan*, *booper*, *goose*, *duck*, &c.

Of *insectivorous* water-fowl, some have *very long* bills; others *middle sized* ones, as the *sea pye*, and *red shank*; others *short bills*, as the *lapwing* and *plover*.

Of those with *long bills*, some have them crooked, as the *curlew* and *twimbrel*, and others straight, as the *woodcock* and *godwit*.

Note, those are reckoned short bills, which exceed not an inch and a half; middle-sized bills, two inches and an half; and long bills above two inches and a half.

Of aquatics, which *swim* in the water, some are *fissipedes*, cloven-footed, as the *rail*, *plover*, &c. some are fin-footed, *pinnati*, as the *coot* and *grebe*, &c. but most are web-footed, or web-footed, *palmipedes*.

Of these, some few have very long legs, as the *flamingo*, the *avosetta*, and *cornorn*; but the generality are short-legged.

Of the *short-legged*, *web-footed aquatics*, some have but three toes on each foot, as the *penguin*, *razor-bill*, &c. but generally they have four toes on each foot, and these either all connected together by intervening membranes, as in the *pelican*, *soland-goose*, &c. or more usually with the back-toe loose.

This last kind are either *narrow-billed*, or *broad-billed*.—Those with *narrow bills* have them either blunt or hooked at the tip, or sharp-pointed and straighter.

Of the former sort some are serrate, as in the diver-kind; and some not toothed, as in the *auglin*.

Of those with sharp-pointed and straighter bills, some have long wings, as the *gull* kind, and some shorter, as those diving *birds* called *dunckers*.

Those with *broad bills* may be divided into the *goose-kind*, which are larger; and the *duck-kind*, which are smaller; and these latter into sea-ducks, and river, or plash-ducks.

In flat-billed *birds*, as *ducks*, there are three pair of nerves, which come down between the eyes into the upper bill, whereby they are enabled to smell, and find out their food in the mire, water, and the like. The like has also been discovered in several round billed *birds*; but much smaller, and scarce discernible, except in the rook, where they are conspicuous enough; and it is remarkable that these, more than any other round-billed *birds*, seem to grope for their meat in cow-dung and the like. In the lower bill there are also nerves, which have much the same situation with those in the flat-billed kind; but very small, and scarce discernible. Phil. Trans. N°. 206. p. 696.

Most water-fowls have a short tail; and none of this kind have their feet disposed like parrots and woodpeckers, which have two toes forward, and two backward; whereas none of these have more than one back-toe, and some have none at all.

The structure and œconomy of *birds* are, in many respects, different from those of their fellow-biped, man, and of their fellow brutes, the quadrupeds, having some parts which those want, and being without others which they have, besides great variations in the contrivance of parts which are common to both; all wisely adapted to their different conditions and manners of life.

Among the parts peculiar to *birds*, are first, the bill, which serves them both in lieu of lips and teeth; wherewith the rapacious tear their meat, the granivorous crack their seeds, and separating the pulp with the tongue, throw out the husk. Drake's Anthrop. lib. i. cap. 14.

Secondly, a horny nictitating membrane, to draw over and cover their eyes, and save them from the annoyance of thorns and bushes, much like that which frogs are furnished with to secure their eyes from mud and dirt. See Derham's Phyf. Theol. & Nieuwent. Rel. Philof. § 18.

To which may, thirdly, be added, feathers and wings for cloaking and flight.

The parts which physiologists have generally supposed not to be found in *birds* are, 1. Teeth and lips, as already mentioned. 2. Lacteal vessels. But Mr. Hewson observes that the difficulty of discovering the lacteals of *birds* is owing to the transparency of the chyle which they contain, and the want of mesenteric glands. The lymphatic system in *birds*, he says, may be divided, as it is in quadrupeds, into two branches, viz. the lacteals and lymphatics, and their trunk, or thoracic duct. The lacteals are the lymphatics of the intestines, and, like the other lymphatics, carry a transparent lymph; and, instead of one thoracic duct, there are two, of which one goes to each jugular vein. The lymphatics in the necks of fowls were discovered by Mr. J. Hunter many years ago. We may infer from hence, that absorption is not carried on even in *birds* by the common veins. See an account of the lymphatic system in *birds* by Mr. Hewson, Phil. Trans. vol. lviii. N° 34. 1768. 3. Kidneys, and a bladder of urine, which they can be without, as they have but little moisture in their bodies, so but rarely drink, and this only to moisten their food. 4. A *septum transversum*, the want of which is supplied by a peculiar disposition of the lungs. Lastly, Pliny says they also want an *epiglois*; but in two eagles, and other birds dissected by the royal academists at Paris, there were membranes like *epiglottis* found.

Some authors also speak of ducts which pass immediately from a sort of kidneys to the extremity of the *rectum* of *birds*, whereby a white, liquid kind of excrement is discharged, being first mixed with the grosser *fæces*. Gentzken's Phyf. Hypoth. p. ii. c. 5. &c.

Variations in the parts of *birds* from those of men and quadrupeds, are, 1. In the ear where the cavities and the drum are of a peculiar make. Phil. Trans. N° 190. The ears of *birds* differ much from those of men or beasts; there is almost a direct passage from one ear to the other of *birds*; so that prick but the small membrane called the drum in either ear, and water poured in at the one ear will run out at the other. But this is not all: what is much more remarkable, they have no *cochlea*; but instead thereof, there is a small twisted passage that opens into a large cavity running betwixt two scults, and passes all round the head; the upper scull is supported by many hundreds of small thread-like pillars or threes, which, as it is supposed, have another use also, to break the sound from making any confused echo, and to make it one and distinct.

This passage, observed betwixt the two scults, is much larger in singing *birds* than in others that do not sing; so very remarkable, that any person that has but been shown this, may easily judge by the head, what *bird* is a singing *bird*, or has aptitude thereto, though he never saw the *bird* before, nor knew what *bird* it were. Phil. Trans. N° 206. p. 995.

2. In the division of the *aorta*.

3. In the spinal marrow, which is divided into two in the middle of the back, with a ventricle between the two. Phil. Trans. No 180. p. 374.

4. In the bones, which are all hollow and fistular, to make the body lighter and more buoyant. Nieuwent. Relig. Philof. cont. 22. § 12. p. 335, seq.

Both in the bones, and in the fleshy parts, there are receptacles of air communicating with the lungs. Phil. Trans. vol. lxiv. N° 29.

5. In the heart, which has a fleshy valve at the mouth of the *vena cava*. See Pitfield's Nat Hift. of Anim.

6. In the lungs, which are strongly conjoined to the back, for greater convenience of flight. Vater. Phyf. Exp. p. 826, &c.

7. In the stomach, of which *birds* have two or three, to supply the want of mastication. See Grew's Comp. Anat. The digestion of *birds* is very strong, especially in *hens*, *ducks* and *pigeons*, whose stomachs have been found to act even on glass bullets. Boyle's Phil. Works, abr. ton. ii. p. 183.

8. In the legs and feet, which, in some species of *birds*, are made to hold or cling soft by; in others to wade in the mud without sinking. Nieuwent. Relig. Phil. p. 341. The posture and action of *birds* in standing and walking, are shewn by Borelli to be very different from those of man, though both be bipeds; particularly as to equipoise, whereby *birds* are enabled to stand better on one foot. See Phil. Trans. N° 344. p. 63. N° 67, p. 6004.

9. In their tails, which are made to poise their bodies in flight. Ibid. inct. 20. p. 343.

10. In the pectoral muscles, which, in *birds*, are the strongest of all, as serving for the motion of the wings, which, in long or swift flights, requires great strength; where-

whereas, in man, the crural muscles are strongest; so that, if he would fly, it must rather be by the action of his legs than his arms. Phil. Transf. N° 220.

Their whole structure is admirably accommodated to flight, especially that of the *pelican*, which beside all other *apparatus* for this purpose, has a quantity of air lodged in the *cellulæ* of the skin, which it takes in at every inspiration, and expels again at expiration, whereby its bulk is considerably enlarged, without any sensible increase of weight. Hist. Acad. Sc. an. 1693. p. 259, &c. 11. In the brain, which is different from that both of man and quadrupeds, being adapted rather to the exercise of the locomotive faculty, than for imagination and memory.

However, the sagacity of *birds* in building, and placing their nests out of the reach of enemies, and in avoiding noxious plants, is prodigious. It is said they will not so much as touch or perch on such plants, being warned of the danger by the smell or *effluvia* of the plant. Boyle's Phil. Works abr. tom. ii. p. 183, and p. 437.

12. In the bronchial ducts, which are extended to the very bottom of the cavity of the *abdomen*, that the air received into them, may the better fill and enlarge the *thorax*, whereby they are rendered much lighter; than if their bodies were solid, like other animals. Acad. des Sc. an. 1693. p. 259.

13. In the ovaries, which, in *birds*, are single, and only furnished with single tubes, whereby to convey the eggs to the *uterus*; the whole inverted to their back. Acad. des Scienc. 1693. 36.

Many methods have been used by naturalists for preserving dead *birds* from corruption, in their natural form and colour. Some have taken off the skin, with all the feathers upon it, from the body and thighs, leaving the legs and wings, with the whole neck with the bill, and filled it with some *succedaneum*, such as hay, wool, or flax. Others have put them into vessels full of spirit of wine, or strong brandy; against which it has been objected that spirituous liquors change the colours of the feathers; but M. Reaumur concludes from many experiments, that this objection is groundless; and he has given several minute directions for preserving and conveying them in this way. Others again, especially in countries where spices are cheap, have embalmed dead *birds*; Reaumur observes, that powdered alum or lime will serve the same purpose. Another method, which has been sometimes practised, is that of drying birds for preservation in a heated oven. The same ingenious naturalist informs us, that quadrupeds, fishes, reptiles, and insects, may be preserved in the same manner with birds. Phil. Transf. vol. xlv. p. 304, &c. See further on this subject, ibid. vol. xl. N° 16, and N° 26.

BIRDS, *footless*, *apodes*, a fabulous denomination given by some of the ancients to the *birds* of paradise, from a mistaken notion that they had no feet, and could not walk, but only fly.

These are placed in contradistinction to the *ephedrii*, which could only walk, not fly.

BIRDS, *fulvi ramum*, those which reside in caves and holes under ground; as some species of owls, bats, &c.

To this class may also be referred their vast quantities of *birds*, which break out of the caves adjoining to the Zirchnitzer lea in time of thunder, in such numbers as to cover the lake. Phil. Transf. N° 101. p. 420.

BIRDS, *singing*, are the *nightingale*, *blackbird*, *starling*, *thrush*, *linnet*, *lark*, *throstle*, *Canary-bird*, *bullfinch*, *goldfinch*, &c.

See some very curious experiments and observations on the singing of *birds*, Phil. Transf. vol. xlii. part ii. N° 31. Their first sound is called *chirp*, which is a single sound repeated at short intervals; the next *call*, which is a repetition of one and the same note; and the third sound is called *recordings*, which a young *bird* continues to do for ten or eleven months, till he is able to execute every part of his song; and when he is perfect in his lesson, he is said to *sing his song round*. Their notes are no more innate, than language in man; they all sing in the same key. The honourable author, Daines Barrington, has there attempted to reduce their comparative merits to a scale; and to explain how they first came to have particular notes. See SONG of *Birds*.

BIRDS, *migratory*, the same with *birds* of PASSAGE, and MIGRATION. Phil. Transf. vol. lxii. N° 20.

BIRDS, *decoy*, those trained up to call and allure others into the fowler's nets, *snares*, lime-twigs, or the like.

BIRDS, *messenger*, *epistolary*, those employed to convey letters or other dispatches, either for the sake of expedition or safety. See CARRIER-*pigeon*.

BIRD, *mocking*, in Virginia, a *bird* which imitates the voices of men, and the notes of all other *birds*, by way of disguise, and thus eludes and escapes the fowler. Trev. Dict. Univ. tom. iv. p. 264. See MOCK-*bird*.

We have one *mocking bird* in England, which is the *sky*-LARK.

BIRD, *humming*, the American *trochilus*, denominated from the noise it makes in flight. It is said to be the smallest of the whole species of *birds*. See HUMMING *Bird*, and Phil. Transf. N° 200. p. 760.

BIRDS, *anomalous*. It is disputed whether the BAT belong to the *bird* or quadruped kind. Later naturalists incline to the latter, and notwithstanding its wings, condemn it to be a mouse.

The like difficulty has been raised with respect to the *barnacle*, *solandgoose*, or *mergus cucullatus*. Some, notwithstanding its feathers, maintain it to be a fish. What shall we then say of the *penguin*, or *poenguin*, an eastern *bird*, denominated from the island of that name, which walks erect like a man, has no feathers, nor flies, nor associates with other *birds*; and which some will have to participate both of the human, the volatile, and the fishy kingdom. In reality, it is *animal biped*, and *implume*, and consequently a man, on the terms of Plato's definition.

Macer, among the ancients, and Willughby and Ray among the moderns, have written expressly on *birds*. This last author assigns, that the kinds of birds known and described, are about five-hundred. Boyle has given pneumatical experiments on *birds in vacuo*. Phil. Transf. N° 100. p. 280, &c.

Presciency, or knowledge of futurity, was supposed, among the ancients, a natural faculty of *birds*, owing, perhaps, to their nearer intercourse with heaven, or their breathing a purer and more celestial air than other animals. Hence it was, that divination by *birds* obtained among the ancient Greeks and Romans, being performed by observing, and interpreting the flight, chirping, and feeding of divers birds. See AUGURY and AUSPICIUM.

Birds, with regard to augury and divination, were of divers kinds, viz.

Aves Auspicatæ, or *felices*, those which naturally portended good: such were the *dove*, *swan*, &c.

Aves inauspicatæ, *tetræ*, *ominosæ*, those which boded some evil or mischief: such were the *kite*, *raven*, *crow*, and *owl*, every where, except at Athens.

Admissivæ, that which excites and encourages the consulter to execute what he has in view.

Arcentes or *arcuales*, that which forbad a thing to be done; otherwise called *cloacia*, *clamatoria*, and *prohibitoria*, *inhibitoria*, and *inhibia*.

Incendiariæ, that which gave omen of a fire, or other calamity; or which is seen carrying a fire-brand from the funeral-pile to a house.

Remoræ, that which stays, or delays an action.

Sinistræ, that on the left hand, denoted a happy or prosperous omen; and was also called *bonæ*, *prosperæ*.

Alites, those which gave omens by their wings and flight.

Oscines, those by their singing or chirping.

Pulli by their pecking.

Præpetes, those which by their flight, or perching, gave happy omens.

Inferæ, or *inclitæ*, those which in like manner gave ill omens.

BIRD, in *Falconry*, denotes a *hawk*, or FALCON.

BIRDS, *nidis*, *aves nidificatoriæ*, those taken while in the nest.

BIRDS, *ramages*, or *aves ramagiæ*, those only arrived at strength sufficient to fly from branch to branch.

BIRD, *haggard*, that which has lived at liberty, and is become more wild and unreclaimable.

BIRD *of the fist*, that which having been reclaimed, returns to, and perches on the hand, without the help of a lure.

BIRD *of lure*, that which comes to the lure, and by that means to the hand.

BIRD, *bastard*, a *hawk*, for instance, bred of a *hawk* and a *lanier*. Or a *falcon* bred of a *falcon* and a *lanier*.

BIRDS, *coward*, those which only put up their game for their own belly, and which are not to be reduced to full point.

Aves rapaces, *kites*, &c.

BIRDS, *storm*. See PROCELLARIA.

BIRDS, in *Medicine*, are chiefly the *goose*, *duck*, *hen*, *peacock*, and *pigeon*; of which the fat, eggs, and dung are in use.

Sextus Placidus treats at large concerning remedies from *birds*.

Birds, considered as food, are of a dry warm nature, as feeding chiefly on dry meats and drinking little. They are supposed to abound much in salt and sulphury, whence Kircher accounts for the bright colour of their feathers. Some have denied the existence of any volatile salt in *birds*. Borrichius establishes it.

The *peacock* has been called *avis medica*, or the *medicinal bird*, on account of its great efficacy in divers diseases.

BIRDS, in *Husbandry*, are to be guarded against as destructive. *Kites* and *buteos*, to chickens; *crows* and *pigeons*, to corn; *jays*, *sparrows*, and other small *birds*, to fruits, &c.

Writers in husbandry prescribe divers methods of scaring away, or destroying noxious *birds*. Some prevent *birds* from eating the seed when first sown, by liming, and mixing it with soot.

BIRD, in *Astronomy*, *avis Indica*. See APUS.

BIRD *of Phœbus*, the *Raven*, one of the fourteen constellations. See CORVUS.

BIRDS, in *Heraldry*, are figures frequently borne in arms. *Birds* are esteemed a more honourable bearing than fishes; and wild, ravenous *birds*, than tame ones. The terms *armed*, *beaked*, *crested*, *displayed*, *jessed*, *investopped*, *languid*, and *membered*, are applied to *birds*, which see.

BIRD *of the west*, among *Chemists*, is the philosophical mercury: and, in general, sublimations or substances spiritualized by the separation of their terrestrial part.

BIRD, *golden*, the hermetic matter partly matured.

BIRD, *green*, the philosopher's stone, at the time when its green colour appears.

BIRD-*call*, a little stick cleft at one end, in which is put a leaf of some plant, wherewith to counterfeit the cryer's CALL of several *birds*, and bring them to the net, or snare, or lime-twig, to be taken.

A laurel-leaf fitted on the *bird-call*, counterfeits the voice of *luscinia*: a leek, that of *ægithus*, &c.

BIRDS, *Cyprian*, *aves Cypriæ*, or *avicula Cypriæ*, is a denomination given to a kind of edacious candles, made of the matter of torches, and burnt for the sake of their fumes; called also, from their figure, *beads*, or *sticks*.

BIRD *of Hermes*, *avis*, or *avicula Hermetica*. All chemists speak much of that which flies in the night without wings. Some will have the *avicula Hermetica* to be an universal salt prepared from dew.—It also denotes red-lead.

BIRD *cherry*, in *Botany*, see PRUNUS.

BIRD's *eye*, in *Botany*, see PHEASANT's *eye*.

BIRD's *eye view*. See PERSPECTIVE.

BIRD's *foot*, *Ornithopus*, in *Botany*, a genus of the *decandria decagynia* class. Its characters are these: the empalement of the flower is permanent, of one leaf, tubulous, and indented in five equal segments at the brim; the flower is of the butterfly kind, the standard heart-shaped and entire, the wings oval, erect, and almost as large as the standard, and the keel is small and compressed: it has ten stamina, nine of which are joined and one standing separate, terminated by single summits; the germen is narrow, supporting a bristly ascending style, terminated by a punctured stigma. The germen becomes a taper incurved pod, having many joints connected together, which separate when ripe, each containing one oblong seed. Linnæus enumerates four, and Miller five species.

BIRD, or *bird-weed grass*, a species of grass, which has been lately cultivated with particular attention. It is a fine, forest, silky grass, with a durable verdure, throws out a great crop, and produces a large quantity of seed. One rood of ground yielded a hundred weight of seed, and a very large load of hay. It is most proper for upland meadow: the seed should be left uncovered on the ground.

BEAN's *nest*, in *Botany*, a name used by some for the *daucus*, or CARROT; and by others for ORIGANUM.

BIRD's *nest*, *purple*, see ORCHIS.

BIRD's *nests*, in *Cookery*, the nests of a small Indian swallow, very delicately tasted, and frequently mixed among soups. On the sea-coasts of China, at certain seasons of the year, there are seen vast numbers of these *birds*; they leave the inland country at their breeding time, and come to build in the rocks, and form their nests out of a gummous matter, which they find on the shore, washed thither by the waves. They are of a hemispheric figure, and of the size of a goose's *egg*, and in substance much resemble the *ichthyocolla*, or isinglass. The Chinese gather their nests, and sell them to all parts of the world; they dissolve in broths, &c. and make a kind of jelly, of a very delicious flavour.

BIRD's *pepper*, see CAPSICUM.

BIRDLIME, a viscid substance, prepared various ways, and from various materials, for the catching of birds, mice, and other vermin.

The *birdlime* ordinarily used among us, is made from holly-bark, boiled ten or twelve hours: when the green coat is separated from the other, it is covered up a fortnight in a moist place, then pounded into a tough pate, to that no fibres of the wood be left, and washed in a running stream till no motes appear, put up to ferment four or five days, skimmed as often as any thing arises, and laid up for use. To use it, a third part of nut oil, or any thin grease, is incorporated with it over the fire.

The mistletoe affords a juice, even superior to that of the holly; and if a young shoot of the common elder be cut through, a stringy juice will draw out in threads, and follow the knife like *birdlime*, or the juice of holly. It seems in this tree to be lodged, not in the bark, but in certain veins just within the circle of the wood. The roots of all the hyacinths also afford a tough and stringy juice of the same kind, and so do the asphodel, the Narcissus, and the black bryony root, in a surprising quantity.

The *birdlime* brought from Damascus is supposed to be made of Ichesthus, their berries being frequently found in it; but this does not endure either frost or wet. That brought from Spain is of an ill smell; that of the Italians is made of the berries of mistletoe, beaten, mixed with oil, as before; to make it bear the water, they add turpentine.—It is said, the bark of our white-thorn, or way-faring shrub, makes *birdlime* as good as the best.

Birdlime is a substance very apt to be congealed, and rendered unserviceable by frosts; to prevent which, it is proper, at the cold seasons, to incorporate some petroleum with it, before it is used. The method of using it is to make it hot, and dip the ends of a bundle of rods in it, then to turn them about and play them together till a sufficient quantity is extended over them all. If things, or cords are to be limed, they are to be dipped into the *birdlime*, while very hot. The cords may be put in cold, but the rods should be warmed a little. Straws are to be limed, while the matter is very hot: a large bundle of them should be put in at once, and washed about in it, till they are well impregnated. When things prepared, they should be preserved in a leather bag, till they are used. When the twigs, &c. are cold, are to be put in places subject to wet, the common *birdlime* is apt to have its force soon taken away. It is necessary, therefore, to have recourse to a particular sort which, from its property of hoarding water unhurt, is called *water-birdlime*; and is prepared thus.

Take a pound of strong and good *birdlime*, wash it thoroughly in spring-water, till the hardness is entirely removed: and then beat it well, that the water may be separated from it; then dry it well, and put it into an earthern pot; add to it, as much capon's grease as will make it run. Then add two spoonfuls of strong vinegar, one spoonful of oil, and a small quantity of Venice turpentine. Let the whole boil for some minutes over a moderate fire, stirring it all the time. Then take it off, and when there is occasion to use it, warm it, and cover the sticks well with it. This is the best sort of *birdlime* for snipes, and other birds that love wet places.

M. Barrera, physician at Perpignon, has discovered an animal *birdlime*, prepared of the bolls of a sort of caterpillars, by putrefying them in the earth, steeping them in water, and then pounding and mixing them with nine oil. Vonteuil Hist. Acad. Science. 1720, p. 12.

BIREMIS, from *bis*, *double*, and *remus*, an *oar*, in *Antiquity*, a vessel with one or more rows of oars, rowed, as some think, in two stages over each other; or a vessel having two ranks or rows of oars placed over, and abide of each other. But the particular fabric of these vessels seems far from being a settled point among the learned.

The Roman *biremis* is the same with what the Greeks called *δικρωτος*, and stands contradistinguished from *triremis*, *quadriremis*, &c.

BIRETUM, *see* BIRRETUM.

BIROTA, *Birotum*, from *bis* and *rota*, *wheel*, a kind of vehicle denominated from the two wheels whereon it moved.

The *birota*, by the constitution of Constantine, was drawn by three mules, and carried two hundred pound weight; by which it was distinguished from the *rheda*, which carried a thousand pounds and was drawn by eight, and in winter by ten mules.

BIRRETUM, in *Writers of the Middle and Lower Ages*, a thin black cap, or cover for the head, made of linen, fitted close to the head, and pointed by a pyramid, anciently worn by priests, soldiers, doctors, &c. Du Cange.

The word *birretum*, sometimes written *biretum* and *birum*, is also applied to a cap or coif of a judge, or serjeant at law.

The *birretum* also denotes the cap worn by the novices in the jesuits order, formerly of a square, now a round figure.

The *birret* was the ordinary cover of the head in France five hundred years ago. It took its denomination from *birrus* or *burrus*, the coat anciently used by ecclesiastics; with which the cap was then of a piece, and made part of it; so that the whole covered, not only the head, but the shoulders. Afterwards when they began to retrench the lower part, still retaining the upper, it was no longer called *birrus*, or *burrus*, but diminutively *birret*, or *birretum*.

BIRRUS, an ancient habit worn by the Christians in Africa.

The word is also written *byrrus*, supposed to be formed from *πυρρος*, on account of its red colour.

Some will have the *birrus* an episcopal habit. Others extend it to all the clergy. Others, on softer grounds, make it the common coat of all the Christians in that quarter.

BIRTH, the natural exclusion of a perfect FOETUS from the womb by the *vagina*. See DELIVERY, &c.

BIRTH, *an immature*, is called an ABORTION.

BIRTH, *seven months, partus septimestris*, that which happens on the hundred and eighth, or hundred and eighty-second day after impregnation.

This, phyſicians allow, may not only be a living, but a vital *birth*; though it does not often prove long lived. And the civil laws all own it as legitimate.

Hippocrates has written expreſly on the ſeven months birth, περὶ ὀκταμήνου, in two books, the firſt of which, as now extant, is held ſpurious. The ſecond is commented on by Galen, περὶ ὀκταμήνου δευτέρου.

A child born in the ſeventh month rarer lives than a child born in the eighth; perhaps becauſe the premature *birth* in the firſt caſe is owing to the ſtrength of the child, and in the ſecond to the weakneſs of the mother.

BIRTH, *eight months, partus octimestris*. Seldom if ever produces a living, or lively child. An eight month's *birth* is always weak and ſickly, and ſeldom ſurvives the fortieth day.

BIRTHS, *præternatural*, are thoſe made by way of the *anus*, navel, &c.

For the number of *births*, ſee MARRIAGE: under which the proportions of *births* to marriages, of *births* to burials, and of male *births* to females is computed. See alſo MORTALITY.

BIRTH, *after*, *ſee* AFTER-*birth*.

BIRTH, or BIRTHING, among *Seamen*, denotes the due diſtance obſerved between ſhips lying at an anchor, or under ſail. A convenient place aboard for a watch to put their cheſts, ſleep, &c. is alſo called a *birth*.—There is uſually one of theſe in ſhips of war between every two guns. And a proper place to moor a ſhip in is called by the ſame name, as is alſo the ſtation in which a ſhip rides at anchor.

BIRTH, *expoſition of*, among the *Ancients*, was where a new-born infant was expoſed or caſt away, and left to the mercy of the firſt-comer, who might either take and bring it up, or ſuffer it to periſh. See EXPOSING *of children*.

Ger. Noodt has a treatiſe expreſs on the ſubject. Julius Paulus, Sixt. de Partu Expoſitione & Nece apud Veteres. Lugd. Bat. 1716. 4to.

BIRTH, *ſuppoſition of, partus ſuppoſitio*, in the *Civil Law*, is a crime, for which accuſation may be intented by thoſe who have intereſt therein, and is puniſhed with death, like the *crimen falſi*, or forgery.

BIRTH, *ſuppreſſion of, partus ſuppreſſio*, is the crime of a woman, who endeavours, by medicines, to deſtroy or hinder the *birth* of a child: or, after its being born, hides, expoſes, or even ſtrangles it.

BIRTH-*day*, the anniverſary return of the day wherein a perſon was born.

This anſwers to what the ancients called *genethlia*, *genitalia*, *natalitia dies*, *natalitius dies*, *natalis*, and, in the middle age, *generalitia*.

The ancients made much of their religion to conſiſt in the celebration of *birth-days*, and took omens from thence of the proſperity of the coming year. We meet with *birth-days* of the gods, emperors, great men, poets, and even private perſons. What is more, the *birth-days* of cities, as Rome and Conſtantinople, were celebrated with great pomp by the inhabitants. Virgil's *birth-day* was held very ſtrictly by the wits and poets who ſucceeded him. Pliny aſſures us, that Silius kept it with more ſolemnity than he did his own. Epiſt. lib. iii. ep. 7.

The manner of celebrating *birth-days* was by a ſplendid dreſs; wearing a fort of rings peculiar to that day; offering ſacrifices, the men to their genius, of wine, frankincenſe; the women to Juno; giving ſupper, and treating their friends and clients; who, in return, made them preſents, wrote and ſung their panegyrics, and offered vows and good wiſhes for the frequent happy returns of the ſame day.

The *birth-days* of emperors were alſo celebrated with public ſports, feaſts, vows and medals ſtruck on the occaſion.

But the ancients, it is to be obſerved, had other ſorts of *birth-days* beſides the days on which they were born. The day of their adoption was always reputed as a *birth-day* and celebrated accordingly.

The emperor Adrian, we are told, obſerved three *birth-days*; viz. the day of his nativity, of his adoption, and of his inauguration. Fabr. Bib. Græc. tom. xii. lib. vi. cap. 6.

In thoſe times it was held, that men were not born only on thoſe days when they firſt came into the world, but on thoſe alſo when they arrived at their chief honours and command in the commonwealth, e. gr. the conſulate. Hence that of Cicero in his oration Ad Quirites, after his return from exile: *A parentibus id quod noſtis natus, parvus ſum procreatus, ſubito natus ſum conſularis.*

Beſides, thoſe who returned from baniſhment, were alſo conſidered as being born again, *renati*, and ever after called the day of their return their *birth-day*. Thus Cicero to Atticus: *Denique natalem reditus mei cura, ut in tuis ædibus amiciſſimis agam tecum, & cum meis.*

Cenſorinus has a treatiſe De Die *Natali*, addreſſed to Q. Cerellius, as a compliment on his *birth-day*.

BIRTH-*days of the ſaints and martyrs*, *natales ſanctorum*, denote the days of their deaths.

In reality, *natalis* among the ancients was not reſtrained to *birth-days*, but extended to all feaſt-days.

Hence it is we meet with *natalis ſolis*, *natalis calicis*, *natalis ſcalpræ*, *natalis reliquiarum*, &c.

BIRTH-*ſin*, the ſame with *original* SIN.

BIRTH-*wort*, in *Botany*, the Engliſh name of the plant ARISTOLOCHIA, a genus of the *gynandria hexandria* claſs.

Its characters are theſe: the flower is of one leaf, which is unequal, the baſe is ſwelling and globular; it is afterward extended in a cylindrical tube, which ſpreads open at the brim, where the lower part is ſtretched out like a tongue; the oblong angular germen ſits under the flower, which afterwards turns to a large ſeed-veſſel, differing in form, which opens in ſix cells, filled with ſeeds, for the moſt part compreſſed. There are nine ſpecies, one of which is the ſnake-root, which is greatly uſed in medicine; theſe roots are brought over from Virginia and Carolina. There are ſome of theſe plants preſerved in the gardens of thoſe who are curious; but as they are ſometimes killed by froſt in winter, ſo they are not very common in the Engliſh gardens.

BIS, in *Botany*, a name given by ſome old writers to the NAPELLUS, or monks-hood; and by others to the CICUTA or hemlock.

There is, however, another ſenſe of the word, very different from both theſe, in which it is uſed to expreſs an eſculent plant. The phraſe *bis at ſol* is frequent among the Arabian writers; and as *at ſol* ſignifies only of the river Nile, the whole name ſhould ſeem to expreſs the character of ſome poiſonous plant growing in the Nile. This, however, is by no means the ſenſe in which it is received; for we are told, that *bis at ſol* ſignifies a bulbous root of a ſweet taſte, growing on the mountains about Damaſcus, and in other parts of Syria, and eaten in the ſpring by the people of the adjacent country.

BIS-*annual*, a name given by botaniſts to thoſe plants, which ordinarily do not flower till the ſecond year.

BISA, or BIZA, a coin in Perſia, current there for half a ducat. The denomination is alſo given to a kind of weight uſed in the ſame country, equivalent to two Venetian pounds five ounces, or to three pounds nine ounces of the ſmaller weight of that city.

BISACUTA, in *Middle Age Writers*, an ax with two edges, or which cuts either way; or a mallive weapon, pointed at both ends.

Walſingham repreſents the *ſecuris biſacuta* as peculiar to the Scottiſh nation. See BATTLE-*ax*.

BISANT. See BEZANT.

BISARCA, in *Botany*, a name uſed by ſome authors for the herb TARRAGON.

BISBÆA, a feaſt celebrated by the *Meſſapii*, after the pruning of their vines, to obtain of the gods that they might grow again the better.

The word is formed from βὶς, uſed by ſome for a vine.

BISCAIAN *language* denotes the Cantabrian, or ancient language of Spain, being a branch of the Celtic, which firſt gave way to the Romanſe.

BISCIA, in *Ichthyology*, a name by which ſome have called the ACUS, or, as we call it in Engliſh, the tobacco-pipe-fiſh, the needle-fiſh, or trumpet-fiſh.

BISCUIT, ſee BISKET.

BISCUTELLA, in *Botany*, ſee MUSTARD.

BISECTION, ſee BISSECTION.

BISELLIARII, or BISELLIANI, in *Antiquity*, thoſe who enjoyed the honour or privilege of the BISELLIUM.

The word occurs in ancient inſcription. CN. FLAVIO VITIRO AUGUSTALI BISELLIARIO. Gruter. Inſcr. p. 1069.

The *honor biſellii* appears to have been much the ſame with what in France is called *droit de fauteuil*; and the *biſellarii* thoſe who, in public aſſemblies, enjoy this diſtinction of the *fauteuil*, while other perſons are obliged to ſtand, or ſit on benches, ſtools, or ordinary chairs. Scaliger in his index to Gruter, miſtook the *biſellarii* for artificers who made theſe ſeats.

BISELLIUM, from *bis* and *ſella*, a *chair*, in *Antiquity*, a kind of ſeat or chair, larger and richer than ordinary, big enough to hold two perſons, wherein to ſit in courts, theatres, and other public aſſemblies.

BISERRULA, in *Botany*, a genus of the *diadelphia decandria* claſs. We have no Engliſh name for this plant. Its characters are theſe: the flower is papilionaceous, having a large roundiſh ſtandard, whoſe edges are reflexed; the wings are oblong, and the keel is of the ſame length with the wings. It hath ten ſtamina, nine of which are joined, and the other ſingle: in the centre is ſituated an oblong compreſſed germen, which afterwards becomes a flat,

flat, narrow pod, indented on both edges like the saw of a sword-fish, having two cells filled with kidney-shaped seeds. We have but one species of this genus, which is an annual plant, growing naturally in Italy, Sicily, Spain, and the south of France.

BISETÆ, from *bis* and *seta*, *briſtle*, in *Natural Hiſtory*, a term uſed to expreſs a genus of flies of the claſs of the APTICAUDATA, diſtinguiſhed from the others by their having two hairs or briſtles growing out of the tail. There are many ſpecies of this genus, and they are uſually divided by authors into two principal kinds; ſuch as have ſharp ends, and ſuch as have blunt ones. There are ſeveral ſpecies of the former found in our hedges. See HEXOTHRIX.

BISHOP, a prelate, or perſon conſecrated for the ſpiritual government and direction of a dioceſe.

The word comes from the Saxon *biſchop*, and that from the Greek επισκοπος, an *overſeer*, or *inſpector*; which was a title the Athenians gave to thoſe whom they ſent into the provinces ſubject to them, to ſee whether every thing was kept in order; and the Romans gave the ſame title to thoſe who were inſpectors and viſitors of the bread and proviſion. It appears from a letter of Cicero, that he himſelf had a biſhopric; being *epiſcopus Cretæ & Cumparum*.

A *biſhop* differs from an archbiſhop in this, that an archbiſhop with *biſhops* conſecrate a *biſhop*, as a *biſhop* with prieſts ordain a prieſt; that the archbiſhop viſits a province, as the *biſhop* a dioceſe: that the archbiſhop convocates a provincial ſynod, as the *biſhop* a dioceſan one; and that the archbiſhop has canonical authority over all the *biſhops* of his province, as the *biſhop* over the prieſts in his dioceſe. It is a long time that *biſhops* have been diſtinguiſhed from mere prieſts or preſbyters; but whether that diſtinction be of divine or human right, whether it was inſtituted in the apoſtolical age, or introduced ſince, is much controverted. On the one ſide ſtands the *New Teſtament*, wherein it is certain the names *biſhop* and prieſt are uſed indifferently; on the other ſide are tradition, the fathers, and the Apoſtolical Conſtitutions.

There appear no footſteps of any inſtitution of *biſhops*, diſtinct from prieſts, in the Scriptures; nor do the oppoſers thereof pretend to ſhew any mark of any other form of church-government therein; ſo that it may ſeem probable, the apoſtles did not ſettle any thing of this kind at all; but either left the ſpiritual economy in the hands of the preſbyters, or of thoſe together with the people.

Accordingly, new occaſions requiring new meaſures, in a little time the functions of the prieſthood were divided, and the prieſts diſtinguiſhed into degrees; the political part of religion being aſſigned principally to *biſhops*, and the evangelical to the prieſts, &c. or rather, as ſome will have it, the functions of teaching and preaching were referred to the *biſhop*, and that of ordination ſuperadded; which was their principal diſtinction, and the mark of their ſovereignty in their dioceſe.

By the antient diſcipline, *biſhops* were to be married once and not to put away their wives on pretence of religion; but a ſecond marriage was a diſqualification for this order. If they lived chaſte, they were ranked as confeſſors.

Some *biſhops* in the middle age, on account of their *regalia*, or temporalities, were obliged to a military ſervice called *hoſtis*, by which they were to lead their vaſſals into the field and attend the king in his military expeditions. This Charlemagne executed, and even forbid; but the prohibition was little regarded, ſince we find the thing often practiſed afterwards. Du-Cange.

The election of *biſhops* was anciently placed in the clergy, and the people of the pariſh, province, or dioceſe; but afterwards, princes and magiſtrates, patriarchs and popes, uſurped the power. The election was to be within three months after the vacancy of the ſee; and the perſon to be choſen out of the clergy of that church. Formerly the *biſhop* claimed a right in the election of an archbiſhop; but this was firſt aſſiſted by the pope.

In England during the Saxon times, all eccleſiaſtical dignities were conferred by the king in parliament. At length, however, after ſeveral contents, eſpecially between archbiſhop Anſelm and Henry I. in conſequence of a grant of king John, recognized in Magna Charta, and eſtabliſhed by ſtat. 25 Edw. III. ſtat. 6. § 3. *biſhops* were elected by the chapters of monks or canons, ſome ſhadow of which ſtill remains in the preſent method of filling of biſhopricks. But by ſtat. 25 Hen VIII. cap. 20. the right of nomination was reſtored to the crown.

Ordinarily, at leaſt three *biſhops* are required in the ceremony of conſecrating a *biſhop*; but, in ſome caſes, a ſingle one might ſuffice. The Engliſh ſucceſſion of proteſtant *biſhops* ſtands on this laſt ground.

In England, the king being certified of the death of a *biſhop* by the dean and chapter, and his leave requeſted to elect another, the *congé d'elire* is ſent to them, with a letter miſſive, nominating the perſon whom he would have choſen. The election is to be within twelve days after the receipt of it, otherwiſe the king by letters patent appoints whom he pleaſes; and the chapter, in caſe of refuſing the perſon named by the king, incurs a *præmunire*.—After election, and its being accepted of by the *biſhop*, the king grants a mandate under the great ſeal for confirmation, which the archbiſhop conſigns to his vicar-general; conſiſting mainly in a ſolemn citation of ſuch as have any objections to the *biſhop* elect, a declaration of their contumacy in not appearing, and an adminiſtration of the oaths of allegiance and ſupremacy, of ſimony, and canonical obedience. Sentence being read by the vicar-general, the *biſhop* is inſtalled in the province of Canterbury by the archdeacon: the fact is recorded by a public notary; and the biſhop is inveſted with full powers to exerciſe all ſpiritual juriſdictions, though he cannot ſue for his temporalities till after conſecration.—Then follows the conſecration by the archbiſhop, or ſome other *biſhop* appointed by lawful commiſſion, and two aſſiſtant *biſhops*: the ceremony of which is much the ſame as in the Romiſh church, ſave that, having put on the epiſcopal robes, the archbiſhop and *biſhops* lay their hands on the new prelate's head, and conſecrate him with a certain form of words. The fees of the whole proceſs are ſaid to amount to about 600*l*.

The proceſs of the tranſlation of a *biſhop* to another biſhoprick only differs in this, that there is no conſecration. The age of a *biſhop* is to be at leaſt thirty years; and, by the ſocial diſcipline, none were to be choſen but thoſe who had paſſed through all the inferior orders; but, in ſome caſes of neceſſity, this was diſpenſed with, and deacons, nay laymen, were raiſed *per ſaltum* to the epiſcopal dignity.

The form of conſecrating a biſhop is different in different churches.—In the Greek church, the biſhop elect, being by the aſſiſtant biſhops preſented for conſecration, and the inſtrument of election put in his hands after ſeveral prayers, (the firſt called *dimiſſion*,) unſtanding conſecration, makes profeſſion of his faith; after which he receives a benediction. He is then interrogated as to the belief of the Trinity, to which he anſwers by a *long confeſſion of faith*, and receives a ſecond benediction. Laſtly, he is aſked what he thinks of the *communion*; to which he anſwers in a *third profeſſion of faith*; which is followed by a third benediction: after which the conſecrator gives him the paſtoral ſtaff: then he is led up to the altar; where, after certain prayers, and three croſſes on his head, he receives the *pallium*, if he be an archbiſhop or patriarch; he then receives the kiſs of peace, of his *conſecrator* and two aſſiſtants; and ſitting down, reads, prays, and gives the communion to his *conſecrator* and others.

In the Romiſh church, the *biſhop* elect being preſented by the elder aſſiſtant to the conſecrator, takes the oath: he is then examined as to his faith; and after, ſeveral prayers, the New Teſtament is drawn over his head, and he receives the chriſm or unction on his head. The paſtoral ſtaff, ring, and Goſpel, are then given him; and, after communion, the mitre is put on his head: each ceremony being accompanied with proper prayers, &c. the conſecration ends with Te Deum.

Theſe laſt mentioned ceremonies are laid aſide in the conſecration of Engliſh *biſhops*. Nevertheleſs, the book of conſecration, ſet forth in the time of Edward VI. and confirmed by act of parliament, in which ſome of them are enjoined, is declared to be the ſtandard for this purpoſe by the thirty-ſixth Article.

The function of a *biſhop* in England may be conſidered as two-fold; viz. what belongs to his *order*, and what belongs to his *juriſdiction*.—To the *epiſcopal order* belong the ceremonies of dedication, conſecration, and ordination; to the *epiſcopal juriſdiction*, by the ſtatute-law, belong the licenſing of phyſicians, chirurgeons, and ſchoolmaſters, the uniting ſmall parſhes (though this laſt privilege is now peculiar to the *biſhop* of Norwich), aſſiſting the civil magiſtrate in the execution of ſtatutes relating to eccleſiaſtical matters, and compelling the payment of tenths and ſubſidies due from the clergy.

By the common law, the *biſhop* is to certify the judges touching legitimate and illegitimate births and marriages; and by that and the eccleſiaſtical law, he is to take care of the probate of wills, and granting adminiſtrations; to collate to benefices, grant inſtitutions on the preſentation of other patrons, command induction, order the collecting and preſerving the profits of vacant benefices for the uſe of the ſucceſſors, defend the liberties of the church, and viſit his dioceſe once in three years. To the *biſhop* alſo belong ſuſpenſion, deprivation, depoſition, degradation, and EXCOMMUNICATION.

The *biſhops* of England are all barons. Barons in a two-

fold

fold manner; viz. *feudal*, in regard of lands and baronies annexed to their bishopricks: and by *writ*, as being summoned by writ to parliament.—They have the precedence of all other *barons*, and sit in the upper house as *barons*.—They are twenty-four in number, besides two archbishops.

With respect to the order of precedency among one another, the archbishop of Canterbury takes the lead; then the archbishop of York; next to him the *bishops* of London, of Durham, and of Winchester. The other *bishops* follow according to the seniority of their consecration; excepting only, that a *bishop* being a privy-counsellor, takes place after the *bishop* of Durham.

Bishops have two special privileges more than regal; the first, that in their courts they sit, and pass sentence, of themselves and by their own authority: the *bishops* courts being not like other courts, but writs are sent out in their own name, *viz.* the *bishop*, not in the king's name, as is done in the king's courts.—The second, that, like the king, they can depute their authority to another, as their suffragan, chancellor, commissary, &c.

They have also their advantage over lay-lords, that, in whatever Christian country they are, their episcopal degree and dignity are acknowledged; and they may, *pontificalibus indutus*, preach, &c.

They have several immunities, as from arrests, outlawries, *distress*, &c. liberty to hunt in the king's forests, &c. to have certain *tons of wine duty-free*, &c. Their persons may not be seized, as lay-peers may, upon contempt, but their temporalities alone. They may qualify as many chaplains as a duke, *viz.* six. But, as they have no right to be tried themselves in the court of the lord-high steward, as peers, they ought not to be judges there.

By law the crime of *episcopicide*, which a clergyman commits by killing *his bishop*, is petty-treason.

In Denmark there are six superintendents, who take it very kindly to be called *bishops*, and *my lords*.—They have no temporalities; keep no ecclesiastical courts; have no cathedrals, or prebends, &c. but are only *primi inter pares*, having the rank above the inferior clergy of the province, and inspection over their doctrine and manners. They are allowed two or three parishes each. Their habit is common with that of the other ministers. In Sweden are an archbishop, and ten *bishops*, with seven or eight superintendents under them.—They have also ecclesiastical courts, &c.

BISHOP-*abbot*, *episcopus abbas*, was an abbot invested with the episcopal order; of which we meet with several in the richer and more considerable monasteries.

BISHOP, *cardinal*, a *bishop* in chief, or *in capite*.

St. Gregory sometimes uses the term for a proper *bishop*. Anciently there were also *bishops*, who by a peculiar privilege from the holy See, were ranked, and had a seat among the cardinals.

BISHOP, *cathedral*, was also a title given to the proper *bishops*, by way of distinction from the *chorepiscopi*.

BISHOPS, *regular*, those without any diocese, sometimes attendant in camps, or in foreign countries, for the conversion of infidels.

The like *regular bishops* were sometimes also granted by popes to monasteries, exempt from the jurisdiction of the diocesan, where they performed all the episcopal functions. Du-Cange.

BISHOP *in partibus infidelium*, he who is dignified with the title of a bishoprick, whose district or diocese is in the possession of infidels or heretics.

By the canon law, a *bishop in partibus* is qualified hereby to be a COADJUTOR of another *bishop*.

The denomination took its rise from the expulsion of the *bishops* and clergy, out of the Holy Land by the Saracens; when flying into Italy for shelter, coadjutories were given them for their subsistence.

BISHOP, *archbishop*, he who is immediately subject to the papal see, without any metropolitan over him.

BISHOP-*elect*, is he who has the king's nomination, with the sanction of the chapter, but without consecration.

BISHOP *designed*, *episcopus designatus*, denoted a COADJUTOR of a *bishop*, who, virtue of his office, is to succeed at the incumbent's death.

BISHOPS, *suffragan*, are coadjutors or assistants of diocesan *bishops*, authorised by commission from him.

BISHOPS, *exempt*, those freed from the jurisdiction of the metropolitan, and immediately subject to the See of Rome alone.

BISHOP *of the palace*, *episcopus palatii*, was probably the same with *bishop* of the king's chapel, a title in the court of Bohemia. Du-Cange.

It was also a title given those *bishops*, who, by licence of the pope, dwelt in palaces of kings, to be in readiness for spiritual service and council in church-matters.

BISHOP *of the prime see*, denoted a PRIMATE, otherwise denominated a *senior bishop*.

BISHOPS, *commendatory*, or *bishops in* COMMENDAM, are cardinals not of the order of *bishops*, or other prelates, who yet hold bishopricks *in commendam*.

The appellation had its origin during the residence of the papal see at Avignon, whence hence any cardinal, priest, or deacon, was created, who held not one, two, three, or more *bishopricks in commendam*. Du-Cange.

BISHOP, *universal*, or *catholic*, is a title given to the patriarch of Armenia.

BISHOP *of the catholic or universal church*, a title sometimes assumed by the popes.

BISHOP *of bishops*, was a title anciently given to the prelates of some of the greater and more honoured sees, as Jerusalem and Rome.

The first who had the title was James *bishop* of Jerusalem. Some will have the appellation to have been common to all *bishops*.

BISHOPS, in the *Lutheran Church*, are those more usually called SUPERINTENDENTS.

The Calvinists allow of no other *bishops* besides presbyters; but the Lutherans make some distinction, and give a superiority or pre-eminence over the rest to their *bishops*, *superintendents*, or *overseers*.

BISHOP is also a quality sometimes attributed to secular princes, in respect of their SUPREMACY or jurisdiction in matters belonging to religion.

In this sense it is that the emperor Constantine, in a letter to the *bishops* in his dominions, calls himself *common bishop*, as being, in some respects, general *bishop* of the whole Roman world.

BISHOP *of the Jews*, the head of that people in England, chosen by themselves, to whom they submitted to be judged, and governed according to their law. Prideaux's Connect. part ii. lib. v. p. 428.

This officer, which subsisted under our Norman kings, and was licensed by them, answered to the RESHALGOTARCH in Babylon, and the ALABARCHS in Egypt.

BISHOPS *at chess*, a kind of pieces, the third in rank, below queens, but above knights, distinguished by their crown heads.

In Latin writers of the middle age, the *bishop* is called *alphinus*; and by the French *le fou*, the *fool* or *madman*. See CHESS.

BISHOP, in *Zoology*, a little spotted beetle, commonly called the lady-cow, or lady-bird.

BISHOP'S, *registrary*, see REGISTRARY.

BISHOP'S *Courts*, see COURT.

BISHOP'S *see*, or seat, originally denoted the throne or chair in the church where the *bishop* sat.

This was also denominated APSIS.

BISHOP'S *see* also denotes the city or place where the residence of the *bishop* is fixed.

Every *bishop's see* was anciently called *sedes apostolica*; though the appellation has since been restrained to the see of Rome.

Anciently *bishops* seem to have had a right in England to sit as judges in the hundred and county-courts. In after-times, they were forbid to sit in secular courts, and had separate courts erected for them; which proved an occasion of much dispute between the two jurisdictions. No church-tenant might be sued in any court but the *bishop's*. There are still traces of a separate court of the *bishops* much earlier, among our Saxon ancestors, in the eighth century.

The regard borne to the character of *bishops*, made them the common arbitrators even of secular causes: they had the cognizance of all causes concerning lands in *frankalmoign*; and for ecclesiastics, were judges even in capital causes.

BISHOP'S *weed*, *Ammi*, in *Botany*, a genus belonging to the *pentandria digynia* class of Linnæus. Its characters are these: it is an umbelliferous plant, with diffuse flowers, each having five heart-shaped petals; they have five slender stamina, and two reflexed styles, crowned with obtuse stigmas: the germen becomes a small, round, striated fruit, composed of two seeds. There are three species.

BISHOP, in *Ornithology*, is a name given to an excellent singing bird in Louisiana. His song continues for the space of a *minute*, in all which time he does not appear to breathe; he is then silent twice as long before he renews it; so that the alternative of song and rest continues two hours.

BISHOPING, in *Horsemanship*, a term denoting the art used by jockies for making old horses appear young, &c.

BISHOPRIC, the jurisdiction of a *bishop*: or the district within which it is comprised; called also *diocese*.

There are twenty-four *bishoprics*, and two archbishoprics, in England and Wales.—To the *old ones*, subsisting before the times of the Reformation, *Henry VIII.* by letters patent added five more *bishoprics*; viz. those of Chester, Gloucester, Peterborough, Bristol, and Oxford, stat. 34 & 35 Hen. VIII. cap. 17.

In Ireland, there are eighteen *bishoprics*, and four archbishoprics; in Scotland none.

BISK, or BISQUE, in *Cookery*, a rich sort of broth or soop, made of pigeons, chickens, force-meat, mutton-gravy, and other ingredients.

The word is French, formed, as some think, from *bis coctus*; because the *bisque*, consisting of a diversity of ingredients, needs several repeated coctions to bring it to perfection.

There is also a *demi-bisque*, made at a low expence, in which only half the ingredients are used; and *bisque* of fish, made of carps, minced with their roes and lobsters.

BISKET, or BISQUET, usually denotes a delicate kind of bread prepared by the confectioners, of fine flower, eggs, sugar, and rose or orange-water; or of flower, eggs, and sugar, with anise-seeds and citron-peel; baked in the oven in tin or paper moulds.

The word comes from the Latin *bis*, *twice*; and the French *cuit*, *coctus*, q. d. *baked*.

We find divers sorts of such *biskets*; as, seed-*biskets*, fruit-*biskets*, long-*biskets*, round-*biskets*, Naples-*biskets*, spunge-*biskets*, &c.

BISKET, *sea*, is a sort of bread much dried, by passing the oven twice, to make it keep for the service of the sea.—For long voyages they bake it four times, and prepare it six months before the embarkation. It will hold good a whole year.

To preserve sea-*biskets* from insects, Dr. Hales advises to make the fumes of burning brimstone pass through the casks full of bread.

Biskets may be likewise preserved a long time, by keeping it in casks well caked, and lined with tin.

The ancients had their *biskets* prepared after the like manner, and for the like use as the moderns. The Greeks called it *apton bizuyon*, q. d. *bread put twice to the fire*. The Romans gave it the name of *panis nauticus*, or *vasta*. Pliny denominates it *panis aut nauticus panis toties atque iterum coctus*. By which it appears, that, after the first baking, they ground or pounded it down again for a second. In some middle-age writers, it is called *paximus*, *paximus*, and *panis paximatus*.

Among the Romans, we also meet with a kind of land-*biskets* for the camp-service, called *buccellatum*, sometimes *expeditionalis annona*, which was baked much, both to make it lighter for carriage, and less liable to corrupt, the coction being continued till the bread was reduced one fourth of its former weight.

BISLINGUA, *double-tongue*, a name used by many authors for the narrow-leaved RUSCUS, or BUTCHER'S-BROOM; called by many others the Alexandrian bay, or *laurus Alexandria*.

BISMILLAH, in the *Mahometan Customs*, a solemn form, viz. *in the name of the most merciful God*, constantly placed at the beginning of their books and writings in general, as a peculiar mark, or distinguished characteristic, of their religion, it being counted an impiety to omit it.

The Jews, for the same purpose, make use of the form, *in the name of the Lord*, or, *in the name of the great God*. Sale.

BISMILLAH is also used among the Arabs, as a word of invitation to eat.

An Arab prince will frequently sit down to eat in the street before his own door, and call all that pass, even beggars, by this word, who do not fail to come and sit down to eat with him; for the Arabs are great levellers, and set every body upon a footing with themselves. Pococke's Egypt, &c. p. 283.

BISMUTH, a mineral body, of the semimetallic kind; by many supposed to be composed of the first matter of tin, while yet imperfect. It is found usually in tin-mines, sometimes also in silver-mines.

Its weight and colour discover it to be of a mercurial or metallic nature. In common menstruums, it undergoes much the same alterations, and assumes much the same forms as lead. Quincy says, there is always some silver in it.

Its substance is hard, ponderous, and brittle, of a large grain, glossy, white, and shining.—It is also called TIN-*glass*; because, when broken, it shews a vast number of little polished *lamina* like glass: it is also called MARCASITE, by way of excellence, because surpassing all other marcasites or semimetals in whiteness and beauty.

It appears to be composed of cubes, formed by the application of plates upon each other. Its colour is less white than that of the regulus of antimony, and has a reddish tinge, especially when exposed to the air. It is the heaviest of the semimetals, and loses in water about a ninth part of its weight: its specific gravity being from 9.600 to 9.700. Like the other semimetals it is semi-volatile; when exposed to the fire, flowers rise from it, it is calcined, and converted into a litharge and glass nearly as lead is, and, like it, may be employed to the purification of gold and silver by cupellation. It easily combines with sulphur, and amalgamates with mercury, and unites with all metallic matters, excepting, according to Mr. Grellett, zinc, and arsenic; their affinities with it are, according to him, in the following order; iron, copper, tin, lead, silver, and gold. *Bismuth*, like iron, is said to occupy, when fused, a less space than when solid; it is fusible with a heat of 600 degrees of Fahrenheit's thermometer; it greatly increases the fusibility of some other metals; a small portion of it increases the brightness, hardness, and sonorousness of tin, for making pewter, with which it is chiefly used; as it is also for soldering some metals, and for making printer's types; for solid fat mirrors; for anatomical injections; for imitating filigree upon wood; and for rendering some metals fitter for being cast into moulds.

Bismuth is found native. Its most usual appearance is in the state of ore, into which it is reduced by its particles being penetrated by, and intimately mixed with, a sulphur, and with a large quantity of arsenic, and with an earthy matter, which yields a blue colour, equal to the azure, or smalt produced from cobalt.

In the fusion of this ore, the sulphur and arsenic evaporate over the fire; and the regaline matter, being freed from its imprisoned state, runs off from the earthy substance, which being left fixed behind, may, with the addition of flints, and a fixed alkali, be run into a fine blue, glassy matter, no way differing from the smalt of cobalt.

Native *bismuth* is found in small compact masses, of a pale lead colour on the outside, and when broken, of a fine, glittering, silvery white, and composed of a multitude of foliaceous flakes or plates, laid evenly over one another, and disposed in several irregular directions in the mass. It is subject to fewer variations in its ores than most other minerals; but it is sometimes turned yellow by too great a proportion of sulphur and sometimes is very deeply tinged with the matter of the common marcasites, and, in this condition, so often mistaken for them in mineralogy, to the mortal loss of the proprietor of the mine.

It is very common in Germany and England. The tin-mines in Cornwall afford no considerable quantity worth shewing.

Mr. Boyle mentions a medicine prepared from *bismuth* by calcination, and the addition of spirit of vinegar and *cremor tartari*, which has been extolled in the dropsy. He also mentions a preparation of it with common sublimate into a white powder, a few grains of which purge gently. Works abr. p. 501.

Its medicinal virtue is much the same with that of the dross of lead, being seldom used except in external forms, as containing an arsenical salt, very dangerous to be taken inwardly; yet M. de Cloes made a purgative of it, to be used in the dropsy. Add, that *bismuth* being dissolved in spirit of nitre, yields a fume, which being precipitated with water, produces a white powder, called magistery of *bismuth*, and Spanish white, found a good diaphoretic in acute cases.

But its chief use among the ancients, as well as moderns, is as a cosmetic. Other menstrua, and other precipitates, have been used for producing this powder; but by whatever means it is prepared, it retains a corrosive quality, and injures the complexion.

Sig. Poli, by repeated distillations of *bismuth* with an equal quantity of corrosive sublimate, procured a running mercury, and a fine powder, of the colour of pearl, which might be of use in counterfeiting the oriental pearls. Hist. Acad. Sc. 1713.

To the same purpose, Neumann says, that by exposing a mixture of *bismuth* and corrosive sublimate to the fire in a retort, part of the quicksilver distilled, and was succeeded by a dark brown butter, which condensing, grew hard as a stone. By repeatedly rectifying the butter, it became clearer and browner, and harder; and an unctuous pearl-coloured matter remained after every distillation. Neumann's Works, p. 109.

Bismuth bears a near affinity to ZINC.

Lemeri says, that if the solution of *bismuth* be used as an ink to write with, the writing does not appear, but that it becomes very black, when moistened with the deliquiated liquor of the scoria of *regulus* of antimony. See INK *sympathetic*.

There is also an *artificial bismuth*, which is that ordinarily found in the shops, made by reducing tin into thin *lamina*, or plates, and cementing them by a mixture of white tartar, salt-petre, and arsenic, stratified in a crucible over a naked fire. The same is also by some made of a mineral called ZINC, using lead instead of tin, and a little calamine.

BISMUTH *granulum*, in *Mineralogy*, a name given by the Germans to a fixed earth contained in the ores of *bismuth*, which serves to make *smelt*, as well as the earth of *cobalt*. After the *bismuth* is melted from the ore, they take the *residuum*, or *granulum*, and mixing it with flints calcined

and powdered, they run it into a fine blue glass, which is no way inferior to the common *smalt*.

The *bismuth* ore is often mixed among the *cobalt*, and, in this case, the miners separate them with all the care they can; but often they are not able to do it perfectly, and the two minerals bear the fire together; in which case, there arises some difficulty in the working; for the *bismuth* mixing itself with some of the earth of the *cobalt*, in this case, subsides to the bottom of the vessel in form of reddish *regulus*; but this is to be separated by a second operation, and the *regulus* obtained pure and white; and its own earth, together with that of the *cobalt*, are separated from it, and wrought together into *smalt*.

BISNOW, or BISCHNOU, a sect among the Indian BANIANS, or call of merchants.

The banian sect consists of two lesser ones; that of *bisnow*, and that of *samarath*.

The followers of the former hold one God, whom they call *ram-ram*, and allow of no lieutenants or deputy-gods, as is done by those of the sect *samarath*; but they allow their god a wife, and have idols, which they dress up with gold chains, and collars of pearl and precious stones, and put them worship, by singing hymns in their temples, and dancing before them to the sound of a kettle and kettle-drums.

In this sect, the wives do not burn themselves after their husbands death, as is practised by those of the *samarath* sect; but content themselves with a perpetual widowhood.

BISOMUM, in *Antiquity*, a TOMB for two bodies, or the ashes of two.

The word is compounded of *bis*, *twice*, and the Greek σωμα, *body*, or *ashes of a body*. Some, with greater purity, write *disomum*.

The ancients frequently buried two, three, or four bodies in the same sepulchre, disposed aside of each other; for it was held an impiety to lay one atop of another. Hence the sepulchres of the primitive Christians had the words *bisomi*, *trisomi*, *quadrisomi*, &c. inscribed on them, to indicate the number of bodies depositied in them. Du-Cange.

BISON, in *Natural History*, the name of a species of wild-bull, which differs from all other species, by having a very shaggy mane, running down his neck quite to his shoulders, and a large hump on his back. In Mr. Ray's time, there was a bull of this kind kept in St. James's Park; but there was no account whence it was brought. This author supposes it to have been from Florida, where, according to Ambrose Paré, there are bulls called *bufferes* by the natives, which have horns of about a foot long, and a bunch in the middle of the back, like the camel. Thevet also mentions this creature; and Gesner describes it under the name of the BOS CAMELUS.

BISQUET. See BISKET.

BISSACRAMENTALES, a denomination given by some Romish writers to protestants, on account of their only holding two sacraments, viz. baptism and the supper.

BISSECTION, in *Geometry*, the division of any quantity into two equal parts, otherwise called BIPARTITION. See DIVISION, &c.

BISSELÆON, in the *Materia Medica*, a name that is found in many works of the most ancient Greek and Roman writers, and used to express the oil of pitch, or that fluid substance which swims on the surface of melted pitch, and was taken up by means of wool or cotton by the ancients, and used in many external disorders.

The common name of this oil was *pisselæum*; and this other name is only a corrupt way of spelling it. The old authors, in many other words as well as this, have changed the initial P into B.

BISSEXTIALIS, or BISSEXTILIS *olla*, an ancient measure or vessel, containing twelve ounces, or two SEXTARIES.

BISSEXTILE, or *Leap-year*, in *Chronology*, a YEAR consisting of 366 days, happening once each four years, by reason of the addition of a day in the month of February, to recover the six hours which the sun spends in his course each year, beyond the 365 days ordinarily allowed for it.

The day thus added, is also called *bissextile*; Cæsar having appointed it to be the day before the 24th of February, which among the Romans was the sixth of the calends of March, and was reckoned twice.

By the statute *de anno bissextili*, 21 Hen. III. to prevent misunderstandings, the intercalary day, and that next before it, are to be accounted as one day.

The astronomers concerned in reforming the calendar, by order of pope Gregory XIII. in 1582, observing, that the *bissextile* in four years added 44 minutes more than the sun spent in returning to the same point of the zodiac, and computing that these supernumerary minutes in 133 years would form a day; to prevent any changes being thus insensibly introduced in the seasons, directed, that, in the course of 400 years, there should be three *bissextiles* retrenched; so that every centesimal year, which, according to the Julian account, is *bissextile*, or leap-year, is a common year, in the Gregorian account, unless the number of centuries can be divided by 4, without a remainder. Thus 1600 and 2000 are *bissextiles*; but 1700, 1800, and 1900, are common.

The Gregorian computation was received in most foreign countries ever since the reforming of the calendar; and by act of parliament passed anno 1751, it commenced in all the dominions under the crown of Great Britain, in the year following, ordering that the natural day following the second of September, should be accounted the fourteenth; omitting the intermediate eleven days of the common calendar.

BISTER. See BISTRE.

BISTI, a species of Persian money, valued at sixteen or eighteen French *deniers*. Some represent the *bisti* as an ancient silver coin: others, as Chardin, make it only a money of account, and call it DINAR BISTI.

BISTORT, or SNAKEWEED, *Polygonum*, in *Botany*, the name of a genus of the *octandria trigynia* class of plants, the characters of which are these: the flower is of the apetalous kind, consisting of a number of stamina, which arise from a cup, divided into several segments at the edge: the pistil becomes afterwards a seed, usually of a triangular figure, and contained in a capsule, which was before the cup of the flower.

To this it is to be added, that the flowers are disposed in spikes; and the roots are large and fleshy, oddly twisted or contorted, and furnished with a number of small fibres, like hairs. There are also some species of *bistort*, in which, beside the common flowers and seeds, there are certain tubercles, which have their roots, and rudiments of leaves.

There are three different species of this plant which are found wild in England, but they are seldom planted in gardens, the common sort only is used in medicine. Phil. Transf. vol. xlix. part ii. N° 112. See KNOT-*grass*.

The common great *bistort*, or *snakeweed*, flowers in May, and if the season proves moist, will continue to produce new spikes of flowers until August: it may be propagated by planting the roots in a moist shady border, either in spring or autumn, which will soon furnish a garden with plants, for it greatly increases by its creeping roots.

The root of *bistort*, which is the only part that is used, is drying and binding, of service in all kind of fluxes and haemorrhages, either from the bowels, or any other part; they help the incontinence of urine, and the making of bloody water; they are also alexipharmic, and good in pestilential fevers, resist poison, and the bites and stings of venomous creatures.

BISTOURY, a kind of surgeon's cutting instrument, of the knife kind; much used in making incisions.—There are three kinds: the blade of the first turns backwards and forwards like a lancet for opening abscesses, and is sometimes used instead of it.—The *straight bistoury* does not turn, but stands straight in the handle like a common knife.—The *crooked bistoury* is shaped like a half moon, the keen edge being on the inside. See *Tab. Surgery, fig.* 4, 5, 6, 7, 8.

We have the description of a *bistoury*, and borrowed director, somewhat different from the common, by Mr. Munro, in the Medic. Ess. Edinb. vol. v. art. 41.

M. le Dran describes a *bistoury cachè*, for more safely performing the operation of *hernia*. The point of the *bistoury* slides in the furrow of the director, to keep down the guts, and thereby prevent their being cut.

BISTRE, a composition made of the most glossy and highest flying soot, calcined, and passed through a fine sieve, then baked in a little gum-water, and made into cakes.

The soot is prepared from the soot of dry beech-wood, by steeping it with urine or water, into a smooth paste, and then diluting it with more water; after the grosser substance has subsided, the liquor is poured off into another vessel, and left to settle three or four days; the fine matter that remains is *bistre*. That which is good is transparent, when moistened with water, and of a warm, deep, brown colour.

Instead of this, some use the hatches of a pen, with a little Indian ink, others red chalk, others black lead, &c. See WASHING.

BIT, or BITT, an essential part of a bridle; its form and use well known: its parts and kinds various.

The kinds of *bits* are, 1. The mustroll, snaffle, or watering-*bit*. 2. The cannon-mouth, jointed in the middle; preferred by Solleysel to all others. 3. The cannon with a full mouth all of a piece, only kneed in the middle, to form

form a liberty or ſpace for the tongue; fit for horſes too ſenſible or ticklish, and liable to be continually bearing on the hand. 4. The cannon-mouth, with the liberty in form of a pigeon's neck; proper where a horſe has too large a tongue. 5. The cannon with a port, mouth, and an upſet, or mounting liberty, uſed where a horſe has a good mouth but large tongue. 6. The ſcratch-mouth, with an upſet; ruder, but more ſecure than a cannon-mouth. 7. The cannon-mouth with a liberty, after M. Pignatel's manner; proper for a horſe with a large tongue and round bars. 8. The maſticadour, or ſlavering *bit*. 9. The cat's foot *bit*. 10. The baſtonet *bit*, &c.

The ſeveral parts of a ſnaffle or curb-*bit* are—the mouth-piece, the cheeks and eyes, guard of the cheek, head of the cheeks, the port, the wells, the campanel, or curb and hook, the boſſes, the boſſters and rabbets, the water-chains, the ſide-bolts, bolts and rings, kirbles of the *bit* or curb, trench, top-roll, flap, and jeive.

To BIT *a horſe*, is to give him ſuch a bridle as is moſt proper for gaining his conſent to thoſe actions, which are required of him.

All *bits* ought to be proportioned to the mouth of the horſe, according as it is more or leſs cloven or wide; or more or leſs ſenſible and tender: alſo according as the tongue and lips are higher and flatter; and as the palate is more or leſs fleſhy.

BIT is alſo uſed for a little tool, fitted to a ſtock or handle, to bore withal.

In this ſenſe we ſay, the *bit* of a piercer, an AUGRE, or the like; meaning that iron part of thoſe tools, wherewith the holes are bored.

BIT *of a key* is that part fitted at right angles to the ſhank of the KEY, wherein the wards are made. See LOCK, &c.

BIT is alſo uſed, in *Commerce*, for a piece of coin current in Jamaica, and valued at 7*d*. ½.

BITS, or *butts*, in a *ſhip*, are two great pieces of timber uſually placed abaft the manger in the ſhip's hoof, through which the croſs-piece goes, their lower parts being faſtened to the ruddiers; and their middle parts, in great ſhips, bolted to two large beams, croſs the hows. Their uſe is to belay the cable to, when the ſhip rides at anchor.

The word ſeems formed from the French *bitte*, which ſignifies the ſame; unleſs we ſuppoſe that the French word is formed from ours.

In great ſtorms, to ſtrengthen the *bits*, and ſecure the bows, the cable is faſtened to the main-maſt.

BITS, *fore-jeer*, thoſe to which the fore-jeer is faſtened and belayed.

BITS, *fore-top-ſail-ſheet*, thoſe to which the fore-top-ſail-ſheet is belayed.

BITE is defined to be a ſolution of the continuity of a ſoft part, cauſed by the impreſſion of an animal's teeth.

For the poiſonous, or venomous *bites* of VIPERS, the RATTLE-SNAKE, MAD-DOGS, the TARANTULA, &c. See VIPERS, &c.

SNAKE-STONE, SNAKE-WEED, *terra mellitenſis*, &c. are reputed ſpecifics againſt poiſonous *bites*.

The *bites* of ſpiders, at leaſt of ſome *ſpecies*, alſo appear to be poiſonous; which has perhaps been the occaſion of the common error, that this inſect is poiſonous, when eaten. See SPIDER.

Mr. Robie, a phyſician in New England, gives the hiſtory of a perſon bitten in the leg by a ſmall ſpider, accidentally enclaſped in his ſtocking; it was followed by an acute, erratic pain; firſt in the leg, then in the groin, and ſucceſſively paſſing into the ſmall of the back, the thigh, and the head, attended with a numbneſs, &c. It was cured with *ſp. vin. corv.* and *ſol vol. corn. cerv.* with *unum viperinum*, and onions or garlic applied to the wound. Phil. Tranſ. N° 388. p. 61.

Sig. Redi attributes the malignity of the *bite* of a VIPER, to a yellow juice lodged in a bag behind the gum, which is inſtilled through a pipe in the teeth, into the wound. M. Bourdelot, and Charas, aſcribe it to the irritated bilious ſpirits, and breath of the enraged animal. Phil. Tranſ. N° 83.

In ſupport of which it is alledged, that the viper's lungs are full of bilious ſpirits, which exhale with its breath; and that there is an immediate duct in this creature, from the gall-bladder to the throat; by means of which, a quicker, and more copious infuſion of the bile, is made into the wound. But much of this may be juſtly doubted. Phil. Tranſ. N° 77. p. 3015.

The beſt remedy for it is ſucking the wound; a kind of cure, for which the ancient Marſi and Pſilli are celebrated.

The beſt cure for the *bite* of the rattle-ſnake is an actual cautery; *c. gr.* a hot burning coal held on the wound. Phil. Tranſ. N° 210.

The *bites* of divers creatures, when mad, are poiſonous, which at other times are not ſo, as of dogs, cats, men, &c. See HYDROPHOBIA, MAD-*dog*, MADNESS, MANIA, &c.

BITE is alſo applied, in a leſs proper ſenſe, to the impreſſion of other ſharp, or pungent bodies. Thus a file is ſaid to *bite* the metal; *aqua fortis bites*, or eats into copper. An anchor is alſo ſaid to *bite*, when it holds faſt in the ground.

BITERLOGH, or BITHERLAGE, the ancient Daniſh military, or camp law.

The word is compounded from *bithe*, *mulct*; and *logh*, *law*; q. d. the law of *mulct*, or *mites*.

Among the laws of the Danes, there are two peculiarly eminent; viz. the *bit of ſtrand*, or *ſtrant-lone*; and the *biterlage traett*, made by Canute the Great, about the year 1035. Of which an edition has been given by Reſenius.

BITHYNIARCHIA, a ſort of ſuperior prieſthood in the province of Bithynia, to which belongs the ſuperintendency of the ſacred games, and which gave an exemption to him poſſeſſed of it, called *bithyniarcha*, from the care of tutorage.

BITTACLE, or BINACLE, a ſquare box, or frame of timber, placed in the ſteerage of a ſhip, wherein the COMPASS is placed.

The word is formed, by contraction, from the French *habitacle*, a *mean habitation*, which ſignifies the ſame.

Large veſſels have two *bittacles*, a leſſer placed before the pilot, and a greater before the ſteerſman.

In the ſmaller veſſels, the *bittacle* is divided into three ſpaces or apartments; in large veſſels into five. One for the hour-glaſſes; another for the lamp, or light; another for the compaſs, &c.

Great care is to be taken in the diſpoſition, framing, &c. of the *bittacle*, that it ſtand true, and that it be not faſtened together with iron nails, but with wooden pins, becauſe the former would affect the compaſs.

BITTACUS, in *Natural Hiſtory*, a name given by Cteſias, and ſome others of the Greek authors, to the parrot. The word *βίττακος* is ſo near this, that they are plainly only a corruption of one another. The Greeks called this bird indifferently *ψίττακος*, and *βίττακος*, as they did the fine ointment *ψῆγμα*, indifferently by that name, or *βῆγμα*; the *β* being only one letter with them; and that, and the ſingle S, very frequently uſed at pleaſure for one another.

BITTER *almonds*. See ALMOND.

BITTER *apple*. See COLOCYNTHIS.

BITTER *gourd*. See COLOCYNTHIS.

BITTER *waters*. See WATER.

BITTER *wine*. See WINE.

BITTER *ſweet*, in *Botany*. See NIGHTSHADE.

BITTER *vetch*. See VETCH.

BITTER *wort*. See GENTIAN.

BITTERN, in *Ornithology*, the name of a bird of the heron-kind, called by authors ARDEA *ſtellaris*; and by ſome *taurus*, *auratus*, *botaurus*, and *onocrotalus*: in Engliſh, the *butter-bump*, and *mire-drum*. It builds on the ground, and lays five or ſix eggs, which are roundiſh, and of a greeniſh white. When wounded, and going to be taken, it ſtrikes at the perſon's eye, and ought carefully to be guarded againſt.

BITTERN is alſo a name given to the brine ſwimming upon the firſt concreted ſalt in the ſalt-works; this liquor is ladled off, that the ſalt may be taken out of the veſſel, and is afterwards put in again, and affords more ſalt, which is to be ſeparated like the reſt, by ladling off the liquor a ſecond time, and ſo on.

The *bittern*, according to Mr. Boyle, is a very ſaline, bitter, ſharp, pungent liquor, which drains off in the making of ſalt from ſea-water; or which remains in the pans, after the coagulation, and granulation of the *purer*, and more ſaline part, by boiling.

A *bittern* alſo runs, or oozes, from the heaps of foſſile ſalt at Limington, and Portſea in Hampſhire. Phil. Tranſ. N° 377. p. 348.

Bittern makes the baſis of *ſal catharticum amarum*, or EPSOM-SALT.

Bittern is the mother-ley of SEA-*ſalt*, or the liquor which remains after the purification and cryſtallization. It is employed in this country for making a purging bitter ſalt, which proves ſimilar in quality to the ſalt obtained from the Epſom waters, and is commonly ſold under its name. The *ley* is boiled down to a certain pitch, then ſtrained and inſpiſſated, the dry matter is calcined, rectified, and cryſtallized. If the mother-ley be inſpiſſated and diſtilled with vitriolic additions, a ſpirit of ſalt is obtained. Neumann, p. 212.

BITTERNESS, a kind of ſavour or ſenſation, oppoſite to ſweetneſs.

According to Grew, *bitterneſs* is produced by a ſulphur well impregnated with a ſalt, either alcaline or acid, and ſhackled with earth.

Hence it is that the bitterſt plants uſually yield the greateſt quantity of lixivial ſalt; and that many diſtilled oils,

oils, digested with any ſtrong acid, acquire a bitter taſte. Add, that the leaves of all ſweet roots are bitter; the fig-tree, which bears a ſweet fruit, bleeds a bitter milk; and that the roots of plants, which bear a bitter ſtalk, are not bitter, but hot. That the earthy parts contribute conſiderably to the *bitterneſs* of bodies, appears hence, that moſt bodies of that kind are fixed; or, if they do emit fumes, do not loſe their bitter taſte therewith. Diſc. of Taſte of Plants, cap. iv. § 12.

Bitterneſs, Neumann obſerves, is extracted both by water and ſpirit: does not ariſe in diſtillation; is freed from its ſmell by boiling in water, and covered by acids. He has given the chemical hiſtory of *bitter* VEGETABLES. See his Works.

Mr. Boyle obſerves, that a ſubſtance bitter in the higheſt degree, may be divided into two ſubſtances, the one extremely four, and the other inſipid. This happens, when the cryſtals of Silver are diſtilled by a heat ſufficient to drive away all the ſpirits from the ſilver. What remains is inſipid, and what riſes is highly acid. Works abr. vol. i. p. 241.

The extinguiſhing, or removing of *bitterneſs*, is called DULCIFYING, ſweetning, &c.

M. Boin has given methods of removing, or diſcharging the *bitterneſs* of olives and Indian cheſnuts. Mem. Acad. Sc. 1720. p. 600.

The *bitterneſs* of SEA-water has been ſuppoſed to ariſe from the diſſolution of the beds, or ſtrata of BITUMEN; as its ſaltneſs does from a diſſolution of the ſtrata of ſalt. Ibid. 1710. p. 33.

The qualities of *bitter* bodies are ſuppoſed to be dry, warm, aſtringent, and earthy.

According to Grew, all plants which are bitter and pungent, either on the tongue, or in the throat, are good elſewhere, e. gr. daiſy, anagallis, &c. The ſame author adds, that moſt purgative and emetic plants, which have any ſenſible taſte, are *bitter*; either ſimply, as coloquintida; or *bitter* and aſtringent, as aloes, &c. *Bitter* things are generally reputed STOMACHIC; yet, according to Abercrombie, they are naturally the reverſe, and hurtful to the ſtomach; and only become beneficial to it, where their aſtringency renders them proper. Phil. Tranſ. N° 171. p. 1026.

Bitters are ſaid to reſiſt putrefaction and moderate fermentation: hence appears their uſe in putrid diſorders. *Bitters* likewiſe correct acidities, and aſſiſt digeſtion, by braſing the fibres of the ſtomach.

BITTER *purging ſalt*, *ſal cathartikum amarum*. See EPSOM *ſalt*.

BITTER *place*, *locus amarus*, a poor barren ſoil, by Pliny called *terra amara*, *ſive macra*.

BITTER, in the *Sea-language*, denotes a turn of the cable about the bitts, in order to its being veered out by little and little at pleaſure.

A ſhip is ſaid to be brought up to a *bitter*, when ſhe is ſtopped by her cable.

BITTER *end*, is that part of the cable which ſtays within board, wound about the bitts, when the ſhip is at anchor. When they would have that end bent to the anchor, they ſay, bend to the *bitter end*.

BITUMEN, in a general ſenſe, a fatty, tenacious, mineral juice, very inflammable; or a foſſil body, which readily takes fire, yields an oil, and is not ſoluble in water.

The origin of *bitumen* has not yet been aſcertained: ſome ſuppoſe that they belong to the mineral kingdom, and others that they proceed originally from vegetable ſubſtances. Macquer inclines to the latter opinion; though Dr. Lewis, the tranſlator of Neumann's works, diſtinguiſhes between mineral *bitumens* and vegetable reſins.

Naturaliſts diſtinguiſh three kinds of *bitumen*; *hard*, *ſoft*, and *liquid* or *oily*; each of which they ſubdivide into ſeveral ſpecies.

Among the *hard* or *ſolid bitumens* are ranked, yellow amber, ambergris, jet, aſphaltum, paſſaphaltum, pit-coal, and ſulphurs.—The *ſoft* are maltha, *bitumen* of Calao, and of Surinam.—Laſtly, the naphtha of Italy, and petroleum, are ranked among the *liquid bitumens*.

Of *bitumens*, ſome again are foſſil, others are found floating on the ſurface of certain lakes, and others ſpring from the earth like fountains; as at Pitchford in Shropſhire, &c.—Some *bitumens* are ſo hard, that they are uſed in forges, inſtead of coals; others ſo glutinous, that they ſerve inſtead of cement, or mortar, in buildings; of which kind was wherewith the famous walls of Babylon were built: and others ſo liquid, that they are burnt in lamps inſtead of oil.

The *bitumen* in moſt eſteem is that of Judea.

From the origin and inflammability of *bitumens*, it appears they bear a near affinity to ſulphurs, and are ſuppoſed both formed of the ſame principles or ingredients; only differing in this, that ſulphurs are harder and more brittle, *bitumens* more fatty and tenacious.

Bitumens are uſually divided into two ſpecies, *liquid* and *ſolid*. Though ſome diſtinguiſh three kinds, as before mentioned.

Dr. Woodward gives a different diviſion of the Engliſh *bitumens*, or bituminous foſſils. The firſt are thoſe of a more lax and coarſe conſtitution; and which, when wetted, yield a groſſer, or pitchy matter. Such are the *lapis piceus*, or pitch-ſtone, the *lapis ampelites*, *obſidianus* or canel, and the *lithanthrax* or coal. The ſecond is of a more denſe and fine conſtitution, and yields an oil: ſuch are the GAGATES, or jet; and SUCCINUM, or amber.

Bitumen is ſuppoſed the chief fuel of the ſubterranean fires.

Many have been fond of ſuppoſing all ſea water to contain a large quantity of *bitumen*, and that it owes its bitterneſs to this admixture; but this ſeems erroneous, ſince we find that all ſea-water contains a large quantity of bitter purging ſalt of the nature of what is ſold in our ſhops, under the name of *Epſom ſalt*; and its bitterneſs is of the very ſame kind with the taſte of that ſalt.

That there are, however, *bitumens* mixed in ſeveral places with the water of the ſea, is very certain. Barbadoes tar is found floating on the ſea, being waſhed in great quantities from the rocks, and count Marſigli obſerved ſpiral filaments ariſing from the ſurface of the ſea Marmora, near Conſtantinople, which concreted into *bitumen*, exactly of the ſame kind with that he obſerved at Zant, flowing from the ſides of a bituminous mountain.

On ſome of the coaſts of Italy they ſkim off a kind of liquid *bitumen*, or petroleum, from the ſurface of the ſea. Some think that ambergris is a *bitumen* of the ſea, and many travellers tell us of a fatty ſubſtance on the ſurface of it, that gives light in the night. Theſe various ſubſtances may impart various properties to the ſea-water, in ſuch parts where they are found to abound, and they may be common in many places, but they are certainly not found in all, nor is *bitumen* a neceſſary ingredient in ſea-water. Count Marſigli has indeed proved, that a ſpirit diſtils from the moſt common of all *bitumens*, Pit-coal will give water a bitter taſte, but ſea-water is not yet proved to be impregnated with ſuch a ſpirit. On the contrary, when diſtilled, it has no bitter taſte; therefore marine waters are not impregnated with ſuch a volatile *ſpirit*, but evidently owe their *bitterneſs* to a fixed principle; and it is very certain, that pit-coal cannot give this taſte, ſince the waters which iſſue out from among the ſtrata of ſea-coal are never found to be bitter, though often ſtrongly impregnated with iron.

All *bitumens* have this good quality in their burning, that they will do without a wick. Dr. Plot therefore conjectures, that the famous ſepulchral LAMPS of the ancients were contrived of theſe *bitumens*, particularly of the liquid kind, becauſe any thing that would require a wick, would be liable to its choaking up, and being deſtroyed.

BITUMEN, in a more particular ſenſe, is reſtrained to the ASPHALTOS, otherwiſe called *bitumen Judaicum*.

BITUMEN *Barbadenſe*; ſee BARBADOES *tar*.

BITUMEN *Hyblæum*, in *Mineralogy*, a name given by Boccone and others to a peculiar ſpecies of bituminous foſſil, which is flexile while in the earth, a property very ſingular in a foſſil not of the talcy kind, as this evidently is not. It is a ſtony ſubſtance, ſmelling like the common *bitument*, and compoſed of a very great number of thin plates, laid evenly and regularly on one another. It has its name from the place where it is found, which is the Hyblæan mountains of Sicily, near Milelli, neighbouring upon the town of Auguſta and the ancient Megara. When burnt in a candle, the bituminous ſmell is perceived very ſtrong; and the ſtone, though when firſt taken up it be flexible like paper, yet in time hardens, and becomes brittle like other foſſils of that lax conſiſtence. There are found whole hillocks covered with it. This does not prevent their bearing plants and herbage, the roots of the graſs, &c. inſinuating themſelves between the *lamina* of this ſtone, and getting good nouriſhment there. Phil. Tranſ. N° 200.

BITUMINOUS, ſomething that relates, or partakes of the nature and qualities of BITUMEN.

All *bituminous* bodies are offenſive to the head. Their ſmell or ſtench makes the EPILEPSY diſcover itſelf.

BIVALVE, or BIVALVULAR, a term uſed by the writers of natural hiſtory, for ſuch ſhell-fiſh as have two ſhells, e. gr. cockles, muſcles, oyſters, &c. which are ſaid to be of the *univalvular* kind.

Theſe are a leſs numerous claſs than the *univalves*, and have been arranged by an accurate French writer under ſix genera. Theſe are, 1. The OYSTERS. 2. The CHAMÆ. 3. The MYTULI, or MUSCLES. 4. The CARDIFORM ſhells. 5. The PECTINES, or ſcallops.

And,

And, 6. The solens, or razor-shells. For the characters and species of each of these, see their several heads, oysters, &c.

See a description of *bivalve* insects by Mr. Muller, in the Phil. Trans. vol. lxi. part i. N° 29.

Bivalve is also applied to the *siliqua*, or seed-pods, of such plants as open their whole length to discharge their seeds. Such are peas, beans, &c. which the botanists say, have *bivalve* or *bivalvular siliquæ*.

BIVENTER, from *bis*, and *venter*, *belly*, in *Anatomy*, a denomination given to the sixth muscle of the lower jaw; being the last of those serving to depress or open it: thus called, as having two bellies for its two extremities, and a tendon in the middle.—See *Tab. Anat. (Myol.) fig.* 2. n. 2.

The *biventer*, or *digastricus*, has its origin from a fissure between the occipital bone and the mastoidal *apophysis*; whence passing its tendon through a hole in the *stylohyoideus*, and an annular ligament of the *os hyoides*, there arise some fibres, which join its second belly: hence, growing fleshy, and returning upwards, it is inserted into the middle of the inferior part of the lower jaw.—By this contrivance it is enabled to draw the jaw downwards.

BIUMBRES, from *bis*, *double*, and *umbra*, *shadow*, in *Geography*, an appellation given to the inhabitants of the torrid zone, because, at two different seasons of the year, their shadows are projected two different ways.

The *biumbres* are the same with those otherwise denominated amphiscii.

BIXA, in *Botany*, a genus of the *polyandria monogynia* class; ANOTTA, by the French called rocou. Its characters are these: the flower hath a double series of petals, the outer consisting of five, which are large, the inner of the same number and shape, but narrower. It hath a great number of bristly stamina: in the centre is situated an oval *germen*, which afterward becomes an oval heart-shaped capsule, covered with sharp bristles, opening with two valves, with one cell, and filled with angular seeds. We have but one species of this genus; which must be constantly kept in a bark stove, or they will not thrive in England.

BIZARRE, Fr. denoting *capricious*, &c. a term used among *Florists* for a particular kind of carnation, which has its flowers striped or variegated with three or four colours.

BIZE, in *Ichthyology*, a name by which some call the Pelamys, a sea-fish, of the shape of the tunny, and resembling the young brood of that fish; but distinguishable by its wanting scales in most parts of its body.

BIZOCHI, or Biochi, a sect or branch of religious minorites, condemned by several popes.

The *Bizochi* were also called *fratricelli*, or *frères de pauvre vita*; sometimes *Bichini*, or *Bicchini*, and Beguini. The name is formed from *bisaccus*, on account of a double budget or wallet wherewith they begged their living. See Beghardi.

BIZARRO, or en Bizzaria, in the *Italian Music*, signifies *with capricious changes*; sometimes full, at others slow, soft, strong, &c. as the fancy of the composer.

BLACK, something opake and porous, that imbibes all the light falling on it, reflects none, and therefore exhibits no colour. See Blackness.

There are various kinds of *blacks*, which pass in commerce; *viz. blue black*, *dyers black*, *painters black*, *German black*, *ivory black*, *Spanish black*, *lamp black*, *Indian black*, &c.

Bodies of a *black* colour are found more inflammable, because the rays of light falling on them are not reflected outwards, but enter the body, and are often reflected and refracted within it, till they be stifled and lost. They are also found lighter, *cæteris paribus*, than white bodies, being more porous: it may be added, that cloths dyed of this colour wear out faster than those of any other, because their substance is more penetrated and corroded by the vitriol necessary to strike their dye, than other bodies are by the galls and alum which suffice for them.

The inflammability of *black* bodies, and their disposition to conceive heat beyond those of other colours, is easily evinced. Some appeal to the experiment of a white and a *black* glove worn in the same sun; the consequence will be, a very sensibly greater degree of heat in the one hand than the other. Others allege the phenomena of burning-glasses, by which *black bodies* are always found to kindle soonest. Mr. Boyle gives other proofs still more obvious: he took a large tile, and having whited over one half of its superficies, and blacked the other, exposed it to the summer sun; where having let it lie a convenient time, he found, that whilst the whited part remained still cool, the *black* part was grown very hot. For further satisfaction, the same author has sometimes left on the surface of the tile a part retaining its native red, and exposing all to the sun, has found the latter to have contracted a heat in comparison of the white part, but inferior to that of the *black*.

So also on his exposing two pieces of silk, one white, the other *black*, in the same window to the sun, he often found the latter considerably heated, when the former has remained cool. It is observable likewise, that rooms hung with *black* are not only darker, but warmer than others. Boyle's Works abridg. tom. i. p. 144. and tom. ii. p. 36.

To all which may be added, that a virtuoso of unsuspected credit assured Mr. Boyle, that, in a hot climate, he had, by carefully blackening the shells of eggs, and exposing them to the sun, seen them thereby well roasted in a short time.

Dr. Watson of Cambridge covered the bulb of a thermometer with a *black* coating of Indian ink; in consequence of which, the mercury role ten degrees. Phil. Trans. vol. lxiii. part i. p. 40.

Black cloaths heat more, and dry sooner in the sun than white cloaths. *Black* is a bad colour for cloaths in hot climates; but a fit colour for the linings of ladies summer hats. Dr. Franklin's Experiments, Observations, &c. 5th edit p. 483. & seq. He observes also, ibid. p. 382, that a chimney painted *black*, is less exposed to the sun, will draw more strongly.

Black, in matters of dress, is the distinguishing habit of church-men and mourners.

Some will have it, that the common people among the Romans were clothed in *black*; whence the denomination given them of *turba pullata*.

Black, in *Heraldry*, is properly called sable.

Black, in the *Manege*.—A horse of a deep, shining, and lively *black* is called a *black-mare*, or *coal-black*. Horses *black* all over are commonly reckoned dull and melancholy; but a white foot, or star in the forehead, gives them a degree of sprightliness. The Spanish gravity is said to be best pleased with those entirely *black*.

Black, *blue*, is the coal of some kind of *wood*, or other vegetable matter: the best sort is said to be made of vine-stalks and tendrils.

Black, *bone*, is made of the bones of bullocks, cows, &c. well burnt and ground. To be good, it must be soft and friable, of a gloffy cast. It is in considerable use, though inferior in goodness to *ivory black*.

The invention of *bone* or *ivory black* is attributed to Apelles. Plin. Hist. Nat. lib. xxxv. cap. 5.

Black, *dyers*, is one of the five simple and mother colours used in dying; and given differently, according to the different quality and value of the stuffs to be dyed.

Green vitriol ſtrikes a *black* colour with vegetable aſtringents, and hence it is the baſis of the *black* dye for cloth, feather, hats, &c. And as ſolutions of iron with galls, &c. produce the ſame colour, a method is derived from hence of diſtinguiſhing the minuteſt portions of iron in mineral waters, &c. Neumann.

For broad cloths, fine ſtuffs, and druggets, &c. they uſe woad and indigo; the goodneſs of the colour conſiſts in there not being above ſix pounds of indigo to a hall of woad, when the latter begins to call its blue flower; and, in its not being heated for uſe above twice.—Thus blued, the ſtuff is boiled with alum, or tartar, then maddered; and, laſtly, the black given with galls, copperas, and ſumac.—To bind it, and prevent its ſmearing in uſe, the ſtuffs are to be well ſcoured in the fulling-mill, when white, and well waſhed afterwards.

For ſtuffs of leſs value, it is ſufficient they be well blued with woad, *and blotched* with galls and copperas: but no ſtuff can be regularly dyed from white into *black*, without paſſing through the intermediate blue.

Yet there is a colour called a *dead black*, or *Jeſuit's black*, prepared of the ſame ingredients as the former, and ſufficient of itſelf without the blue-dye. Here the drugs are diſſolved in water: the cloth boiled *four hours*, and ſtood to cool till the hand would bear it; then the ſtuff is dipped in it, and again taken out ſix or eight times. Some even prefer this *black* to the other.—This method of dying *black* is ſaid to have been invented by the Jeſuits, and to have been practiſed in their houſes, where they retained numbers of dyers.

By 23 El. c. 9. nothing of the nature of cloth ſhall be maddered for a *black*, except it be firſt grounded with woad only, or with woad and anele [blue ind.] unleſs the madder be put in with ſumac or galls; on pain of forfeiting the value of the thing dyed: provided it ſhall be lawful to dye any manner of *gall black*, and *ſumac black* [*plain black*] wherein no madder ſhall be uſed.

Logwood ſtrikes a *black* with chalybeate ſolutions, and is employed with thoſe liquors for ſtaining wood *black*, as picture-frames, &c. With the addition of galls, it is uſed for dying cloth and hats *black*. Neumann's Works, p. 287. This *black* colour is not permanent, though beautiful, any more than the natural violet dye of the log-wood.

BLACK, *earth*, is a kind of coal found in the ground, which, well pounded, is used by painters in fresco.

There is also a kind of BLACK made of silver and lead, used to fill up the strokes and cavities of things engraved.

BLACK, *German* or *Frankfort*, is made of the lees of wine burnt, then washed in water, and ground in mills for that purpose, together with ivory or peach-stones burnt. This *black* makes the principal ingredient in the rolling-press-printers INK. It is ordinarily brought from Frankfort, Mentz, or Strasbourg, either in lumps or powder.

That made in France is more valued than that of Germany.

BLACK, *horn*, that which remains in the retort after extracting the spirit, salt, and oil of harthorn. This residue, being ground up with water, makes a *black* not much inferior to that of ivory.

BLACK, *ivory*, is made of ivory burnt or charred, ordinarily between two crucibles well luted; which, being thus rendered perfectly *black*, and in scales, is ground in water, and made into troches, or little cakes, used by the painters; as also by the jewellers to blacken the bottom or ground of the collets, wherein they set diamonds to give them their teint or foil. Some recommend striking the chips or shaving of ivory in hot linseed oil, before it is charred.

There are particular machines and contrivances for burning the ivory for these purposes, by which the colour is rendered more beautiful than that of the coal which remains in the distillation. Neumann.

The goodness of *ivory black* may be perceived by its fulness, without a blue-cast; and by the fineness of the powder.

BLACK, *lamp*, or *Lamp* BLACK, originally perhaps the soot collected from lamps, is generally prepared by melting and purifying resin or pitch in iron vessels; then setting fire to it under a chimney, or other place made for the purpose lined a-top with sheep skins, or thick linen cloth, to receive the vapour or smoke, which is the *black*: in which manner they prepare vast quantities of it at Paris. In England it is ordinarily prepared from the resinous and fatty parts of woods, burnt under a kind of tent, which receives it; but the greatest part is brought from Sweden and Norway, where it is frequently obtained not from pure resin or pitch, but from the dregs, and pieces of the bark of the tree, separated in preparing them. The dross left on straining the resin is burnt for *lamp black*, in a low oven, from which the smoke is conveyed by a long passage into a square chamber, having an aperture in the top, upon which is fastened a large sack. The soot concretes partly in the sack, and partly in the chamber and canal.

It is used on various occasions, particularly in the printers INK; for which it is mixed with oils of turpentine and linseed, all boiled together.

It must be observed that this black takes fire very readily, and when on fire, is very difficultly extinguished: the best method of putting it out is with wet linen, hay, or straw; for water alone will not do it.

There is a finer and brighter kind of *lamp* or *candle black* procured from the fumes of a lamp or candle, gathered by a proper receptacle placed in manner of a canopy over the luminary, and wiped or brushed off; but it is not procured in quantity sufficient for ordinary use.

A glass tube closely filled with *lamp black* has been found to conduct a considerable charge of electricity instantaneously, and with scarce any explosion. But a coating of this substance mixed with tar or oil is a perfect non-conductor, and has proved a preservative from lightning, by repelling the electric matter from those parts of the masts of ships which have been covered with it.

BLACK, *soot*, or *chimney*, is a poor colour; but ready for painting *black* draperies in oil. See SOOT.

BLACK, *Spanish*, so called, because first invented by the Spaniards, and most of it bought from them; is no other than burnt cork used in various works, particularly among painters.

BLACK, *Indian*; see *Indian* INK.

BLACK, *carriers*, signifies a teint or dye laid on tanned leather; of which there are usually two; the first made of galls, allegre, and old iron; the second of galls, copperas, and gum Arabic. See CURRYING.

BLACK *act*; the statute of 9 Geo. I. c. 22, is commonly called the Waltham *black act*, because it was occasioned by the devastations committed near Waltham in Essex, by persons in disguise, or with their faces *blacked*. By this statute it is enacted, that persons hunting armed and disguised, and killing or stealing deer, or robbing warrens, or stealing fish out of any river, &c. or any persons unlawfully hunting in his majesty's forests, &c. or breaking down the head of any fish-pond, or killing, &c. of cattle, or cutting down trees, or setting fire to house, barn, or wood, or shooting at any person, or sending letters, either anonymous or signed with a fictitious name, demanding money, &c. or rescuing such offenders, are guilty of felony, without benefit of clergy. This act is made perpetual by 31 Geo. II c. 42. See farther 6 Geo. II. c. 37. and 27 Geo. II. c. 15. Blackstone's Comm. vol. iv. p. 144. 208. 232. 244.

BLACK-*berry*, in *Botony*, a species of the RASP-*berry*.

BLACK-*bird*, *merula*, in *Ornithology*, a bird of the TURDUS or thrush kind, of which there are several species. 1. The common kind, well known in our hedges. 2. The kind called the PASSER *solitarius*, or solitary sparrow. 3. The *caruleus*, of which there are two kinds. 4. The Brasilian *black-bird*, remarkable for the shortness and crookedness of its beak, and for its remarkably beautiful colours. Its tail and wings are black, and the rest of its body of a fine beautiful deep red. Its legs and feet are black, or of a brownish grey. Its wing-feathers also have some slight variegations of red. 5. The MERULA *rosea*, or rose-coloured *black-bird*; this is smaller than the common kind, and its back, breast, and wings are of a pale red or damask rose-colour. Its wings and tail black. 6. The red-breasted Indian *black-bird*, called by the Brasilians JACAPU. 7. The *merula torquata*, or ring AMZELL. Beside these there is the MERULA *montana*, or common AMZELL: and the MERULA *bicolor*: and two other birds, called MERULÆ *congeneres*, described by Aldrovandus, but not now known. See *Tab.* III. *of Birds*, N° 29, 30.

The merit of the *black-bird* is not its only valuable quality: for it is a very delicate bird for the table. It builds its nest in woods, very early in the spring, often in March, while the snow is on the ground. It generally chooses the stumps of trees, or thick hedges, for the place. The outside of the nest is made of dry grass, sticks, and the fibres of roots of trees: the inside is lined with clay, and formed so round, that art cannot mend it. They build three or four times in the year, and even oftener than that, if their nests are taken early from them. The young ones may be easily raised with any kind of meat. It sings three or four months in the year; the note is loud, and not very agreeable; but may be much improved by teaching.

BLACK-*books*, a name given to those which treat of NECROMANCY, or, as some call it, NIGROMANCY.

The BLACK-*book* of the English monasteries was a detail of the scandalous enormities practised in religious houses, compiled by order of the visitors under king Henry VIII. to blacken them, and thus hasten their dissolution.

BLACK-*canons*, a name given to the regular canons of St. Augustine, who wore a *black* mantle over their surplice, by way of distinction from the *Præmonstratenses*.

BLACK-*cap*, in *Ornithology*, a name given by the common people of many counties of England to the PEWIT, a bird of the gull-kind.

BLACK-*cap*, is also the common English name for the *parus palustris*, or marsh TITMOUSE.

BLACK-*cap*, or *motacilla atricapilla* of Linnæus, is one of the smallest birds: the crown of the head in the male is black, but in the female of a dull dusk-colour; and they are thus distinguished. This is a bird of passage. It sings finely, with a full, sweet, deep, loud, wild pipe: its strains are short, and motions desultory. Its notes are superior to those of any of our feathered warblers, the nightingale excepted: and it is therefore called in Norfolk the mock-nightingale.

BLACK-*chalk*; see CHALK.

BLACK-*silver*, in *Ornithology*, a name given by many to a species of duck very common about the coasts of Lancashire, Yorkshire, and some other counties, and called more generally the SCOTER. It is all over *black*.

BLACK-*ears*, or black-eared cat; see SIGAH *gutt.*

BLACK-*earth*, *terra nigra*, denotes the natural mould or loam. See SOIL, &c.

BLACK-*eunuchi*, in the customs of Eastern nations, are Ethiopians castrated, to whom their princes commonly commit the care of their women. See EUNUCH.

BLACK-*eye*, *hypochyma*, in *Medicine*, a suffusion of blood on the *tunica adnata* turning livid, occasioned by a blow. See ECCHYMOSIS.

BLACK-*eye*, is also a name given to the GERM in BEANS, which the Romans called HILUS.

BLACK-*friers*, a name given to the DOMINICAN order, called also *Predicants* and *Preaching friers*; in France, *Jacobins*.

BLACK-*game*, in *Zoology*, a common English name for the *urogallus* or *tetrao major*, called also the OROUSE.

BLACK-*glass*; see GLASS.

BLACK-*grass*, a species of American grass growing in meadows which borders on tide rivers, well supplied also with fresh water; for a mixture both of fresh and salt water seems to be necessary for its prolific vegetation. Its seeds are small like those of tobacco; its colour a deep green; and it affords from three to four tons of hay by the acre. This kind of grass thrives best on a clay or strong loam; nor is the vicinity of salt-water absolutely

solutely neceſſary. The ſeeds have been lately brought over into England, and diſtributed for trial in proper ſoils.

BLACK-*jack*, or BLEND, is a mineral called alſo *falſe* GALENA, and BLINDE, &c.

BLACK-*land*, in *Agriculture*, a term by which the huſbandmen denote a particular ſort of clayey ſoil, which, however, they know more by its other properties than by its colour, which is rarely any thing like a true *black*, and often but a pale grey. This, however pale when dry, always blackens by means of rains; and when ploughed up at theſe ſeaſons, it ſticks to the plough-ſhares, and the more it is wrought, the muddier and duſkier-coloured it appears. This ſort of ſoil always contains a large quantity of ſand, and uſually a great number of ſmall white ſtones.

BLACK-*lead*; ſee LEAD.

BLACK-*leather*, is that which has paſſed the curriers hands, where from the ruſſet as it was left by the tanners, it is become *black*, by having been ſcoured and rubbed three times on the grain-ſide with copperas-water.

BLACK-*legs*, a name given in Leiceſterſhire to a diſeaſe frequent among calves and ſheep. It is a kind of jelly which ſettles in their legs, and often in the neck, between the ſkin and fleſh.

BLACK-*mail*, a certain rate of money, corn, cattle, or other matter, anciently paid by the inhabitants of towns in Weſtmoreland, Cumberland, Northumberland, and Durham, to divers perſons inhabiting on or near the borders, being men of name, and allied with others in thoſe parts, known to be great robbers and ſpoil-takers; in order to be by them freed and protected from any pillage. Prohibited by 43 El. c. 13.

The origin of this word is much conteſted, yet there is ground to hold the word *black* to be here a corruption of *blank* or white, and conſequently to ſignify a rent paid in a ſmall copper coin called *blanks*. This may receive ſome light from a phraſe ſtill uſed in Picardy, where ſpeaking of a perſon who has not a ſingle halfpenny, they ſay, *il n' a pas vne blanque maille*.

BLACK-*monks*, a denomination given to the BENEDICTINS, called in Latin *nigri monachi*, or *nigromonachi*; ſometimes *ordo nigrorum*, the order of *blacks*.

BLACK-*oats*; ſee OATS.

BLACK-*proceſſion*, in *Eccleſiaſtical Writers*, that which is made in *black* habits, and with *black* enſigns and ornaments. See PROCESSION.

Anciently at Malta there was a *black-proceſſion* every Friday, where the whole clergy walked with their faces covered with a *black* veil.

BLACK-*rents*, the ſame with BLACK-*mail*, ſuppoſed to be rents formerly paid in proviſions and fleſh, not in ſpecie.

BLACK-*rod.—Gentleman-uſher of the* BLACK-*rod*, is the chief gentleman-uſher to the king, called in the black-book, *Latus virgæ nigræ, & baſtiarius*; and elſewhere, *virgæ bajulus*.

His duty is to bear the rod before the king at the feaſt of St. George at Windſor; he has alſo the keeping of the chapter-houſe door, when a chapter of the order of the garter is ſitting; and, in time of parliament, attends the houſe of peers. His badge is a *black-rod*, with a lion in gold a-top. This rod has the authority of a mace; and to his cuſtody all peers queſtioned for any crime are firſt committed.

BLACK-*row grains*, a ſpecies of iron-ſtone or ore found in the mines about Dudley in Staffordſhire.

BLACK-*ſands*; ſee SANDS.

BLACK *ſealing-wax*; ſee WAX.

BLACK-*ſheep*, in the *Oriental Hiſtory*, the enſign or ſtandard of a race of Turkmans ſettled in Armenia and Meſopotamia; hence called the *dynaſty of the black-ſheep*.

BLACK-*ſtaining*; ſee STAINING.

BLACK-*ſtones* and gems, according to Dr. Woodward, owe their colour to a mixture of tin in their compoſition.

BLACK-*ſtrakes*, a range of planks immediately above the wales in a ſhip's ſides: they are always covered with a mixture of tar and lamp-*black*.

BLACK-*thorn*, in *Botany*, a ſpecies of the *prunus*. See PLUM-*tree*.

BLACK-*tin*, in *Mineralogy*, a denomination given to the tin-ore, when dreſſed, ſtamped, and waſhed ready for the blowing-houſe, or to be melted into metal. Phil. Tranſ. N° 40. p. 1116.

It is prepared into this ſtate by means of beating and waſhing; and when it has paſſed through ſeveral buddles or waſhing-troughs, it is taken up in form of a black powder, like fine ſand, called *black*-TIN.

BLACK-*varniſh*; ſee VARNISH.

BLACK *vegetable juice*; ſee ANACARDIUM.

BLACK-*whyſtle*, in our old writers, bread of a middle fineneſs betwixt white and brown, called in ſome parts *rowel bread*.

In religious houſes, it was the bread made for ordinary gueſts, and diſtinguiſhed from their houſhold loaf, or *panis conventualis*, which was pure manchet, or white bread.

BLACK-*work*, iron wrought by the black-ſmith; thus called by way of oppoſition to that wrought by white-ſmiths.

BLACK *of charcoal*; ſee CHARCOAL.

BLACK *Book of the Exchequer*, *Eagle*, *Heliborow Money*, *Order*, *Star*; ſee the ſeveral ſubſtantives.

BLACKING is ſometimes uſed for a factitious black, as lamp-black, ſhoe-BLACK, &c. A mixture of ivory or lamp-black with linſeed oil, makes the common oil *blacking*. For a ſhining *blacking*, ſmall-beer or water is uſed inſtead of oil, in the proportion of about a pint to an ounce of the ivory black, with the addition of half an ounce of brown ſugar and as much gum Arabic. The white of an egg, ſubſtituted for the gum, makes the black more ſhining; but is ſuppoſed to hurt the leather and make it apt to crack.

BLACKNESS, the quality of a black body; or a colour ariſing from ſuch a texture and ſituation of the ſuperficial parts of the body, as does, as it were, deaden, or rather abſorb the light falling on it, without reflecting any, or very little of it, to the eye.

In which ſenſe, *blackneſs* ſtands *directly* oppoſed to *whiteneſs*; which conſiſts in ſuch a texture of parts, as indifferently reflects all the rays thrown upon it, of what colour ſoever they be.

Deſcartes, ſays Dr. Prieſtley, though miſtaken with reſpect to the nature of light and colours, yet diſtinguiſhes juſtly between *black* and *white*, obſerving, that *black* ſuffocates and extinguiſhes the light that falls upon it; but that *white* reflects them. This, adds the hiſtorian of philoſophy, is the firſt diſtinct account I have met with of this ſenſible hypotheſis. *Hiſt. of Viſion*, p. 727 and 743, &c.

Sir Iſaac Newton, in his Optics, ſhews, that for the production of *black colour*, the corpuſcles muſt be leſs than thoſe which exhibit any other colours; becauſe, where the ſizes of the component particles are greater, there is too much light reflected to conſtitute this colour; but, if they be a little leſs than is requiſite to reflect the white, and very faint blue of the firſt order, they will reflect ſo little light, as to appear intenſely black; and yet may, perhaps, reflect it variouſly to and fro within them ſo long, till it happen to be ſtifled and loſt; by which means they will appear *black* in all poſitions of the eye, without any tranſparency.

And from hence it appears, why fire, and putrefaction, by dividing the particles of ſubſtances, turn them black; why ſmall quantities of *black* ſubſtances impart their colours very freely, and intenſely, to other ſubſtances, to which they are applied; the minute particles of theſe, by reaſon of their very great number, eaſily overſpreading the groſs particles of others. Hence alſo appears, why glaſs ground very elaborately with ſand, on a copper plate, till it be well poliſhed, makes the ſand, together with what by rubbing is worn off from the glaſs and copper, become very black; and why black ſubſtances do, ſooneſt of all others, become hot in the ſun's light, and burn, (which effect may proceed partly from the multitude of refractions in a little room, and partly from the eaſy commotions of ſuch very ſmall particles): alſo, why blacks are uſually a little inclined towards a bluiſh colour; for, that they are ſo, may be ſeen by illuminating white paper with light reflected from black ſubſtances, where the paper will uſually appear of a bluiſh white; and the reaſon is, that black borders on the obſcure blue of the firſt order of colours; and therefore reflects more rays of that colour than of any other.

BLACKS, *Negroes*: a people, ſo called from the colour of their ſkin.—For the reaſon of their colour, and the commerce of them, ſee NEGRO.

BLACKS is alſo a name given to an aſſociation of diſorderly, and ill-deſigning perſons, formerly herding chiefly about Waltham in Eſſex, who deſtroyed deer, robbed fiſh-ponds, ruined timber, &c.—See BLACK *act*.

BLADDER, in *Anatomy*, a thin expanded membranous body, found in ſeveral parts of an animal, ſerving as a receptacle of ſome juice, or of ſome liquid excrement; from whence it takes various denominations, as *urine-bladder*, *gall-bladder*, &c.

BLADDER, by way of eminence, is a large veſſel, which ſerves as a receptacle of the urine of animals, after its ſecretion from the blood in the kidneys.

This is ſometimes alſo called, by way of diſtinction, the *urinary bladder*, *veſica urinaria*.

The *bladder* is ſituated in the *pelvis* of the *abdomen*; in men immediately on the *rectum*; in women, on the *vagina uteri*: its figure in quadrupeds reſembles a pear, with the baſis upwards; but in human bodies the lower

part

part is almoſt on a level with the upper; and its orifice, or neck, placed ſideways, while the *fundus*, or bottom, which in a human bladder is very broad, reſts either on the *rectum*, or the *vagina uteri*—It is faſtened to the navel by the *urachus* degenerated into a ligament, its ſides to the umbilical arteries, and its neck to the *inteſtinum rectum* in women.

The *bladder* is compoſed of three coats; the firſt a covering of the *peritonæum*; the ſecond conſiſts of muſcular fibres, which run irregularly ſeveral ways; and the third, which is full of wrinkles for facilitating its dilatation, is both glandulous and nervous.—Its glands ſeparate a viſcous and ſlimy matter, which defends the *bladder* from the acrimony of the ſalts in the urine. Around its neck there goes a ſmall muſcle, called *ſphincter veſicæ*, which contracts the orifice of the *bladder*, to prevent the urine from dripping involuntarily, or till it thruſt open the paſſage by the contraction of the ſecond coat of the *bladder*, which is therefore called *detruſor urinæ*.

Though the urinary *bladder* be naturally ſingle, yet there have been inſtances of nature's varying from herſelf in this particular. The bladder of the famous Caſaubon, upon diſſecting his body after his death, was found to be double; and, in the Philoſophical Tranſactions, we have an account of a triple *bladder* found in the body of a gentleman who had long been ill, and no one could gueſs the cauſe.

As to the figure and ſituation of the human *bladder*, Mr. Weitbrecht has given a better deſcription of them than is to be met with in the common ſyſtems. Vide Med. Eſſ. Edinb. Phil. Tranſ. N° 280. p. 1211.

The diſeaſes to which the *bladder* is ſubject are ulcers, wounds, deſcents, or ruptures, preternatural contents, particularly ſtones and gravel, *ſuppreſſion*, palſies, inflammations of its neck, &c. To theſe diſeaſes may be added incontinence of urine.

The internal membrane of the *bladder* has been known to come away with the urine, without any great danger. Mr. Rohault gives an account, in the Memoirs of the Academy of ſciences, of a patient he had, who, after a very violent ſtoppage of urine, voided with ſome pain a piece of a membrane of an inch ſquare. Three or four days afterwards, the patient felt ſomething again obſtruct the paſſage: and as it came nearer the end of the *urethra*, he at length took hold of it, and drew out a larger piece of the ſame ſort of membrane. Some time after this, in ſtraining violently in diſcharging his urine, he voided three other ſuch pieces, which together, according to Mr. Rohault's judgment, could not make leſs than two thirds of the internal membrane of the whole *bladder*; and in effect it was plain, that, in the courſe of the diſeaſe, the whole internal membrane had gradually detached itſelf from the external one, and made its way out by the *urethra*. After the whole was thus diſcharged, the urine found no ſtoppage; and it is evident, that what had before ſtopped its paſſage, was no other than the pieces of this membrane falling before, or blocking up the *urethra*. The pieces of the membrane, when examined, appeared to have all their blood-veſſels in their natural ſize; and the urine, in the whole courſe of the diſeaſe, having never been tinged with blood, is a proof that the membrane detached itſelf naturally, not by violence. The patient, after this, was wholly quit of his complaint; but had a ſmall incontinence of urine attending him, which was plainly owing to the ſphincter's having been weakened, by being, as well as the *bladder*, diveſted of its membranes. Mem. Acad. Scienc. 1714.

The operations performed on the *bladder* are chiefly ſection, and extraction of the ſtone; to which may be added injection, dilatation, the application of lithontriptics, diuretics, &c. Phil. Tranſ. N° 236. p. 15, ſeq. where Hippocrates's aphoriſm, that the ſections of the *bladder* are always mortal, is decended; and the beſt method of extracting the STONE out of the *bladder*, eſpecially in women, is ſhewn to be by a gradual dilatation of the *urethra*. See alſo Hiſt. Acad. Scienc. ann. 1720. p. 33. where the great impediments to the diſſolution of the STONE in the *bladder* by lithontriptics, are repreſented to be the medicine's not continuing long enough in the *bladder*, and its being altered by the urine.

The urinary *bladders* of brutes are differently contrived from the human *bladder*, and from each other, according to the ſtructure, economy, and manners of living of each creature.

Birds are uſually ſaid to be without *bladders*, as being without urine; yet does not this hold univerſally; ſince, in an oſtrich diſſected by the French Academy, a *bladder* was found ſituate at the extremity of the *rectum*, big enough to hold both fiſts, and in it eight ounces of urine.

Many have alſo denied a *bladder* of urine to fiſhes; but the more exact obſervers find this part in all, at leaſt the greater part of the fiſhy kind. Phil. Tranſ. N° 178. Tortoiſes, Ariſtotle obſerves, have large *bladders*, and they need ſuch; ſince being covered with a thick ſhell, and having no pores or perſpirative veſſels whereby to carry off their moiſture, it is retained within them, and accumulated in the *bladder* of urine.

In the lion the *bladder* is ſmall, as is the kidney; for that creature rarely drinks; inſomuch that Albertus affirms the female does not ſuckle her young, as having no milk.

Bladders, when below a certain magnitude, are more uſually denominated by the diminutive, veſicles, *veſiculæ*. Of theſe we meet with many ſorts both in the animal and vegetable world; ſome natural, as in the lungs, eſpecially of frogs, and as ſome alſo imagine, in the muſcles; others morbid or preternatural, as the *hydatides*, and thoſe obſervable in the itch. Naturaliſts have alſo diſcovered *bladders* in the *thorax* and *abdomen* of birds, as well as others in the belly of fiſhes, called *air-bladders* and *ſwims*.

Vegetable *bladders* are found every-where, in the ſtructure of the bark, the fruit, pith, and *parenchyma*, or pulp; beſides thoſe morbid ones raiſed on the ſurface of leaves by the puncture of inſects.

BLADDER, *ſwimming*; *ſee* AIR-*bladder*.

BLADDERS, *oil*, in the anatomy of plants; *ſee* OIL-*bladders*.

BLADDER-*ſperma*; *ſee* PUCERON.

BLADDER-*nut*, *ſtaphylea*, in *botany*, a genus of the *pentandria trigynia* claſs. Its characters are theſe: the empalement is concave, colonated, and ſo large as to incloſe the flower, which has five oblong erect petals, and a pitcher-ſhaped concave *nectarium*, at the bottom of the flower, with five oblong erect ſtyles terminated by ſingle ſummits, and a thick *germen* divided in three parts ſupporting three ſtyles to which there are obtuſe ſtigmas contiguous. The *germen* afterward becomes two hard almoſt globular ſeeds, included in three bladders, joined by a longitudinal ſeam, with an acute point, opening within. There are two ſpecies; the *bladder-nut* with winged leaves; and the *bladder-nut* with trifoliate leaves, or three-leaved Virginian *bladder-nut*.

The firſt makes a pretty variety, when intermixed with others; though the flowers are not very beautiful. The nuts of this tree, being hard and ſmooth, are ſtrung for beads by the Roman catholics in ſome countries; and the children of the poor inhabitants eat the nuts, though they have a diſagreeable taſte.

It is ſaid that from the ſeeds is expreſſed an oil having a reſolvent virtue.

BLADDER-*nut*, *African*; *ſee* ROVENA.

BLADDER-*nut*, *laurel-leaved*; *ſee* HOLLY.

BLADDER-*ſena*; *ſee* SENA.

BLADE, in *Botany*, that part of the flower, or floral attire of a plant, which ariſes out of the concave of the ſheath, and, at the top, uſually divides into two parts, which are covered with globules of the ſame nature as thoſe of the *apices*, but not ſo copious.

The *blade* runs through the hollow of the ſheath and baſe, and is faſtened to the convex of the ſeed-caſe, having its head and ſides beſet with globules, which, through a glaſs, appear like turnip-ſeeds, and which, in ſome plants, grow cloſe to the *blade*, and in others adhere to it by little pedicles, or foot-ſtalks. Theſe globules, as the *blade* ſprings up from within the ſheath, are ſtill rubbed off, and ſo ſtand like a powder on both. In ſome plants, as knap-weed, they ſeem alſo to grow on the inſide of the ſheath, as appears on ſplitting it with a pin.

The head of a *blade* is divided uſually into two; but ſometimes, as in the cichory, into three parts, which, by degrees, curl outward, like ſcorpion-graſs. Grew's Anat. of Plants, lib. 1. c. 5. § 20. lib. 2. c. 4. § 5.

BLADE, in *Anatomy*; *ſee* SHOULDER-*blade*.

BLADE, in *Commerce*, a thin, broad piece of metal, either forged by the hammer, or run and caſt in moulds, to be afterwards ſharpened to a point, edge, or the like.

Sword-*blades*, are made by the armourers, knife-*blades* by the cutlers, &c.

The Engliſh and Damaſcus *blades* are moſt eſteemed. Among the French, thoſe of Vienne in Dauphiny have the preference.

The conditions of a good *blade* of a ſmall ſword are, that it be light and tough, apter to bend than break. When it will ſtand in the bend, it is called a *poor man's blade*.

BLADE *of a viſcid*, is the iron or ſteel part, as diſtinguiſhed from the wooden handle.

BLADE *of mace*, or cinnamon, among apothecaries, are little ſlips or ſhces of thoſe barks.

BLADE *of an oar*, is the flat part which is plunged into the water in rowing. On the length of this does the force and effect of the oar, in a great meaſure, depend.

BLADE *of a saw*, the thin part wherein the teeth are cut, which, to be good, must be stiff, yet bend equally into a regular bow all the way, without yielding more in one place than another.

BLADE-*mill*, is that contrived for grinding iron tools, as scythes, reaping-hooks, axes, chissels, and the like, to a bright edge.

BLADUM, in *Middle Age Writers*, is taken for all sort of standing corn in the blade and ear. The word is also written *bladum*, *bava*, and *blavum*.

In our old charters, the word *bladum* included the whole product of the ground, fruit, corn, flax, grass, &c. and whatever was opposed to living creatures.

The word *bladum* was sometimes also applied to all sorts of grain or corn threshed on the floor: *tria quarteria Frumenti, tria quarteria avenarum, & unum quarterium fabarum, omni quarto in feodirmo præditi* bladi *in perpetuum*.

But the word was more peculiarly appropriated to breadcorn, or wheat, called in French *bled*.

Thus the Knights Templars are said to have granted to Sir Wido de Mer-ton's wife *duos summas bl.* Kennet's Paroch. Ant. and Du-Cange.

BLATTARIA, in *Botany*, a genus of the *tetrandria monogynia* class of plants. Its characters are: that the calyx is quadripartite, the corolla quadrifid, the filaments inserted in the receptacle, and the fruit a capsule, of four cells, containing many seeds. There are two species.

BLÆSUS, among *Medicinal Writers*, the same with *balbus*. Dr. Holder calls the letters F and TH &c. on account of the difficulty multitudes find of pronouncing them. Elem. Speech, p. 52.

The word is also used to denote an irregularity in the figure of the limbs, especially the legs, when bent outwards.

BLAIN, a distemper incident to beasts, consisting in a bladder growing on the root of the tongue against the wind-pipe, which at length swelling does the beast in.

It comes by great heating, and heating of the stomach, whereby, as some judge, it full grows, and increases by more heat.

It is perceived, by the beast's gaping, holding out his tongue, and foaming at the mouth: to cure it, cut the beast, take forth his tongue, and then slitting the bladder, wash it gently with vinegar and a little salt.

BLAISE, a military order instituted by the kings of Armenia, in honour of St. Blaise, ancient bishop of Sebasta in that country, the patron saint of that nation.

Justinian calls them *Knights of St. Blaise* and *St. Mary*, and places them not only in Armenia, but in Palestine.

They made a particular vow to defend the religion of the church of Rome, and followed the rule of St. Basil.

The precise year of the institution of the *Knights of St. Blaise* is not known; but they appear to have commenced about the same time with the Knights Templars, and Hospitalers; to the former of which they bore a near affinity, the regulars being the same in both.

BLAKEA, in *Botany*, a genus of the class of *decandria monogynia*: with a calyx compsted of six leaves below, and entire above; six petals, and a six-celled polyspermous capsule. There is only one species.

BLANC, see BLANK.

BLANC-*manger*, Fr. q. d. *white food*, is a preparation of dissolved isinglass, milk, sugar, cinnamon, &c. boiled into a thick consistence, and garnished for the table with blanched almonds. It is cooling and strengthening.

BLANCS *mantteaux*, a name originally given to the *Servites*, or servants of the Blessed Virgin, on account of their white cloaks; but since applied to divers sorts of religious, who have successively inhabited the house of the *Servites*, and now to the BENEDICTINES at Paris, though habited in black.

BLANCH, in *Medicine*, denotes a lenitive composition, formerly much in use, so called either from its white colour, or because of its purging white, i. e. phlegmatic humours. There were three sorts, a great, middle, and small *blanch*.

BLANCA *mulierum*, among the *Chymists*, signifies CERUSS.

BLANCARD, a name given to certain linen cloth, thus called, because the cloth used to weave them, has been half bleached or bleached before it was used. They are manufactured in Normandy, particularly in the places which are in the district, or under the jurisdiction of Pont-Audemer, Bernay, and Lisieux.

BLANCH *ferme*, or BLANK *farm*, a *white farm*, that is, where the rent was to be paid in silver, not in cattle.

In ancient times, the crown rents were many times reserved to be paid in *alba alba*, called *blanche firmes*; for which cause the buyer was holden *duabarra firmam*, viz. his base money or coin, worse than standard, was melted down in the exchequer, and reduced to the fineness of standard silver; or instead thereof he paid to the king 12*d.* in the pound, by way of addition.

BLANCHE *carte*, see CARTE.

BLANCHERS, a name given to mechanics employed in BLANCHING, i. e. the art or manner of BLEACHING or WHITENING.

BLANCHING, in *Gardening*, is an operation performed on certain sallads, roots, &c. as of celery, and endives, to render them fairer and fitter for the table. See APIUM and ENDIVE.

BLANCHING also denotes the operation of covering iron plates with a thin coat or cruft of tin. See LATTEN.

BLANCHING *of copper* for sale, in imitation of silver; or mixing blanched copper with silver; or exposing the same to sale; or any malleable composition or mixture of metals or minerals heavier than silver, and which looks, and touches, and wears like gold, but is manifestly worse than standard, is made felony, 8 and 9 W. III. &c. 26.

BLANCHING *of wax*, see WAX.

BLANCHING, in *Coinage*, the operation of preparing the pieces before striking, to give them the requisite lustre and brightness.

The *blanching*, as now practised, is performed by heating or heating the pieces in a kind of pan or shovel, with a wood-fire, in manner of a reverberatory furnace; so that the flame passes over the shovel. The pieces being sufficiently heated, and cooled again, are put successively to boil in two copper pans, wherein are *aqua fortis*, common salt, and tartar of Montpelier; when they have been well drained of this first water in a copper sieve, they throw sand and fresh water over them; and when they are well rubbed.

The ancient method of *blanching* was, by putting the pieces, after heating, in a large vessel of common water, and some ounces of *aqua fortis*; but in diligent people's hands for gold and silver.—The method is now altered, partly by reason of its expensiveness, and partly because it diminishes the weight of the metal.

BLANK, or BLANC, in a general sense, signifies WHITE; and BLANCUS, or BLANCA, is more particularly used for a kind of white, or silver money, of base alloy, coined by Henry V. in those parts of France then subject to England, valued at 8*d.* sterling. They were forbidden by his successor to be current in this realm. In some ancient charters they are called *fellis blanci*, *white shillings*.

BLANK also denotes a small copper coin, formerly current in France, at the rate of five deniers Tournois.

They had also great *blanks*, or pieces of three *blanks*, and others of 6*s.* in respect whereof the single sort were called little *blanks*: but of late they are all became only monies of account.

BLANK, or BLANK-*ticket*, in LOTTERIES, that to which no prize is allotted.

The French have a game, under the denomination *blanque*, answering much LOTTERY.

BLANK, in *Coinage*, a plate, or piece of gold, or silver, cut and shaped for a coin, but not yet stamped. See COINING.

BLANK, in *Ichthyology*, a name given by authors to a species of the cod-fish, called *gade*, *kabeliau*, and *milles fourgeons*.

BLANK-*bar*, in *Law*, is used for the same with what we call a *common bar*, and is the name of a *plea in bar*, which in an action of trespass is put in to oblige the plaintiff to assign the certain place, where the trespass was committed.

BLANK, in judicial proceedings, certain void spaces sometimes left by mistake. A BLANK (of something material to be omitted) in a declaration, abates the same: and such a *blank* is a good cause of demurrer.

BLANK-*verse*, see VERSE and RHYME.

BLANK-*wind*, see POINT *blank*.

BLANKET, in *Commerce*, a warm woolly sort of fluff, light and loose weaven; chiefly used in bedding.

The manufacturing of *blankets* is chiefly confined to Witney in Oxfordshire, where it is advanced to that height, that no other place comes near it. Some attribute a great part of the excellency of the Witney *blankets* to the abstersive nitrous water of the river Windrush, wherewith they are scoured; others think they rather owe it to a peculiar way of loose spinning, which the people have thereabouts. Be this as it will, the place has ingrossed almost the whole trade of the nation for this commodity; insomuch, that the wool fit for it centres here, from the southern-wool parts of the kingdom. Plott, Hist. Oxf. chap. 9. § 103.

Blankets are made of felt wool, i. e. wool from off sheep-skins, which they divide into several sorts.

Of the best wool, and best wool, they make *blankets* of twelve, eleven, and ten quarters broad; of the ordinary and middle sort, *blankets* of eight and seven quarters broad; of the best tail wool, *blankets* of 5*x* quarters broad, commonly called *cots*, serving for seamen's hammocks. See HYKES.

BLANKET, *tossing in a*, a ludicrous kind of punishment, of which we find mention in the ancients, under the denomination *jactatio*. Martial describes it graphically enough. *Ibis ab excusso, missus ad astra, sago.*

A late writer represents it as one of Otho's imperial delights. But this is turning the tables; that emperor's diversion, as related by Suetonius, was not to be the subject, but the agent in the affair; it being his practice to stroll out in dark nights, and where he met with a helpless, or drunken man, to give him the discipline of the *blanket*.

BLANQUILLE, a small silver coin, equivalent to about 1½*d.* sterling, current in Morocco, and on the coasts of Barbary.

BLASIGONIA, a kind of *disease*, or defect in bees, when they neglect, or fail to produce young, being wholly employed in making honey.

The word is Greek, compounded of Βλαστη, *Ibori*, and γονη, *breed* or *issue*.

BLARE, a small copper coin, containing a little mixture of silver, struck at Bern, and valued at much the same with the BATZE in other places.

BLAS, a novel term, in the Helmontian philosophy, denoting the local, and alterative motion of the stars; from whose influence proceed changes of weather, seasons, storms, and the like.

In imitation of this *blas stellarum*, the same author framed another in animals, either natural, whereby each *viscus* is framed according to the model of its particular; or voluntary, which is directed to motion by the will.

BLASIA, in *Botany*, the name of a genus of plants belonging to the class of *cryptogamia zigiarum*, approaching to the nature of the *Bubons*: the characters of which are these: the male flower has a cup composed of one leaf, which is oval at the base, somewhat cylindric in the middle, and expanded and truncated at the top; in this are contained a number of loose granules, which seem to perform the office of *apices*, and contain the *farina fecundans*. The female flower has scarce any cup, but produces a single roundish fruit, usually immersed in the leaves; in this are contained certain round bodies, which appear to be seeds. Linnæus is much in doubt, whether these flowers are not to be understood a contrary way, and seems to suspect, that what are called female flowers are really male ones; and what are called male, female.

BLASPHEMY, *blasphemia*, or *blasphemium*, in *Middle Age Writers*, denotes simply the blaming, or condemning of a person, or thing.

The word is Greek, Βλασφημια, from Βλαπτω, *Ledo*.

Among the Greeks, *to blaspheme*, was to use words of evil omen; or that portended something ill, which the ancients were careful to avoid, substituting in lieu of them other words of softer and gentler import, sometimes the very reverse of the proper ones.

BLASPHEMY is more peculiarly restrained to evil or reproachful words spoken of the Deity. Augustin says, *Jam vulgo blasphemia non accipitur nisi mala verba de Deo dicere.*

According to Lindwood, *blasphemy* is an injury offered to God, by denying that which is due and belonging to him, or attributing to him what is not agreeable to his nature.

By the Mosaic law, *blasphemy* was punished with death. Levit. chap. xxiv. ver 13—16. As also by the civil law. Novel. 77. In Spain, Naples, France, and Italy, the pains of death are not now inflicted. In the empire, either amputation, or death, is made the punishment of this crime.

By the canon law, *blasphemy* was punished only by a solemn penance; and by custom, either by a pecuniary or corporal punishment. By the English law, *blasphemies of God*, as denying his being, or providence, and all contumelious reproaches of Jesus Christ, &c. are inflicted by the common law, and punishable by fine, imprisonment, and pillory. And, by the statute law, he that denies one of the persons in the Trinity, or affirms there are more than one, or denies Christianity to be true, for the first offence, is rendered incapable of any office; for the second, adjudged incapable of suing, being executor or guardian, receiving any gift or legacy, and to be imprisoned for three years. 9 and 10 W. III. c. 32.

According to the law of Scotland, the punishment of *blasphemy* is death. The first species thereof consists in railing at, or cursing God, and here the single act constitutes the crime. The second consists in denying the existence of the Supreme Being, or any of the persons of the Trinity; and therein obstinately persevering to the last. For reiterated denial does not fully constitute the crime, because the stat. of Charles II. 1661, admits of repentance before conviction, as a complete expiation.

This statute of 1661, is ratified by a statute of king William, whereby the calling in question the existence of God, or of any of the persons of the Trinity, or the authority of Scripture, or the Divine Providence, is made penal. For the first offence, imprisonment, till satisfaction given by public repentance in sack-cloth. For the second, a fine of a year's valued rent of the real estate, and twentieth part of the personal estate. And the trial in both these cases is competent to inferior judges. The trial of the third offence is death, to be tried only by the justices.

BLASPHEMY *against the Holy Ghost*. Divines are not agreed with respect to the nature of the crime thus denominated, Matthew, chap. xii. ver. 31. and the grounds of the extreme guilt ascribed to it. Dr. Tillotson maintains, that it consisted in maliciously attributing the miraculous operations which Christ performed by the power of the Holy Ghost to the devil. Vol. ii. serm. xxii. But Dr. Whitby, with greater probability, refers it to the dispensation of the Holy Ghost, which commenced after our Lord's resurrection and ascension; and those were guilty of the crime, who persisted in their unbelief and blasphemed the Holy Ghost, representing him as an evil spirit. The crime was unpardonable, because it implied a wilful opposition to the last and most powerful evidence which God would vouchsafe to mankind, and precluded the possibility of a recovery to faith and repentance. Whitby's Fourth Appendix to the Gospel of St. Matthew, in his Paraphrase. vol. i. p. 168.

BLAST, *flatus*, in the *Mystery Art*, a sudden compression of the air, caused by the discharge of the bullet out of a great gun.

The *blast* sometimes throws down part of the embrasures of the wall.

BLAST is also applied, in a more general sense, to any forcible stream of wind, or air; excited by the mouth, bellows, or the like.

BLAST is also used in *Agriculture* and *Gardening*, for what is otherwise called a BLIGHT.

Blasts differ from MILDEWS, *vide* MILDEW.

The SMUT of corn is a species of *blast*.

Blasts, or *blastings*, are by some supposed owing to cold; by others, to the want of due supply of sap; by others, to ascending fumes of the earth; by others, to sharp winds and frosts, immediately succeeding rains. Phil. Trans. N° 44.

That species, called *wedding*, or *fire blasts*, is supposed by Dr. Hales owing to the solar rays reflected from, or condensed in the clouds, or even collected by the dense steams in hop-gardens, and other places. Ibid. N° 309.

The effect of them is to wither, shrivel, scorch, turn black, and, as it were, burn up the leaves, blossoms, and fruits of trees, shrubs, herbs, grass, corn, even for whole tracts of grounds.

Physicians also speak of a kind of *blasts* affecting human bodies, and exciting ERYSIPELAS, PALSIES, &c.

BLASTS, among *Miners*, see DAMPS.

BLASTED, something struck with a BLAST.

Among the Romans, places *blasted* with lightning were to be consecrated to Jupiter, under the name of FIDENTALIA, and PUTRALIA.

It was also a ceremonial of religion to burn *blasted* bodies in the fire.

BLASTING, among *Miners*, a term for the tearing up of rocks, which they find in their way, by gun-powder. The method of doing which is this; they make a long hole, like the hollow of a large gun barrel, in the rock they would split; this they fill with gun-powder, then they firmly stop up the mouth of the whole with clay, except a touch-hole, at which they leave a match to fire it.

A small quantity of powder does great things this way.

BLASTOLOGY, from Βλαστος, *bud*, and λογος, *I gather*; the regular and natural method of pruning trees.

BLASTUM *myrinum*, in the *Materia Medica*, a term used by some writers to express the *tegula myrina*, or callis bark, when not peeled off from the branches, but kept with the wood within it; this was a common way of collecting and preserving, not only this bark, but the cinnamon, and many others.

BLATTA, in *Natural History*, a genus of insects of the order of *hemiptera* in the Linnæan system, the characters of which are, that the head is inclined, the *cornua* are setaceous, the wings are membranaceous, the *thorax* is flat, orbiculated, and marginated, the feet are formed for running, and there are two small horns above the tail. There are several species.

It is likewise the name of a species of beetle, called by Columna ICARAMUS *scabimanus*.

BLATTA, in *Middle Age Writers*, denotes a purple in the wool or silk, dyed with the liquor of the fish of the BLATTA.

This was otherwise denominated *blatta fartica*, or *blatta fartorum*; whence alſo *blattiarius*, uſed in ancient writers for a dyer in purple.

BLATTA, according to ſome writers, was alſo uſed for the CERABUS inſect; and, according to others, for the purple worm. But both of theſe acceptations are ſuſpicious.

We know that it was anciently uſed for a kind of moth, or fly, whoſe fat was reputed excellent for the ears. See BOOK-*worm*.

BLATTA, *byzantina*, in *Phyſicians* and *Pharmacy*, a teſtaceous body, being the *operculum*, or lid of a turbinated ſhell, whoſe fiſh yields a purple dye.

The *blatta* differs from the lid of the *buccinum*, or *purpura*, in figure, the firſt being oblong, the latter round: but in the ſhops they are ordinarily confounded, and ſold for each other. The *blatta byzantina* is alſo confounded by apothecaries with the UNGUIS ODORATUS, from which it ought to be diſtinguiſhed, as belonging to another kind of ſhell-fiſh.

Dr. Liſter takes the *blatta byzantina* to have ſucceeded the UNGUIS ODORATUS, and to have been brought into the ſhops in its place. In Dioſcorides's time, the beſt was brought from the Red Sea, viz. the paleſt and faireſt; the blacker and leſs from Babylon, or the Perſian gulf: but it ſeems, latter times took up with thoſe found about Conſtantinople; whence the preſent *byzantina* had its name.

The name *blatta* ſeems to have been given to this *operculum* from the colour; as being of a dark hair-colour, as the common *blatta ſeptentrionis*, or *bubalus foſſilis*, ſo frequent in London, &c.

The *blatta byzantina*, when exhibited internally, renders the body ſoluble, ſoftens the ſpleen, and diſcuſſes peccant humours. When uſed externally, by way of fumigation, it reſtores epileptic parents, and women labouring under a ſtrangulation of the *uterus*. In other diſorders its effects are the ſame with thoſe of moſt other teſtaceous ſubſtances.

BLATTARIA, in *Botany*, ſee MULLEIN.

BLAZE, in the *Manege*, ſee STAR.

BLAZING-*ſtar*, ſee COMET.

BLAZON, or BLAZONRY, in *Heraldry*, the art of deciphering the arms of noble houſes; or of naming all the parts in their proper and particular terms.

Various etymologies are given of the word *blazon*: the moſt probable is that which derives it from the German *blaſen, to blow a horn*; it being the cuſtom of thoſe who preſented themſelves at the liſts in the ancient tournaments to blow a horn, to notify their coming. After this the heralds ſounded their trompets, and then *blazoned* the arms of thoſe who preſented themſelves; deſcribed them aloud, and ſometimes expreſſed on the praiſes, and high exploits of the perſons who bore them.

There is this difference between *arms* and *blazon*; that the firſt are the device or figures borne on the coat, or ſhield; and *blazon* the deſcription thereof in words.

The rules of *blazon* are, 1. To name the metal or colour of the field firſt: as, *ar. argent*, or *gules*, &c. 2. To name the manner of the diviſion of the eſcutcheon by line, whether downright or bendwiſe, and alſo the difference of the line, whether it be indented, ingrailed, &c. in the next place. 3. Then to name the charge that is on the field. 4. Having thus expreſſed the field, the diviſion, and the charge, if there be more parts of the field occupied by the charge than one, you are to name the principal part of the field firſt. 5. If there be more than one kind of charge in the field, that in the chief part is to be named firſt. 6. To uſe no iteration or repetition of words, in *blazoning* a coat, eſpecially of any of theſe four words, *of, a, and, each*. 7. The three forms of *blazon* are by metals and colours, by precious ſtones, and by the celeſtial planets: the firſt for private gentlemens; the ſecond for perſons ennobled with titles, as dukes, earls, &c. and the third for emperors, kings, and princes. Though this variety of form is rejected by the French, from whom we had our heraldry, and by all other nations, who uſe none but metals and colours for all degrees. 8. That metal upon metal, and colour upon colour, in falſe heraldry: which admits of no exception, except in the arms of Jeruſalem, which are, argent, a croſs potent between four croſſets, or.—Add, that when lions ſtand upright in a coat, they are called *ramparit*, when walking forward, *paſſant*; when they look you in the face, *paſſant guardant*; in other poſtures they have other terms, as *ſaliant, regardant*, &c. Wolves and bears are termed after the manner of lions; griffins (inſtead of *rampant* and *ſaliant*) are termed *ſegreant*; lions, griffins, and eagles, are alſo ſaid to be *langued* and *armed*; ſwans, *membered*; hawks, *jeſſed* and *belled*; cocks, *combed, creſted*, and *jewelled*: that is, when the tongues, bills, and claws of ſuch creatures are found of different colours from the body.—When an animal proceeds from the bottom of the ordinary, it is termed *iſſuant*; when over ſome ordinary, *iſſuant*; and if it proceed from the middle of any ordinary, or common charge, *naiſſant*.

BLEA, in vegetables, is that part of a tree, which lies immediately under the bark, and between that and the hard wood, and is the firſt progreſs of the alteration of the bark into wood by the natural growth and ſtrengthening of the fibres.

While the *blea* remains yet ſoft, and retains ſomething of the nature of bark, it may maintain a feeble vegetation; but when it is grown abſolutely hard and woody, it can contribute nothing to the growth of the tree. The vegetation of the young branches of trees is the moſt freely and vigorous, and the only one that goes as far as the flowers and fruit, becauſe theſe branches are little elſe but bark.

BLEACHING, or BLANCHING, the art of whitening linens, ſtuffs, ſilks, and other matters.

BLEACHING *of ſilk*. While it is yet raw, it is put into a thin linen bag, and thrown into a veſſel of boiling river-water, wherein ſoap has been diſſolved, then boiled two or three hours, and the bag being turned ſeveral times, it is taken out beaten and waſhed in cold water, ſlightly wrung out, and thrown into a veſſel of *cold* water, mixed with ſoap and a little indigo: the indigo gives it the bluiſh call always obſerved in white ſilks. After taking it out of the ſecond veſſel, it is wrung out, and all the water and ſoap expreſſed, ſtuck out to dry on pegs, and ſtraining the thread, and hung up in the air, in a kind of cloſet made on purpoſe, wherein is burned ſulphur; the vapour whereof gives the laſt degree of whiteneſs to the ſilk.

BLEACHING *or ſcouring of woollen ſtuff*. There are three ways of whitening woollens; the firſt with water and ſoap; the ſecond with vapour of ſulphur; the third with chalk, indigo, and vapour of ſulphur.

For the firſt, the ſtuffs being taken from the fulling-mill, are put into ſoaped water a little warm, and worked afreſh by force of arms over a bench, which finiſhes the whitening the fulling-mill had begun; and laſtly, waſhed out in clear water and dried; this is called *the natural way of bleaching*.

In the ſecond method, they begin with waſhing the ſtuff in river-water; it is then laid to dry on poles, and, when half dry, ſpread out in a kind of ſtove well cloſed, wherein is burnt ſulphur: the vapour whereof diffuſing itſelf, ſticks by little and little over all the ſtuff, and gives it a fine whitening; this is commonly called *bleaching by the ſtove*.

In the third method, after the ſtuffs have been waſhed, they are thrown into cold water impregnated with chalk and indigo; after they have been well agitated here, they are waſhed afreſh in clear water, half dried on poles, and ſpread in a ſtove to receive the vapour of the ſulphur: which finiſhes the operation. This is not eſteemed the beſt method of *bleaching*, though agreeable enough to the ſight.

It may be here obſerved, that when a ſtuff has once received the ſteam of ſulphur, it will ſcarce receive any beautiful dye but black or blue.

BLEACHING *of Hollands or fine linens*. After taking them from the loom, they are ſteeped a day in fair water, waſhed out and cleared of their filth, and thrown into a bucking-tub filled with a cold *lixivium*, or ley of wood-aſhes and water. When taken out of the ley, they are waſhed in clear water, ſpread in a meadow, and watered, from time to time, with water from little dikes, or canals, along the ground, by means of ſcoops, or hollow peels of wood, called by the Dutch, who pretend to be the inventors of them, *gieters*. After lying a certain time on the ground, they are paſſed through a new ley, poured on hot, and again waſhed in clear water, and laid a ſecond time on the ground, and every thing repeated as before; then paſſed through a ſoft gentle ley, to diſſolve them to reſume the ſcorings which the other harſher leys have taken from them, waſhed in clear water, ſoaped with black ſoap, and that ſoap again waſhed out in clear water: they are then ſteeped in cow's milk, the cream being firſt ſkimmed off, which finiſhes their whitening and ſcouring, gives them a ſoftneſs, and makes them call a little knap: when taken out of the milk, they are waſhed in clear water for the laſt time. After all this proceſs they give the linen its firſt blue, by paſſing it through a water, wherein a little ſtarch, and ſmalt, or Dutch *lapis lazuli*, have been ſteeped. Laſtly, the proper ſtiffneſs and luſtre are given with ſtarch, pale ſmalt, and gums, the quantity and quality whereof may be adjuſted according to occaſion.

In fine weather, the whole proceſs of *bleaching* is completed in a month's time; in bad weather it takes up ſix weeks or more.

In some parts of France, ARGUM, or WAKE-robin, is used in *bleaching*, being supposed by its corrosive quality to dissolve unctuosities, and make the linen white. It was used also for STARCH before the discovery of that from wheat; and was said to cause sorenels of the hands hardly relievable by ointments. Neumann.

BLEACHING *of coarse linens*. They are taken from the loom, and laid in wooden frames, full of cold water; where, by means of wooden hammers, worked by a water-mill, they are beat fo as to wash and purge them of their filth; then spread on the ground, where the dew, which they receive for eight days, takes off more of their impurity; then put into a kind of wooden tube or pans, with a hot ley over them. Thus lixiviated, they are again purged in the mill, laid afresh on the ground, and after eight days more, paffed through a fecond ley, and all things repeated, till fuch time as they have acquired their juft degree of whitenefs.

The procefs of *bleaching* in Scotland differs in fome particulars from that above defcribed, and ufed in France, &c. The following is an abftract. The linens are folded up in diftinct pieces, depofited in a wooden veffel, and covered with warm water, or equal parts of water and ley: a wooden cover is laid over them to preft them down when the fermentation begins, bubbles of air rife to the furface of the liquor and there form a kind of pellicle or fcum; when this begins to fubfide, which generally happens in the fpace of thirty-fix or forty-eight hours, the linen is taken out, well rinfed, waihed in a mill, and fpread on a field to dry. As foon as it is thoroughly dry, it is fit for bucking. For this purpofe a mother ley is prepared of 30lb. of blue, and as much white pearl afhes, 200lb. of Marcoft afhes, or 300lb. of caffhub, and 200lb. of Mufcovy afhes, all well pounded, and boiled for a quarter of an hour in a large copper, containing about 220 Scotch gallons of water. This liquor is left to fettle and is then ufed for preparing the bucking-ley: two gallons of this, with 2lb. of foft foap, are mixed with thirty-eight gallons of water: this ley, made blood-warm, is poured on the linens, previoufly difpofed in a large wooden veffel: after a fhort interval, the liquor is drawn off and heated again to a greater degree, and poured on the linen as before; which procefs is repeated feveral times, till at laft the ley is thrown on boiling hot. When this is done, the linens are fpread on the grafs, and watered feveral times in the courfe of forty-eight hours: this procefs of bucking and watering is repeated from ten to fixteen times or more, and the ley is gradually made ftronger from the firft to the middle bucking, and weakened in the fame manner to the laft. The next operation is that of fouring, which is performed by pouring fuch a quantity of butter milk or four milk, or inftead of this, four liquor made with bran or rye meal and water, as is fufficient to cover and well moiften the linen, which is put in rows into a large veffel, and kept down by a lid full of holes, and prevented from rifing. A fermentation takes place in this part of the procefs, which lafts five or fix days, and when the fcum formed by the afcending air bubbles begins to fubfide, the linens fhould be taken out, rinfed, mill-waihed, and then waihed with foap and water. Thefe feveral operations are repeated in fucceffion, till the linen is fufficiently whitened; after which it is blued, ftarched, and dried. In *bleaching* coarfe cloths, boiling is ufed inftead of bucking; and they are foured with warm water and bran.

Inftead of the acid of milk, Dr. Home recommends for this purpofe water acidulated with fpirit of vitriol, in the proportion of half an ounce, or at moft three quarters of an ounce to a gallon. This procefs is much quicker than the other, requiring only as many hours as the other requires days. Home's Exper. on Bleaching.

The method ufed for *bleaching* coarfe cloths in Scotland, is like that practifed in Ireland for both fine and coarfe. Perfons appointed by the truftees for improving the hempen and flaxen manufactures in Scotland, may enter into any bleach-yard, back-houfe, &c. and fearch all rooms, and the boilers therein, and view the lees, and refufe and dregs thereof, to fee whether there have been any lime, pigeons-dung, or foap-dregs, ufed in the *bleaching* of linen cloth or yarn, contrary to the ftatute. 13 Geo. I. c. 26. § 10.

Lime, or pigeons-dung, are not to be ufed in *bleaching* and whitening of linen, 10 Ann, c. 21.

Lime-water prohibited in *bleaching* is made either of fhell-lime, or of ftone-lime: the former is ftronger than the latter, and more powerful on the human *calculus*; and Dr. Home difcovered by experiment, that it was likewife more efficacious in *bleaching* linen. It whitens more, but weakens more, and extracts more out of the cloth. He concluded from his experiments, that it ought to be conlidered as the moft expeditious, but at the fame time as the moft dangerous material for *bleaching* yet known. In the courfe of his experiments, this remarkable phenomenon occurred, that though LIME and LIME-water preferve many animal fubftances in a found ftate; yet mixed with alkalies, it produces a ley corrofive with refpect to animals: but the effects on linen were juft the reverfe. LIME-water was corrofive, and alkalies in proportion to their quantity weakened its corrofive power: infomuch that he judged that a mixture of one part of lime with four of pure alkali, might be fafely ufed in *bleaching*.

For BLEACHING *of hair*, *fee* HAIR.

For BLEACHING *of wax*, *fee* WAX.

BLEAK, in *Ichthyology*, a name given by us to the fifh called by authors the ALBURNUS and *alburnus*. According to the new fyftem of Artedi, it is a fpecies of the CYPRINUS. The French call it the ABLETTE.

BLEB, a fmall biftor or BUBBLE.

Naturalifts have obferved fmall purple *blebs* on all the parts of the *fepiarium* kind. Phil. Tranf. N° 224.

Thick pieces of glafs, fit for large optic glaffes, are rarely to be had without *blebs*. Ibid. N° 4.

LECTINUM, in *Botany*, a genus of plants of the claft of the *cryptogamia filices*; the fructifications of which are difpofed in parallel lines on the fides of the leaves.

BLEEDING, PHLEBOTOMY, an operation in chirurgery; being the opening of a vein with a lancet, for the evacuation of corrupt, or redundant blood.

Some phyficians extol *bleeding* as the fureft, and moft effectual fpecies of evacuants. Yet it was very rare among the ancients, however frequent among the moderns. Celfus has obferved, that at Rome perfons of quality are not allowed to be let blood, even in the moft dangerous difeafes, without leave from the pope.

The *hippopotamus* is faid to have firft taught men the ufe of *bleeding*: for that animal, being overcharged with blood, rubs itfelf againft a pointed bulrufh, and opens a vein; till finding its plenitude difcharged, it wallers in the mire to ftanch the blood again.

Bleeding is a fpecies of evacuation of the utmoft importance in medicine; an idea of its effects, with the reafon of its ufe, may be conceived from what follows.

It is evident the blood thrown out of the heart, while it ftrikes upon the antecedent blood, and drives it forwards, transfers to it part of its own motion; and it is therefore fo much retarded in its own motion. Hence, if blood be drawn out of the bafilic vein of the right arm; the fucceeding blood, or that carried by the axillary artery, or right fubclavian, will be lefs hindered in its motion than it was before that vein was opened; for part of the blood being taken away by the opening of that vein, there remains behind a leffer quantity in the axillary vein, or lefs is contained between the farther extremity of the axillary artery and the heart, than was before: therefore the blood being let out by the vein, the remainder in the artery will be lefs impeded in its motion than before.

Hence the blood of that artery, which communicates with the vein that is opened, will flow with a greater velocity after the aperture is made than before. Conlequently, while the blood is flowing out of the vein in the arm, that thrown out of the heart into the *aorta*, will find lefs refiftance in the afcending trunk than in the defcending; and will therefore flow falter in the afcending than in the defcending trunks: and thence too it will find lefs refiftance in the right fubclavian artery than in the left.

Laftly, it hence appears, that the blood being let out of a vein in the right arm, the remaining blood in the right axillary artery runs with a greater velocity into the artery of that arm that is contiguous to it, than through the thoracic artery, or the right fcapulary, which is likewife contiguous to it; becaufe, when the blood is not fuppofed to be drawn out from any vein corresponding to the thoracic artery, or into which this diftributary itfelf, there is proportionable a greater impediment to the motion of the blood in the thoracic artery, than is that of the arm. But becaufe the velocity of the blood in the fubclavian artery, or the right axillary, is greater than in the left; the velocity in the right thoracic will alfo be greater than in the left thoracic artery. Hence it is manifeft, that the blood being let out of a vein in the right arm, the greateft velocity of the remaining blood will be in the artery of that arm, becaufe it immediately empties its blood into the vein that is opened; and the next greateft velocity will be in the thoracic artery, or fcapulary of the fame fide, going out from the axillary artery. But the velocity of the blood will be leaft in the brachial, axillary, and thoracic arteries on the left and oppofite fide; and leaft of all in the arteries arifing from the defcending trunk of the *aorta*.

On this view it may eafily be gathered, what is to be done in the leveral circumftances of blood-letting: for inftance, if we would prevent the increafe of any humour

more from the blood stagnating in the left leg, or bring it about, that as little blood as poſſible ſhould flow to that leg in any given ſpace of time; firſt, blood is to be taken from the arm or leg of the right ſide: becauſe this is truly making what is called a *revulſion*.

Again, if blood be drawn away on the ſame ſide, and from ſome vein that receives the blood from a branch of that trunk which tranſmits it to the vitiated part; it will occaſion a great derivation of blood to that limb for a few moments: and this is all that can make any difference between the diſtinct parts from which the blood is drawn.

As to what relates to the whole habit; in all leuture and vicidities, if there be a due ſtrength and chaſtity remaining in the ſolids, PHLEBOTOMY will make the remaining blood circulate the ſafter, and become thinner and warmer, but in a *plethora*, from a debauch, or too large quantities of ſpirituous nouriſhment, or from a diminution of perſpiration, where the blood yet retains its natural fluxility, PHLEBOTOMY will make the remaining maſs circulate ſlower, and become cooler.

In the former caſe, a diminution of the reſiſtance in the blood-veſſels will increaſe the contractile powers of thoſe veſſels, and make them beat ſafter, and circulate their contents with greater velocity; but in the latter caſe a diminution of the quantity of ſpirituous blood will leſſen the quantity of ſpirit ſecreted in the brain, the conſequence of which will be, that the heart and arteries will not contract ſo often and ſo ſtrongly as before, and therefore the blood will move ſlower, and become cooler. And on theſe things depends the whole doctrine of blood-letting.

Bleeding, according to Dr. *Pringle*, is the moſt indiſpenſible of all remedies in inflammatory diſeaſes; to the delaying of which too long, or not repeating it, are chiefly owing the bad conſequences of colds, as dangerous fevers, rheumatiſms, and conſumptions. He obſerves farther, that, in general, young practitioners are apt to be too ſparing in having blood, by which means many lives are loſt: for a ſurgeon may be aſſured a ſoldier will never complain of a cough, or pains with inflammatory ſymptoms, whereby *bleeding* is not neceſſary; and from the frankneſs of the bloody and continuance of the complaints, he is to judge of the neceſſity of repeating it, which, in caſe of a quick or difficult breathing, is never to be delayed. In inflammatory caſes, from twelve to fifteen ounces may be taken for the firſt *bleeding*, and ſomewhat leſs for all the reſt: and when it is neceſſary to exceed this quantity, it may be proper to follow Celſus's rule, in minding the colour of the blood whilſt it flows, and when it is of a blackiſh caſt, which is always the caſe in difficult breathing and great inflammations, to let it run till it becomes more florid. In all caſes, where plentiful *bleeding* is indicated, it is beſt to do it in bed, to prevent fainting; and we may obſerve, that a perſon will bear the loſs of a much greater quantity of blood if the ſtream is ſmall, than by a large orifice, which ſome have thought neceſſary for making a more ſpeedy revulſion.

Bleeding is highly neceſſary in the *phrenitis*, *ophthalmia*, quinſey, rheumatiſm, *cough*, hectic fits, and in general, in all inflammatory caſes. See Pringle's Obſervations on the Diſeaſes of the Army, paſſim.

It is to be obſerved, however, that, in malignant and putrid diſorders, *bleeding* frequently renders them more malignant; it is therefore to be committed, or at leaſt not repeated, unleſs there appear evident marks of inflammation. See MALIGNANT BILIOUS *fever*, DYSENTERY, &c.

As to the method of the operation, the puncture ſhould neither be too ſmall nor too large. Different ſurgeons open the vein in three different manners: ſome make the orifice in a ſtraight line with the courſe of the vein; others tranſverſely; but moſt make it obliquely: and if the patient is to be bled ſtanding in the left arm, the ſurgeon ſhould be able to uſe his left hand, inſtead of his right.

If the blood ſtop after a ſmall time, looſen the BANDAGE a little, to give way to more blood's deſcending by the artery, and it will bleed freſhly again; and if the orifice be obſtructed by too great a tenſion of the ſkin, or an inteuſion of the *membrana adipoſa*, the piece of fat ſhould be removed by preſſing of the finger, or a bit of ſponge, and the ſkin relaxed by bending the arm: and, laſtly, if the orifice be obſtructed by thick grumous blood, that impediment may be removed by wiping with a ſponge, dipped in warm water.

When a ſufficient quantity of blood is diſcharged, the ligature muſt be immediately taken off, and the ſkin about the orifice gently ſtroaked or preſſed together by the two fore-fingers of the left hand; by which means, the lips of the divided vein are cloſed: then the ſmaller of the two compreſſes is to be applied, firſt letting what little blood there may be between the orifice and the vein be diſcharged; the larger compreſs ſhould then be laid on the ſmaller, and preſſed ſlightly down with the thumb; then wiping the blood from the arm, the bandage is to be applied. Some wet the compreſſes in vinegar, water, or ſpirit of wine; but it is not neceſſary, and they ſit cafieſt when applied dry.

In *bleeding* it ſometimes happens that an artery is opened either inſtead of, or together with, the vein: an accident of this kind is attended with the utmoſt danger. An artery is known to be wounded when the blood ſpins out very forcibly from the orifice, and that by ſtarts or leaps, not in an even ſtream, and extends itſelf in a greater arch from the orifice to the baſon. The colour of the blood from an artery is alſo much more florid than from a vein; to which add, that on preſſing the finger on the veſſel below the orifice, the blood ſtarts out more violently than before; and ſtops, or at leaſt abates, on preſſing above the orifice; quite the contrary of what happens on the opening of a vein.

In an accident of this kind, the ſurgeon ſhould have preſence of mind not to betray the caſe, by his fears, to the patient, or attendants: he ſhould obſerve whether the blood flows freely from the orifice, or whether it infiltrates itſelf in any conſiderable quantity between the integuments. If the firſt is the caſe, he muſt take a large quantity of blood away, even till the patient faints, perſuading the attendants that the heat of the blood requires it; and while the patient is in his fainting fit, as the fits then ceaſes, he may commodiouſly dreſs and bind up the wound; and by this precaution hinder a freſh haemorrhage or an aneuriſm. The ſurgeon muſt place ſome firm piece of money between the folds of the firſt compreſs, and on this place two, three, or more compreſſes, each larger than the other: and then, bending the *cubitus*, apply two bandages in this manner, as after bleeding in the vein, only a little tighter; and lay a thick, long, and narrow compreſs over the artery, from the *axilla* to the *cubitus*: and the patient muſt be warned to wear his arm in a ſling, pinned to his cloaths, for a fortnight, and refrain from all uſe of it.

If the blood from the wounded artery is found to infiltrate itſelf between the integuments, the orifice muſt be immediately compreſſed, and tied up as before directed; and the arm often inſpected, to ſee whether a bleeding within the integuments does not yet continue. The patient muſt be frequently bled in the other arm, and, if a large quantity of blood ſhould be lodged from the wounded artery under the integuments, it will be neceſſary to open the integuments to diſcharge it.

It is too common an accident to find a nerve or tendon punctured in *bleeding*; and this is generally known to be the caſe by the patient's making a ſevere outcry at the time; and eſpecially if he complains afterwards of acute pains, and the limb begins to ſwell and be inflamed, convulſed, ſtiff, and extended as in the cramp: which ſymptoms, if not timely relieved, threaten convulſions of the whole body, a gangrene of the part, and even death in a ſhort time.

The beſt method to be taken in theſe accidents is, to firſt bathe the part with a mixture of oil of turpentine and ſpirit of wine, and then inveſt the whole arm with the diachalcitis plaſter, melted down in oil of vinegar and roſes, retaining it on by the expulſive bandage; which, beginning upon the hand, aſcends gradually by ſpiral turns to the top of the ſhoulder; by which means the impulſe of the blood on the part is not only much abated, but alſo the pain and inflammation much diminiſhed: and, laſtly, the following cataplaſm ſhould be applied to the arm, to complete the cure: take of flour of barley and of bitter vetch, of each two ounces; chamomile flowers and melilot flowers, of each two handfuls; freſh butter, an ounce and half: boil theſe into a cataplaſm with ſoap ſuds, and apply them to the arm till the pain and other bad ſymptoms are removed. Heiſter.

BLEEDING *in the hand*.—There are two principal veins in the hand, which are ſometimes opened to bleed the patient: the one is the *baſilica*, which runs on the outſide of the back of the hand towards the little finger. This was called *ſphyrica* by the antients, and they eſteemed the opening of it particularly ſerviceable in melancholy, and diſeaſes of the ſpleen. The other is the *cephalica*, which runs betwixt the thumb and fore-finger, and was ſo denominated from an opinion, that the *bleeding* from it was particularly ſerviceable in diſeaſes of the head; but theſe opinions were all without foundation; and though the patient is bled more difficultly and ſlowly in theſe veins, the effect is the ſame as if bled in the arm. It is ſometimes, however, neceſſary for a ſurgeon to open them, either at the particular deſire of the patient, or when the veins of the arm are very obſcurely ſituated, or lie deep, while theſe lie fair and conſpicuous.

When any one is to be bleeded in the hand, it muſt firſt be held for a conſiderable time in warm water, and well

rubbed there with the other hand, in order to make the small veins become turgid and conspicuous; then a ligature is to be fixed on the wrist, that the veins may continue thus distended, and wiping the hand dry with a napkin, an orifice is to be made in the most convenient part of the vein, as in *bleeding* in the arm. If the blood does not flow freely from the orifice, the hand must be again plunged into warm water, and kept there till the quantity taken away is judged sufficient: then the hand is to be wiped dry, and the orifice covered with a compress, defended by a proper BANDAGE. Heister.

BLEEDING *in the head*.—Many physicians have been of opinion, that bleeding from the veins of the forehead and temples is more expeditious in giving relief in disorders of the head, than the like discharge by veins more remote from the part affected. There seems, however, to be but little foundation for this, and that the *bleeding* by the jugular vein would much more expeditiously answer the end proposed. If the surgeon, however, is called upon to perform this operation, he must first draw a handkerchief or neck-cloth as tight round the neck as can conveniently be borne, that by compressing the jugular vein, those branches of it may become more turgid and conspicuous. The vein being opened, the patient must hold down his head, that the blood may not trickle down into his eyes or mouth, when the stream does not spin out with sufficient force. If the blood does not stop of itself, after a sufficient quantity is discharged, you must compress the orifice with a finger, and, after wiping the forehead and face, apply a compress or two, with the proper bandage.

BLEEDING *in the eyes*.—There are several ways of performing this operation, but the best seems to be this. The patient being seated on a chair, and his head held in a proper posture, a transverse incision is to be made, with a fine lancet, upon the turgid small veins in the corners of the eye, so as to open them or cut them quite asunder. The eye-lids must be held apart with one hand, whilst the veins are opened with the other; and some use a pair of fine scissars for this purpose, instead of a lancet, and others elevate the veins with a crooked needle before they divide them: but in this operation the better way would be to make the needles with edges, that when the veins were thus elevated, they might divide them without the help of any other instrument. When the incision is made, the discharge of blood must be promoted by means of fomentation with a sponge dipped in warm water; and if the discharge is not sufficient, the incision may be repeated two or three times; but few patients can be brought to suffer this, and there is no practising it at all upon infants, because they will not keep the eye steady. Heister.

BLEEDING *in the neck*.—It has been a very ancient practice to bleed in the external jugular veins of the neck for most inflammatory disorders of the adjacent parts. The accumulated blood and humours may certainly be thus discharged from the parts, and the operation is no way difficult or dangerous; since the jugular veins run on each side of the neck, from the head to the clavicles, just under the skin. They are very large, and easily opened; but a stricture is first to be made on the lower part of the neck with a handkerchief or the like ligature. The best method of raising this vein is, however, by a loose ligature thrown over the neck, which the patient, or an assistant, must pull downward over the breast; and by this means the jugular veins will be compressed on each side, and become turgid, without occluding the *trachea*, or obstructing perspiration. When the veins are thus made turgid, whichever of them lies the fairest, may be secured by the finger for incision, if the disorder affects the whole head; but if only one side be affected, it is best to open the jugular on that side.

When the proper quantity of blood is taken, close the orifice, and apply a proper compress and bandage. The common fear of this vein's bleeding afterwards is ill-grounded, and there seldom is any difficulty of stopping the blood. The patient commonly faints away in *bleeding*; but this occasions no harm. Heister.

BLEEDING *in the ranula*.—It is often found of service in quinsies and other inflammatory disorders of the neck, to bleed in two small veins, which run under the tip or end of the tongue, especially if a larger vein has been before opened in the neck or arm. To bleed in these veins, a stricture must be made upon the neck; the *apex* of the tongue must be then elevated with the left hand, while with the other the veins are both opened, first one, and then the other, by the lancet. When they have bled sufficiently, remove the stricture from the neck, on which the *bleeding* usually stops of itself; but, if it does not, let the patient take a little vinegar, or red wine, in his mouth, or else apply a bit of vitriol, or alum, or a compress dipped in some styptic liquor, till the hæmorrhage ceases. But there is no need of being too busy with these topics; for the blood never flows violently or long, without them; and if there be not a good quantity of blood discharged by these veins on the occasions for which they are usually opened, the operation is of no use. Heister.

The Bramins never bleed, but, in lieu thereof, fast.

BLEEDING *at an artery* is called ARTERIOTOMY.

BLEEDING *by measure*, is where account is taken of the quantity as it flows from the vein, in order to put a stop to the flux when the requisite portion is had.

BLEEDING *at large*, where the flux is continued without regard to the quantity, till such time as some expected effect is perceived. This method is sometimes used in cases of apoplexies, comata, &c.

BLEEDING *of a corpse, cruentatio cadaveris*, is a phenomenon said to have frequently happened in the bodies of persons murdered, which, on the touch, or even approach of the murderer, began to bleed at the nose, ears, and other parts; so as formerly to be admitted in England, and still allowed in some other parts, as a sort of detection of the criminal, and proof of the fact. Phil. Trans. N° 77. p. 3012. But this kind of evidence derives its weight merely from superstition and credulity.

Numerous instances of these posthumous hæmorrhages are given by Wechter, Lemnius, Libavius, and especially Horstius, who has a discourse express on the point, under this title, De Cruentatione Cadaverum.

BLEEDING is also applied, in a less proper sense, to a flux of sap out of the wounded vessels of plants, either spontaneously at certain seasons, or by art, and the help of incision.

BLEMISH, a term in *Hunting*, used when the hounds, or beagles, finding where the chace has been, make a proffer to enter, but return.

BLEMMYES, or BLEMYES, among the *Ancient Geographers*, a fabulous sort of people, supposed without heads; having eyes and mouths on their breasts, &c.; said to have inhabited part of Æthiopia.

Bochart derives the word *Blemmyes* from בלם, which implies a *negation*, and מים, *aqua*; in which sense the *Blemmyes* should have been people without brains.

BLENCH, a sort of tenure of land; as to hold land in *blench* is by payment of a sugar-loaf, a couple of capons, a beaver-hat, &c. if the same be demanded in the name of *blench* i. e. *nomine albæ firmæ*.

BLEND, BLENDE, or BLACK-*Jack*, is a mineral called also *false galena*. See BLIND and ZINC.

BLEND-*metal iron*, a coarse sort of iron from the Staffordshire mines, used for making nails and heavy ware; in some places also for horse-shoes.

BLEND-*water*, a distemper incident to black cattle, which comes several ways, 1. From blood. 2. From the yellows, which is a ringleader of all diseases. And 3. From the change of ground: for being hard, it is apt to breed this evil, which if not remedied in six days, will be past help.

BLENNA, BLENNA, βλεννα, μυξα, πτυελα, in Hippocrates, is a thick phlegm and mucus flowing from the brain through the nostrils, and the like spittle of a beginning concoction; as Galen explains him in several parts of his works.

BLENNIUS, in *Ichthyology*, the name of a genus of fish of the general order of the ACANTHOPTERYGII, according to the distribution of Artedi, and of the *jugulares* in the Linnæan system. The name is derived from the word βλεννα, which signifies a tough and mucous matter, such as that which the body of this fish is covered with. The characters of this genus are, that the membrane of the gills has six bones; the fore-part of the head is very flanting; the body is prickly; and the belly-fins have two bones. Of this genus there are several species, as the crested *blennius*, or *galerita*, with a triangular lobe red at the edges, and situated between the eyes, and a cuticular creft running transversely over the head; the *gattorugine*, or *blennius* with two little fins at the eyes, and twenty-three bones in the *pinna ani*; the *gunnellus Cornubiensium*, *lipatis*, or *butter-fish*, with about ten black spots, and a white border on each side of the back-fin; the *phicis*, or smooth-headed *blennius*, called in Cornwall *mulgrume*, and *bulcard*; the viviparous *blennius*, &c. But the name *blennius*, and *blenna*, is usually appropriated to that with a furrow between the eyes, and a large beautiful spot, black in the middle, and edged with white, in the back-fin; and on this account called in English the *butter-fish*. It is common in the Mediterranean, and is sold to Venice and elsewhere for the FABER. The flesh is very *soft*. See *Tab. of Fish*, N° 16. Willoughby, p. 131.

Blennus is also a name given by some authors, particularly Schonfelt, to the SYNGNATHUS *corpore hexagono, cauda hexagona*; the ACUS of Aristotle; and *cum secunda* of other writers; called also by Gesner and Bellonius,

TYPHLE *morina*. It is a name uſed alſo by ſome for the tobacco-pipe fiſh.

BLESENSIS *bolus*, *bole of Blois*, in the *Materia Medica*, a very valuable medicinal earth dug about Saumur, Blois, and Burgoyne in France, and ſeeming to poſſeſs all the virtues of the Armenian bole of Galen, which it alſo much reſembles in external appearance.

It is a very valuable medicine in fluxes and many other caſes, and might be had in any quantities, at a ſmall price; but the common red French bole, or a counterfeit of it, or the ſubſtance called BOLE *Armoniac*, is generally ſold for it.

BLESTRISMUS, from βλαισσω, *I ſtiſle*, derived from βλαω, in the *Ancient Phyſic*, a continual toſſing and inquietude of the body, occaſioned by a tumultuary effervescence of the blood, eſpecially in acute fevers.

BLETA *alba*, an epithet given by ſome to the milky urine voided in ſome diſorders of the kidneys, ranked by Paracelſus among the cauſes of the *phthiſis*.

BLETUS, βλητος from βλαω, *I ſtrike*, in the *Ancient Phyſic*, a perſon whoſe ſide, by reaſon of ſome internal inflammation, as a pleuriſy or peripneumony, turns black or livid-ſpotted, chiefly preſently after death.

BLEW-CAP, or *Blue-cap*, an Engliſh name for a peculiar ſpecies of fiſh of the ſalmon kind, diſtinguiſhed by a broad blue ſpot on the head, from whence they have their name. Theſe ſeem not to breed with us; but appear in our rivers only at certain ſeaſons, when there have been very violent north winds. This fiſh is ſeldom found ſingle; ſo that the fiſhermen rejoice at the taking one of them, expecting a large ſhoal of them near.

BLEYME, in *Farriery*, an inflammation in a horſe's hoof, occaſioned by blood putrefied in the inner part of the coffin towards the heel, between the ſole and the coffin-bone.

Some write the word corruptly *bleine*. It is originally French, *bleyme*, which ſignifies the ſame.

There are three ſorts of *bleymes*, the firſt, bred in ſpoiled wrinkled feet with narrow heels, are uſually ſeated in the inward or weaker quarter: the ſecond, beſides the uſual ſymptoms of the firſt, infects the griſtle, and muſt be extirpated, as in the cure of a quitter-bone: the third is occaſioned by ſmall ſtones and gravel between the ſhoe and the ſole.—For a cure, they pare the foot, let out the matter, if any, and dreſs the ſore, like the prick of a nail.

BLICEA, in *Ichthyology*, the name of a ſmall fiſh of the harengiform kind, caught in the German and other ſeas, and ſuppoſed by many to be the ſame with what in England we call the ſprat, which to ſome ſeems to be no other than a young herring.

It is likewiſe the name of a freſh-water fiſh of the *malacoſtomous*, or as we call it in Engliſh, the leather-mouthed kind, ſeeming to be the ſame with the more common kind of *cariuſſus*. It is alſo the name of an Eaſt-Indian fiſh, which might be more properly called *harengus minor Indicus*, or the ſmall Indian herring. It is of the ſhape of the herring but ſomewhat broader and thinner, and is of the ſame colour. Its tail alſo is forked; but its head is of an odd figure, its eyes and the end of its ſnout being extremely large. This fiſh ſwims uſually in veſt ſhoals, and is caught principally on the coaſt of Malabar. It is a well taſted fiſh; but has not at all the taſte of a herring. It takes ſalt, which ſcarce any other of the Eaſt-India fiſh will do, and is therefore very much valued, and ſent into all the neighbouring parts of the country in pickle. There is alſo another very conſiderable uſe it is put to by the natives, which is the manuring of the lands whereon they ſow their rice: they uſe this fiſh, which is caught in prodigious plenty, inſtead of dung on this occaſion. Willoughby and Ray.

BLIEGG, in *Ichthyology*, a name given by the Germans to the fiſh we call the BLEAKE, and authors in general the ALBURA and ALBURNA.

BLIGHT, in *Huſbandry*, a diſeaſe incident to plants, and affecting them variouſly; the whole plant ſometimes periſhing by it, and ſometimes only the leaves and bloſſoms, which will be ſcorched and ſhrivelled up, the reſt remaining green and flouriſhing.

This diſorder ſeldom happens but upon the blowing of ſharp eaſterly winds, which are moſt frequent with us about March; whence that month proves, of all others, the moſt fatal to plants.—From this circumſtance, ſome imagine the colds that then reign, being exaſperated by the eaſtern winds, effect *blights*; but Mr. Bradley furniſhes a more plauſible account: for on this principle, it were hard to ſay why one plant, or one part of a plant, ſhould be *blighted* more than another. He obſerves then, that caterpillars and other inſects generally attend thoſe winds; and that they infect ſome one kind of tree more than another, and even ſome particular branch more than others; and thence infers, either that the eggs of thoſe inſects, or the inſects themſelves, are brought to us by the eaſterly winds; or that the temperature of the air, when the eaſtern winds blow, is neceſſary to hatch thoſe creatures, ſuppoſing the eggs to have been already laid on the infected parts. Now each of theſe cauſes ſeems to have its effect: thoſe *blights* attended with large worms, or caterpillars, ſeem hatched by the eaſtern winds; and thoſe others, which only produce the ſmall inſects, that occaſion the curling of the leaves of trees, may proceed from ſwarms of them, either ready hatched, or in the egg, brought with the wind.

The coldneſs of thoſe winds he ſhews to be no objection againſt their being fitted to hatch inſects; different inſects requiring vaſtly different degrees of heat. To this he adds, that every inſect has its proper plant, or tribe of plants, which it naturally requires for its nouriſhment, and will feed on no other; and in which, therefore, it lays its eggs: it is no wonder then, that one kind of tree ſhould be infected, and all the reſt eſcape. That wind, v. gr. which brings or hatches the caterpillars on the apple-tree, will not infect the pear, plum, or cherry; becauſe, were the ſhoals of inſects natural to the apple to light on thoſe other trees mentioned, they would either want their proper matrix to hatch in; or, were they ready hatched, would periſh for want of proper food. So that it is morally impoſſible all kinds of plants ſhould be *blighted* at the ſame time, unleſs the eggs of every kind of inſect natural to each tree could be brought at one time with the wind; or, that an eaſterly wind could contain in it, at once, as many different degrees of cold, or heat, as would be required to hatch and maintain each different claſs of inſects. Nor is it any objection, that in *blights* there are not frequently any animals immediately perceivable. By the microſcope, we diſcover animalcules a million of times leſs than the ſmalleſt which come under ordinary notice; theſe, the genteſt air may be conceived capable of blowing from place to place; ſo that it is no wonder if they be brought to us from the ſeptentrional regions, eſpecially the north-eaſt part of Great Tartary, &c. where the cold is intenſe enough, to give them life; and from whence there is not ſea enough, by the warmth and fulneſs of whoſe vapours they might be ſuffocated. Thoſe brought from the north-eaſt parts of America are probably deſtroyed by paſſing the vaſt Atlantic ocean, which may be the reaſon why the north-weſt wind is not ſo infectious.

But that *blights* are frequently no more than an inward weakneſs or diſtemper in trees, evidently appears, if we conſider how often it happens, that trees againſt the ſame wall, expoſed to the ſame aſpect, and equally enjoying the advantages of ſun and air, with every other circumſtance which might render them equally healthy, are often obſerved to differ greatly in ſtrength and vigour; and as often do we obſerve the weak trees to be conſtantly *blighted*, when the vigorous ones in the ſame ſituation eſcape. Dr. Hales aſcribes *blights* to the obſtruction of perſpiration in bloſſoms and leaves, occaſioned by a continued dry eaſterly wind, without ſhowers or dew; in conſequence of which the perſpirable matter becomes glutinous, and adheres to the ſurfaces of leaves, hereby affording a proper nutriment for inſects, which prey on the leaves and tender branches of fruit-trees, when the *blight* happens, though they are not the firſt cauſe of it.

To prevent *blights*, the more knowing among country-people, while the eaſterly winds blow, are accuſtomed to guard againſt them by burning heaps of weeds, chaff, and other combuſtibles, on the wind-ſide of their orchards, that the ſmoke may either poiſon the inſects or their eggs, as they paſs along. It may be added, that theſe fires are often made with good ſucceſs, to deſtroy the caterpillars, even after they are hatched, and have begun to devour the trees.—Another method of preſerving trees from *blights* is, by ſprinkling tobacco-duſt, or pepper-duſt, or waſhing the leaves with water wherein tobacco-ſtalks have been infuſed; which, it is ſaid, is preſent death to all inſects and animalcules.—Another is by pulling off the leaves when withered, and cutting off the ſmaller branches, when they produce crooked and unnatural ſhoots. Dr. Hales recommends waſhing and ſprinkling the trees occaſionally with fair water: and if their ſhoots ſeem to be much infected, waſhing them with a woollen cloth, ſo that their perſpiration may not be obſtructed.

But there is another ſort of *blight*, againſt which it is more difficult to guard fruit-trees; that is occaſioned by ſharp, pinching, froſty mornings, which often happen at a time when the trees are in flower, or while the fruit is very young, and occaſion the bloſſoms or fruit to drop off; and ſometimes the tender parts of the ſhoots and leaves are greatly injured thereby. The only method yet found out to prevent this miſchief is, by carefully covering the walls, either with mats, canvas, &c. Which being faſtened ſo as not to be diſturbed with the wind, and ſuffered to remain on during the night

night, are to be taken off every day, if the weather permits.

Another sort of *blight*, which sometimes happens in April or May, and which is often very destructive to orchards and open plantations, and against which we know of no remedy, is what is called a *fire-blight*, which in a few hours hath not only destroyed the fruit and leaves, but many times parts of the trees, and sometimes whole ones have been killed by it. This more frequently happens in close plantations, where the stagnating vapours from the earth, and the plentiful perspirations from the trees, are pent in, for want of a free air to dissipate and dispel them; than in those planted at a greater distance, or surrounded with hills or woods. See RUST.

Corn is liable to *blights*, like other sorts of grain.

BLIGHT *of corn* is called SMUT.

BLIKE, in *Ichthyology*, a name given by some to an unadromous fish, somewhat resembling our river chub, and called by Gesner *esox anadromus*; but more generally known by the name of ZERTA, or the ZERTE.

BLIND.—*Pore or Pus*-BLIND, denotes only a great degree of short-sightedness. Phil. Trans. N° 37. p. 731.

BLIND, *Moon*, is used in speaking of horses, which according to the vulgar, but very absurd opinion, lose their sight only under certain states of the moon, and see at every other time. This disease is the forerunner of cataracts, and generally ends in total blindness.

In some cases of this distemper, a thin vitcid corrosive water runs from the diseased eye, more or less in proportion to the degree in which the eye and eye-lids are swelled and inflamed. In other cases, the diseased eye discharges no humour; but looks thick and troubled; and the horse sees little, or very indistinctly. The causes of this distemper are various: it sometimes proceeds from a natural defection of the eyes, and often from some accidental malady. When the humour attaches one eye without changing to the other, there is hope of a cure; at least of preserving one eye. But when the eyes look deperished, and gradually decay, total blindness commonly ensues. If the eyes are full and inflamed, bleeding is proper; but if they appear sunk and perishing, it is often pernicious. In the former case, when the eyes discharge a sharp water, they should be washed twice a day with a strong tincture of roses, made by steeping two drams of rose buds in half a pint of boiling water, and dissolving half a dram of sugar of lead in the quantity of four ounces of it. If the matter digests, two drams of honey should be added to the above quantity. At the same time purges should likewise be administered twice a week. Lenitive electary and cream of tartar, of each four ounces; Glauber's purging salts, three ounces; the solutive syrup of roses, two ounces, mixed with white wine and water, or warm water-gruel, are very proper for this purpose. Cutting out the haw is also an operation which is usually performed on *moon-blind* horses. Gibbon.

BLIND is also used for occult, or imperceptible. Hence *blind* rampart, *caecum vallum*, among the ancients, was that belief with sharp stakes, concealed by grass or leaves growing over them.

BLIND *testimonies*, *caeca testimonia*, those given by absent persons in writing.

BLIND is also used in speaking of bodies without apertures. Hence,

BLIND *wall*, *caecus paries*, that without windows. In a like sense we meet with *blind* chamber, *cubiculum caecum*.

BLIND is also used in speaking of vessels which are not perforated.

In this sense, the chemists say a *blind* alembic. A tube is said to be *blind*, when it is closed at top.

Some anatomists also call the third cavity of the ear CONCHUM, as having no issue; but it is more usually denominated LABYRINTH.

BLIND *grounds*, that which does not light or take fire.

BLIND, in *Ichthyology*, a local name for a fish, called by authors the ASELLUS *fuscus*, and more universally in English the *bib*. It is a fish of the cod kind, but never growing to any great size. The word *blind* is used in Cornwall.

BLIND, or BLINDE, among *Mineralists*, a species of lead-MARCASITE, by our miners called *mock-ore*, *mock-lead*, and *worthless*, &c.

Blinde is a mineral mass, flaky, glossy, and breaking in angles, much like the potters lead-ore, only of a colour more dusky, and approaching to black. In it are veins of a yellow shining MARCASITE, with a little white spar, and on one side a greenish arsenious matter. On a trial by the fire, it yielded very little copper, less lead, and no tin. It is very obstinate, several attempts having been made with the alkaline fluxes to run it, in vain.

The German mineralists call it BLENDE, whence our denomination *blende*. It answers to what in Agricola is called GALENA *ironii*.

It usually lies immediately over the veins of lead-ore in the mines which produce it, for it is not found in all. When the miners see this, they know the vein of ore is very near. See *Ores of* ZINC.

BLIND *faith*, see FAITH.

BLIND *gut*, see COECUM.

BLIND *worm*, see SLOW-*worm*.

BLINDS, or BLINDES, in the *Military Art*, denote every thing serving to cover the besiegers from the enemy, as wool-sacks, earth-baskets, fand-bags, and the like.

Blinds are sometimes only canvas stretched to take away the sight of the enemy; sometimes they are planks set up, properly called mantlets; others are of baskets, others of barrels.

BLINDS more peculiarly denote wooden frames of four pieces, round or flat, two of which are fix feet long, and pointed at the ends, and the others three or four feet, which serve as spars to fasten the two first together. They are fixed upright in the ground, against the sides of the saps to sustain the earth, and to fasten faslines on the upper part, or to cover the saps, and to lay faslines over them, to secure the troops from stones and grenades. They are chiefly used, where the trenches are carried on in the face of the place, in a right line, so as the enemy might scour them with their guns from the walls. See *Tab. of Fortification, fig. 1.*

BLIND is sometimes also used for GRILLON.

BLINDING, a species of corporal punishment anciently inflicted on thieves, adulterers, perjurers, and others: and from which the ancient Christians were not exempt. Sometimes lime and vinegar, or hastily scalding vinegar, was poured into the eyes, till their balls were consumed; sometimes a rope was twisted round the head till the eyes started out. Stolin. Polyhist. c. 4. Lamprid. in Alex. Sev. c. 17. Val. Max. lib. vi. c. 5. Lactant. de Mort. Persec. c. 36.

In the middle age, they changed total *blindness* for a great darkness, or diminution of sight, which they produced by holding a red hot iron cask or bason before the eyes, till their humours were dried, and their coats shrivelled up.

The inhabitants of the city Apollonia executed it on their watch whom they found asleep. Democritus, according to Plutarch, Cicero, and Aurelius, put out his own eyes, that he might be less disturbed in his mental contemplations, when thus freed from the distraction of the objects of sight. Herodot. lib. vi. c. 92. Aul. Gell. Noct. Att. lib x. c. 71. Cicero Tusc. Qu. 5.

BLINDING, *chromatic*, in the *Black Art*, denotes a species of NECROMANCY, whereby a visible body may be concealed, or hidden by an invisible power.

BLINDING *of a commune*, signifies erecting a battery against it, in order to dismount its cannon, and render them useless.

BLINDNESS, a privation of the sense of sight, arising from a total destruction of its organs, or an involuntary obstruction of their functions.

Blindness is of divers kinds. Natural *blindness* is that happening according to the ordinary course of things; thus that of certain insects formed without eyes, though it is not easy to fix which these are, since divers animals have been erroneously supposed to, on account of their smallness or imperceptibility; as the CAECILIA, commonly called the blind-worm, the mole, &c.

Preternatural, or morbid *blindness*, is that owing to disease or accident.

Total *blindness*, is that wherein all light or perception, even of light, is wanting, as in the case of those who are said to be *stone-blind*.

A *blind* man, by the civil law, cannot make a testament, except under certain modifications; but in every case he is disabled from being a witness to a testament, on account of his *blindness*.

Partial *blindness*, is that wherein some faint glimmering is left, as is always the case in people who have ripe cataracts, who are never so blind, but they can discern clay from night; and, for the most part, in a strong light, distinguish black, white, and scarlet, though they cannot perceive the shape of any thing. The reason is, that the light by which those perceptions are made, being let in obliquely through the aqueous humour, or the anterior surface of the crystalline (by which the rays cannot be brought into a focus upon the *retina*), they can discern in no other manner than a found eye can through a glass of broken jelly, where a great variety of surfaces so differently refract the light, that the several distinct pencils of rays cannot be collected by the eye into their proper foci; wherefore the shape of an object in such a case cannot be at all discerned, though the colour may. Phil. Trans. N° 402. p. 447.

Perpetual *blindness*, is that which remains alike under all the diversity of seasons, times, ages, &c.

Transient *blindness*, is that which gives way of itself in due time,

blisse, as that of whelps, which continues for several days, sometimes nine, rarely twelve, after they are littered.

The Nogais Tartars, according to father Du Ban the Jesuit, who lived among them, are born *blind*, and open not their eyes, till several days.

Periodical *blindness* is that which comes and goes by turns, according to the season of the moon, time of day, and the like. Phil. Trans. N° 233. p. 728.

Diurnal *blindness* is called *hemera copia*.

Nocturnal *blindness*, called also *nyctalopia*, that which ensues on the setting of the sun in persons who see perfectly in the day, but become quite blind as soon as night comes on. Brigg. in Phil. Trans. N° 159. p. 560. where an instance of it is given. See a singular case of this kind, related by Dr. Samuel Pye, in the Medic. Observ. and Inquir. vol. i. p. 211. See also the Col. Acad. tom. vi. p. 507.

The causes of *blindness* are either ordinary, as a decay of the optic nerve (an instance whereof we have in the Academy of Sciences, where, upon opening the eye of a person long blind, the optic nerve was found extremely shrunk and decayed, and having no medulla in it); or some external violence, vicious conformation, growth of a cataract, *gutta serena*, small-pox, or the like. Hist. Acad. Scienc. ann. 1713 and 1721.

Extraordinary causes of *blindness* are malignant fleshes, poisonous juices dropped into the eye, baneful vermin, long confinement in the dark, or the like.

The docks, which breed under ground, and break out into the Zuchnitzer sea, in Carniola, after all great storms, are blind at their first irruption; but in some time, come to their sight.

The author of the embassy of D. Garcina de Silva Figueroa into Persia tells us, that in several parts of that kingdom are found vast numbers of blind people of all ages, sexes, and conditions; by reason of a species of little flies which prick the eyes and lips, and enter the nostrils, carrying certain *blindness* with them when they light on the eyes.

The miseries of *blindness* are feelingly painted by Milton, and may be also partly guessed at by the evasives into which persons have fallen on their recovery from it. Mr. Boyle mentions a gentleman, who having been blind, and brought to sight at eighteen, was very near going distracted with the joy. See a remarkable case of this kind, Tatler, N° 55 vol. i. Parad. Lost, lib. iii. init. Boyle's Works abr. tom. i. p. 4.

We find various recompenses for *blindness*, or substitutes for the use of the eyes, in the wonderful sagacity of many blind persons recited by Zahnius in his *Oculus Artificialis*, and others. In some, the defect has been supplied by a most excellent gift of remembering what they had seen; in others by a delicate nose, or the sense of smelling; in others by an exquisite touch, or sense of feeling, which they have had in such perfection, that, as it has been said of some, they learned to hear with their eyes; as it may be said of these, that they taught themselves to see with their hands.

Some have been enabled to perform all sorts of curious and subtle works in the nicest and most dextrous manner. Aldrovandus speaks of a sculptor who became *blind* at twenty years of age, and yet ten years after made a perfect marble statue of Cosmo II. de Medicis; and another of clay like Urban VIII. Bartholin tells us of a *blind* sculptor in Denmark, who distinguished perfectly well, by mere touch, not only all kinds of wood, but all the colours; and F. Grimaldi gives an instance of the like kind; beside the *blind* organist lately living in Paris, who is said to have done the same.

The most extraordinary of all is a blind guide, who, according to the report of good writers, used to conduct the merchants through the sands and deserts of Arabia. James Bernouilli contrived a method of teaching blind persons to write. Leo Afr. Descr. Afr. lib. vi. p. 246. Casaub. Treat. of Enthus. chap. ii. p. 45. Fontan. Elog. des Acad. p. 114.

Yet have not blind persons any idea of visible objects, though they can distinguish them by the touch: thus the gentleman couched by Mr. Cheselden, though he knew the colours asunder in a good light during his blind state; yet when he saw them after couching, the faint ideas he had of them before, were not sufficient for him to know them by afterwards. Phil. Trans. N° 403. p. 447.

It was even a considerable time before he could remember which was the cat, and which the dog, though often informed, without feeling them. Add, that he had no idea of distance; but thought that all the objects he saw touched his eyes, as what he felt did his skin.

BLINDNESS, in *Farriery*, is a disease incident to horses, especially those of an iron-grey or dapple-grey colour, when ridden too hard, or backed too young. Phil. Trans. N° 37.

It may be discovered by the walk or step, which, in a blind horse, is always uncertain and unequal, because he does not set down his feet boldly when led in one's hand; though, if the same horse be mounted by an expert horseman, and the horse himself be mettled, the fear of the spur will make him go more freely; so that his *blindness* can hardly be perceived. Another mark whereby a horse may be known to have lost his sight, is, that upon hearing any body enter the stable, he will prick up his ears, and move them backwards and forwards, as mistrusting every thing, and being in continual alarm by the least noise.

D. Lower first shewed the cause of the ordinary *blindness* in horses, which is a spungy excrescence, growing in one, sometimes in two or three places of the *uvea*, which being at length overgrown, covers the pupil when the horse is brought into the light, though in a dark stable it dilates again.

BLINKS, in *Botany*, *see* MONTIA.

BLINKS, among *ancient Sportsmen* denoted boughs broken down from trees, and thrown in the way where deer are likely to pass, to hinder their running, or rather to mark which way a deer runs, in order to guide the hunter.

BLINKING *of beer*, in Lincolnshire, signifies letting the wort stand for some time in the vat, till it hath acquired some degree of acidity, in order to dispose it to fine, and be the sooner ready for drinking.

BLISSOM, among *Husbandmen*, corruptly called *blossom*, is the act of a ram when coupling with an ewe.

BLISTER, EPISPASTIC, or VESICATORY, an external medicine serving to raise a blister; whence also it is itself, though improperly, called a *blister*.

Of *blisters* there are some which act very gently, and others with great violence.

Blisters are unguents, cataplasms, or plasters made of sharp, irritating medicaments, which have a faculty of drawing the humours from within, outwards; inflaming and ulcerating the skin, and raising *vesicæ*, or bladders; whence their denomination, *vesicatory*.

We have *vesicatories* made of CANTHARIDES, of EUPHORBIUM, FICA, SUBLIMATE of MERCURY, LAPIS INFERNALIS, MUSTARD, ANACARDIUM, SQUILLS, BRIONY, VINEGAR, PEPPER, LEAVEN, *Issue* SPUNGE, &c. which are incorporated and made up with honey, gum, resina, &c. to bring them to the consistence required.

Blistering chiefly takes place in the dropsy, delirious and feverish disorders, apoplexies, phrenitics, and the like. Some also prescribe it in the *hydrocephalus*, *ophthalmia*, suffocative catarrhs, *orthopnœa*, &c. Some say, that *blistering* is generally found useful in dropsies.

In the Phil. Trans. vol. l. part ii. N° 75. an. 1758, there is a paper by Dr. Whytt, containing cases of the remarkable effects of *blisters* in lessening the quickness of the pulse in coughs, attended with inflection of the lungs, and fever. See also several papers concerning *blisters* in the Land. Medic. Observ. &c. vol. ii. p. 311. ibid. p. 382. and vol. iii. p. 102. where they are recommended as efficacious in curing an incontinence of urine.

The operation and effect of *blisters* in curing fevers are by some resolved into the pain which they excite; by others into the ingress of the particles of the CANTHARIDES into the blood; by others, into the quantity of hot, sharp, and salt lymph discharged; by others, into the condensation of the blood, and stoppage of the rarefaction, whereby the spirits are disposed to be plentifully separated. Dr. Cockburn, who refutes all these systems, accounts for it from the CANTHARIDES wounding the nerves or canal whereby the spirits are conveyed to the heart; Dr. Morgan from the subtile, hot, active salts of the flies, strongly attracted by the *serum*, and carried with it through the several glands and secretory ducts of the body where they act by dissolving, attenuating, and rarefying the viscid cohesions of the lymph and *serum*, and stimulating the nervous coats of the vessels, whereby they are induced to throw off their stagnating viscidities, and restore the free drain of the lymph from the arteries to the veins; and at the same time, by scouring and cleansing the expurgatory glands, bring on critical sweats and urines. Phil. Trans. N° 252. p. 173.

Dr. Morgan endeavours to discard the method of dressing *blisters*, by which nothing is gained but the plaguing

and tormenting of the patient, and depriving him of the benefit of a much greater discharge, which would be at least three to one, were the same plaister left on for four or five days, or as long as it will draw off any thing; and then, when it has done running, taking it off and applying a plaister of mellot, or rather of diachylon, once, for all, till the part is quite well and healed. Indeed when a *blister* is first raised, if it doth not break and run of itself, it may be proper to raise the lower end of the plaister a little, to snip the bladder, and let out the water; but if the surgeon has made the plaister strong enough, this is commonly done of itself, without help. It is usually objected, that a strong epispastic left on five or six days, must deeply corrode the flesh under it, and thereby endanger a mortification. But this, according to the author last cited, is so far from being true, that on the contrary, it prevents the worst accidents usually happening in *blistering*, which are what they call *sloughs*, or deep strong incrustations of a sharp fait and adhesive matter, covering the whole surface of the flesh where the plaister had been applied. Now this is always occasioned by an unseasonable removal of the epispastic, while the humour is in full flow, and strongly feeding to the part; and the humour, thus suddenly checked and thrown back for want of a sufficient drain, forms this slough. Mem. Mech. Pract. of Phys. p. 176.

BLISTERING, in *Farriery*, is used in cases of straitt and shrunk sinews in horses, as some maintain, with good effect; but others lay with none.

BLITE, *strawberry spinage*, *bitum*, in *Botany*, a genus of the *monoecia digynia* class of plants; the characters of which are these: the flower hath no petals, but one briefly flamen, of the length of the empalement. In the centre is situated an oval pointed germen; the empalement afterward becomes an oval compressed capsule, including one globular compressed seed, of the size of the capsule. There are two species.

Blite is esteemed cooling and emollient, and therefore good in dysenteries and spitting of blood.

BLOATED *fish* or *herring*, in our *Statutes*, are those which are half-dried. Vide Stat. ann. 18. Car. II. c. 2.

Bloated herrings are made by steeping them in a peculiar brine, and then hanging them in a chimney to dry.

BLOATING, a puffing up or inflation of the exterior habit of the body, lodged chiefly in the adipose cells. It is the same with what physicians callan *anasarca*.

BLOCK is used for a piece of marble as it comes out of the quarry, before it has assumed any form from the hand of a workman.

BLOCK, in the *Mechanic Arts*, a large piece of solid wood whereon to fashion work, or to fashion it; strength and stability being the requisite properties.

In this sense we say a chopping *block*; a sugar-finer's *block*; a smith's *block*, on which his anvil is fastened; an executioner's *block*, on which the criminal's head is laid to be struck off.

BLOCK, *mourning*, *see* ANAESTHESIA.

BLOCK, among *Cutters in Wood*, is a form made of pear-tree, box, or other hard and close-grained wood, free from knots, on which they cut their figures in relievo with knives, chissels, &c.

The like *blocks* are in use for card-making; and from the same first arose the modern art of printing. Phil. Trans. N° 310. p. 2398.

BLOCK, among *Bowlers*, the mark which is aimed at, being a small sized bowl laid on the green for this purpose: it is called also the *jack*.

BLOCK, in *Falconry*, denotes the perch whereon a bird of prey is kept. This is to be covered with cloth.

BLOCKS, in *Sea-language*, are pieces of wood belonging to *ships*, in which the shivers of pullies are placed, and wherein the running ropes go. Of these, some are single, some double, and some have three, four, or five shivers in them. They are named and distinguished by the ropes they carry, and the uses they serve for. See *Tab. Ship*.

The *cat-block* is employed to draw the anchor up at the cat-head.

The *clue-garnet-blocks* serve to draw the clues or lower corners of the courses up to the yard, and are fastened to the clues of those sails.

The *fish-block* is hung in a notch at the end of the davit, serving to haul up the flooks of the anchor to the ship's bow.

The *foarch-block* is a large *block* with a shiver in it, and a notch cut through one of its cheeks, for the more ready receiving a rope, since, by means of this notch, the middle part of the rope may be received into the *block*, without passing it endwise. It is commonly fastened with a strap about the main-mast close to the upper deck, and is chiefly used for the fall of the winding tackle, which is reeved into this *block*, and then brought to the capstan.

The *top-block* is used to hoist up or lower down the top-mast, and is hooked in an eye-bolt driven into the cap. *Back and Block*, is a phrase used, when on hauling on any tackle, halyard, or the like, to which two *blocks* belong, the two meet and touch; so that they can haul no farther.

BLOCK, *royal*, *see* ROYAL.

BLOCKS, *wind-tackle*, *see* WIND.

BLOCK-*wood*, is a name sometimes given in our laws to LOGWOOD. 23 Eliz. c. 9.

BLOCKADE, a sort of siege of a place, intended to be taken by famine, wherein all the passages and avenues are seized, and that so, as that no supplies of provision can be brought in.

It comes from the German *blochen* or *blockhaus*, *a bulwark*, *or house of wood*; or from the Gaulish *bloch*, *barricade*: though others derive it from the Latin *incursare*, *to stop a passage*.

A *blockade* is no regular siege; inasmuch as there are no trenches or attacks. *Blockades* are formed by the cavalry.

The word *blockade* is sometimes also used in speaking of the beginning of a siege, when forces are sent to seize the principal avenues where the besiegers intend to fix their quarters.

There are two ways of forming *blockades*. The first is simply by fortifying or seizing posts at some distance from the place, chiefly on the banks of rivers both above and below, and on the great roads and inlets, where bodies of foot and horse are placed, communicating with each other, till the distress of the place, for want of necessaries, occasions defections of the garrison, and murmurings or insurrection of the townsmen, whereby the governor is frequently forced to capitulate.

The other sort is made nearer the place, by lines of circumvallation, wherein an army is pelted, being chiefly used, when, after a battle, the vanquished party have shut themselves up in some town ill provided, and thereby capable of being starved in a short time.

BLOCK-*batteries*, in the *Military Art*, denotes a wooden battery on four wheels, movable from place to place, where-by to fire *en barbe*, or over the parapet; sometimes also used in galleries and casemates, where room is wanted.

BLOCK-*boats*, a kind of wooden fort or battery, either mounted on rollers, or on a vessel, and serving either on the water, or in some counter-scarpe and counter-approaches.

The name is sometimes also given to a brick or stone fort built on a bridge, or the brink of a river, serving not only for its defence, but for the command of the river both above and below. Such was that noted *London-house* formerly on the bridge of Dunstan, since demolished on enlarging the bridge.

BLOCKING, in *Middle Age writers*, denotes a kind of burial used for persons dying excommunicated.

BLOCKINGS, *turrets*, in *Architecture*, are bases to the dome represented in *Tom. of Archit. fig.* 20. (QQQ); which by their aquatick solidity seem to strengthen the dome, and at the same time taking from its height, add a peculiar gracefulness to its appearance.

BLOCKINGS, *figures*, are represented at S. *fig.* 40. in *Tom. Archit.* These, when enriched with bale and cap, obtain the appellation of PEDESTALS.

BLOCKING-*course*, *see* COURSE.

BLOCKY, among *Farriers*, a name given to a diamond when its sides are too upright, by its TABLE and COLLAR being larger than they ought to be.

BLOD, *bale of*, *see* BLEEDING *below*.

BLOMARY, or BLOOMARY, the first forge in an iron-work, through which the metal passes after it is melted out of the ore. *See* IRON. They are also called *blomary-hearths*.

BLOOD, a warm, red liquor in most animals, circulating, by means of arteries and veins, through every part of the body, during their life, and the common source whence all the necessary and superfluous animal liquids are derived.

BLOOD, *microscopically examined*. By the microscope, the *blood* appears to consist of little red globules, swimming in an aqueous liquor, supposed to be the *serum* and *serum* that appear distinct when set rest. Mr. Leeuwenhoeck computes these globules to be twenty-five thousand times smaller than the smallest grain of sand; and Dr. Jurin makes them still less. Upon an accurate mensuration, he found the diameter of one equal to $\frac{1}{1000}$ of an inch, or less than $\frac{1}{50}$ of an ordinary hair of the head.

Blood makes a very common object for microscopical observations. The method of examining it is this: take a small drop of warm *blood* immediately from the vein, with the nib of a pen, or hair-pencil, and spread it as thin as possible on a plate of glass; and applying this to the microscope with the second, or first magnifier, the globules will all be seen very distinctly, and a little

practice

practice will enable us to form a judgment on the alterations that may happen in the size, figure, or colour of them. If a little warm water be applied to the *blood*, the globules will be divided, and many of them break into a number of smaller globules. If warm milk be added instead of water, the larger globules will be seen very diſtinct; but the ſmaller will be blended with, and loſt in the milk, which is itſelf no other than a congeries of ſuch globules.

Late writers have induſtriouſly purſued the examination of the globules of the *blood*; and found divers orders of them: thoſe large ones viſible to the eye conſtitute the *globules of the firſt order*; each of which, according to Leewenhoeck, is compoſed of ſix ſmaller ſpheres, cloſtered together in a very regular way; and that ſo nicely, in a perfect globule, that the compoſition comes to be imperceptible. But ſometimes the ſame perſon has ſeen a red globule looſening and breaking into theſe compounding ſpherules; and ſometimes has had the good fortune to perceive theſe running together, and beginning the compoſition of a new red globule. Theſe ſmaller ſpherules are called *globules of the ſecond order*. But Leewenhoeck did not ſtop here; he ſaw in the chyle and *blood* a great many particles ſix times leſs than theſe globules of the ſecond order, and thirty-ſix times leſs than the great red globules. So that the globules of the ſecond order are to be looked on as compounded of theſe ſmaller ones; which therefore are juſtly to be reckoned as another claſs, or *globules of the third order*. Farther, the moſt innumerable *blood*-veſſels in the body of ſuch animals, that none of thoſe hitherto mentioned globules could paſs through them; ſo that it ſeems neceſſary to ſuppoſe inferior claſſes of *globules of the fourth, fifth, ſixth, &c. orders*. He even ſaw veſſels, the wideneſs of which was leſs than the eighth part of the diameter of a red globule; ſo that the particles, paſſing through them, ſhould be upwards of five hundred times leſs than ſuch globules, and conſequently ſmaller than thoſe of the fourth order. Beſides, upon a careful examination, he could perceive ſtill ſmaller veſſels, narrower than the tenth part of the diameter of a red globule, and conſequently not capable of tranſmitting ſpherules greater than if a red globule were broken into a thouſand parts. On the whole then, the globules of the firſt order are made up of ſix globules of the ſecond, thoſe of ſix of the third, thoſe of ſix of the fourth, thoſe of ſix of the fifth order, and ſo on. And accordingly we find the globules of the higher orders may be broken down into their compounded particles. That the *blood*, in ſome caſes, might be turned into *ſerum*, was obſerved by Ariſtotle. Nor did ſuch a change of the *blood* eſcape the obſervation of the accurate Dr. Harvey. Phil. Tranſ. N° 104. N° 106. N° 109. N° 165. N° 263 N° 380. Med. Eſſ. Edinb. tom. ii. *paſſim*.

Dr. Martine has alſo given us ſome computations of the diameters, magnitudes, weights, &c. of the globules of the *blood*. The doctor's computation of the diameter of a red globule agrees with Leewenhoeck's and Dr. Jurin's, being about $\frac{1}{125}$ of an inch.

The *blood*, as already obſerved, is compoſed of globules of different orders and magnitudes. The diameters of thoſe of the tenth order are eſtimated at leſs than $\frac{1}{1000000}$ of an inch.

The particles of *blood* have, ever ſince the time of Leewenhoeck, been generally deemed ſpherical, and therefore called globules; though ſome accurate obſervers have at different times expreſſed their doubts concerning their figure. Leewenhoeck acknowledges, that in fiſh and in the *amphibia* they are flat and elliptical; but thoſe of the human blood, and of the blood of quadrupeds, have generally been reckoned ſpherical. Father de la Torre, by obſerving them with glaſs ſpherules of a very conſiderable magnifying power, was led to apprehend, that they were flat and annular. Mr. Hewſon has proſecuted the inquiry both into their ſize and ſhape; and he concludes, that ſo far from being of the ſame ſize in all animals, as ſome have ſuppoſed, they differ much in this reſpect; and that this difference bears no regular proportion to the ſize of the animal to which they belong; thoſe of an ox's *blood* not being ſo large as thoſe of the human *blood*, and thoſe of a porpoiſe not being larger than thoſe of ſmaller fiſh: nor are they all of the ſame ſize in the ſame animal. With reſpect to their figure, he obſerves, that they are flat in all animals, the human ſubject not excepted; that a dark ſpot may be ſeen in the middle of one of theſe particles, which F. de la Torre ſuppoſed to be a perforation; but which Mr. Hewſon ſuppoſes to be a ſolid particle contained in a flat veſicle, and filling only the middle of it, whilſt the edges of this veſicle are hollow and either empty, or filled with a fubtile fluid. He ſuppoſes farther, that they are ſolid particles, and not fluid, as has been commonly believed: and he adds, that the uſe of thoſe ſalts which *enter* into the compoſition of the *blood*, is probably to preſerve the red veſicles in their flat form. See an account of the experiments on which theſe concluſions are founded, in the Phil. Tranſ. vol. lxiii. part ii. p. 393.

Blood, *analyſis of the*. The *blood*, while in its veſſels, appears to the naked eye uniform and homogeneous; but, when let out and cold, it ſeparates ſpontaneouſly into two different parts: the one red and ſirmous, which coheres into a maſs, and is called the *crur*; the other thin and tranſparent, which retains its fluidity when cold, and, being ſuppoſed ſpecifically heavier than the other, ſuſtains and bears it up, and is called the *ſerum*. The proportion of the *ſerum* to the *crur*, Dr. Drake makes as a medium, as one and a half to one: but Mr. Boyle, more accurately, makes the *ſerum* $\frac{3}{5}$ of the whole *blood*; and Dr. Jurin, $\frac{5}{9}$ of the whole weight, or $\frac{5}{8}$ of the bulk.

Experience extends the proportion of the *ſerum* of *blood* to $\frac{7}{8}$ parts of the whole mass; yet Dr. Morgan ſeems not to depart from this, and makes the *crur* and *ſerum* equal to each other. Incited in cold, and ſufficiently congulated *blood*, the tough or *gelatinous* and the ſurrounding fluid, *ſerum*, are ordinarily found in the eye pretty nearly equal to one another.

If the red part of the *blood* bears too great a proportion to the *ſerum*, which is the caſe of athletic perſons, and others who do not take a ſufficient quantity of drink with their meat, the faults may be corrected by diluting the mass, or by increaſing their drink. The learned Boerhaave tells us of a young man, who, not having for a conſiderable time drank with his meat, had a very foul complexion and ſcorbutic eruption all over his body, which indicated too great a proportion of the red part of the *blood* to the *ſerum*; he was freed from his diſorder by drinking with his meat, without any farther remedy.

In the beginning of fevers, the proportion of the red part of the *blood* to the *ſerum* is greater, and at the end of them leſs, than it is in health. The change of this proportion is owing to perſons under this diſorder living wholly on drink and liquid nourishment. And bodies loaded with ſerous matters, an agreement of too ſmall a proportion of the red part of the *blood* to the *ſerum*, have been freed from their load by abſtaining wholly from drink.

There are other cauſes beſides the large quantities of meat and drink, which vary the proportion of the red part of the *blood* to the *ſerum*; for this proportion is greater in country people than in citizens, in perſons who uſe exerciſe than in perſons who are inactive, and in perſons who live upon fleſh meats and fermented liquors, than in perſons who live upon vegetables and water. In theſe, this proportion is increaſed by things which dry the body and ſtrengthen the fibres; and leſſened by things of a contrary nature.

Too great a proportion of the red part of the *blood* to the *ſerum* renders bodies ſubject to inflammatory fevers on taking cold.

When extravaſated *blood* is left to ſtand, the red globules run ſwiftly together, and ſqueeze out the intervening *ſerum* in ſome animals with a great, in others with a leſs force; which is a proof, that their globules are endowed with an attractive power. This force in deer's *blood* is ſo weak, that it ſcarcely congulates into a firm *craſſamentum*. On the contrary in ſome great and ſtrong beaſts, it becomes a tough, and almoſt indiſſoluble maſs; ſo that the *blood* of bulls was frequently uſed by the ancients, as a moſt effectual poiſon.

Mr. Le Cat thinks, that the *blood* is detained in its fluid ſtate by a caſeous fluid, and that this forms the red globules. But this it needs the abſtinence of the animal fluid, which is the principle that preſerves all from corruption, and to which we owe our ſenſation and motion. See Coagulation, Crassamentum, and Sensitive *fluid*.

The *blood* is found to conſiſt chiefly of phlegm, as the laſis or vehicle of volatile *ſalts*, of *oil*, which, by ſome nice examiners, has been found of two kinds; and of *caput mortuum*, or earth, which, though it may conſiſt of divers ſubſtances, eſſentially different from each other, yields only a little fixed ſalt. From the beſt experiments of this kind it appears, that in ſeven ounces of human *blood*, there are five ounces two drachms of phlegm, three drachms of a ſubtile ſulphurous oil, a ſmall quantity of a thicker oil, two drachms of ſalt, and about two of earth.

The *blood*, and other parts of animals, all contain more or leſs of an acid; and this ſeems wholly owing to the effects of their organs of digeſtion upon the aliments they take in, which, in time, become aſſimilated to, and make part of their fluids and ſolids.

It might be ſuppoſed, that this acid, however, ſhould be only found in ſuch animals as eat vegetables, not in ſuch as feed on other creatures; but this doubt will va-

ſuch when we conſider, that the carnivorous animals ſubſiſt on thoſe acids, at leaſt, at ſecond-hand, in the fleſh of thoſe animals which had fed on vegetables. This, though a very fair way of reaſoning, did not content Mr. Homberg, but he tried the *facts* themſelves by a number of experiments; by which he was convinced, that in carnivorous and fruchivorous animals, and in ſuch as eat vegetables alone, the acids of thoſe vegetables remained acids in the parts of the animal. Mr. Homberg tried the ſame experiments on the fleſh and *blood* of creatures that eat only fleſh, as well as on thoſe which eat indifcriminately every ſort of food, and the event proved the ſame in all. All contained a real acid liquor, which had the properties before deſcribed, and in which the alkali and acid were ſo blended together, that they deſtroyed not one another, but each was ready to exert itſelf on occaſion. *Mem. Acad. Scienc.* 1712.

Dr. Jurin adds, that the *ſerum*, upon a chemical analyſis, exhibits a great deal of phlegm, and of the other principles a ſmall quantity; and, on the contrary, the *crur* yields leſs phlegm, but the other principles much more copiouſly than the *ſerum*. From which data he concludes, that the globules conſiſt of ſome phlegm united with the oil and ſalts, and a ſmall quantity of earth; but in what proportion, and how, and in what parts they are formed, &c. is not determined. Indeed, it muſt be conſidered, that the principles which the chemiſts thus produce ſeparate, may poſſibly be much altered by the fire. Thus, it is paſt doubt, the oils drawn from the *blood* by fire, are vaſtly different from the natural oil, which circulates with the *blood*. To which may be added, that the *caput mortuum* remaining after diſtillation may, poſſibly, be a new production, which had no exiſtence under any form reſembling that in the *blood*.

The origin of the *blood* is in the chyle, which, paſſing the lacteals, is delivered into the ſubclavian; where, mixing with the *blood*, they proceed together to the right ventricle of the heart; and there, being yet more intimately mixed, they circulate together through the whole body; till, after ſeveral circulations and ſecretions at the ſeveral ſtructures of the body, they are aſſimilated, ſo as to make one uniform compound maſs, which appears to be nothing elſe but chyle altered by the artifice of nature, and exalted into *blood*; there being no appearance of any thing extraneous mixed with the liquor circulating in the *blood*-veſſels, but chyle; excepting what had been before ſeparated from it, for ſome particular purpoſes, which being once ſerved, it is returned to it again: unleſs, perhaps, it may receive ſome portion of air in the lungs.

That there is *air mixed* in the *blood*, and circulating with it, is paſt doubt; but, whether any more than was at firſt contained in the food whereof the chyle is formed, is a queſtion not yet decided. The principal arguments urged for it are, the neceſſity of reſpiration; which may be accounted for on another principle: and the florid colour the *blood* receives in the lungs, and firſt ſhews in the *vena pulmonalis*; which is countenanced by an experiment made with the red grumous part of the *blood* after coagulation on *blood*-letting; for, upon turning the no-ther ſurface, which was before black, upwards, and expoſing it to the air, by its contact wherewith it acquires a florid colour. Like that of the *blood* in the *vena pulmonalis*. But this effect others account for from the extraordinary agitation and comminution of the *blood* in the lungs. Dr. Lower has confuted this notion, by obſerving that the nutrition of the *blood* is greater in the muſcles, *from* which, however, it always returns black.

Indeed, Dr. Keil, Borelius, Bernouilli, and ſome other mathematical phyſiologiſts, go farther. Mr. Boyle having examined the ſpecific gravity of *blood*, and found that of the *ſerum* to be greater than that of *blood*, in the proportion of 1190 to 1040, i. e. nearly as 8 to 7, it followed, that the *crur*, or *blood-globules*, were ſpecifically lighter than the *ſerum*, and that in a conſiderable degree; which was farther confirmed by the globules being ſuſtained in the *ſerum*, both while circulating, and when let out.—Hence it was conjectured, that theſe globules were nothing elſe but thin veſicles filled with a ſubtile aerial ſubſtance: and this opinion was confirmed from its being obſerved, in viewing the circulation by a microſcope, that a *blood*-globule, in paſſing through a very narrow veſſel, would change its ſhape from a globular, to an oval form, and would again recover its former figure, as ſoon as it was got through its narrow paſſage; which appearance was naturally enough aſcribed to the elaſticity of the included air: and, from this conjecture were accounted for a great number of the phenomena of the animal œconomy, particularly Dr. Keil's theory of muſcular motion.

But this principle Dr. Jurin has examined, and appears to have overthrown. He made ſeveral experiments, in ſome of which the *crur* before ſuſpended at the ſurface of the *ſerum*, immediately ſunk, when its adheſion to the ſides of the pureinger was cut off, and it was removed to another veſſel of *ſerum*. In others where the *crur*, buoyed up in the *ſerum*, even without any adheſion to the ſides of the glaſs, and merely by the bubbles of air adhering to its ſurface, upon being included in a receiver, and exhauſting the air, ſo that the bubbles burſt, would ſink: whence he concludes the globular part of the *blood* to be heavier than the ſerous: and, from other experiments, he aſcertains the proportion of the gravity of *blood* to that of *ſerum*, to be as 1054 to 1030; whence the quantity of the globules being before fixed at $\frac{1}{2}$ of the whole, the precie gravity of the globules beyond that of the *ſerum* is eaſily determined. The *blood*-globules therefore are not veſicles filled with air, or any other fluid ſubſtance lighter than *ſerum*: which is farther confirmed from this, that *blood*-globules are not found to dilate, or undergo any alteration, in an exhauſted receiver, when viewed through a microſcope; whereas, were they filled with any elaſtic fluid, they would either burſt, or at leaſt dilate into 50 or 60 times the ſpace.

As to the *uſes* of the *blood*, authors are exceedingly divided about the cauſe thereof: the ancients aſcribe it to a vital flame, or ſomate heat lodged in the heart, and thence communicated to the *blood*. Dr. Willis imagines a kind of acceſſion to the *blood*, and thinks its heat reſults from its being, as it were, fet on fire, and periſhering in that ſtate. Dr. Henſhaw ſolves it from an ebullition conſequent on the mixture of two fluids, ſo diſſimilar as the chyle and *blood*. Others have recourſe to the chemical principles of alkali and acid; others to the mutual action of the principles, or component parts of the *blood*, by means whereof an inteſtine motion, and by that means an inteſtine heat, or incalefcence, is effected.

Dr. Drake, with more reaſon, attributes the heat of the *blood* to the *ſpring* of the air incloſed together with it in the veſſels: for, air being included in the *blood*-veſſels, will endeavour to expand itſelf; and, conſequently, if it have force enough, will drive outwards the parts of the body that incloſe it; by which means it cauſes the *blood* to beat againſt the ſides of the veſſels; which, having muſculous, contractile coats, do in their turns compreſs it again, and ſo cauſe a reciprocal reſiſt in the *blood*, greater than the mere circulatory motion could; whence the parts of the ſolids, or containing veſſels, being put into a conſtant agitation, a heat is produced in both, which they mutually impart to each other. See ATTRITION, &c.

Laſtly, Dr. Boerhaave accounts for the heat of the *blood* from the action of the heart, and the reaction of the *aorta*: for the *blood*, driven by the heart obliquely againſt the ſides of the *aorta*, preſſes them, and ſpends almoſt its whole endeavour againſt the exterior thereof, and is, by the figure and elaſticity of this veſſel, preſſed back again. Every moment of time, therefore, each particle of *blood* acquires a new motion, a new mixt and rotation: hence follows a perpetual attrition, attenuation, rubbing off of angles, and a ſemifimilar and homogeneous of all the parts; and hence the maſs derives its fluidity, heat, diviſion into particles accommodated to all veſſels, preſſure into the lateral tubes, &c.

Nor is the cauſe of the *redneſs* of the *blood* leſs obſcure: the chemiſts account for it from the exaltation of its ſulphur; others from the mixture of ſaline and ſubacid juices with ſulphureous ones; and others from the colour of the heart. The French philoſophers attribute the redneſs to the ſmallneſs of the fize, and roundneſs of the figure, of the particles that compoſe the *crur*; notwithſtanding that red, being the colour of all others leaſt refrangible, and the globular figure of all others the moſt refrangible, that figure ſecms, of all others, leaſt apt to produce this colour. Others aſcribe the colour of the *blood* to the impregnation of the air in the lungs; but, that air is diſpoſed to produce ſuch an effect, appears from the experiment above.

But others, more reſerved, extend this *effect* of the air no further than to account for the difference of redneſs between the venal and arterial *blood*; ſuppoſing, that after its colour has been heightened, and rendered more florid, by the mixture of the air in the lungs, it retains it pretty well in the arteries; but that, circulating in the body, and carried through the veins, the air tranſpires by degrees, through the pores of the veſſels, and leaves the liquor of a paler dye.

There is now little doubt that the redneſs of the *blood* is owing to its contact with air: M. Cigna of Turin found, by putting a little oil on a quantity of *blood*, that it remained black throughout; but that when he took away the red part, and expoſed to the air the *lower lamina* which were black, they alſo became ſucceſſively red, till the whole maſs acquired that colour. Boccaris, at his requeſt, expoſed *blood in vacuo*, and found that it always

continued black; but when he brought it into contact with the air, it became red.

M. Cigna, in his firſt Memoir, publiſhed in the Miſcellanea Taurinenſia, expreſſes this opinion, that the air which is introduced into the *blood* by means of the chyle, continues to preſerve its redneſs: but in a ſecond Memoir on the ſame ſubject, he doubts whether the change of colour takes place in the lungs: and if it does, he inclines to aſcribe it to the evaporation from the *blood* in the lungs. The ingenious Mr. Hewſon is fully convinced, that the air in the lungs is the immediate cauſe of this change of colour; and to this purpoſe he obſerves, that he has diſtinctly ſeen the *blood* of a more florid red in the left auricle of the heart than it was in the right: and though ſome have attributed the effect to nitre abſorbed from the air, he conſiders this as a mere hypotheſis, adding, rather too haſtily, that air contains no nitre; and that moſt of the neutral ſalts produce the ſame effect in ſome degree.

Dr. Prieſtley, who has purſued his enquiries on the ſubject of RESPIRATION with very conſiderable ſucceſs, apprehends, that the air we breathe may be ſo far decompoſed, as to communicate a nitrous quality to the *blood*, in its paſſage to the lungs: and this opinion is confirmed by his analyſis of atmoſpherical air, which he has proved to conſiſt of earth and ſpirit of nitre. He has further demonſtrated, by the moſt accurate and concluſive experiments, that the florid red colour of the *blood* is owing to the effect which the air has upon it: for the blackeſt parts of the *craſſamentum* of coagulated *blood*, ſeparated from the *ſerum*, aſſumed a florid red colour in common air: and the colour was more florid, and the change produced in leſs time in dephlogiſticated air, which is purer and more fit for reſpiration than common air: on the contrary, the brighteſt red *blood* became black in any kind of air, that was unfit for reſpiration, as in fixed air, inflammable air, nitrous air, or phlogiſticated air; but upon expoſing the *blood*, which became black in the phlogiſticated air, to common or dephlogiſticated air, it regained its red colour: and the ſame pieces became alternately black and red by being tranſferred from phlogiſticated to dephlogiſticated air; and *vice verſa*. The *blood*, in theſe experiments, he ſays, muſt have parted with its phlogiſton to the common air or dephlogiſticated air; and have imbibed it and have become ſaturated with it, when expoſed to phlogiſticated, nitrous, inflammable, or fixed air. There are, however, he acknowledges, other cauſes to which the blackneſs of the *blood* may ſometimes be owing, beſides its acquiring phlogiſton: nor can it be expected, that, when *blood* has become black without having received phlogiſton *ab extra*, it will generally recover its florid colour by being expoſed to the *air*.

Dr. Prieſtley proceeded to examine, whether the quality of the air, to which pieces of *blood* had been expoſed, and in which their colour was changed, was at all affected or altered, during the operation. In this experiment he made uſe of dephlogiſticated air, as its quality is more ſuſceptible of alteration than common air; and he found, that a piece of *craſſamentum*, about the ſize of a walnut, put into the quantity of about five ounce meaſures of this air, and changed about ten or twelve times in the ſpace of twenty-four hours, ſo depraved the air, that a mixture of one meaſure of this, and two of nitrous air, which, at the beginning of the experiment, occupied the ſpace of no more than half a meaſure, afterwards occupied the ſpace of a meaſure and a half. See AIR, *nitrous*. Whence he infers, that the black *blood* muſt have communicated phlogiſton to the air; and that its change of colour from black to florid red, muſt have been occaſioned by the ſeparation of phlogiſton from it. He afterwards ſatisfied himſelf, that *blood* has likewiſe a power of taking phlogiſton from air; for by expoſing *blood* of a very beautiful florid colour to nitrous and to inflammable air, both were conſiderably diminiſhed by the proceſs. And he concludes, upon the whole, that the air becomes phlogiſticated in paſſing through the lungs, by means of the *blood*. Dr. Prieſtley anticipates an objection, which may be urged againſt this concluſion; viz. that the *blood* never comes into actual contact with the air in the lungs, but is ſeparated from it, according to Dr. Hales, at the diſtance of no more than a thouſandth part of an inch; and that the red globules remain in a large quantity of *ſerum*, which is a fluid of a very different nature. In order to reſolve this difficulty, he put a large quantity of black *blood* into a bladder, moiſtened with a little *ſerum*, and tying it very cloſe, hung it in a free expoſure to the air; and the next day he found, that all the lower ſurface of the *blood*, which had been ſeparated from the common air by the intervention of the bladder, and a ſmall quantity of *ſerum*, had acquired a coating of a florid red colour, as thick, in his opinion, as it would have acquired, had it been expoſed to the open air. He alſo found that a deep covering of *ſerum* did not obſtruct the mutual action of the *blood* and air any more than the bladder had done. From both experiments he infers, that the change of colour cannot be owing, as M. Cigna imagined, to evaporation; nor is the change of colour in the laſt experiment owing to the *ſerum*, but to the air; for two equal portions of black *blood* were put into equal cups, containing equal quantities of *ſerum*, covering them to the depth of half an inch; one cup was expoſed to the open air, and the other placed in an exhauſted receiver: the *blood* in the former preſently acquired a florid colour, but the other continued after twelve hours as black as at firſt. Dr. Prieſtley infers, from another experiment, that the moſt florid *blood* contains a conſiderable quantity of phlogiſton; and he obſerves that there is a great difference in the conſtitution of *blood*, with reſpect to its property of being affected by the air. See on this curious ſubject, Hewſon's Experimental Inquiry into the Properties of Blood, or Phil. Tranſ. vol. lx. p. 368, &c. Prieſtley's Exp. and Obſ. on Air, vol. iii. p. 55. or Phil. Tranſ. vol. lxvi. p. 226, &c.

Boerhaave accounts for the colour of the *blood* from the ſame cauſe as for its heat, viz. from the action of the heart, and re-action of the fibres of the *aorta*. Borelli, to aſcertain the cauſe of the redneſs, took a parcel of the *ova*, after it had ſeparated itſelf as far as ſpontaneouſly it would from the *ſerum*, and, waſhing it frequently in water, found it ſeparable into a viſcous, ſlippery ſubſtance, conſiſting of white or colourleſs fibres (which roſe to the ſurface of the water, and there gathered into a ſkin, or coherent pellicle of a reticular texture), and a deep red powder, which precipitated partly plentifully to the bottom. Hence it appears, that the red colour of the *blood* is imparted to it by red tinging particles, as in the common caſe of dyers. By examining the red precipitate apart, and finding which of the elements it conſiſted chiefly of, a man who would reaſon about the colour of the *blood* from principles of the chemiſts, might carry that matter nearer an iſſue.

However, this red colour, though generally found in all terreſtrial animals, is not yet abſolutely neceſſary and eſſential: there being whole ſpecies which have their circulating liquor, or *blood*, white and limpid; to which Dr. Drake adds an inſtance of a pure white *blood*, like milk, which he let out of the median vein of a man, and which, when *cold*, did not ſeparate into a *craſſamentum*, as the red uſually does; nor yield a ſkim of cream, or turn ſour upon keeping, as milk does. Dr. Beal gives us another inſtance of the like kind; and Dr. Lower adds a third, of a perſon who bled ſo long at the noſe, till at laſt the broth he drank flowed, little altered, that way, as *blood*.

BLOOD, *changes and diſorders of the*. From the principles, or conſtituent parts of the *blood* above recited, variouſly combined and diſtributed by the circulatory motion impreſſed by the heart, and by the oſcillatory expanſive motion of the interſperſed air, and the re-action of the contractile veſſels, flow all the properties and operations of the *blood*. From this mixture of elements, and their fix compoſition, it becomes ſuſceptible of various alterations and impreſſions; the principal whereof are, *coagulation*, which uſually attends it out of the body, ſometimes in it, and ſcarce ever without an artificial procurement, but always mortal: and *diſſolution*, which is juſt oppoſite to the former, and conſiſts in ſuch a comminution of the fibrous parts of the *blood*, as indiſpoſes it for a ſeparation of the *ſerum* from the *ſerum*. This is frequently the conſequence of malignant and peſtilential fevers, &c. and is likewiſe occaſioned by ſome kinds of poiſon.

Their two contrary affections of the *blood*, Dr. Drake aſcribes to the oppoſite kinds of ſalts, acids, and volatile alkalis. For though, adds he, in a human body, no pure acid is found, nor could it, indeed, be conſiſtent with life; yet it may, and does often, enter the *blood*, ſo compounded as to bridle the volatile, alkalious ſalt of the *blood*, and ſo hinder the due attenuation and mixture of the ſeveral parts; as is the caſe in a *diabetes*, and perhaps in a *chloroſis*, where the *blood* is thick and torpid: on the other hand, where the alkalious ſalts are too redundant, the *blood* is rendered too thin and fluid, ſo that the difference of its conſtituent parts is loſt.

Another affection frequent in the *blood* is, a too great abundance of oils, or oily particles, by means whereof the active parts of the *blood* are too much clogged, and thoſe parts which ſhould be ſecreted, for peculiar uſes in the body, are detained; and perhaps the ſolids, through which it paſſes, too much lubricated, their tone relaxed, ſhrunk, reduced, &c. whence the ſluggiſhneſs and inactivity of very fat people.

The contrary affection to this is, the defect of oil in the *blood*, which, being, as it were, its baſſam, lines

ruth when we conſider, that the carnivorous animals ſo follow theſe acids, at leaſt, at ſecond-hand, in the fleſh of thoſe animals which had fed on vegetables. This, though a very fair way of reaſoning, did not content Mr. Homberg, but he tried the facts themſelves by a number of experiments; by which he was convinced, that in carnivorous and fruchivorous animals, and in ſuch as eat vegetables alone, the acids of thoſe vegetables remained acids in the parts of the animal. Mr. Homberg tried the ſame experiments on the fleſh and *blood* of creatures that eat only fleſh, as well as on thoſe which eat indiſcriminately every ſort of food, and the event proved the ſame in all. All contained a red acid liquor, which had the properties before deſcribed, and in which the alkali and acid were ſo blended together, that they deſtroyed not one another, but each was ready to exert itſelf on occaſion. Mem. Acad. Scienc. 1712.

Dr. Jurin adds, that the *ſerum*, upon a chemical analyſis, exhibits a great deal of phlegm, and of the other principles a ſmall quantity; and, on the contrary, the *crore* yields leſs phlegm, but the other principles much more copiouſly than the *ſerum*. From which data he concludes, that the globules conſiſt of ſome phlegm united with the oil and ſalts, and a ſmall quantity of earth; but in what proportion, and how, and in what parts they are *formed*, *&c.* is not determined. Indeed, it muſt be conſidered, that the principles which the chemiſts thus produce ſeparate, may poſſibly be much altered by the fire. Thus, it is paſt doubt, the oils drawn from the *blood* by fire, are vaſtly different from the natural oil, which circulates with the *blood*. To which may be added, that the *caput mortuum* remaining after diſtillation may, poſſibly, be a new production, which had no exiſtence under any form reſembling that in the *blood*.

The *ſerum* of the *blood* is in the chyle, which, paſſing the lacteals, is delivered into the ſubclavian; where, mixing with the *blood*, they proceed together to the right ventricle of the heart; and there, being yet more intimately mixed, they circulate together through the whole body; till, after ſeveral circulations, and ſecretions at the ſeveral ſtrainers of the body, they are aſſimilated, ſo as to make one uniform compound maſs, which appears to be nothing elſe but chyle altered by the artifice of nature, and exalted into *blood*; there being no appearance of any thing extraneous mixed with the liquor circulating in the *blood*-veſſels, but chyle; excepting what had been before ſeparated from it, for ſome particular purpoſes, which being once ſerved, it is returned to it again: unleſs, perhaps, it may receive ſome portion of air in the lungs.

That there is *air mixed* in the *blood*, and circulating with it, is paſt doubt; but, whether any more than was at firſt contained in the food whereof the chyle is formed, is a queſtion not yet decided. The principal arguments urged for it are, the neceſſity of reſpiration; which may be accounted for on another principle: and the florid colour the *blood* receives in the lungs, and firſt ſhews in the *vena pulmonalis*; which is countenanced by an experiment made with the red grumous part of the *blood* after congulation on *blood*-letting; for, upon turning the under ſurface of it outwards, before black, towards, expoſing it to the air, by its contact wherewith it acquires a florid colour, like that of the *blood* in the *vena pulmonalis*. But this effect others account for from the extraordinary agitation and comminution of the *blood* in the lungs. Dr. Lower has conſuted this notion, by obſerving that the attrition of the *blood* is greater in the muſcles, from which, however, it always returns black.

Indeed, Dr. Keil, Bohnius, Bernouilli, and ſome other mathematical phyſiologiſts, go further. Mr. Boyle having examined the ſpecific gravity of *blood*, and found that of the *ſerum* to be greater than that of *blood*, in the proportion of 1190 to 1040, i. e. nearly as 8 to 7, it followed, that the *crore*, or *blood*-globules, were ſpecifically lighter than the *ſerum*, and that in a conſiderable degree; which was further confirmed by the globules being ſuſtained in the *ſerum*, both while circulating, and when let out.—Hence it was conjectured, that theſe globules were nothing elſe but thin veſicles filled with a ſubtile aerial ſubſtance: and this opinion was confirmed from its being obſerved, in viewing the circulation by a microſcope, that a *blood*-globule, in paſſing through a very narrow veſſel, would change its ſhape from a globular, to an oval form, and would again recover its former figure, as ſoon as it was got through its narrow paſſage; which appearance was naturally enough aſcribed to the elaſticity of the included air: and, from this conjecture were accounted for a great number of the phenomena of the animal œconomy, particularly Dr. Keil's theory of muſcular motion.

But this principle Dr. Jurin has examined, and appears to have overthrown. He made ſeveral experiments, in ſome of which the *crore* before ſuſpended at the ſurface of the *ſerum*, immediately ſunk, when its adheſion to the ſides of the porringer was cut off, and it was removed to another veſſel of *ſerum*. In others where the *crore*, buoyed up in the *ſerum*, even without any adheſion to the ſides of the glaſs, and merely by the bubbles of air adhering to its ſurface, upon being included in a receiver, and exhauſting the air, ſo that the bubbles burſt, would ſink: whence he concludes the globular part of the *blood* to be heavier than the *ſerous*: and, from other experiments, he aſcertains the proportion of the gravity of *blood* to that of *ſerum*, to be as 1054 to 1030; whence the quantity of the globules being before fixed at $\frac{1}{13}$ of the whole, the preciſe gravity of the globules beyond that of the *ſerum* is eaſily determined. The *blood*-globules therefore are not veſicles filled with air, or any other fluid ſubſtance lighter than *ſerum*; which is farther confirmed from this, that *blood*-globules are not found to dilate, or undergo any alteration, in an exhauſted receiver, when viewed through a microſcope; whereas, were they filled with any elaſtic fluid, they would either burſt, or at leaſt dilate into 90 or 80 times the ſpace.

As to the *uſes* of the *blood*, authors are exceedingly divided about the cauſe thereof: the ancients aſcribe it to a vital flame, or innate heat lodged in the heart, and thence communicated to the *blood*. Dr. Willis imagines a kind of effervition in the *blood*, and thinks its heat reſults from its being, as it were, ſet on fire, and perſevering in that ſtate. Dr. Heathaw ſolves it from an ebullition conſequent on the mixture of two fluids, ſo diſſimilar as the chyle and *blood*. Others have recourſe to the chemical principles of alkali and acid; others to the mutual action of the principles, or component parts of the *blood*, by means whereof an inteſtine motion, and by that means an inteſtine heat, or incalefcence, is effected.

Dr. Drake, with more reaſon, attributes the heat of the *blood* to the ſpring of the air incloſed together with it in the veſſels: for, air being inclined in the *blood*-veſſels, will endeavour to expand itſelf; and, conſequently, if it have force enough, will drive outwards the parts of the body that incloſe it; by which means it cauſes the *blood* to beat againſt the ſides of the veſſels; which, having muſculous, contractile coats, do in their turns compreſs it again, and ſo cauſe a reciprocal reſiſt in the *blood*, greater than the mere circulatory motion could; whence the parts of the ſolids, or containing veſſels, being put into a conſtant agitation, a heat is produced in both, which they mutually impart to each other. See ATTRITION, *&c.*

Laſtly, Dr. Boerhaave accounts for the heat of the *blood* from the action of the heart, and the re-action of the *aorta*: for the *blood*, driven by the heart obliquely againſt the ſides of the *aorta*, preſſes them, and ſpends almoſt its whole *momentum* againſt the curricy thereof, and is, by the figure and ductility of this veſſel, preſſed back again. Every moment of time, therefore, each particle of *blood* acquires a new motion, a new *veſis* and rotation: hence follows a perpetual friction, attenuation, rubbing off of angles, and a diminution and homogeneity of all the parts; and hence the maſs derives its fluidity, heat, diviſion into particles accommodated to all veſſels, preſſure into the lateral tubes, *&c.*

Now is the cauſe of the *redneſs* of the *blood* leſs obſcure: the chemiſts account for it from the exaltation of its ſulphur; others from the mixture of ſaline and ſubacid juices with ſulphureous ones; and others from the colour of the heart. The French philoſophers attribute the redneſs to the ſmallneſs of the ſize, and roundneſs of the figure, of the particles that compoſe the *crore*; notwithſtanding that red, being the colour of all others leaſt refrangible, and the globular figure of all the moſt refrangible, that figure ſeems, of all others, leaſt apt to produce this colour. Others aſcribe the colour of the *blood* to the impregnation of the air in the lungs; for, that air is diſpoſed to produce ſuch an effect, appears from the experiment above.

But others, more reſerved, extend this effect of the air no farther than to account for the difference of redneſs between the venal and arterial *blood*; ſuppoſing, that after its colour has been heightened, and rendered more florid, by the mixture of the air in the lungs, it retains it pretty well in the arteries; but that, circulating in the body, and carried through the veins, the air ſtaniſhes by degrees, through the pores of the veſſels, and leaves the liquor of a paler dye.

There is alſo little doubt that the redneſs of the *blood* is owing to its contact with air: M. Cigna of Turin found, by putting a little oil on a quantity of *blood*, that it remained black throughout; but that when he took away the red part, and expoſed to the air the *lower lamina* which were black, they alſo became ſucceſſively red, till the whole maſs acquired that colour. Boccaris, at his requeſt, expoſed *blood* in *vacuo*, and found that it always

continued

continued black; but when he brought it into contact with the air, it became red.

M. Cigna, in his firſt Memoir, publiſhed in the Miſcellanea Taurinenſia, expreſſes his opinion, that the air which is introduced into the *blood* by means of the chyle, continues to preſerve its redneſs: but in a ſecond Memoir on the ſame ſubject, he doubts whether the change of colour takes place in the lungs: and if it does, he inclines to aſcribe it to the evaporation from the *blood* in the lungs. The ingenious Mr. Hewſon is fully convinced, that the air in the lungs is the immediate cauſe of this change of colour; and to this purpoſe he obſerves, that he has diſtinctly ſeen the *blood* of a more ſhrill red in the left auricle of the heart than it was in the right: and though ſome have attributed the effect to nitre abſorbed from the air, he conſiders this as a mere hypotheſis, adding, rather too haſtily, that air contains no nitre; and that moſt of the neutral ſalts produce the ſame effect in ſome degree.

Dr. Prieſtley, who has purſued his enquiries on the ſubject of RESPIRATION with very conſiderable ſucceſs, apprehends, that the air we breathe may be ſo far decompoſed, as to communicate a nitrous quality to the *blood*, in its paſſage to the lungs: and this opinion is confirmed by his analyſis of atmoſpherical air, which he has proved to conſiſt of earth and ſpirit of nitre. He has further demonſtrated, by the moſt accurate and concluſive experiments, that the ſhrill red colour of the *blood* is owing to the effect which the air has upon it: for the blackeſt parts of the *craſſamentum* of coagulated *blood*, ſeparated from the *ſerum*, aſſumed a ſhrill red colour in common air: and the colour was more ſhrill, and the change produced in leſs time in dephlogiſticated air, which is purer and more fit for reſpiration than common air: on the contrary, the brighteſt red *blood* became black in any kind of air, that was unfit for reſpiration, as in fixed air, inflammable air, nitrous air, or phlogiſticated air; but upon expoſing the *blood*, which became black in the phlogiſticated air, to common or dephlogiſticated air, it regained its red colour: and the ſame pieces became alternately black and red by being tranſferred from phlogiſticated to dephlogiſticated air; and *vice verſa*. The *blood*, in theſe experiments, he ſays, muſt have parted with its phlogiſton to the common air or dephlogiſticated air; and have imbibed it and have become ſaturated with it, when expoſed to phlogiſticated, nitrous, inflammable, or fixed air. There are, however, he acknowledges, other cauſes to which the blackneſs of the *blood* may ſometimes be owing, beſides its acquiring phlogiſton: nor can it be expected, that, when *blood* has become black without having received phlogiſton *ab extra*, it will generally recover its ſhrill colour by being expoſed to the air.

Dr. Prieſtley proceeded to examine, whether the quality of the air, to which pieces of *blood* had been expoſed, and in which their colour was changed, was at all affected or altered, during the operation. In this experiment he made uſe of dephlogiſticated air, as its quality is more ſuſceptible of alteration than common air; and he found, that a piece of *craſſamentum*, about the ſize of a walnut, put into the quantity of about five ounce meaſures of this air, and changed about ten or twelve times in the ſpace of twenty-four hours, ſo depraved the air, that a mixture of one meaſure of this, and two of nitrous air, which, at the beginning of the experiment, occupied the ſpace of no more than half a meaſure, afterwards occupied the ſpace of a meaſure and a half. See AIR, *nitrous*. Whence he infers, that the black *blood* muſt have communicated phlogiſton to the air; and that its change of colour from black to ſhrill red, muſt have been occaſioned by the ſeparation of phlogiſton from it. He afterwards ſatisfied himſelf, that *blood* has likewiſe a power of taking phlogiſton from air; for by expoſing *blood* of a very beautiful ſhrill colour to nitrous and to inflammable air, both were conſiderably diminiſhed by the proceſs. And he concludes, upon the whole, that the air becomes phlogiſticated in paſſing through the lungs, by means of the *blood*. Dr. Prieſtley anticipates an objection, which may be urged againſt this concluſion; viz. that the *blood* never comes into actual contact with the air in the lungs, but is ſeparated from it, according to Dr. Hales, at the diſtance of no more than a thouſandth part of an inch; and that the red globules remain in a large quantity of *ſerum*, which is a fluid of a very different nature. In order to reſolve this difficulty, he put a large quantity of black *blood* into a bladder, moiſtened with a little *ſerum*, and tying it very cloſe, hung it in a free expoſure to the air; and the next day he found, that all the lower ſurface of the *blood*, which had been ſeparated from the common air by the intervention of the bladder, and a ſmall quantity of *ſerum*, had acquired a coating of a ſhrill red colour, as thick, in his opinion, as it would have acquired, had it been expoſed to the open air. He alſo found that a deep covering of *ſerum* did not obſtruct the mutual action of the *blood* and air any more than the bladder had done. From both experiments he infers, that the change of colour cannot be owing, as M. Cigna imagined, to evaporation: nor is the change of colour in the laſt experiment owing to the *ſerum*, but to the air; for two equal portions of black *blood* were put into equal cups, containing equal quantities of *ſerum*, covering them to the depth of half an inch; one cup was expoſed to the open air, and the other placed in an exhauſted receiver; the *blood* in the former preſently acquired a ſhrill colour, but the other continued after twelve hours as black as at firſt. Dr. Prieſtley infers, from another experiment, that the moſt florid *blood* contains a conſiderable quantity of phlogiſton; and he obſerves that there is a great difference in the conſtitution of *blood*, with reſpect to its property of being affected by the air. See on this curious ſubject, Hewſon's Experimental Inquiry into the Properties of Blood, or Phil. Tranſ. vol lx. p. 368, &c. Prieſtley's Exp. and Obſ. on Air, vol. iii. p. 55. or Phil. Tranſ. vol. lxvi. p. 226, &c.

Boerhaave accounts for the colour of the *blood* from the ſame cauſe as for its heat, viz. from the action of the heart, and re-action of the ſides of the *aorta*. Borelli, to aſcertain the cauſe of the redneſs, took a parcel of the *crura*, after it had ſeparated itſelf as far as ſpontaneouſly it would from the *ſerum*, and, waſhing it frequently in water, found it ſeparable into a viſcous, ſlippery ſubſtance, conſiſting of white or colourleſs fibres (which roſe to the ſurface of the water, and there gathered into a ſkin, or coherent pellicle of a reticular texture), and a deep red powder, which precipitated pretty plentifully to the bottom. Hence it appears, that the red colour of the *blood* is imparted to it by red tinging particles, as in the common caſe of dyers. By examining the red precipitate apart, and finding which of the elements it conſiſted chiefly of, a man who would reaſon about the colour of the *blood* from principles of the chemiſts, might carry that matter nearer an iſſue.

However, this red colour, though generally found in all terreſtrial animals, is not yet abſolutely neceſſary and eſſential: there being whole ſpecies which have their circulating liquor, or *blood*, white and limpid; to which Dr. Drake adds an inſtance of a pure white *blood*, like milk, which he let out of the median vein of a man, and which, when cold, did not ſeparate into a *craſſamentum*, as the red uſually does; nor yield a ſkim of cream, or turn four upon keeping, as milk does. Dr. Boal gives us another inſtance of the like kind; and Dr. Lower adds a third, of a perſon who bled ſo long at the noſe, till at laſt the broth he drank flowed, little altered, that way, as *blood*.

BLOOD, *changes and diſorders of the*. From the principles, or conſtituent parts of the *blood* above recited, variouſly combined and diſtributed by the circulatory motion impreſſed by the heart, and by the oſcillatory expanſive motion of the interſperſed air, and the re-action of the contractile veſſels, flow all the properties and operations of the *blood*. From this mixture of elements, and their laſt compoſition, it becomes ſuſceptible of various alterations and impreſſions; the principal whereof are, *coagulation*, which uſually attends it out of the body, ſometimes in it, and ſcarce ever without an artificial procurement, but always mortal: and *diſſolution*, which is juſt oppoſite to the former, and conſiſts in ſuch a comminution of the fibrous parts of the *blood*, as multiplotes it for a ſeparation of the *crura* from the *ſerum*. This is frequently the conſequence of malignant and peſtilential fevers, &c. and is likewiſe occaſioned by ſome kinds of poiſons.

Theſe two contrary affections of the *blood*, Dr. Drake aſcribes to the oppoſite kinds of ſalts, acids, and volatile alkalis. For though, adds he, in a human body, no pure acid is found, nor could it, indeed, be conſiſtent with life; yet it may, and does often, enter the *blood*, ſo compounded as to bridle the volatile, alkalious ſalt of the *blood*, and ſo hinder the due attenuation and mixture of the ſeveral parts; as is the caſe in a *diabetes*, and perhaps in a *chloroſis*, where the *blood* is thick and torpid: on the other hand, where the alkalious ſalts are too redundant, the *blood* is rendered too thin and fluid, ſo that the difference of its conſtituent parts is loſt.

Another affection frequent in the *blood* is, a too great abundance of oils, or oily particles, by means whereof the active parts of the *blood* are too much clogged, and thoſe parts which ſhould be ſecreted, for peculiar uſes in the body, are detained; and perhaps the ſolids, through which it paſſes, too much lubricated, their tone relaxed, ſhrunk, relaxed, &c. whence the ſluggiſhneſs and inactivity of very fat people.

The contrary affection to this is, the defect of oil in the *blood*, which, being, as it were, its ballaſt, lines

and preserves the parts from being fretted and corroded by the salts, whose *spicula* or edges are, as it were, sheathed in this soft balsamic matter, and their attrition against the solid parts prevented: this state of the *blood* is usually attended with a general atrophy, and a fretting and corrosion of some particular parts; whence scrofous defluxions, apothemations, and ulcers, especially in the lungs; whose tender viscidous substance is more easily incorporated than any other, by the acrimony of the saline *serum*. See CATARRH, CORPULENCY, &c.

There are other affections of the *blood*, resulting from its inordinate temperature and nature, with regard to the earthy parts; the consequences of which are, the stone, &c. and others that do not originally spring from any diversity, or undue mixture of the elements, but from an alteration in its motion; such as an augmentation or diminution of its progressive motion, or the like changes in its intestine motion; whence supernatural fermentations, are induced. The occasions here may be various; sometimes fevers, and other disorders occasioned by surfeits, debauches, catching cold, violent exercise, &c. whence stones; at other times some latent malignity of the air, whence epidemical diseases.

To which may be added divers other morbific constitutions depending on the different states and dispositions of the *blood*, in respect of quantity, velocity, fluidity, density, tenacity, &c. An excess in the quantity of *blood* constitutes what we call a *plenitude*, or *plethora*; a defect or want of a competent quantity, a *inopsemia*.

The symptoms of excess or defect, of an over-repletion or depletion, in the *blood*-vessels, are obvious; but caution must be used not to mistake every occasional flushing or ebb of the *blood* to the head for a general *plethora* of the *blood*-vessels, such ebbs and flushings being very common in cases where there is yet no *blood* to spare.

The *equilibrium* of the *blood* is an uniform and proportional diffusion of it through all the parts of the body.

Any considerable *stimulus*, it is known, will drive the *blood* in large quantities to the stimulated part, which must necessarily break the *equilibrium* and uniformity of its circulation; whence congestions, stagnations, concretions, &c. of the *blood*; and hence it is that a great part of regular practice consists in driving, revulling, discussing, and variously directing, and determining the *blood*, in order to recover its *equilibrium*.

The *equilibrium* of the *blood* against any occasional afluxes and refluxes of this fluid, is preserved or restored, either by raising and diffusing it when too weak and languid by cardiacs; as saffron, opium, Virginia snake root, &c. or by depressing and repelling it when too much raised and diffused; which is done by the abforbents, coolers, purgatives, acids of all forts, especially apples.

The morbific excess or defect of the *blood's velocity* is as remarkable as that of its quantity; but this cannot be judged from the natural state of the pulse in health, which is different in different constitutions. The ordinary number of pulsations in a minute is from 70 to 80 under a state of walking and moderate heat, and from 80 to 96 during the time of sleep. See PULSE.

The too great *heat* and *fluidity of the blood* are some of its most generally prevailing morbific constitutions, especially in a country, as ours, abounding with all the temptations to, and provisions for, ease and luxury. This state of the *blood* is brought on generally by drinking too freely hot, spirituous, inflammable liquors, and feeding plentifully on things, which contain a large proportion of volatile oily salts; as flesh-meats half-boiled or roasted, eaten in their bloody gravy, and all hot, spicy, and high-seasoned broths, sauces and the like. The *blood* being by these over-heated and rarefied, the *serum* is, in consequence, thickened into a sort of jelly, by which means it is rendered unfit for motion, coheres too strongly with the *crassamentum*, and passes but slowly through the lymphatics and secretory glands. In this state, the thicker and more viscid parts of the *serum*, lodging on the lymphatics and receptacles of the glands, gradually obstruct or fill them up. From which obstruction and diminished or intercepted circulation of the animal fluids, the heat and viscidity of the *blood* still increase, till a vital flame, raised too high, produces a fever. This state of the *blood*, and its symptoms, are aggravated by a sedentary life, or the want of due motion or exercise; for while the natural motion of the muscular *fibrilla* is either not at all, or but little promoted by voluntary action, the glands, and their receptacles, must be the sooner stuffed up, and the circulation of the lymph, that powerful means by which nature continually cools and dilutes the *blood*, sooner be suspended.

The blood is cooled, diluted, and attenuated by temperance, exercise, the use of water as beverage, and otherwise, and by deobstruents, especially mercury, in the gentler preparations of it; as *ethiops* or cinnabar given in moderate doses, so as not sensibly to affect the stomach; not excite salivation, for a long time.

As to the greater or less degree of fluidity and viscidity of the *blood*, it is manifest, that this humour may either have its parts too intimately divided and attenuated, or, on the contrary, there may be too close a cohesion between its parts, so as to render the mass too thick and viscous. The first of these states disposes the *blood* to a too quick, easy, and rapid motion, and sometimes dissolves and fuses it to such a degree, that the globules or *crassamentum* pass, together with the *serum*, through the glandular strainers, and occasions bloody serruses; as in malignant and pestilential fevers, bloody sweats, and other preternatural hæmorrhages. The latter or viscid state renders the *blood* unapt for motion, and disposes it to stick and lodge in the capillaries and lymphatics. Phil. Trans. N° 44. p. 891.

The *specific gravity* of the *blood*, or the various degrees of its rarefaction and condensation, depend on the degrees of heat as the natural heat either rises too high, or sinks too low; the *blood* will, of consequence, be either too much rarefied, or too much condensed. In the former case, where the *blood* is overheated and rarefied, the expansive force of the elementary fire and air contained in the mass, prevails over the corpuscular attraction; and thus, by the coagulating power of heat upon the *serum*, and its too intimate mixture and cohesion with the *crassamentum*, the lymph, which should form the secretions, cannot be separated, but the *serum* is, as it were, absorbed in the *crassamentum*, in consequence of which, the secretions must be diminished, or quite suspended, and a fever ensue, more or less inflammatory, according to the degrees of heat in the *blood*, and the consequent suspension or interruption of the lymphatic secretions. See FEVER and BURN.

On the other hand, when the *blood* is immoderately cooled and condensed, the corpuscular attraction prevailing over the expansive forces the *serum* will be overthinned and diluted, and consequently separated too fast, and thrown off too plentifully on the glands and lymphatics; so that if the urinary drains happen to be obstructed, a surcharge of *serum* must ensue, and in consequence of this a dropsy: and in case the fluid parts of the urine pass freely enough, and only the grosser excrements, salts, and *feculæ*, or fine fæces, be kept back, these being thrown on the several organs, will produce the symptoms of the scurvy.

In order to ascertain the colour of the different parts of corrupted *blood*, Dr. Pringle made the following experiment. He took a fresh quantity without any inflammatory crust, and divided it into the *crassamentum*, the *serum* with a few red globules in it, and the pure *serum*. The phials containing these several liquors were put into a furnace, where they stood some days, till they became thoroughly putrid.

The *crassamentum* was changed from a deep crimson to a dark livid colour; so that when any portion of it was diluted with water, it appeared of a livid hue. Of the same colour was the *serum* in which the red globules remained. But the pure *serum*, after becoming turbid, dropped a white purulent sediment, and changed into a faint olive green.

From this experiment he concludes, that the *color* of *fordes* and that of a splenetic flatus, consists of the *serum* tinged with a small quantity of red *blood* putrefied; and that when the serum recedes more to a tawny call, we are not to refer that colour to inflammation, but to a sudden solution of some of the red globules mixed with the *serum*.

A few drops of this putrid *crassamentum* were mixed with the recent urine of a healthy person, which they immediately changed into a flame-coloured watery, common in fevers and in the scurvy. After standing an hour or two, the same gathered a cloud, resembling what is seen in the crude urine of persons in acute distempers.

As to a green *serum*, it is perhaps never to be seen in the vessels of a living body, since it is not to be supposed that a person could survive so great a change of the *blood*. In foul ulcers, indeed, and in other cases, where the *serum* is left to stagnate long, the matter is found of a greenish colour, and is then always acrimonious. But the effects of a green *serum* are, in no case, to be so much dreaded as in the case of an *ascites*, where it is collected in so large a quantity, of which we had, some time since, almost a fatal instance in Mr. Cox, surgeon at Peterborough; who upon tapping a woman but a few hours after death, was so affected with the poisonous fleams of a green *serum*, that he was presently seized with a pestilential fever, and narrowly escaped with his life.

In regard to the sediment which the *serum* dropped on becoming putrid, and which resembled well digested matter, the doctor thinks it a terrestrial substance, intended for the nourishment or reparation of the solids; in which opinion he was the more confirmed by observ-

ing

ing a like ſediment in the urine of men in perfect health: and therefore concludes that the *pus*, or digeſted matter of ſores, is nothing but this ſubſtance ſeparated from the *ſerum* of blood. And hence it is that all large ulcers are extremely weakening, from the great expence of *blood* in furniſhing this ſubſtance. Hence alſo it is, that iſſues are of more conſequence for making drains, than one would expect from the viſible evacuation: as near as the doctor could gueſs, an ounce of *ſerum*, after ſtanding ſome days, not furniſhing more of this matter than what might be produced in the daily diſcharge of a large pea-iſſue, or from a ſeton.

There are frequent inſtances of the tawney colour of the *ſerum*, the reſolution of the *craſſamentum*, and even of the offenſive ſmell of *blood* recently drawn. And, indeed, if we reflect how putrefcent *blood* is in a heat equal to that of the human body, we may be convinced, that no ſooner is the perſpiration of the lungs impeded, than a corruption begins in the whole maſs; which, if not timely prevented, brings on ſome putrid diſeaſes. If the acrimony is great and ſudden, a fever or flux will enſue; but if the accumulation is ſo ſlow that the body grows habituated to the putrefaction, a leuroy prevails. This is the caſe in long voyages, or board unventilated ſhips; in marſhy countries; and, in a leſſer degree, in all northerly climates, in moiſt ſituations.

BLOOD, *obſtruction of the*, is alſo a preternatural coagretion, following on a *ſtoppage*, or diminution of its motion, from which ſtagnations and other diſorders draw their riſe. This is either general throughout the whole body; or ſpecial, confined to ſome particular part; as in hypochondriac and hyſteric caſes, where the *blood*, by reaſon of the ſlowneſs of its progreſſion, acquires a *lentor* in the region of the *abdomen*. To the ſame cauſe are alſo owing polypuſes, apoplexies, pleuriſies, inſarctions of the *viſcera*, palpitations of the heart, ſuppreſſions of the menſes, &c.

BLOOD, *ſolubility of the*, is that tendency in the *ſerum* and *craſſamentum*, by which they are diſpoſed to ſeparate and diſengage from each other, when the *blood* comes to cool, and ſtand in a baſon. When *blood* is taken off, it muſt frequently ſtand a long time at reſt, and in a cold place, before its principles can diſunite, ſo as to effect a perfect ſeparation of the *ſerum* from the *craſſamentum*; and yet at laſt, when the ſeparation is made, there may be a ſufficient quantity of *ſerum*, and perhaps a greater proportion than ordinary; whereas, at other times, this ſeparation ſhall be quickly made, and the ſolution effected after a ſhort time of ſtanding in a warmer air. Phil. Tranſ. N° 44. p. 80.

The red part of the *blood* is readily ſoluble in water, but not in *ſerum*, nor in a ſaturated ſolution of neutral ſalts. See an account of ſome experiments on the *blood* by Dr. Lewis, in Neumann's Works, p. 552. n.

BLOOD, *ſweetening, purifying, or cleanſing the*, are terms which ſeems to have riſen from a miſtake, as if the *blood* were an impure fluid, or capable of receiving impurities with the chyle; which ſeems to be overturned by the extreme fineneſs of the orifices of the lacteals, which will hardly allow any thing impure to paſs.

BLOOD, *excretions or evacuations of the*, are either ſpontaneous, as in the haemorrhoids, *hæmptoe*, hæmorrhages at the noſe, the *lochia*, and menſtrual flux; or artificially produced by medicines, emmenagogues, venæſections, ſcarifications, leeches, &c.

The want of due evacuations of the *blood* produces plethoras. In hypochondriacal caſes, the natural excretions by the *anus*, menſtrual flux, &c. are by all means to be promoted, as the fureſt means of cure.

BLOOD, *tranſfuſion of*, ſee TRANSFUSION.

BLOOD, *injecting liquors into*, ſee INJECTION.

BLOOD, *ſpitting of*. Spirit of plantain-juice, comfrey-roots, and fine ſugar, are recommended by Mr. Boyle as an approved remedy againſt ſpitting and vomiting of *blood*.

TAR-WATER is ſaid to be a very good remedy in this caſe.

BLOOD, *orgaſm of the*, denotes an extraordinary *effatus* or ebullition, obſerved in fevers, phrenzies, *hæmptoes*, palpitations of the heart, and even by ſome ſuppoſed in cephalalgias, ſcurvies, arthritic pains, &c. It is to be compoſed or allayed by calmecs, nitrofe preparations, &c. rather than by opiates.

BLOOD, *cooling of the*, recommended by lord Bacon as a means of longevity, is to be effected by clyſters, baths, unctions, refrigerating decoctions applied to the belly, &c. Some have vainly imagined the chief office of reſpiration to be, to cool the kindled *blood*, and prevent too great a deflagration. See RESPIRATION.

BLOOD, *depuration of*, ſee SECRETION.

BLOOD, *flux of*, is called an HAEMORRHAGE. The periodical ones of women, MENSES. Thoſe after child-birth, LOCHIA. That ordinarily happening on the firſt ciction is by ſome called and conſidered as the teſt of virginity.

In the Philoſophical Tranſactions we have ſeveral very uncommon inſtances of ſpontaneous hæmorrhages or effuſions of *blood*, particularly of a child that bled at the noſe, ears, and hind part of the head, for three days; from that to the ſixth, the ſweat blood from the head; on the ſixth, bled at the head, ſhoulders, and waiſt; and for three days more continued to bleed at the two bend of the arms, joints of the fingers of each hand, and at the fingers ends, till the died: after death were found, in the places whence the *blood* iſſued, little holes like the prickings of a needle.

About the matter of nutrition, or the ſource whence the nouriſhment is derived, great conteſts have ariſen among phyſicians and anatomiſts; ſome contending for a nutritious juice conveyed through the lungs; ſome ſetting up the lymph, others the chyle, ſome the *ſerum* of the *blood*, ſome the *cruor*, as the univerſal *ſuccus alibilis*, &c. However, all theſe, except they who bring the nutriment through the nerves, make the *blood* the vehicle, that conveys the alimentary parts through the body, whatever they be, and whencefoever derived: but perhaps it was on the ſcore of its heterogeneity, or compoſition of different elements, that they did not make itſelf the nutritious fluid; without reſtraining that faculty to ſome particular parts of it. But Dr. Drake makes no ſcruple to ſay, that the *blood*, in its largeſt acceptation, as conſiſting of all the parts before deſcribed, is ſimple and homogeneous enough for the purpoſes of nutrition; and that every part thereof contributes ſomething, either materially or inſtrumentally, to the augmentation, or reparation of the parts through which it paſſes. See NUTRITION.

For the manner in which the *blood* is formed, and how the chyle is aſſimilated into *blood*, ſee SANGUIFICATION.

BLOOD, *the quantity of*, in a human body, has been variouſly eſtimated by various authors: Dr. Lower computes it in an ordinary man, at about twenty pounds; Dr. Moulin by obſerving the proportion of the weight of ſeveral animals to their *blood*, eſtimates it at about $\frac{1}{13}$ of the weight of the whole man, which may amount to eight or ten pounds. Dr. Keil, from a calculation founded on the proportion of the coats to the diameters of the veſſels, ſhews, that in a body weighing 160 pounds, 160 pounds thereof are *blood*; but then under *blood* he includes the juices of the lymphæductis, nerves, and other veſſels which are ſecreted from it.

In reality, it is very difficult to determine the quantity of *blood* in the body. Bleeding to death, the method uſed by Doctor Moulin and others, can never give the eſtimate of its true quantity; becauſe no animal can bleed longer than while the great artery is full, the continuance of which will be longer or ſhorter as the wounded artery is ſmaller or greater; and the *aorta* muſt always be the firſt veſſel that empties. The moſt certain way, in Dr. Keil's opinion, is, by finding what proportion the cavities of the veſſels of which the whole body is compoſed, bear to the thickneſs of the coat. This, in the veins and arteries, may be exactly found; but, in other veſſels, we only know the quantity of fluid they contain, by carefully evaporating as much as poſſible.

Some think it probable, that at leaſt two-thirds of the quantity of *blood* contained in an animal body, is continually paſſing the capillaries and ſmall veſſels in the glandular and muſcular parts, which can never be drawn off by any thick diſcharge from cutting the large veſſels; ſince, in that caſe, the larger veſſels being emptied much faſter than they can be ſupplied again from the capillaries, a defect of *blood* will ſoon enſue at the heart, upon which the animal falls into convulſions, and the circulation ſtops, while far the greater part of the *blood* muſt be ſuppoſed ſtagnating in the ſmaller and remoter veſſels.

BLOOD, *for the ſtanching of*, ſee STYPTIC.

BLOOD, *circulation of the*, denotes a natural motion of the *blood* in every living animal; whereby that fluid is alternately conveyed from the heart to every part of the body, by the arteries, and returned from the ſame parts to the heart by the veins.

The *circulation of the blood* has been generally allowed to have been firſt diſcovered in England, in the year 1628, by Harvey, a phyſicism of our own country; though there are ſeveral authors who diſpute it with him.

Janſſon ab Almeloveen, in a treatiſe of New Inventions, printed in 1685, quotes ſeveral paſſages from Hippocrates to prove that the *circulation* was known to him. Wallæus, ep. ad Barthol. pretends it was known not only to Hippocrates, but alſo to Plato and Ariſtotle. It is added, that the Chineſe phyſicians taught it 400 years before it was ſpoke of in Europe.

Some go back as far as Solomon, and imagine they ſee ſome traces of it in Eccleſiaſtes, chap. xii. Bern. Genga, in an Italian treatiſe of Anatomy, quotes ſeveral paſſages from Realdus Columbus, and And. Cæſalpinus, where

by

by he endeavours to prove that they admitted a *circulation*, long enough before Harvey.

He adds, that Fra. Paolo Sarpi, the famous Venetian, from a consideration of the structure of the valves of the veins, and other experiments, concluded a *circulation*. See also Dutens's Recherches sur l'Origine des Decouvertes attribuées aux Modernes. Paris, 1766.

Leonicenus adds, that F. Paolo durst not make known his discovery, for fear of the inquisition; that he therefore only communicated the secret to Fabr. ab Aquapendente; who, after his death, deposited the book he had composed on it in the library of St. Mark; where it lay hid a long time, till Aquapendente discovered the secret to Harvey, who then studied under him at Padua; and who, upon his return to England, a country of liberty, published it as his own. But much of this is fable.

Sir Geo. Ent has shewn that Father Paul received the first notice of the circulation of the *blood* from Harvey's book on the subject, which was carried to Venice by the ambassador of the republic at the court of England, who showed it to F. Paul, by whom some extracts were made from it, which coming afterwards into the hands of his heirs, gave rise to an opinion in several persons that he was the author of the papers and of the invention.

Servetus first announced the *minor circuitus*, or the lesser *circulation* of the *blood* through the lungs, but the *major circuitus* was undoubtedly the discovery of Harvey. Many of the ancients had some knowledge of the *motion* of the *blood*; but they were ignorant of its regular *circulation*.

The *circulation* of the *blood* is evinced, from the following considerations. 1. All the *blood* of a living animal, upon wounding any one of the larger arteries, is in a little time, evacuated, and that with a considerable force: as appears from the operation of butchers, &c.

Hence, it follows that the *blood* has a paſſage from every part of the animal body into every artery; and if the whole mass of *blood* be found to move in this occasion, it is evident it must have moved before.

2. The great quantity of *blood* driven out of the heart into the arteries at every pulse, makes a *circulation* neceſſary; since, without it, an infinitely greater ſtock of *blood* must be ſuppoſed in the body of a man, than any obſervation or experiment will allow of.

For though the ancients, who knew not this *circulation*, imagined that only a drop or two was expelled at each *pulſe*; which they were neceſſitated to ſuppoſe, to avoid the too great diſtenſion of the arteries, from a more conſiderable influx: yet it is certain, and even demonſtrable, that theſe muſt needs be an ounce, or more driven into them at each time; and yet ſome compute that there are five or ſix thouſand pulſations in an hour.

3. Any of the arteries, being tied with a thread, ſwell, and beat, between the bandage and the heart; but they grow flaccid between the bandage and the extremities of the body. If now the artery be cut between the bandage and the heart, blood ſtreams out, even to death; if it be cut between the bandage and the extremities of the body, the quantity of *blood* it yields is very ſmall.

The *vital blood*, therefore, flows through the arteries; and its courſe is from the heart towards the extremes of the body: and this it does in *every* part of the body, internal and external: the veſſel of a wider part into a narrower; out of the trunk into the branches. And it is on this principle alone, that all the *blood* may be derived into any artery, and evacuated at it.

4. Any one of the larger veins being bound up with a thread, ſwells between the extremes of the body and the bandage, but without beating; and between the bandage and the heart it becomes flaccid.

If opened in the former part, it bleeds largely; if in the latter it ſcarce bleeds at all. The *blood*, therefore, flows briſkly from every part of the body into this vein; and its courſe is from the extremes of the body towards the heart; from the narrower parts of the vein towards the wider parts; from the branches to the trunk.

From the whole, it is evident, that all the arteries of the body are continually bringing the *blood* from the left part of the heart, through the trunks of the arteries, into the branches; and from thoſe to all parts of the body, internal and external; and on the contrary, that all the veins, excepting the *porta*, are perpetually bringing back the *blood* from the *extreme* parts into the ſmaller branches, from thoſe it paſſes into the larger, at length into the trunks, and thence into the *cava*; and through the *ſinus venoſus*, or trunk of that vein (which ends in the cavity of the right auricle) into the heart.

The *blood* being arrived here, its motion, or *circulation* is, continued as follows.

The auricles of the heart being large hollow muſcles, are furniſhed with a double ſeries of ſtrong fibres proceeding with a contrary direction to two oppoſite tendons, the one adhering to the right ventricle, the *other* to the *ſinus venoſus*; as alſo with innumerable veins and arteries; by the contractile force of theſe auricles, the *blood* will be vigorouſly expreſſed, and drove into the right ventricle; which, upon this contraction, is rendered flaccid, empty, and diſpoſed to admit it.

If now the right ventricle, thus full of *blood*, by the contraction of its fibres preſs the *blood* towards the aperture again, venous blood at the ſame time pouring in, will drive it back again into the cavity and mix it more intimately; till riſing up againſt the *parietes*, it raiſes the *valvulæ triſcuſpides*, which are ſo connected to the fleſhy columns extended on the oppoſite ſide, as that when laid quite down they cannot cloſe the *parietes* of the right ventricle: theſe it thruſts towards the right auricle, till being there joined they ſtop the paſſage very cloſely, and prevent any return.

By the ſame means, the ſame *blood* riſes up into the three ſemilunar valves, placed in the extremity of the other mouth, and lying open to the pulmonary artery: theſe it ſhuts cloſe againſt the ſides of the artery, and leaves a paſſage into the artery alone. The venous *blood*, therefore, that is, the *blood* of the whole body, continually moves out of the *ſinus*, or trunk of the *vena cava*, through the right auricle, and right ventricle, into the pulmonary artery, in a continued and forcible ſtream.

The *blood* carried by this artery into the lungs, and diſtributed by its branches through the whole ſubſtance thereof, is firſt admitted into the extremities of the pulmonary vein, called *arteria venoſa*; whence paſſing into four large veſſels, which unite together, it is brought to the laſt *ſinus communis*, or trunk of the pulmonary vein; by the force of whoſe muſculous ſtructure it is driven into the left ventricle, which, on this occaſion, is relaxed, and by that means prepared to receive it.

Hence, as before, it is driven into the left ventricle, which is relaxed by the ſame means; and the *valvulæ mitrales* opening, admit it into the left ventricle, and hinder its reflux into the pulmonary vein.

From hence it is forced into the *aorta*; at whoſe orifice there are three ſemilunar valves, which alſo prevent a reflux by cloſing the ſame.

And thus is *circulation* effected: all the *blood* ſent into the lungs, and received in the *arteria venoſa*, *ſinus venoſus*, left auricle and ventricle, being here continually propelled into the *aorta*, whoſe ramifications are ſpread throughout all the reſt of the body, with a violent motion.

This motion, in living animals, is attended with the following *phænomena*.

1. Both the venous ſinuſes are filled, and grow turgid at the ſame time. 2. Both auricles grow flaccid at the ſame time, and both are filled at the ſame time, with *blood* impelled by the contractile force of its correſpondent muſcular venous ſinus. 3. Each ventricle contracts, and empties itſelf of *blood* at the ſame time; and the two great arteries are filled and dilated at the ſame time. 4. As ſoon as the *blood*, by this contraction, is expelled, both ventricles being emptied, the heart grows longer and broader; and conſequently more flaccid and capacious. 5. Upon which, the muſcular fibres of both venous ſinuſes contract, and expreſs the *blood* contained in them into the ventricles of the heart. 6. In the mean time, the venous ſinuſes are again filled, as before; and the auricles, &c. return into their former habitude. 7. And this alternation continues till the animal begins to languiſh, under the approach of death; at which time the auricles and venous ſinuſes make ſeveral palpitations, for one contraction of the ventricle.

Thus is all the *blood*, in its return from every part of the body, internal and external, and from every part of the heart and its auricles, impelled into the right ventricle; out of that into the lungs; thence into the left ventricle; and thence through the whole extent of the body; and thence again brought back to the heart.

As to the manner of the *blood's* paſſing out of the arteries into the veins, in order to its being returned to the heart, there are two opinions.

In the firſt, the veins and arteries are ſuppoſed to open into each other, or to be continued from each other, by ANASTOMOSES, or inoculations of their extremities.

In the latter, the extreme capillary arteries are ſuppoſed to let out their *blood* into the pores of the ſubſtances of the parts; on whoſe nutrition part is ſpent, and the reſt is received in at the mouths of the capillary veins.

Each of theſe opinions muſt be allowed to have its reaſon: for without the firſt, it were difficult to account for ſo quick a return of the *blood* to the heart, as in effect we find; beſides, that in ſome of the larger veſſels, there is a manifeſted anaſtomoſis, viz. in the ſplenic artery with the ſplenic vein, &c. whence authors conclude the ſame contrivance to hold in the leſſer veſſels; even in the ſmalleſt twigs in the extreme parts of the body, though not diſcovered by the eye; nature being ordinarily found very uniform, and conſiſtent with herſelf.

Bjolanus, however, who will allow of no *circulation* but

by anaſtomaſes, allows of none, neither, but by the larger veſſels.

The reaſon of the latter opinion is deduced hence, that if part of the arterial *blood* did not ooze out into the ſubſtance of the parts, they could not be nouriſhed thereby: for the *blood*, while contained in the veſſels, may indeed convey warmth thereto, but no nutriment; the very veſſels themſelves being not nouriſhed by the fluid running in their cavity, but by capillaries paſſing their coats.

If then the *blood* be driven out of the veſſels in a greater quantity than is required for NUTRITION, the redundancy muſt be imbibed by the capillary veins.

M. Leewenhoeck ſeemed to have put this matter out of doubt by his microſcopes, with which he diſcovered the inoculations, or continuations of the extremities of the veins and arteries in fiſhes, frogs, &c. See ANASTOMASIS.

But doubts ariſing, whether the veins and arteries in human bodies and quadrupeds were of ſimilar ſtructure, Mr. Cowper made experiments, which evinced the inoculations in the *omentum* of a cat, and alſo in the meſentery of a dog. He found, that the extremities of the veſſels are not equally leſſened, in the inoculations in different animals.

In the tail of the tadpole, he frequently obſerved ſeveral communications between the veins and the arteries; through each of which two globules of *blood* might paſs together. In young fiſh, particularly *frigi*, the communicant branch is ſo ſmall, that one globule of *blood* can ſcarce paſs in the ſpace of three ſeconds.

The tail of a newt, or water-lizard, affords alſo a very entertaining proſpect of the *circulation* of the *blood* through almoſt numberleſs ſmall veſſels; but no object ſhews it ſo agreeably as one of theſe animals while ſo young as not to be above an inch long; for then the whole body is ſo very tranſparent, that the *circulation* may be ſeen in every part of it, as well as in the tail; and, in theſe objects, nothing is more beautiful than the courſe of the *blood* into the heart, and back again, where it may be traced all the way with great eaſe. Near the head there are alſo found three ſmall ſins, which afford a very delightful proſpect: theſe are all divided like the leaves of polypody, and, in every one of the branches of theſe, the *blood* may be very accurately traced, running to the end through the artery, and there returning back again by a vein of the ſame ſize, and laid in the ſame direction; and as the veſſels are very numerous and large in this part, and the third or fourth magnifier may be uſed, there are ſometimes ſeen thirty or forty channels of the running *blood* at once; and this the more as the globules of *blood* in the newt are large, and are fewer in number, in proportion to the quantity of *ſerum*, than in any other animal, and their figure, as they are protruded through the veſſels, changes in a very ſurpriſing manner.

In a *fœtus*, the *apparatus* for the *circulation* is ſomewhat different from that above deſcribed. The *ſeptum*, which ſeparates the two auricles of the heart, is pierced through with an aperture, called the FORAMEN *ovale*; and the trunk of the pulmonary artery, a little after it has left the heart, ſends out a tube in the deſcending aorta, called the *communicating canal*.

The *fœtus* being born, the *foramen ovale* cloſes, by degrees, and the canal of communication dries up, and becomes a ſimple ligament. Though in ſome inſtances it has been known to remain open.

This mechaniſm once known, it was eaſy to perceive its uſe. For while the *fœtus* is incloſed in the *uterus*, it receives no air, but that little furniſhed by the umbilical vein: its lungs, therefore, cannot ſwell and ſubſide as they do after the birth, and after the free admiſſion of the air. They continue almoſt at reſt, and without any motion; their veſſels are, as it were, full of themſelves, and do not allow the *blood* to circulate, either in abundance, or with eaſe.

Nature, therefore, has excuſed the lungs from the paſſage of the greateſt part of the *blood*; and has contrived the *foramen ovale*, by which part of the *blood* of the *vena cava*, received into the right auricle, paſſes into the left auricle, as the mouth of the pulmonary veins; and by this means it is found as far in its journey as if it had paſſed the lungs.

But this is not all: for the *blood* of the *cava*, which, miſſing the *foramen ovale*, paſſes from the right auricle into the right ventricle; being ſtill in too great quantity to paſs by the lungs, whither it is driven through the pulmonary artery; is, partly, intercepted in the way by the communicant canal, and poured immediately into the deſcending aorta.

This is the doctrine of Harvey, Lower, and moſt other anatomiſts; but M. Mery, of the Royal Academy, has made an innovation in it.

He aſſigns another uſe for the *foramen ovale*; and maintains, that the whole maſs of *blood* brought from the *cava* to the right ventricle, paſſes, as in adults, into the pulmonary artery; whence part of it is conveyed by the communicant canal into the aorta; and the reſt brought from the lungs by the pulmonary vein into the left auricle, where it is divided into two parts; the one paſſing through the *foramen ovale* into the right ventricle, without circulating through the aorta, and the reſt of the body; the other part puſhed, as in adults, by the contraction of the left ventricle, into the aorta, and the whole body of the *fœtus*.

The whole queſtion, then, turns upon this, viz. whether the *blood* paſs through the *foramen ovale* from the right to the left ventricle, or from the left to the right?

M. du Verney aſſerts the ancient opinion, againſt M. Mery; and maintains, that the *foramen ovale* has a valve ſo diſpoſed, as to be opened by the *blood* driving into the right ventricle; but ſhut the more firmly, by its puſhing towards the left. But M. Mery denies the exiſtence of any ſuch valve.

Again, in an adult, the aorta, being to receive all the *blood* of the pulmonary artery, is found of the ſame bigneſs. In a *fœtus*, the two arteries are to receive unequal quantities, which of the two ſyſtems ſoever be followed. According to the common opinion, the aorta, receiving more *blood* than the pulmonary, ſhould be bigger: according to the opinion of M. Mery, the pulmonary artery ſhould be the bigger, as being allotted to receive a greater quantity of *blood*.

To judge of the two ſyſtems, therefore, it ſhould ſeem, there needed nothing but to determine which of the two veſſels were biggeſt in a *fœtus*.

M. Mery always found the pulmonary artery half as big again as the aorta; and, on the other hand, M. Tauvry, who ſeconded M. Du Verney, produces caſes where the pulmonary is leſs than the aorta: the facts on both ſides being examined by the French Royal Academy.

M. Tauvry adds, that though the pulmonary artery ſhould be greater than the aorta, yet this does not prove, that more *blood* paſſes the firſt than the ſecond; ſince it may be accounted for from the *blood*'s paſſing more ſlowly towards the lungs, which it finds ſome difficulty to penetrate, and accordingly ſwells, and is driven back.

M. Littre, upon diſſecting an adult, in whom the *foramen ovale* was ſtill open, and meaſuring the capacities of the veſſels on each ſide, declares for M. Mery.

As to the force of the *circulation* in the *fœtus*, anatomiſts are again divided. The popular opinion is, that, during geſtation, the arteries of the *uterus* convey their *blood* into the *placenta*, which is nouriſhed by it, and that the ſurplus is conveyed into the roots of the umbilical vein, which makes part of the navel ſtring: thence it is carried to the liver of the *fœtus*, where it enters the *vena cava*, and ſo thence conveyed to the right ventricle of the heart, and diſtributed as before.

Again, the *blood*, brought from the iliac arteries of the *fœtus*, enters the navel-ſtring by the umbilical arteries; then paſſes into the *placenta*, where it is reſumed by the veins of the *uterus*, which carry it back again to the mother; and perhaps, alſo, by the roots of the umbilical vein, which mix it afreſh with the *blood* of the mother. According to this ſyſtem, therefore, it is the *blood* of the mother that ſupplies the child; which is here only regarded as a diſtinct member, or part, of her frame.

The beating of her heart ſends to it a portion of her *blood*; and ſo much of the impulſe is preſerved, as ſuffices to maintain that languid *circulation* which a *fœtus* enjoys; and, in all probability, gives that feeble pulſation obſerved in the heart.

Other anatomiſts maintain, that the *fœtus* is only ſupplied with chyle from the glands of the *uterus*; which is farther elaboraſed, and turned into *blood*, in the veſſels of the *fœtus*; and *circulates* therein, without any farther communication with the mother. Theſe allow of no reciprocal *circulation*, excepting between the *placenta* and the *fœtus*.

But the former opinion ſeems beſt ſupported: for the *placenta*, being ſeparated from the *uterus*, during the time of geſtation, neither yields any chyle, nor any other thing but *blood*. Beſides, M. Mery has ſhewn, that the *uterus* has no glands to furniſh any chyle.

Two other obſervations of the ſame author confirm the popular ſyſtem: the inner ſurface of the *uterus* is lined with veins; and the outer ſurface of the *placenta* is not lined with any membrane: now as it is by theſe two ſurfaces that the two ſeem, in ſome meaſure, glued together, it looks as if they were only left without membranes, for an immediate communication between their blood-veſſels.

Add to theſe a fact, whereof M. Mery was an eye-witneſs: a woman, big with child, was killed by a fall; in the cavity of her belly was found ſeven or eight pints

of *blood*; all the *blood-vessels* being emptied: the child, too, was found dead; but without the least appearance of any wound, or contusion; all its *blood*-vessels being empty of *blood* like those of the mother. The body of the *placenta* still adhered to the whole inner surface of the *uterus*: nor was there any extravasated *blood* there.

Now the *blood* here had no other way to discharge itself but by the veins of the *uterus*: whence it follows, that those veins bring back to the mother the *blood* of the *fœtus*; which, alone, establishes the whole system. If the *circulation* were only from the *fœtus* to the *placenta*, and not also to the mother, the dead child would have had all its *blood*.

Upon the whole, the *blood* in the lungs of the *fœtus* has none of the advantages of *air*, or respiration; which yet being necessary, nature, it is supposed, takes care that it receives a portion of air, mixed together with its mother's *blood*, and transmitted to it by the umbilical vessels, to be diffused through the body.

This is confirmed hence; that, by constringing the navel-string very tight, the child dies like a man strangled: which appears to be owing to nothing but the want of air.

Add to this, that as soon as the mother ceases to respire, the *fœtus* expires.

As to the velocity of the circulating *blood*, and the time wherein a circulation is completed, several computations have been made. By Dr. Keil's account, the *blood* is driven out of the heart into the aorta, with a velocity which would carry it 32 feet in a minute; but this velocity is continually abated in the progress of the *blood* through the numerous sections, or branches, of the arteries: so that before it arrives at the extremities of the body, its motion is infinitely diminished.

But Dr. Jurin shews, that in any two arteries transmitting equal quantities of *blood*, the *momentum* of the *blood* is greater in the artery more remote from the heart than in that nearer; and that its *momentum* is greater in all the capillary arteries together, than in the aorta; and that the *momentum* of the *blood* is greater in any of the veins than in the artery corresponding to it; and therefore greater in the vena cava than in the aorta. Lastly, he shews, that the *momentum* of the *blood* in the vena cava is equal to that of the quantity of *blood* thrown out into the aorta at each systole, whose velocity is such as would pass the whole length of the arteries and veins in the interval of time between two pulses, and that the absolute *momentum* of *blood* in the *aorta*, without any regard to the resistance, is equal to the *momentum* of the weight of thirty pounds falling over the space of an inch in a second. He supposes the motion of the *blood* to be equable, which in reality it is not.

Dr. Keil upon a moderate *ratio* of the branches of the arteries to the trunks, shews, that the greatest velocity of the *blood* is to the least, in a greater proportion than that of 10000,00000,00000,00000,00000,00000,00000, to 1.

The space of time wherein the whole mass of *blood* may ordinarily circulate, is variously determined. Some of the latest writers state it thus: supposing the heart to make 2000 pulses in an hour, and that at every pulse there is expelled an ounce of *blood*; as the whole mass is not ordinarily computed to exceed 24 pounds, it must be circulated seven or eight times over, in the space of an hour. See HEART.

The *impetus*, occasioning the *circulation*, is great enough in some animals to raise the *blood* six, seven, or eight feet high from the orifice it springs out at; which, however, is far exceeded by that of the sap of a vine in bleeding-time, which will sometimes rise upwards of forty feet high. Phil. Trans. N° 398. p. 274.

The heat and motion of the *blood* are always greater from a greater activity in the soul, in the day than in the night; and they are likewise ever greater from the food taken in the day-time, for the pulse is always quicker after eating than before it; after a full meal, than after a spare one; and after a meal of drier and stronger food, than after a meal of food that is moister and weaker.

BLOOD, *vitality and accretion of the*.—Dr. Willis endeavours to shew that the *blood* being animate, this animation or life depends on its being kindled; insomuch as the common affections of fire and flame belong to the *blood*, though this vital flame doth not appear to sight, because its form is subordinate to another superior form, *viz.* the soul of the animal. Phil. Trans. N° 57. p. 1178. See BOLVCHIUM.

BLOOD, *inflammability of the*.—Mr. Boyle having held a piece of human *blood*, dried till it was almost pulverable, in the flame of a candle, found it would take fire, and afford a flame much like that which excited it, burning with a crackling noise, and here and there melting. But this inflammability much better appeared, when putting together four or five thoroughly kindled coals, he laid on them a piece of dried *blood* of the bigness of a small nutmeg; for this yielded a large and very yellow flame, and if it were seasonably and warily blown from time to time as the *caput mortuum* degenerated into smoak, it would long continue to yield clear and yellow flames. The same author having caused some *blood* to be dried till it was reducible to fine powder, took part of the powder, which had passed a fine fearce, and casting it on the flame of a good candle, the grains, in their quick passage through it, took fire; and the powder flashed not without noise, as if it had been rosin.

BLOOD, *uses of the*, are either in the animal œconomy, or in medicine, religion, diet, arts, manufactures, &c.

In the animal œconomy, the *blood* serves as the source or fund from which all the humours of the body are secerned, whether necessary for nutrition, digestion, muscular motion, sensation, or the like. Some also make it the principle of life and heat. And others hold it to do the office of a *vehicle* in the alternate motion of the heart. Phil. Trans. N° 281.

Dr. Priestley has shewn, that one great use of the *blood* must be to discharge the phlogiston with which the animal system abounds; imbibing it in the course of its circulation, and imparting it to the air, with which it is nearly brought into contact, in the lungs: the air thus acting as the great menstruum for this purpose. Exp. and Obs. on Air, vol. iii. p. 72.

BLOOD, *medicinal and commercial uses of*, are chiefly in agriculture, where it is found an excellent manure for fruit-trees; among lapidaries, among whom, it is pretended, rubbies *blood* will soften glass and flint; and goats *blood* dissolves diamonds; in building, boards are sometimes rubbed with *blood* to turn them brown. Some also pretend it has anciently been used in the mortar of old walls. *Blood* is the basis of that noble colour, called by painters PRUSSIAN BLUE; and it is to vitriol, that is, to iron dissolved, and formed into a salt, that it owes its change into that colour.

On this principle, Mr. Brown, an excellent chemist among us, tried the effects of solutions of other metals mixed with *blood*, the result of which may be a *basis* for many valuable discoveries. The *blood*, in all these experiments, was prepared into a *lixivium*, in the same manner as in the making of the PRUSSIAN BLUE, that is, by calcining it with an equal weight of salt of tartar, and then dissolving it in boiling water.

This *lixivium* of *blood*, being poured into a solution of silver in *aqua fortis*, produces a *coagulum* of a pure flesh-colour. The like *lixivium*, made with flesh instead of *blood*, produces, in this case, a white *coagulum*; and simple oil of tartar being used in the same experiment, by way of comparison with these *lixivia*, afforded a much whiter sediment. Spirit of salt being added severally to all the three mixtures, the bloom of the flesh-colour was taken off in the first; but it suffered no other change. In the second, the *coagulum* was tinged a little blue; and in the third, the whiteness was evidently improved. The bluish tinge, in the second case, is not wholly to be attributed to the flesh, but perhaps might be owing to an alloy of copper in the silver, from which it is seldom entirely freed.

The same liquors were made use of to form a precipitate from corrosive sublimate of mercury dissolved in water, the consequence of which was, that the *lixivium* with the *blood* produced a pure yellow; that with flesh, an orange colour; and the simple oil of tartar, a dingy red. The addition of spirit of salt afterwards to these made some very odd alterations; for the first changed its yellow into an orange colour; and the second, its orange colour to a blue; while the third became without any colour. The blue colour in the *lixivium* with the flesh, when mixed with this solution, may be accounted for from the vitriol in this preparation; but it is not so easy to say, why the same vitriol should not have produced also a blue in a *lixivium* with *blood*.

Copper, when dissolved in *aqua fortis*, makes the water of a green colour; and, on pouring to this the two *lixivia* of *blood*, and of flesh, the *coagula* are much alike; that is, they are white, tinged with green; but, on adding spirit of salt to them, they become of a colour not unlike that of copper before the solution. Oil of tartar gives a pale green solution, and the spirit of salt clears up the liquor, and restores it to its former colour.

Bismuth dissolved in *aqua fortis*, and mixed with a *lixivium* of *blood*, produces a milky *coagulum*, which, after a small time standing, with the addition of some spirit of salt, becomes of a pale blue. The *lixivia* of flesh, and of crude salt of tartar, produced both white *coagula*, which the spirit of salt made no alteration in. From these experiments it appears, that not any of these metallic bodies would produce a fine blue colour, with the *lixivium* of the *blood*; but a solution of iron answers all

the experiments that are made with the solution of vitriol, and produces as fine a blue colour, as that made in the common way. Phil. Trans. N° 384. p. 25.

BLOOD, *medicinal uses of.* We find a great number of these enumerated by ancient and modern writers; but most of them, we doubt, on falſe and inſufficient grounds.

BLOOD, *eating of.* This practice appears to have been prohibited to Noah, which prohibition was renewed by Moſes, and obſerved by the Jews, principally with a view to the uſe of ſacrifices in divine worſhip, and as a token of reſpect to the altar, at which the *blood* of every victim was preſented before God. The prohibition was repeated by the apoſtles at the council of Jeruſalem, confirmed and defended by all the fathers, except St. Auguſtin, and the univerſal practice, both of the eaſtern and weſtern church, till his time; and, in many churches, even of the Weſt, much longer, as low as the middle of the tenth, ſome ſay the eleventh century. The queſtion is, whether the apoſtolical precept to abſtain from *blood*, be to be conſidered as only temporal and occaſional, a ſort of accommodation to the weakneſs of the Jewiſh converts; or perpetual, founded on moral principles, and conſequently ſtill obligatory.

The former opinion ſeems the more probable: though the advocates of the latter urge, that *blood* is prohibited, becauſe it tends to make men ſavage; that prohibition is joined with that of fornication, which is an immorality; and that God has enjoined abſtinence from *blood* on all Chriſtians, in order to manifeſt his ſupreme power over all their enjoyments.

BLOOD, *religious uſes of.* Among the Ancients, *blood* was uſed for the ſealing and ratifying of covenants and alliances, which was done by the contracting parties drinking a little of each other's *blood*; for appeaſing the *manes* of the dead, in order to which *blood* was offered on their tombs, as part of the funeral ceremony. Thus we read, that twelve youths were ſacrificed at the funeral of Patroclus; and eight at that of Pallas. Homer Il. φ ver. 27. Virgil Æn. lib. x. ver. 518.

The *blood* of victims was the portion of the gods, both among Jews and heathens; and accordingly was poured, or ſprinkled on the altars in oblation to them.

Some have aſſerted, that the Romans offered human *blood* to appeaſe their deities, which is denied by others.

The prieſts made another uſe of *blood*, viz. for divination: the ſtreaming of *blood* from the earth, fire, and the like, was held a prodigy, or omen of evil.

The Roman prieſts were not unacquainted with the uſe of *blood* in miracles; they had their ſtatues of *blood* from images, ready to ſerve a turn; witneſs that ſaid to have ſtreamed from the ſtatue of Minerva at Modena, before the battle at that place. But in this their ſucceſſors have gone beyond them. How many relations in eccleſiaſtical writers of madonas, crucifixes, and wafers bleeding? At leaſt the liquefaction of the *blood* of St. Januarius at Naples, repeated annually for ſo many ages, ſeems to tranſcend by far all the frauds of the Grecian or Roman prieſthood. But the chemiſts are got into the ſecret, and we find M. Neumann at Berlin performed the miracle of the liquefaction of dried *blood*, with all the circumſtances of the Neapolitan experiment.

BLOOD, in the *Romiſh Church*, is uſed in ſpeaking of the wine in the EUCHARIST; which they ſuppoſe miraculouſly converted, by the prieſt's conſecration, into the real *blood* of Chriſt. See TRANSUBSTANTIATION, &c.

BLOOD is alſo uſed abuſively for the SAP of plants; as having much the ſame office in the vegetable, as the other in the animal œconomy.

In a ſenſe, but unlike this, wine is ſometimes alſo denominated the *blood of the grape*.

BLOOD is alſo applied, in *Pharmacy*, to certain vegetable juices, tears, &c. as DRAGONS *blood*, a ſort of caſſeria gum.

BLOOD, *dragon's, ſanguis draconis*, is alſo uſed by the Arabs for the juice of the ANCHUSA.

BLOOD, *ſatyrion*, a ruddy liquor produced from the roots of *ſatyrium*, baked with bread; and liquefied as it were, into *blood*, by a long digeſtion.

BLOOD, in *Chemiſtry* and *Alchemy*, is a denomination given to ſeveral artificial compoſitions, chiefly on account of their red colour.

BLOOD is more peculiarly uſed by the alchemiſts for the tincture of a thing.

In which ſenſe we meet with *blood of mercury*, denoting the tincture of it; *dragons blood*, denoting the tincture of ANTIMONY.

BLOOD, or *ſanguis veri ruffi*, denotes the ſulphur of MARCASITE.

BLOOD is alſo uſed, in *Middle Age Writers*, for ſupreme juriſdiction, exerciſed by the lord of the fee, in caſes where *blood* is ſpilt.

This is alſo called *judgement of blood*, *juſtice of blood*, ſometimes *juriſdiction of blood*.

BLOOD, *avenger of*, among the Jews, was the next of kin to the perſon murdered, who was to proſecute the murderer.

Eccleſiaſtical judges retire, when judgment is to be given in *caſes of blood*, becauſe the church is ſuppoſed to abhor *blood*: it condemns no perſon to death; and its members become irregular, or diſabled from their functions, by the effuſion of *blood*.

BLOOD *of Chriſt* is the denomination of a military order inſtituted at Mantua in 1608, by Vinc. Gonzaga IV. Its device was, *Domine probaſti me*; or, *Nihil hoc triſte recepit*.

Hermant ſpeaks of this order, and obſerves that it took its name from ſome drops of the *blood of Chriſt* ſaid to have been preſerved in the cathedral church of Mantua.

The number of knights was reſtrained to twenty, beſides the grand-maſter; the office whereof was annexed to himſelf, and his ſucceſſors.

BLOOD, in *Farriery*, denotes a diſtemper in cattle's backs, which makes them in going draw their heads aſide, or after them: the cure is by ſlitting the length of two joints under the tail, and thus letting the beaſt bleed plentifully. If he bleed too much, the farriers knit his tail next the body, and then bind ſalt and nettles bruiſed on the part.

BLOOD-*running itch*, is a ſpecies of itch in a *horſe*, proceeding from an inflammation of the *blood* by overdoing, hard riding, or other ſore labour; which, getting between the ſkin and fleſh, makes the beaſt rub and bite himſelf; and, if let alone, ſometimes turns to a gnarous mange, highly infectious to all nigh him.

BLOOD, *field of*, in Syriac *aceldama*, was a field purchaſed by the Jews, with the thirty pieces of ſilver, which had been given to Judas for betraying his maſter, and which he had reſtored.

It ſtill ſerves for a burial-ground, in which all pilgrims, who die in their pilgrimage at Jeruſalem, are interred.

BLOOD-*flower*, *Haemanthus*, in *Botany*, a genus of the *hexandria monogynia* claſs: its characters are theſe: the flower has a permanent empalement of ſix leaves, ſhaped like an umbel; it hath one erect petal, cut into ſix parts; and ſix awl-ſhaped ſtamina, which are inſerted in the petal. The germen is ſituated under the flower, and afterward becomes a roundiſh berry with three cells, each containing one triangular ſeed. There are four ſpecies.

The ſeaſon for tranſplanting the bulbs of this plant is in May or June, when the leaves are decayed; they may be kept out of the earth at this ſeaſon three or four months, but it is more adviſable to plant them ſooner, as they always flower the ſtronger for it. Their ſoil is half a fine hazel-earth, and half old rotten dung; in September they muſt be removed into a moderate ſtove, and watered gently at times. They flower in the depth of winter.

BLOOD-*hound*. See HOUND.

BLOOD *letting*. See BLEEDING.

BLOOD *of the philoſophers*, in the *Hermetic Art*, denotes a mercurial ſpirit, inherent in all metals, but chiefly in gold and ſilver.

BLOOD, *penitents*, a denomination given to a reformed congregation of Bernardine nuns at Paris, firſt eſtabliſhed under that name in 1661.

BLOOD, *princes of the*, in France, are thoſe deſcended from the *blood* royal.

BLOOD, *ſalamander's*, ſignifies the redneſs remaining in the receiver, after diſtilling the ſpirit of nitre.

BLOOD-*ſhotten*, a diſtemper of the eyes, wherein the blood-veſſels are greatly diſtended, ſo as to make the eyes appear red. See OPHTHALMIA.

BLOOD-*ſtone*. See HEMATITES and SANGUINE.

BLOOD *of ſulphur*, *ſanguis ſulphuris*, is a preparation of liver of ſulphur, ground with oil of tartar *per deliquium*, then digeſted with dulcified ſpirit of nitre. It is reputed a good pectoral and diuretic, but rarely preſcribed.

BLOOD-*veſſels*, in *Anatomy*, uſually include only the veins and arteries; though in a larger ſenſe, all the veſſels in the body; as the nerves, lymphatics, &c. to the very hair, may be comprehended under the denomination.

Mr. Boyle obſerved an actual *blood*-veſſel, and full of red *blood* in the middle of a NERVE.

In the PLICA POLONICA, each hair is ſenſibly a *blood*-veſſel; and when cut, will bleed like a ſmall vein. Boyle's Phil. Works abr. tom. i. p. 173. 449.

BLOOD-*ſnake*. See *Blood*-SNAKE.

BLOOD-*wite*, in *Ancient Law Writers*, ſignifies *blood*, and a cuſtomary amercement paid as a compoſition for the ſhedding or drawing of *blood*.

The word is alſo written *bloduite*, *bloduita*, *bloduyta*, *bludwit*, *bludwi*, *bludwut*, and *bludwti*.

It is formed from the ancient Saxon *blud*, *blood*, and *wite*, or *wite*, a *fine* or *penalty*.

The word alſo denotes an exemption from this penalty, granted by the king to certain perſons and communities, as a ſpecial favour.

King Henry II. granted to all tenants within the honour of Wallingford—*Ut quieti ſint de hidagio & blodwite & hundredum*.

BLOOD-*wood*, *Haematoxylon*. See LOG-*wood*.

BLOOD-*wort*, in *Botany*. See SANGUINARIA and DOCK.

BLOOD, *corruption of*, in *Law*. See CORRUPTION *of Blood*.

BLOOD, *inheritable*, denotes ſuch a regular deſcent, as gives a perſon legal right to inherit the eſtate of an anceſtor. See ATTAINDER, ESCHEAT, INHERITANCE, &c.

BLOOD *royal*, is applied to the regular deſcendants, of the royal family.

BLOOD, *whole* and *half*, a Linſman of the *whole blood* is he that is derived from the ſame couple of anceſtors; whereas a perſon of *half blood* deſcends from either of them ſingly by a ſecond marriage. Blackſt. Com. vol. ii. p. 227.

BLOODY *crime*, *ſanguinum crimen*, in *Writers of the Middle and Barbarous Ages*, that which is puniſhed with the *blood*, or life of the offender.

BLOODY *hand*, one of the four kinds of treſpaſſes in the king's foreſt, by which the offender, being taken with his hands or other part bloody, is judged to have killed the deer, though he be not found either hunting or chaſing.

BLOODY *hell-wech*. See HELLER.

BLOODY *rain*. See RAIN.

BLOODY *ſweat*. Many inſtances of this are recorded, in which it has been owing to bodily diſorder, or extreme mental agitation and agony. See particularly Ariſtotle's Hiſt. Animal. lib. iii. cap. 19. apud Oper. tom. ii. Timanus Hiſt. Temp. &c. lib. ii. apud. Oper. tom. i. Melanges d'Hiſtoire & de Literature, &c. par M. V. Mareille, tom. iii. p. 149. Acta Phyſico-Med. Norimbergæ, vol. i. p. 84. and vol. viii. p. 428.

BLOODY *flux*. See FLUX and DYSENTERY.

BLOODY *urine*, a diſorder wherein the URINE comes away mixed with blood, in greater or leſſer quantity.

The blood here voided uſually comes from the kidneys, though ſometimes from the bladder or ureters. It is ſometimes occaſioned by violent motion, or a fall on the back, cauſing a rupture of ſome of the *blood* veſſels of the urinary parts; ſometimes it ſucceeds ſudden ſuppreſſions of the hæmorrhoids or *menſes*. The ſtone, eſpecially in the kidneys, will alſo occaſion frequent paroxyſms of this diſeaſe: and *cantharides* taken internally, or even applied externally without acids, will ſometimes have the ſame effect. *Bloody urine* is a terrible ſymptom in the ſmall-pox, and malignant fevers; though on ſome occaſions it has proved critical, and carried off the diſtemper.

BLOOM, in the *Iron Works*, a term uſed by the miners for a four-ſquare maſs of hammered iron, of about two feet long, and three quarters of a hundred weight, made from part of a pow of caſt iron. The *bloom*, however, is not yet become iron fit for the ſmith's uſe, but muſt undergo many hammerings, and be firſt made what they call the ANCONY.

BLOOM, *half*, a round maſs of metal, which comes out of the finery of an IRON-*work*. See BLOOMARY.

BLOSSOM, in a general ſenſe, denotes the FLOWER of any plant.

In a more proper ſenſe, the wood is reſtrained to the flowers of trees, which they put forth in the ſpring, as the forerunners of their fruit, otherwiſe called their *bloom*.

The office of the *bloſſom* is partly to protect, and partly to draw nouriſhment to the embryo fruit, or ſeed. Phil. Trant. N° 309. p. 329.

As eſſential as *bloſſoms* may ſeem to be to fruits, being, according to Malpighi, both the *uterus*, and the egg, or *foetus* of the plant; yet we are told of trees bearing fine fruit without *bloſſoms*, as was done by the maple-tree in New-England, mentioned by Mr. Dudley, and is always done by the peſonic tree in China, which, according to Kircher's relation, produces its fruit immediately from the ſtock, without the intervention of any *bloſſoms*. Phil. Trant. N° 117. N° 385 p. 199. N° 26. p. 486.

In ſome plants the male and female parts of generation are remote from each other; e. gr. in the *gourd*, *pumkin*, *melon*, *cucumber*, and all of that race; to which may be added the nut-bearing, and perhaps moſt bearing trees, which have all *bloſſoms* diſtinctly, male and female, on the ſame plant.

The *male bloſſoms*, called alſo CATKINS, may be diſtinguiſhed from the others, in that they have not any piſtil, or rudiment of fruit about them, but have only a large thrum, covered with duſt in their middle.

The *female bloſſom* has a piſtil within the *petala*, or flower-leaves, and the rudiment of their fruit is always apparent at the bottom of the flower before it opens.

Some ſorts of willows appear to change their ſex every year, and produce only male *bloſſoms*, or catkins, one year; and the year following ſtrings of female *bloſſoms*, which if they happen to be near enough ſome flowering male, will produce ſeed, not much unlike thoſe of an *apocynum*.

BLOSSOM is alſo uſed in the *Manege* for the colour of a horſe, which has his hair white, but intermixed all over with ſorrel and bay hairs, called alſo *peach-blowed*.

Horſes of this colour generally are hard and inſenſible, both in the mouth and the flanks; ſo that they are little valued; beſides they are apt to turn blind.

BLOSSOM, in reſpect of ſheep. See BLISSOM.

BLOTED *china ware*, a name given by ſome to a ſort of china that is loaded with colours in an irregular manner. This pleaſes ſome people, but it is a defective ſort of ware, the large blotches of colours having been only laid on to cover the blemiſhes or faults in the firſt baking.

BLOTTING *paper*, a ſpecies of *paper* made without ſize or ſtiffening, ſerving to imbibe the wet ink in books of accounts, and prevent its ſetting off, or blotting the oppoſite page.

BLOTTING *book*, a ſort of minute book, or memorandum book, uſed by ſome merchants, for making imperfect entries in a preſent hurry, which are to be copied out fairer and fuller at night into the journal.

BLOW, in a general ſenſe, denotes a ſtroke given either with the hand, a weapon or inſtrument.

In fencing, *blows* differ from thruſts, as the former are given by ſtriking, the latter by puſhing.

We ſay to give, to return, to parry a *blow*. See PARRYING.

Blows on the ſword make a ſpecies of purſuit, called BEATING.

BLOW, *blind*, *illus orbus*, or *cæcus*, is that which does not appear, or is not attended with effuſion of blood; in contradiſtinction from that followed by a wound, diſcolouring, *tumor*, or the like, called *ictus apertus* or *apparens*, an open *blow*.

In the ancient laws, we find *blows* for remembrance, given to make perſons remember ſome tranſaction, and enable them to become better witneſſes of it in future times.

BLOW, *military*, *ictus militaris*, that given with the ſword, on the neck or ſhoulder of a candidate for knighthood in the ceremony of dubbing him.

The cuſtom ſeems to have taken its riſe from the ancient ceremony of manumiſſion.

In giving the *blow*, the prince uſed this form, *ſis bonus miles*; upon which the party roſe a complete knight, and qualified to bear arms in his own right. Sometimes a double or even triple *blow* was given, called *trina percuſſio*.

BLOW, in *Common Law*. See BATTERY.

Blows and contuſions on the head, and about the *larynx*, are dangerous; thoſe in the epigaſtric region, eſpecially about the *ſcrobiculus cordis*, are frequently mortal.

BLOWS, *fly*, the *ova* of flies depoſited on fleſh, or other bodies proper for hatching them.

BLOW-*pipe*, among jewellers and other artificers, is a glaſs-tube, of a length and thickneſs at diſcretion, wherewith they quicken the flame of their lamp, by blowing through it with their mouth. It is uſed in works of quicker diſpatch, which do not need the bellows, for concentrating flame and various uſes.

Though the wind blown out at a ſmall bent tube of glaſs, called a *blow-pipe*, ſeems not to have any great celerity, in compariſon of the parts of flame, and is itſelf of little force; yet when the flame of a lamp or candle is directed by it, ſo as to beat upon a body at a convenient diſtance, it may be made to melt ſilver, or even copper itſelf, which yet may be kept, for many hours, unmelted in a red-hot crucible, or the flame of the lamp or candle unaſſiſted by the blaſt.

The enamellers have alſo tubes of divers ſizes, wherewith to *blow* their enamel, anſwering to the ſame purpoſe as the *pouzzolle*, or *blow-pipe*, of glaſſmen.

BLOWER, *ſnuffer*, an appellation of contempt ſometimes given to an ALCHEMIST.

In the French king's kitchen, there was anciently an officer under the denomination of *ſuffator*, or *fire-blower*.

The Roman mint-men were diſtinguiſhed by the appellation of *blowers* of gold, ſilver, and braſs, &c. *flatores auri, argenti*.

BLOWER, among dealers in horſes, a term uſed for ſuch horſes as wheeze much, without wanting wind. See WHEEZING.

BLOWING *of glaſs*, one of the methods of forming the divers kinds of works in the glaſs manufacture. It is performed by dipping the end of an iron ponteglo, or blowing-pipe, in the melted glaſs, and *blowing* through it

with the mouth, according to the circumſtances of the glaſs to be blown.

BLOWING *machines*, ſee BELLOWS.

BLOWING, in *Medicine*. One method of adminiſtering medicines is by inflation, or *blowing* them into the part by a tube: thus it is they ſometimes convey powders into the eye, and ſometimes up the noſe, for the cure of a POLYPUS.

BLOWING, *exſufflatio*, was alſo a ceremony in the ancient adminiſtration of baptiſm, whereby the *catechumen*, upon rehearſing the renunciation, blew three blaſts with his mouth, to ſignify that he rejected or caſt the devil abſolutely off.

Something like this is ſtill retained in the Ruſſian church. In the ſacramentary of St. Gregory, the prieſt who adminiſters baptiſm, is enjoined to *blow* thrice on the child's face, making the ſign of the croſs with his head, and pronouncing the words *exi ab eo ſpiritus*. Juſtin Martyr, Tertullian, St. Cyril, and St. Auguſtin ſpeak of this ceremony as uſed in their times.

BLOWING *of tin*, the running or melting of ore, after firſt burning it in a kiln, to deſtroy the mundic. Phil. Tranſ. N° 69 p. 2113, &c. See TIN.

BLOWING *of a fire arm*, is when the touch-hole is gulled, ſo that the powder will ſtame out.

BLOWING is alſo uſed in ſpeaking of the natural motion or courſe of the wind.

In the ſea-language, the wind is ſaid to *blow home*, or *blow through*, when it does not ceaſe, or grow leſs, till it comes paſt the place where the ſpeaker is. To *blow through* is ſometimes alſo uſed to denote, that the wind will be ſo great as to *blow* aſunder the ſails. When a wind increaſes ſo much that they cannot bear any top-ſails, they ſay, they were *blown into their courſe*, i. e. they could only have out the ſails ſo called. To expreſs an extraordinary great wind, they ſometimes ſay, it will *blow the ſail* out of the bolt-ropes.

BLOWING is alſo uſed in ſpeaking of the force and effect of kindled GUN-*powder*, on bodies which happen to be over it.

In this ſenſe we ſay to *blow* up a houſe. Engineers at ſieges make MINES wherewith to *blow* up walls, baſtions, and other defences.

Powder-mills are apt to *blow* up by the iron-gudgeon's growing hot, and ſetting fire to the powder-duſt flying about.

BLOWING, among *Gardeners*, denotes the action of flowers, whereby they open and diſplay their leaves.

In which ſenſe, *blowing* amounts to much the ſame with FLOWERING and BLOSSOMING.

BLOWING *of a ſtraw*, among *Fluriſts*, an artificial proceſs, in order to bring a flower to diſplay itſelf with greater perfection and beauty than it would arrive to in the natural way of *blowing*. The uſual method is thus: about April, when the flower-ſtems begin to put forth, or *ſpindle*, as the gardeners call it, they place by each flower a ſtraight ſtick four feet long, and tie the ſpindles to it as they ſhoot. As ſoon as the flower-buds appear, they leave only one of the largeſt on each flower-ſtem to bloſſom. About ten days before the flowers open themſelves, the round-podded kinds will begin to crack their huſks on one ſide, when the careful gardener, with a fine needle, ſplits or opens the huſk on the oppoſite ſide to the natural fraction; and about three or four days before the complete opening of the flower, cuts off with a pair of ſciſſars the points on the top of the flower pod, and ſupplies the vacancies or openings on each ſide the huſk with two ſmall pieces of vellum, or oil-cloth, ſlipped in between the flower-leaves and the inſide of the huſk; by ſuch means, the bloſſom will diſplay its parts equally on all ſides, and be of a regular figure. Beſides this care, when the bloſſom begins to ſhew its colours, they uſe to ſhade it from the extreme heat of the ſun with a trencher-like board, or other device of the like nature, faſtened to the ſtick which ſupports it; for the flowers, as well as fruits, grow larger in the ſhade, and ripen and decay ſooneſt in the ſun.

In *Heraldry*, a *fleur de lys* is ſaid to be *blown*, *ſpanned*, when its leaves are opened, ſo that buds appear among the *flowers*. The arms of the city of Florence are *argent*, a *fleur de lys blown*, *gules*.

BLOWING-*ſnake*, in *Zoology*, a name given by the people of Virginia to a ſpecies of ſerpent much reſembling the European viper, but conſiderably larger, and very remarkable for its inflating and extending the ſurface of its head before it bites. Its wound is very fatal.

BLOWN-*red*, in the manufacture of porcelane. See RED.

BLUBBER, in *Phyſiology*, and *Trade*, the fat which inveſts the bodies of all large cetaceous fiſh, ſerving to furniſh an oil.

The *blubber* is properly the *adeps* of the animal: it lies immediately under the ſkin, and over the muſcular fleſh. In the porpoiſe, it is firm and full of fibres, and inveſts the body about an inch thick. In the whale, its thickneſs is ordinarily ſix inches; but about the under lip, it is found two or three feet thick. The whole quantity yielded by one of theſe animals ordinarily amounts to forty or fifty, ſometimes to eighty or more, hundred weight. Phil. Tranſ. N° 77. p. 2275.

The uſe of *blubber* to the animal ſeems to be partly to poiſe the body, and render it equiponderant to the water; partly to keep off the water at ſome diſtance from the blood, the immediate contact whereof would be apt to chill it; and partly alſo for the ſame uſe that cloaths ſerve us, to keep the fiſh warm, by reflecting or reverberating the hot ſteams of the body, and ſo redoubling the heat; ſince all fat bodies are, by experience, found leſs ſenſible of the impreſſions of cold than lean ones.

The uſe in trade and manufactures is to furniſh train-oil, which is done by boiling down. Formerly this was performed alſhore in the countries where the whales were caught; but of late the fiſhers do not go alſhore, they bring the *blubber* home, ſtowed in caſks, and boil it down there.

BLUBBER-*livers*. The livers of cods, which having been barrelled, yield ſpontaneouſly a conſiderable quantity of oil, which being ſkimmed off, the reſidue are called *blubber-livers*, to be boiled down for more oil.

BLUBBER, *ſea*, a denomination given by our navigators to the MEDUSA MARINA, or ſea-nettle. Phil. Tranſ. N° 349.

BLUE, one of the primitive colours of the rays of light.

Anciently, *blue* was the ſymbol of the ſea; for which reaſon, in the Circenſian games the combatants who reſpreſented the ſea were clad in *blue*; and thoſe who had diſtinguiſhed themſelves by any notable exploit at ſea, were rewarded with a *blue* enſign.

Mr. Boyle has given us the following method of making tranſparent *blue*, nearly equal to ultramarine. The principal ingredient of this beautiful colour is the *cyanus*, or *blue* corn-bottle-flower, which abounds almoſt in every corn-field, and may eaſily be had during four of the ſummer months. It may be gathered by children about the verges of corn-fields, without doing any damage to the corn.

This flower has two *blues* in it, one of a pale colour in the large outer leaves; and the other of a deeper *blue*, that lies in the middle of the flower. Both theſe will do, being ſeparated from the buttons or cales in which they grow; but the deep *blue* leaves in the middle produce much the beſt colour: this may be obſerved by rubbing the leaves while they are freſh upon a piece of writing paper, ſo hard as to expreſs the juice, which will yield an excellent colour, that by the experience of two or three years has not been found to fade.

A ſufficient quantity of theſe middle leaves being procured, let the juice be preſſed from them; to which a little alum being added, will give a laſting tranſparent *blue*, ſcarcely inferior in brightneſs to ultramarine.

It is very probable, that if the chives of theſe flowers were cured in the ſame manner with ſaffron, they would produce a much greater body of colour, from which a tincture might be drawn with more eaſe than when preſſed freſh from the field.

Mr. Boyle alſo recommends another fine *blue*, produced from the *blue* leaves of rue beaten in a ſtone mortar with a wooden peſtle, and then put in water for fourteen days or more, waſhing them every day until they are rotten. Theſe beaten up at laſt, water and all, until they become a pulp, and then dried in the ſun, will make a fine *blue* for ſhading.

BLUE *aſhes*, *Cendres bleu*, and by corruption from the French *Saunders blue*. Theſe are very much uſed in water-colours, and ſome are very lively; but in oil they grow dull and greeniſh, being ſomewhat of the nature of verdigriſe; and the more oil is put to them, the weaker they become. They are found in the form of a ſoft ſtone, in places where there are copper mines, and water only is made uſe of in levigating them, to reduce them to a fine powder. This kind of *blue* ought to be uſed in works to be ſeen by candle light, as in ſcene painting; for though a great deal of white be mixed with it, it appears very beautiful, notwithſtanding it has a greeniſh caſt; quite contrary to enamel, which looks bright by day, and dull by candle light.

Some of theſe *blue aſhes* look as beautiful as ultramarine, but by mixing them with a little oil, the difference is eaſily diſcovered: for whereas ultramarine becomes much higher on being mixed with oil, theſe acquire no body of colour from the mixture.

There is nothing to be found in the ſhops under this name but common *verditer*, or ſome ſpecies of it. See VERDITER.

BLUE, *blue*, is a colour of good brightness, next to *Prussian blue*; it is also a colour of a body, and flows well from the pencil. See BICE.

BLUE, *azure*, in *Painting*. This colour may be drawn from silver; but Boyle and Hankoo justly observe, that this happens only according to the proportion of copper found mixed in the metal. The following is the best method for making it. Dissolve 6l gum, 6l of tartar, and one ounce alone, in the strongest double distilled vinegar; suspend over the vinegar is prepared, thin plates of silver; and bury the vessel in the hot dung of goats. Every three days remove the plates, and wipe off the *blue* which will be formed on them. Otherwise, put *lamina* of silver as thin as paper into a pint of the strongest vinegar, add to it two ounces of *sal ammoniac* well pulverised; put this into a glazed earthen pot carefully stopped; bury this in horse-dung for fifteen or twenty days, at the end of which time you will find the plates covered with a fine *azure blue*.

BLUE, *dyers*, is one of their simple or mother colours, used in the composition of others; it is given chiefly with woad, and indigo. Some dyers heighten their *blue*, by adding madder, brasil, and other woods. The way of brightening *blue* is by passing the stuff, when dyed and well washed, through lukewarm water; or, which is much better, by working and fulling the dyed stuff with melted soap, and then scouring it well.—*Blues* are dyed immediately from the whites, without any other preparation than scouring. See DYING.

Blue and yellow compose green when blended together. Hellot suspects that such a *blue* green as is procured from INDIGO and WOAD is procurable from any other vegetables. He supposes the natural greens of vegetables to be compounded in like manner of those two colours, *blue* and yellow; and that the *blue* is oftentimes the most permanent, so as to remain entire after the putrefaction or destruction of the yellow. The theory is specious, and perhaps just. Neumann.

BLUE *black*. See BLACK.

BLUE *smalt*. See *smalt* ENAMEL.

BLUE, *Flanders*, is a colour seldom used but in landskapes, as being apt to turn green. The French call it *cendre verte*, or green ashes.

BLUE *for painting on glasses, cloths*. See GLASS.

BLUE *paper*, &c. JAPANNING.

BLUE, *indigo*, see INDIGO.

BLUE *Lincoln*, or *Lumen*, see LITMUS.

BLUE, *painters*, is made differently, according to the different kinds of paintings. In limning, fresco, and miniature, they use indifferently ultramarine, *blue* ashes, and smalt; these are the natural *blues*, excepting the last, which is partly natural, partly artificial. See each under its proper head.

In oil and miniature they use indigo, *blue* bice, *blue* verditer, *lapis armenus*, smalt, and litmus; also a counterfeit ultramarine.

Enamellers and painters on glass have *blues* peculiar to themselves; each preparing them after his own manner. See ENAMELLING: *Painting on* GLASS, and Neumann's Chem. Works, by Dr. Lewis.

BLUE, *Prussian*, or *Berlin* BLUE, is a modern invention, considerably in use among painters, though inferior to the ultramarine *blue*. It was discovered by accident, about the beginning of this century. A chemist of Berlin, having successively thrown upon the ground several liquors from his laboratory, was surprised to see it suddenly stained with a most beautiful colour. Recollecting the liquors he had thrown on each other, he made a similar mixture in a vessel, and produced the same colour. He did not publish his process, but prepared and sold his BLUE, which was substituted for ULTRAMARINE. The account of it was first published in the Berlin Memoirs, 1710; but without the description of its process.

In a paper of Dr. Woodward's, communicated to the Royal Society in the year 1724, there is given a short way of making the *Prussian blue*, which when tried over again by Mr. Brown the chemist, was found to answer perfectly well; and gave hints and occasions to several experiments, which gave great light into the true nature of the bodies used in that preparation.

The method was this. Four ounces of bullock's blood dried, and four ounces of salt of tartar prepared from four ounces of crude tartar and as much nitre, were calcined together; two hours after which, a black spungy substance remained in the crucible, weighing four ounces; a solution of which being made in boiling water, and afterwards filtered, left a remainder which when dried weighed nine drams. An ounce of English vitriol was dissolved in six ounces of rain water, and eight ounces of crude alum in two quarts of water. These being mixed hot with the blood, became green; and on adding two or three ounces of spirit of salt, they become of a fine *blue*, which will subside, and leave the water clear at top. Mr. Brown found the process exactly answer, and the product was an ounce of a very fine colour, and perfectly fit for the painter's use.

Among the several experiments which were made by mixing, in different manners and proportions, the several liquors of which this colour was to be prepared, all produced a *blue*; but that in different degrees, some being deeper, and others much paler. In one experiment the alum was wholly left out, and a very pale *blue* was produced; in another, the alum and vitriol were used in equal quantities, and then the product was an extremely deep *blue*.

Upon the whole, the prescription seems to be given after repeated trials, and appears to be that very combination of the several ingredients, which must give the very finest colour they are capable of giving.

It is curious to know what gave the first hint for the production of so fine a colour from a combination of such materials, especially when we come to consider, that the blood has the principal share in this surprising change. Blood of any kind, or flesh of any kind, would produce the same effects; but it is probable that flesh would not yield so strong or fine a colour. Both have been tried, and found to yield a *blue*, but not so fine as the blood. Phil. Trans. abr. vol. vii. p. 747, &c.

In all the recipes which have been given for making the *Prussian blue*, the liquors are ordered to be mixed together boiling hot, except the spirit of salt; and experience shews, that the colour is most readily and beautifully made that way: but in experiments made with all the liquors cold, the colour have been very well produced, only in less beauty; and they have required nothing several times in fresh water, to bring them to their beauty.

Mr. Brown thinks, that this *blue* is the phlogistic part of iron, disengaged by the lixivium of bullock's blood, and applied to the earth of alum: and this opinion has been adopted by M. Geoffroy. The abbé Menon supposes that *Prussian blue* is nothing but iron entirely freed from all saline matter by the phlogiston of the alkaline lixivium, and precipitated with its natural colour, which, he says, is *blue*: the alum serving to diminish the intensity of the colour, by the whiteness of its earth. M. Macquer concludes, from many experiments, that it is nothing but iron impregnated with a superabundant quantity of phlogiston, which it receives from the phlogisticated alkaline precipitant. He has likewise applied the preparation of this pigment to the dying of wool and silk, and found means of fixing the colour. The cloth must first be dipped in a diluted solution of vitriol and alum, then in the dye diluted, and afterwards in water acidulated with spirit of vitriol; it acquires hereby a light *blue* colour, which becomes deeper and deeper by repeating the dippings as before, and adding to the liquors each time a little more of the respective saline matters. M. Macquer observes, that this *blue* dye exceeds in beauty and lustre that of indigo and woad; that it penetrates the whole substance of felled cloth, without weakening it; that it is durable in the air, and bears boiling in alum water, but is discharged by soap. Phil. Trans. abr. vol. vii. p. 747, &c. Mem. Acad. Scienc. for the years 1725, 1749, 1752.

The method of making this *Prussian blue* in perfection, has been purchased at a very valuable secret. Its process is very extraordinary, and could scarce be derived *a priori* from any reasoning about the nature of colours. It is allowed to be an excellent *blue* pigment, and is by some preferred to ULTRAMARINE, though its durability might have been suspected, from the vegetable and animal matters used in its preparation, if the colour did not seem extraordinarily fixed by the operation.

The goodness of *Prussian blue* must be distinguished by its brightness, deepness, and coolness.

There are four different processes given for making the finest sort of *Prussian blue* with quick-lime, given in the Hist. of the Acad. of Science, at Paris, for the year 1756. Process I. Take 3 lb. of ox's blood, dried and reduced into a kind of small scales; an equal quantity of quick-lime newly baked; 2 lb. of red tartar; and 1 lb. 8 oz. of salt-petre; pulverise the whole grossly, and put it into a crucible, placed in the midst of a great furnace, and give it a gradual fire. After four hours, when the matter is reduced into a kind of paste which emits no more smoke, and is equally red, throw it by spoonfuls into two pails of boiling water; and, having filtrated the lixivium, mix it with a solution of 9 lb. of alum, and 1 lb. 8 oz. of green vitriol. This operation will yield but 7 oz. of *fecula*; but its beauty will make sufficient amends for the small

small quantity, as it will surpass in this respect all the *blues* of Prussia, which are prepared by other methods.

It has also as good an effect as the finest *azure-marine*; and has, besides, the advantage of resisting the impression of the air.

Process II. Take 3lb. of dried ox's blood, an equal quantity of quick-lime, 2lb. of red tartar, and 2lb. of nitre; let them be calcined and lixiviated, as in the former process: pour the lixivium into a solution of 4lb. of alum, and 1lb. of green vitriol. This operation will yield more of the *blue frosts* than the other, but the colour will be less beautiful.

Process III. Take 3lb. of dried ox's blood, 4lb. 8 oz. of quick-lime, 2lb. of red tartar, 2lb. 8 oz. of salt-petre. Proceed as before. This operation will produce the most beautiful *blues*; but the quantity will be only about 8 oz. and 4 drams.

Process IV. Take 3lb. of dried ox's blood, 6 lb. of quick-lime, 2lb. of red tartar, and 1 lb. 8 oz. of nitre. Calcine and lixiviate as before; pour the warm lixivium into a solution of 4lb. of alum, and 1 lb. of green vitriol; the *frosts* precipitated in this way will be as beautiful as those of the first process, and the quantity 36 ounces.

BLUE, *Saxon*. This dye has been known for some time, and is made by digesting indigo in oil of vitriol, by which the indigo becomes of a much more lively colour, and is extended to such a degree, that it will go very far in dying. The following receipt for making it, produces a very fine colour, and never fails of success.

Mix 1 oz. of the best powdered indigo with 4 oz. of oil of vitriol, in a glass body or matrass; digest it an hour with the heat of boiling water, shaking the mixture at different times. Add 12 ozs. of the water to it, stir the whole well, and when cold filter it; a very rich deep colour will be produced: and if a paler *blue* be required, it may be had by the addition of water. The heat of boiling water is sufficient for this operation, and can never spoil the colour. A fand heat, not uncommonly used for this purpose, is often found to damage the colour.

Indigo digested with a large quantity of spirit of wine, and dried, will produce a finer colour than the former, if treated in the same manner with oil of vitriol.

For an account of the processes for obtaining BLUE *liquors* from oak-duft and vitriol, from log-wood and verdigrise, from log-wood and blue vitriol, from an essential oil and volatile spirit; see Dr. Lewis's Commercium Philosophico-Technicum, ed. 4to. ann. 1773. p. 382. 407. 436.

BLUE, *stone* or *powder*, used in washing of linen, is the same with SMALT, either in the lump, or powdered.

When the SMALT is taken from the pot, it is thrown into a large vessel of cold water: this makes it more tractable and easily powdered. Afterwards, when examined after cooling, it is found to be mixed with a greyish matter resembling ashes, which they call *efted*. This grey matter is separated by washing, and then the *blue* substance is powdered and sifted through fine sieves, to bring it to what we call *powder-blue*. Phil. Trans. N° 396.

BLUE, *turnsol*, is a *blue* used in painting on wood, made of the seed of that plant. It is prepared by boiling four ounces of turnsol in a pint and a half of water wherein lime has been slacked. See TURNESOLE.

BLUE, *ultramarine*, a beautiful blue colour, used by the painters, prepared from *lapis* LAZULI.

Some derive its name *ultramarine*, q. d. *beyond sea*, from its being first brought into Europe out of India, and Persia. Others say, it is because its colour is deeper than that of the sea.

This *blue* is one of the richest and most valuable colours, used in painting. The preparation consists in first calcining the stone in an iron pot or crucible, then grinding it very fine on a porphyry; then mixing it up with a paste made of wax, pitch, mastich, turpentine, and oil; and at last washing the paste well in clear water, to separate the colouring part from the rest, which precipitates to the bottom, in form of a subtile, beautiful, *blue* powder. The water is then poured off, and the powder at bottom is dried in the sun; and is the true *ultramarine*.

Those who prepare this colour, make usually four kinds, which they procure by so many different lotions: the first is always the best; and the rest worse and worse to the last. There is *ultramarine* of the first kind, sold for 11*l.* sterling *per* ounce; and of the last, for about 12 or 15*s.*

The common opinion concerning its origin is, that the method of making it was first discovered in England; and that a member of the East India company, having a quarrel with his associates, to be revenged of them, made the secret public.

Ultramarine must be chosen of a high colour, and well ground, which is known by putting it between the teeth where if it feel gritty, it is a sign the triture is not sufficient.

To know whether it be pure and unmixed, put a little of it in a crucible, and heating it red hot, if the powder has not changed as colour after this trial, it is certainly pure: on the contrary, if you perceive any change, or any black specks on it, it is falsified.

Besides this, there is another kind called common or *Dutch ultramarine*; which is only the crude *lapis armenus* and smalt well ground, and pulverised; the colour whereof, when used by the painters, is something like that of the true *ultramarine*, though much less valued.

Ultramarine, on account of its high price, is frequently adulterated, either by a precipitation or mugillery of copper made by alkaline salt, or by fine smalt. The adulteration in the former way may be discovered by pouring some diluted spirit of nitre on a small quantity of the *ultramarine*; which, if there be any copper, will soon dissolve, and form a greenish *blue* solution. The other kind of adulteration may be detected by washing the substance in water; the particles of the smalt being much grosser than those of the *ultramarine*; besides, smalt will not mix so readily with oil, and in enamel painting they may be easily distinguished, because smalt will flux without any addition, whereas the other requires the addition of some vitreous body.

There is a *blue fossil substance*, something like what Kentman mentions under the name of *cæruleum fatonicum*. It was discovered in a peat-moss in Scotland. This earth is at first of a white colour, and only grows *blue* by being exposed to the air. It has also some resemblance to what Mr. Da Costa in his Nat. Hist. of Foss. p. 103, calls *ochra friabilis cærulea*. It is described very minutely by Mr. Douglas, who gives an account of his various experiments upon it, and recommends it as a cheap paint in gum-water, particularly as it is levigated and prepared by nature. See Phil. Trans. vol. lviii. N° 27. an. 1768.

Many similar specimens of *blue* earth have been discovered in England and Ireland, and several parts of the continent.

BLUE-*bell*, a name given in some countries to the *Corn*-WHEAT.

BLUE-*bottle*, in *Botany*, is the English name of the CYANUS. It is a small plant, with beautiful blue-flowers, common in our corn-fields, and of which many beautiful species are kept in gardens. See CENTAURY.

The common wild *blue-bottle* of our corn-fields, is esteemed a cardiac and alexipharmic. Conserves and syrups are prepared from it in some places, and have very properly for the making of other more efficacious medicines of the same intention into form. Schroder and some others have greatly extolled the distilled water of the flowers in inflammations, and many other disorders of the eyes; but this seems a less warranted matter. The flowers of the large garden kind, are said to be particularly good in disorders of the womb, and the leaves of either in infusion in dropsies.

There are several species of this plant, commonly cultivated in gardens, for the beauty of their flowers. They are almost all annuals, perishing as soon as they have ripened their seed. In order to have them flower early, their seeds should be sown in July, or the beginning of August, and when the plants have once got strength, they should be transplanted into warm borders, and will endure the cold very well, and will flower very early the next summer.

BLUE-*cap*, in *Ichthyology*, see BLUE-*cop*.

BLUE-*mantle*, in *Heraldry*, the title of a pursuivant at arms.

BLUE-*nuns*, *filles bleus*, those of the order of the Annunciation.

BLUENESS, that quality which denominates a body *blue*; or such a size and texture of the parts that compose the surface of a body, as disposes them to reflect the blue or azure rays of light, and those only, to the eye.

With respect to the *blueness* of the sky, M. de la Hire, after Leonardo da Vinci, observes, that any black body, viewed through a thin white one, gives the sensation of blue; and this he assigns as the reason of the *blueness* of the sky, the immense depth whereof being wholly devoid of light, is viewed through the air illuminated and whitened by the sun. For the same reason he adds, it is, that soot mixed with white makes a blue; for white bodies, being always a little transparent, and mixing themselves with a black behind, give the perception of blue. From the same principle he accounts for the *blueness* of the veins on the surface of the skin, though the blood they are filled with be a deep red; for red, he observes, unless viewed in a clear, strong light, appears a dark brown, bordering on black; being then in a kind of obscurity in the veins, it must

have the effect of a black; and this, viewed through the membrane of the vein, and the white skin, will produce the perception of *blueness*.

In the same way did many of the early writers account for the phenomenon of a *blue sky*; such as Fromondus, Funccius, Otto Guericke, and many others: their opinion long prevailed, and has been adopted by some of more modern times, especially by Wolf, and Muschenbroek. But in the explanation of this phenomenon, sir Isaac Newton observes, that all the vapours, when they begin to condense and coalesce into natural particles, become first of such a bigness as to reflect the violet rays, before they can constitute clouds of any other colour. This, therefore, being the first colour they begin to reflect, must be that of the finest and most transparent skies, in which the vapours are not arrived to a grossness sufficient to reflect other colours.

M. Bouguer, without having recourse to the vapours diffused through the atmosphere, in order to account for the reflection of the *blue*-making rays, attributes it to the constitution of the air itself, whereby those faint-coloured rays are incapable of making their way through any considerable tract of it. And he accounts for those *blue* shadows, which were first observed by M. Buffon in the year 1742, by the aerial colour of the atmosphere, which enlightens these shadows, and in which the *blue* rays prevail; whilst the red rays are not reflected so soon, but pass on to the remoter regions of the atmosphere. The abbé Nollet accounts for the phenomenon of *blue* shadows by the diminution of light; having observed that, of two shadows which were cast upon a white wall from an opaque body illuminated by the moon, and by a candle at the same time, that which was enlightened by a candle was reddish, and that which was enlightened by the moon was *blue*. However, the true cause of this appearance seems to be that assigned by M. Bouguer, which agrees with the solution given of it about the same time by Mr. Melville. But indeed of attributing the different colours of the clouds, as sir Isaac Newton does, to the different size of those globules into which the vapours are condensed, Mr. Melville supposes, that the clouds only reflect and transmit the sun's light; and that, according to their different altitudes, they may assume all the variety of colours at sun-rising and setting, by partly reflecting the sun's incident light, as they receive it through a shorter or longer track of air; and the change produced in the sun's rays by the quantity of air through which they pass, from white to yellow, from yellow to orange, and lastly to red, may be understood agreeably to this hypothesis, by applying to the atmosphere what sir Isaac Newton says concerning the colour of transparent liquors in general, and that of the infusion of *guaiacum* in particular. Edinb. Ess. vol. ii. p. 75. *Bouguer Traité d'Optique*, p. 368. Newton's Opticks, p. 228; or Priestley's Hist. of Vision, &c. p. 436.—449.

BLUFF-*head*, or BLUFF-*bowed*, in the *sea-language*, is when a ship has but a small rake forward on, being built with her form too straight up.

Bluff-headed ships are opposed to those that are sharp-headed. They are shorter less masted, and sail cheaper.

BLUING *of iron*, a method of beautifying that metal sometimes practised as for mourning buckles, swords, or the like. The manner is thus: take a piece of grind-stone, and whet-stone, and rub hard on the work, to take off the black scurf from it; then heat it in the fire, and as it grows hot, the colour changes by degrees, coming first to a light, then to a dark gold colour, and lastly to a blue. Sometimes they grind also indigo and sallad-oil together; and rub the mixture on the work with a woollen rag, while it is heating, leaving it to cool of itself.

Among sculptors we also find mention of *bluing* a figure of bronze, by which is meant the heating of it, to prepare it for the application of gold-leaf, because of the bluish cast it acquires in the operation.

BLUNDERBUSS, in the *Military Art*, a short sort of fire-arm, with a large bore, contrived to carry a number of musket or pistol bullets at once.

The *blunderbuss* is proper to do execution in a crowd, or to make good a narrow passage, as the door of a house, stair-case, or the like.

BLUNT, in *Fencing*. To fight with *blunts*, is to exercise or parade with weapons without points or edges.

BLUNTING *the angles of a battalion*, in the *Military Art*, signifies to retrench the four corners, and turn the square into an octagon.

This is done in order to give an opportunity for presenting the pikes, or firing on all sides, and was a military evolution formerly much in use; but now disused.

BLUSHING, a suffusion or redness of the cheeks, excited by a sense of shame, on account of consciousness of some failing or imperfection.

Blushing is supposed to be produced from a kind of consent or sympathy, between several parts of the body, occasioned by the same nerve being extended to them all. Thus the fifth pair of nerves being branched from the brain to the eye, ear, muscles of the lips, cheeks, palate, tongues, and nose; a sting from or bestial that immediately affects the cheeks with *blushes*, driving the blood into the minute vessels thereof; or the same sting that affects the eye, and ear. For the same reason it is, as Dr. Darwin observes, that a savoury thing from or smell affects the glands and parts of the mouth: if a thing hateful be pleasing, it affects the muscles of the face with laughter; and unhappily, it exerts itself on the glands of the eyes, and occasions weeping, &c. And to the same cause Dr. Willis ascribes the pleasure of killing.

BMI, in *Botany*, see GRAMEN.

BOA, in *Natural History*, a monstrous serpent of prodigious size, which devours whole beasts at once, from which it takes its name. It sucks the cows' teats, and is found sometimes in Calabria. One of these was killed in the reign of the emperor Claudius, in the belly of which they found a child, which had been swallowed whole. The bite causes an inflammation of the part bitten.

BOA is a genus of serpents in the Linnæan system, with abdominal and subcaudal scuta, and without a rattle.

BOADODA *Bassaw*, in the *Turkish Military Affairs*, an officer of the janizaries, whose business it is to walk every day about the principal parts of the city, with a number of janizaries, to attend him, to keep order, and see that all things are regular, even to the streets. This office is for three months, and from this the person is usually advanced to be a *sanzack*.

BOAH, in *Zoology*, see CERVUS.

BOAR, in *Zoology*, the *wild hog*. This creature differs from the common domestic *hog*, in that the grown animal is not different in colour in the different individuals of the same species, but is always of a sadly tawny-grey. His head is much longer also than that of the other; his ears shorter and rounder; and both these, and his tail and feet, are always black. It differs also in that it is covered with a coat of hairs, the one kind long, the other short: these last serve the creature to the same purposes as the downy fur which the beaver and other have under their long hair. It is very commonly wild in Italy, and its flesh frequently brought to market. Ray.

The *wild boar*, among the *Huntsmen*, has several names, according to its different ages: the first year it is called *a pig of the sounder*; the second, it is called *a hog*; the third, *a hog-sterone*; and the fourth, *boar*; when leaving the sounder, he is called *a jangler or jangler*.

The *boar* generally lives to twenty-five or thirty years, if he escapes accidents. The time of going to rut is in December, and lasts about three weeks. They feed on all sorts of fruits, and on the roots of many plants: the root of fern in particular forms a great favourite with them: and when they frequent places near the sea coasts, they will descend to the shores, and demolish the tenderer shell-fish in very great numbers. Their general places of rest are among the thickest bushes that can be found, and they are not easily put up out of them, but will stand the bay a long time. In April and May they sleep more found than at any other time of the year, and this is therefore the successful time for taking them in the toils. When a *boar* is roused out of the thicket, he always goes from it, if possible, the same way by which he came to it; and when he is once up, he will never stop till he comes to some place of greater security. If it happens that a *sounder* of them are found together, when any one breaks away, the rest all follow the same way. When the *boar* is hunted into the wood, where he was bred, he will scarce ever be brought to quit it; he will sometimes make towards the sides to bite: to the noise of the dogs, but retires into the middle again, and usually dies or escapes there. When it happens that a *boar* runs a-head, he will not be stopt, or put out of his way by man or beast, so long as he has any strength left. He makes no doubles or crossings when chased; and when killed makes no noise, if an old *boar*; but the sows and pigs will squeak, when wounded.

The season for hunting the wild *boar* begins in September, and ends in December, when they go to rut. If it be a large *boar*, and one that has lain long at rest, he must be hunted with a great number of dogs, and those such as will keep close to him; and the huntsman, with his spear, should always be riding in among them, and charging the *boar* as often as he can, to discourage him: such a *boar* as this, with five or six couple of dogs, will run to the first convenient place of shelter, and there stand

ſtand at bay, and make at them as they attempt to come up with him.

There ought always to be relays alſo ſet for the beſt and ſtaunchest hounds in the kennel; for if they are of young eager dogs, they will be apt to ſeize him, and be killed or ſpoiled before the reſt come up. The putting of collars with bells about the dogs necks is a great ſecurity for them: for the *boar* will not to ſoon ſtrike at them when they have theſe, but will rather run before them. The huntſmen generally kill the *boar* with their ſwords or ſpears; but great caution is neceſſary in making the blow, for he is very apt to catch them upon his ſnout or tuſks, and if wounded and not killed, he will attack the huntſman in the moſt furious manner. The places in which the wound is to be given with the ſpear, are either between the eyes in the middle of the forehead, or in the ſhoulders; both theſe places make the wound mortal. When this creature makes at the hunter, his ſafety conſiſts merely in courage and activity; if he flies for it, he is ſurely overtaken and killed: if the *boar* comes ſtraight up, he is to be received at the point of the ſpear; but if he makes doubles and windings, he is to be watched very cautiouſly, for he will attempt getting hold of the ſpear in his mouth, and if he does ſo, nothing can ſave the huntſman but another perſon's attacking him behind; he will on this attack the ſecond perſon, and the firſt muſt then attack him again; two people will thus have enough to do with him, and were it not for the folks of the *boar*-ſpears that make it impoſſible to proſs forward upon them, the huntſman who gives the creature his death's wound, would ſeldom eſcape falling a ſacrifice to his revenge for it.

The modern way of *boar*-hunting is generally to diſpatch the creature by all the huntſmen ſtriking him at once; but the antient Roman way was, for a perſon on foot, armed with a ſpear to keep the creature at bay, and in this caſe the *boar* would run of himſelf upon the ſpear to come at the huntſman, and puſh forward till the ſpear pierced him through.

The wild *boar* was formerly a native of Britain, as appears from the laws of Hoel Dha, Leges Wallicæ, 41. William the Conqueror puniſhed with the loſs of their eyes, any that were convicted of killing him: Charles I. turned out wild *boars* in the New Foreſt, but they were deſtroyed in the civil wars.

The hinder claws of a *boar* are called *gwards*.

In the corn he is ſaid to *feed*; in the meadows or fallow fields, to *root*, *worm*, or *feed* in a cloſe to *graze*.

The *boar* is farrowed with as many teeth as he will ever have, his teeth increaſing only in bigneſs, not in number; among theſe there are four called *tuſhes* or *tuſks*, the two biggeſt of which do not hurt when he ſtrikes, but ſerve only to whet the other two loweſt, with which the beaſt defends himſelf, and frequently kills, as being greater and longer than the reſt.

It is very remarkable, that theſe creatures in the Weſt Indies are ſubject to the ſtone: few of them are abſolutely free from it, yet ſcarce any have the ſtones of any conſiderable ſize. It is common to find a great number in the ſame bladder, and they are uſually of about a ſcruple weight, and are angular, and that with great regularity, each having five angles. Phil. Tranſ. N° 36.

Among the antient Romans, *boar*'s fleſh was a delicacy; a *boar* ſerved up whole was a diſh of ſtate.

The *boar* was ſometimes alſo a military enſign borne by the Roman armies, inſtead of the eagle.

Among phyſicians, a *boar*'s bladder has been reputed a ſpecific for the epilepſy.

The tuſh of the wild *boar* ſtill paſſes with ſome as of great efficacy in quinſies and pleuriſies. See an analyſis of it in Dr. Lewis's edition of Neumann's Works, p. 521.

BOAR, in the *Manege*. A horſe is ſaid to *boar* when he ſhoots out his noſe as high as his ears, and toſſes in the wind.

BOARD, a piece of timber ſawed thin, for the purpoſes of building. See TIMBER.

We ſay, a *deal-board*, an *oak-board*, &c. *Boards* thicker than ordinary are called *plank*. *Boards* formed ready for the coopers uſe are called *clap-boards*. We have alſo *mill-board*, and *ſcale-board*, ſhaved very thin, for caſes, band-boxes, &c.

Deal-*boards* are generally imported into England ready ſawed, becauſe they are prepared cheaper abroad, by means of ſaw-mills.

Clap-*boards* are imported from Sweden and Dantzic.

Oak-*boards* chiefly from Sweden and Holland; ſome from Dantzick.

Pipe-*boards* are brought from Dantzic. We alſo import white *boards* for ſhoe-makers: mill and ſcale-*boards*, paſte-*boards*, &c. for divers artificers.

Scale-*board* is a thinner ſort, uſed for the covers of primers, thin boxes, and the like. It is ſawed with mills, and imported from Hamburgh.

BOARD, *feather-edged*, *grooving*, *lap*, *poſt*, *ſound*, *truſs*, *warp*, *together*. See the ſeveral adjectives.

BOARD, is alſo uſed for a kind of table or bench, whereon ſeveral artificers perform their work.

In this ſenſe, we ſay a *work-board*, a *ſhop-board*, a *tryſel-board*, &c.

BOARD, is alſo uſed for a flat machine, or frame, uſed in certain games, and the like.

In this ſenſe, we ſay a *draught-board*, a *cheſs-board*, a *ſhovel-board* and the like.

BOARDS, in *Book-binding*. See BOOK-BINDING.

BOARD, *bureau*, is alſo uſed for an office where accounts are taken, payments ordered, and the like.

In this ſenſe, we ſay the *board* of works, *board* of ordnance, *board* of treaſury, and the like.

BOARD *of green cloth*. See GREEN-CLOTH.

BOARD *of trade and plantations*, was eſtabliſhed in its preſent form by king William, in the year 1696. Commercial matters had before this time been generally referred to a fluctuating committee of the privy council: the obvious inconveniences attending this mode of management, induced king Charles II. to erect a ſpecial council of trade in the year 1668, which was ſoon after laid aſide: it was renewed again in 1672, but ſoon diſcontinued, and the former method of reference to committees of the privy council revived. In 1696, a regular and permanent *board* was eſtabliſhed, for ſettling all diſputes and regulations relating to commerce and colonies.

This *board*, beſide ſuch of our miniſters of ſtate, who only attend on extraordinary occaſions, conſiſts of a firſt lord commiſſioner, and of ſeven other commiſſioners, with an annual ſalary of one thouſand pounds each. This *board* was abolihed in 1782.

BOARD *of trade, bureau de commerce*, an office in the French polity, eſtabliſhed in 1723, compoſed of eight perſons of experience in commerce and navigation, where all papers and propoſals relating to the improvement of trade are examined, and all difficulties which occur in affairs of navigation and commerce, either within or without the realm, are diſcuſſed.

BOARD-*wages*, denotes a certain annual ſum allowed to houſhold ſervants for maintenance. *Board-wages*, granted to the menial officers and ſervants of the crown, commenced in 1619, when the neceſſities of king Charles obliged him to retrench the expence of his houſhold, by aboliſhing the greateſt part of the daily tables in his palace, which were eighty in number, and ſubſtituting this annual allowance in their room.

BOARD, or ABOARD, in the *Sea-language*, is uſed in ſpeaking of things within a ſhip, or other veſſel.

Hence, to go *aboard* ſignifies to go into the ſhip; to leave over *board*, is to throw a thing out of the veſſel into the ſea: to ſlip by the *board*, is to ſlip down by the ſhip's ſide; *board* and *board*, is when two ſhips come ſo near as to touch one another; or when they lie ſide by ſide.

Weather-board, is that ſide of a ſhip which is to windward.

To board a ſhip, is to enter an enemy's ſhip in a fight. See BOARDING, *infra*.

To *make aboard*, or, as it is otherwiſe expreſſed, to *board it up* to a place, is to turn to windward; and to beat ſometimes upon one tack, and ſometimes upon another; in which it is to be noted, that the farther you ſtand off to one point of the compaſs, the better *board* you will make; and that it is better making *long boards* than ſhort ones, if you have ſea-room. A *long board* is when you ſtand a great way off before you tack or turn; a *ſhort board* is when you ſtand off a little: a *good board* is when we have got up much to windward, or when a ſhip advances much at one tack, and falls upon a ſtraight line. To leave a land on *back-board*, is to leave it aſtern or behind; the *back-board* being that which, in boats or ſhips, we lean our backs againſt.

BOARDED *floor*. See FLOOR.

BOARDING *of a ſhip*, an attack made to take her, by entering her decks with a detachment of armed men.

In order to *board a ſhip*, it is beſt to bear directly up with her, and cauſe all your ports to leeward to be beat open, and bring as many guns from the weather-ſide thither as you have ports for; and then lay the enemy's ſhip on board looſ for looſ, and order your tops and yards to be manned and furniſhed with neceſſaries, and let all your ſmall ſhot be in readineſs; then charge at once with both ſmall and great, and at the ſame time enter your men in the ſmoke, occaſioned by the firing, or by lighted powder-flaſks and an earthen ſhell, called a ſtink-pot, thrown on the enemy's deck, either on the bow of the ſhip, or bring your mid-ſhip cloſe up with her quarter, and to enter your men by the ſhrouds, or, if you would uſe your ordnance, it is beſt to board the enemy's ſhip athwart her bawſe, for then you uſe moſt of your great guns, and the only thoſe of the prow. Let ſome of your men endeavour to cut down the enemy's yards and tackle, whilſt others clear the decks, and beat the

the enemy from aloft; then let the feuttles and hatches be broke open with all speed, to wind trains, and the danger of being blown up by barrels of powder, placed under the decks. Thus, your men bring in poſſeſſion of the tails and helm, and the enemy every way ſtow'd below the decks, the ſhip is taken, and all lies at your diſcretion.

BOARIA *Caſtra*, a name given by the ancient Romans to the finall or rough balls of common pumice we cleavens. Pliny calls this plant ſometimes *aſpa*, ſometimes *longoris*; and the fruit by the names of *aſparagorum*, or *aſparagarum*, and ſometimes *uvaria*.

BOAROLA *boarina*, in *Ornithology*, the name of a very ſmall bird, deſcribed by Aldrovandus, and ſome others, and ſeemingly the ſame ſpecies with the REX-AURIS, or REGICAPA.

BOAT, a ſmall, open, floating veſſel, commonly wrought or moved only by rowing; intended chiefly for the navigation of rivers, lakes, and the like.

The *boat* acquires various names, according to its various ſtructure, and the various uſes it is appointed for, and the places where it is to be uſed. The ſeveral *boats*, and their names are,

A jolly boat, a long-boat, a biſſe, a pinnace, a cutter, a lanch, a water-boat, a punt, which are *boats for ſhips*; *a gondola, a Greenland's boat, a Hermaphrodite, a bulloon of Siam, a ſcrip-boat, a periagua, a phaſel-boat, a paton, a canoe, a trunckle, a ſurveyary, a dunk-boat, a filuca, a ferry-boat, a pram, a punt, a ſhallop, a Biſcay, a till-boat, a cod-boat, a hull-boat, a wherry, a flat bottomed-boat*, &c.

The *boats* or wherries, allowed to ply about London, are either *ſcullers*, wrought by a ſingle perſon with two oars; or *oars*, wrought by two perſons, with each an oar.

De Chales propoſes the conſtruction of a *boat*, which, what burden ſoever it bear, ſhall not only move againſt the current, without either ſails or oars, but alſo advance to much the ſwifter, as the rapidity of the water is greater. He makes it the ſame with that of the others, excepting only a wheel added to its ſide, with a cord, which winds round a roller as faſt as the wheel moves. Something of the like kind has alſo been ſince done by M. Pitot. Vide Mem. Acad. R. Scienc. an. 1719. p. 350, and p. 510.

A new attempt, and with great ſucceſs, is alſo ſaid to have been lately made at Vienna.

M. de la Hire has given an examination of the force neceſſary to move any boat in ſtagnant and running waters, either with ropes faſtened to them, or with oars, or with any other machine; wherein, he ſhews, that the larger the ſurface of the oars plunged in the water, and the ſmaller that of the *boat* preſented to the water, is; and again, the longer that part of the oar between the hand and the place where the oar reſts on the *boat*, and the ſhorter that between this laſt point and the water; the freer will the *boat* move, and the greater effect will the oar have. See OAR.

Hence it is eaſy to calculate the force of any machine that ſhall be applied to rowing; *v. gr.* if we know the abſolute force of all the men who row, it muſt be changed into a relative force, according to the proportion of the two parts of the oar; *i. e.* if the part out of the veſſel be double the other, and all the men together can act with the force of 900 pounds, we compute firſt, that they will exert 300; which 300, multiplied by the ſurface which the veſſel preſents to the water, gives a ſolid water of a certain weight; which weight may be found, and of conſequence the velocity impreſſed on the veſſel by the oars. Or, the velocity of the oars may be found in the ſame manner, by multiplying the 300 pounds by the ſurface of all the parts of the oars plunged in the water. Nor would there be any difficulty in finding firſt the relative forces, then the abſolute ones; the velocities either of the oars, or of the veſſel, being given, or the proportion of the two parts of the oar.

Boats ſail more ſlowly and heavily over ſhallow, than over deep waters. See an account of experiments for explaining this, in Dr. Franklin's Letter to Sir John Pringle. Experiments, &c. 4to. 5th ed. p. 510.

BOAT, *long*, called alſo the *ſhip's boat*, is the largeſt and ſtrongeſt *boat* belonging to a ſhip that can be hoiſted aboard of her. It has a maſt, ſail, and oars, as other *boats*, alſo a tiller to the rudder, which anſwers to the helm of a ſhip.

Her thwarts are the ſeats where the rowers ſit; and her thowls the ſmall pins between which the oars are put when they row.

Inſtead of a *long-boat*, merchant-ſhips in the Mediterranean uſe a LANCH.

A ſhip's *boat* is the very model of a ſhip, and is built in parts in all things anſwerable to thoſe which a ſhip requires, both for ſailing and bearing a ſail: and they bear the ſame names as to all the parts of a ſhip under water, as rake, run, ſtern, ſtern, bow, bilge, &c.

Its uſe is to weigh the anchor, bring goods, proviſion, &c. to or from the ſhips; and other ſervices, as occaſion requires. The *long-boat* of a man of war may be decked, armed, and equipped for ſtalking ſhort diſtances againſt merchant ſhips of the enemy, or ſmugglers, or for impreſſing ſeamen, &c.

The terms uſed in navigating a *boat*, are, to *trim the boat*, that is to keep her even; to *row the boat*, *i. e.* to bring her head the other way; *to ſet the boat*, *i. e.* to bring out the water: *to row the boat*, *i. e.* let ſome men go to row the *boat*; *to row the boat*, *i. e.* to follow it with two ropes, ſo that one ſhall counteract the other; *double oars*, *i. e.* two lies from bearing againſt the ſhip's ſides. The *boat's* gang includes thoſe who uſe to row in the *boat*, which are the ſix ſtream and ſix yoing, to whom the charge of the *boat* immediately belongs.

A *ſea-boat* is that which endures a rough ſea well.

A *good long boat* will row in any crown ſea, if the water be ſmooth and ſtill, though the ſea break very much. The rope by which a *boat* is towed at the ſhip's ſtern, is called the *boat-rope*, or *tow-line*, in order to keep the *boat* from cheering, they add another called a *cheering*.

To ſave the bows of the *boat*, which would be worn out with the twiſting about the ſhip under her, they give it, they ſay, a *turn*, that is, a rope round by the gunwale, and ſo that ſurrounds the *boat*.

BOATS, *train of*, a number of ſmall veſſels faſtened to each other, plying up the Loire in France, by ſide when the wind ſerves, otherwiſe towed by men. Generally to the number of ſeventy or eighty to a ſingle rope.

Boat-Boat. *See* Drive *boat*.

BOAT, *coach*, *becauſe turkey*, more frequently called *water-coaches*, are large covered *boats*, uſed chiefly on the river Seine, for the convenience of paſſengers, and conveyance of all ſorts of goods.

BOAT, *ſurgeon's*, in *Surgery*, a ſpecies of BANDAGE, uſed when the crown of the head and the part between that and the forehead are to be bound. It is likewiſe called *thalus dividuus*.

BOAT-*fly*, a water-inſect, whoſe back is ſhaped much like the bottom of a *boat*; the hind legs, which are thrice as long as the reſt, aptly enough reſembling a pair of oars. Accordingly, contrary to all other creatures, he ſwims, ſays Monfet, on his back.

BOAT-*hook*, an iron hook, with a ſharp point on the under part of it, fixed on a long pole, uſed in hinging it to, or puſhing it from any other *boat*, ſhips, &c.

BOATING, a kind of puniſhment in uſe among the ancient Perſians for capital offenders.

The manner of *boating* was thus: the perſon condemned to it being laid on his back in a *boat*, and having his hands ſtretched out, and tied faſt on each ſide of it, had another *boat* put over him, his head being left out through a place fit for it. In this poſture they fed him, till the worms, which were bred in the excrements he voided as he thus lay, eat out his bowels, and ſo cauſed his death, which was uſually twenty days in effecting, the criminal lying all this while in moſt exquiſite torments. Prid. Connect. tom. ii. p. 368.

BOATSWAIN, an officer on board a ſhip, who has charge of her rigging, ropes, cables, anchors, ſails, flags, colours, and pendants; and is alſo to take care of the long-boat, and its furniture, and to ſteer her, either by himſelf or his mate.

He calls out the ſeveral gangs aboard, to the due execution of their watches, works, &c. He is likewiſe a kind of a PROVOST-marſhal, who ſees and puniſhes all offenders ſentenced by the captain, or a court-martial of the fleet.

BOATSWAIN'S-*mate* is an aſſiſtant of that officer, who has the peculiar command of the long-boat, for the ſetting forth of anchors, weighing or fetching home an anchor, warping, towing, or mooring. He is alſo to give an account of this ſtore.

This officer is the ſame with what the Dutch called *boots-man maet*; the Germans, *unter boots-mann*; and the French *lafleman*, or *ſecond contre-maitre*.

BOB *of a pendulum*, the ſame with its ball; except that the former is uſed in ſpeaking of ſhort PENDULUMS, the latter of long ones.

BOB, *in Ringing*, denotes a peal conſiſting of ſeveral courſes, or ſets of changes.

BOB-*ſtay*, in *Sea-language*, a rope uſed to confine the bowſprit of a ſhip downward to the ſtem.

BOBARTIA, in *Botany*, a genus of the *triandria digynia* claſs of plants, the *calyx* of which is imbricated, and contains only a ſingle flower; the corolla is a glume, bivalve, and placed on the germen; the ſeed is ſingle, of an oval figure, and contained in the cup. There is one ſpecies.

BOBBING, or BOBBIN, a little piece of wood turned into a cylindric form, whereon thread is wound, to be uſed in the weaving of bone-lace.

The French alſo give the denomination *bobine* to what among us is more properly called a *ſpool* or *quill*. In which they are alſo followed by ſeveral Engliſh.

In this general ſenſe, *bobbins* are uſed to wind thread, worſted, hair, cotton, ſilk, gold, and ſilver; and they are of different lengths and ſizes, according to the materials which are to be wound.

BOBBING, among *fiſhermen*, a particular manner of FISHING for eels, different from *jagging*.

Bobbing for eels is thus performed: they ſcour well ſome large lobe, and with a needle run a twiſted line through them from end to end, taking as many ſtraw-ſhoes as will keep them about a board's diſtance at leaſt: when they ſo ſtem all to a ſtrong cord, and, pinch an hard lead and an half above the worms, to a plummet three quarters of a pound weight, and make the cord faſt to a long pole. With this apparatus ſilling in muddy water, they feel the eeling luſtily at the bait; when they think they have ſwallowed it ſufficiently, gently draw up the rope to the top and bring them aſhore.

BOBISATIO, or BOCEDISATIO, in *Muſic*, denotes the uſing of the ſeven ſyllables *bo, re, mi, fa, ſol, la, ſon, ni*, to expreſs the ſeven muſical notes, in lieu of the ſix uſual ones introduced by Arezine. *ut, re, mi, fa, ſol, la*, as has been ſometimes done by the Netherland and German muſicians ſince the beginning of the ſeventeenth century, to avoid the imitation neceſſary in the uſe of theſe latter.

BOCA, in *Ichthyology*, the name given by Paulus Jovius to the *box* of Ariſtotle, called the *bogue*, from the largeneſs of its eyes. It is a ſpecies of the SPARUS, and is diſtinguiſhed by having four parallel longitudinal gold and ſilver coloured lines on each ſide. Gesz and ſome others call it WEGE, and the Italians, *bega*.

BOCAMOLLE, in *Ichthyology*, a name given by ſome to a very large and long Braſilian fiſh, more uſually called by its Braſilian name, *ſurmulet-monſtrous*.

BOCARDO, in *Logic*, the fifth mode of the firſt figure of ſyllogiſm, wherein the firſt propoſition is particular and negative; the ſecond, univerſal and affirmative; and the third, or concluſion, particular and negative. Thus:

BOC *Some animal is not man.*
AR *Every animal has a principle of ſenſation.*
DO *Therefore ſomething has a principle of ſenſation, that is not man.*

BOCCA, in *Zoology*, a name by which ſome authors have called the fiſh, more commonly known by the name of the URANOSCOPUS, or STAR-*gazer*.

It is a ſpecies of the TRACHINUS, diſtinguiſhed from the other kinds by having a great number of beards on the lower jaw.

BOCCA, in *Glaſs-making*, the round hole in the working furnace, by which the metal is taken out of the great pots, and by which the pots are put into the furnace. This is to be ſtopped with a cover made of earth and brick, and removeable at pleaſure, to preſerve the eyes of the workmen from the violence of the heat.

BOCCALE, or BOCAL, a liquid meaſure uſed at Rome, anſwering to what among us is called a bottle, being equivalent to about an Engliſh quart. Seven *boccales* and an half make the *rubbio*.

BOCCARELLA, in the *Glaſs-manufacture*, a ſmall hole or aperture of the furnace, one of which is placed on each ſide of the BOCCA, almoſt horizontally with it. Out of them the furniture take coloured or finer metal from the piling pot.

BOCCONIA, in *Botany*, ſo called after Paul Boccone, a conſiderable botanical writer in Sicily; the name of a genus of the *dodecandria monogynia* claſs of plants; the characters of which are theſe: the flower hath four narrow petals, with a great number of very ſhort ſtamina; in the centre is ſituated a roundiſh germen, contracted at both ends, which afterward becomes an oval fruit, contracted at both ends, having one cell, full of pulp, including a ſingle round ſeed. There is but one ſpecies of this genus known at preſent, which is the branching *bocconia*, with a woolly cow-parſnip leaf; or as it is called by Sir Hans Sloane, the greater tree-celandine, with oak leaves.

It is very common in Jamaica, and ſeveral other parts of America, where it grows to the height of ten or twelve feet; having a ſtraight trunk, as large as a man's arm which is covered with a white ſmooth bark. The whole plant abounds with a yellow juice, like the greater celandine, which is of an acrid nature; ſo that it is uſed by the Americans to take off warts, and ſpots from the eyes. The ſingular beauty of this plant renders it worthy a place in every curious collection; and the Indians are very fond of it, for Hernandez tells us, their kings planted it in their gardens.

BOCE, in *Ichthyology*, ſee BOCA.

BOCKING *herrings*, in the *Dutch trade*, ſignifies the ſame with BLOATED herring among us.

BOCK-LAND, or BOOK-LAND, formerly denoted that which we now call FREEHOLD-*land*, or CHARTER-*land*; and it was by that name diſtinguiſhed from FOLK-*land*, which was COPYHOLD-*land*.

In *ancient law-writers*, it denotes a poſſeſſion or inheritance held by evidence in writing.

The word was doubtleſs written *bockland*, quaſi *bookland*, anſwering to the Latin *terra libellaria*, which was that held without writing.

BOLIANO, in *Ichthyology*, the name of an American fiſh, of the ſize of a perch, with a purple back, and yellow belly. It is more uſually known among authors by the name of DORADO.

BODLEIAN *Library*. See LIBRARY.

BODY, in *Zoology*, the name of a ſpecies of American ſnake of the *amphiſbæna* kind, called alſo IBIJARA.

BODY, in *Phyſics*, a ſolid, extended, paſſable ſubſtance; or ſuch merely paſſive, and indifferent either to motion or reſt, but capable of any ſort of motion, and of all figures and forms.

The word alludes to the Saxon *bodiȝ*, *ſtature*; and to the Belgic *body*, *a cover*, q. d. *the tabernacle of the ſoul*.

Body is compoſed, according to the Peripatetics, of *matter*, *form*, and *privation*; according to the Epicureans and Corpuſculariens, of an aſſemblage of ſolid, heavy *atoms*; according to the Cartheſians, of a certain quantity of *extenſion*; according to the Newtonians, of a ſyſtem or aſſemblage of ſolid, maſſy, hard, impenetrable, moveable *particles*, ranged or diſpoſed in this or that manner; whence reſult *bodies* of this or that form; diſtinguiſhed by this or that name.

Theſe elementary or component particles of *bodies* muſt be infinitely hard; vaſtly harder than the *bodies* compounded of them; nay, ſo hard as never to wear, or break in pieces. "Thus, Sir Iſaac Newton obſerves, it "neceſſary in order to the world's laſting in the ſame "ſtate, and *bodies* continuing of the ſame nature and "texture in ſeveral ages."

BODIES, *motion of*. See MOTION.

BODY, *affections of*. See AFFECTION.

BODY, *ends of*. See MARK.

BODY, *element of*. See ELEMENT.

BODIES, *the exiſtence of*, is a thing incapable of being demonſtrated in the order in which we arrive at the knowledge of their exiſtence ſeems to be this.—We firſt find we have ſenſations; we then obſerve we have ſuch thoſe ſenſations when we pleaſe; and theſe conclude, we are not the abſolute cauſe thereof, but that there is required ſome other cauſe for their production. Thus we begin to know, that we do not exiſt alone, but that there are ſeveral other things in the world together with us.—But this, Dr. Clarke owns, comes far ſhort of a demonſtration of the exiſtence of a corporeal world: he adds that all the proof we have of it is this; that God would not create us ſuch, as that all the judgments we make about things exiſting without us, muſt neceſſarily be falſe. If there be no external bodies, it follows, that it is God who repreſents the appearance of *bodies* to us; and that he does in ſuch a manner as to deceive us.—Some think this has the force of a demonſtration: "It "is evident God cannot deceive us; it is evident he "does deceive and delude us every moment, if there be "no *bodies*; it is evident, therefore, there muſt be *bo-* "*dies*."—But the minor of this argument may be denied without any ſuſpicion of abſurdity.

"In effect, were it poſſible for *bodies*, i. e. ſolid figured, &c. ſubſtances to exiſt without the mind, "correſponding to thoſe ideas we have of external ob"jects, yet how were it poſſible for us to know it? "Either we muſt know it by ſenſe, or reaſon; as for "our ſenſes, by them we have only the knowledge of "our ſenſations or ideas: they do not inform us, that "things exiſt without the mind, or unperceived, like "thoſe which are perceived. It remains, therefore, that "if we have any knowledge at all of external things, it "muſt be by reaſon inferring their exiſtence from what "is immediately perceived by ſenſe. But how ſhall "reaſon induce us to believe the exiſtence of *bodies* "without the mind, when the patrons of matter themſelves deny, that there is any neceſſary connection be"twixt them and our ideas? In effect, it is granted "on all hands, and what happens in dreams, phrenſies, "deliriums, extaſies, &c. puts it beyond diſpute, that "we might be affected with all the ideas we have now, "though there were no *bodies* exiſting without, reſembling them. Hence, it is evident, the ſuppoſition of "external *bodies* is not neceſſary for the production of "our ideas." Berkley's Princ. of Human Knowledge, p. 59. See ABSTRACTION and EXISTENCE.

Body generally ſtands contradiſtinguiſhed from *ſpirit*; though

though in Spinoſa's and the Chineſe ſyſtem, this difference is ſet aſide, and *body* and *ſpirit* ſuppoſed to be the ſame ſubſtance under different modifications. Mr. Hobbes likewiſe affirms *ſpirits* to be *bodies*, the evidences of any ſubſtance not corporeal being rejected by him. *See* alſo Dr. Priſtley on Matter and Spirit.

The Chineſe philoſophers reſolve all things among an infinite number of properties, all equally contained in the nature of beings, we are ſometimes affected with its extenſion, mobility, ſolidity, figure, and colour; to which we call a thing *body*, or material. Sometimes what we call a being being ſenſitiveneſs, ſpeech, we ſing; in which caſe we allow it a ſoul, mind, or ſpirit. On this footing, the ſeveral properties of being, however different from each other in the impreſſions they make on us, are no ways different as to their real nature; ſince they all exiſt peculiarly with an infinity of others, and partake alike of one and the ſame infinite and unalterable exiſtence. Semm. Acad. Inſcript. tome. ii. p. 364.

The true notion of *body* is hard to frame, and philoſophers are not yet agreed on it; the ſubject leads to the perplexing controverſy, *de compoſitione continuorum*. Some place the eſſence of *body* in ſolidity, or impenetrability; others in weight or gravity; others in both; others in mobility. According to the laſt, bodies in extenſion. It is deſired as ſomewhat that perfectly fills a determinate quantity of ſpace or extenſion, to as neceſſarily to exclude all other *bodies* from being comprehended within the ſame dimenſions. According to the ſecond, *body* is defined to be a thing which is receptive and communicative of motion or progreſſion. So W. Petty repreſents *body* as matter under ſome figure. The Carteſians define it any thing extended every way, or to conſiſt in all ſides. According to Wolfius, the eſſence of *body* conſiſts in its compoſition, or mechaniſm of parts, from which all its other properties reſult, even extenſion itſelf, ſince we cannot conceive a compounded *body* otherwiſe than as extended, or conſiſting of parts, at leaſt poſſible if not actual ones.

The laſt or internal PRINCIPLES of *bodies*, which are not reſolvable into others, are called ELEMENTS.

LIGHT or FIRE is found an ingredient in all *bodies*; which ſome indeed, eſpecially among the chemiſts, make to be the ſame with the principle of HEAT.

The Peripatetics maintain, that beſides the common matter of all *bodies*, there is ſomething in every ſpecies, which diſcriminates it from every other, and makes it what it is: this they call *form*; which, becauſe all the qualities, and other accidents of the *body*, muſt depend on it, they alſo imagine to be a ſubſtance, and indeed a kind of ſoul, that, united to the groſs matter, with it compoſes a natural *body*.

The motion of *bodies* is either *local* or *inteſtine*. The latter is not ſenſible; but may be inferred from a great number of operations. Dr. Hooke does not deſpair, but that, under farther helps and improvements of the organ of hearing, we may come at length to diſcern the inteſtine motions of *bodies* by the ear.

As to the *colours* of *bodies*, Sir Iſaac Newton ſhews, that *bodies* appear of this or that colour, as they are diſpoſed to reflect moſt copiouſly the rays of light originally endued with ſuch colours. But the particular conſtitutions, whereby they reflect ſome rays more copiouſly than others, remain yet to be diſcovered. However, ſome of the laws and circumſtances thereof he delivers in the following propoſitions.

1. Thoſe ſurfaces of tranſparent *bodies* reflect the greateſt quantity of light, which have the greateſt refracting power; i. e. which intercede mediums, that differ moſt in their refractive denſities: and in the confines of equally refracting mediums, there is no reflexion. 2. The leaſt parts of almoſt all natural *bodies* are in ſome meaſure tranſparent; and the opacity of thoſe *bodies* ariſes from the multitude of reflexions cauſed in their internal parts. 3. Between the parts of opake and coloured *bodies* are many ſpaces, either empty, or replete with mediums of different denſities; as water between the tinging corpuſcles wherewith a liquor is impregnated, air between the aqueous globules that conſtitute clouds or miſts: and even ſpaces void both of air and water, between the parts of hard *bodies*, are not wholly void of all ſubſtance. 4. The parts of the *bodies*, and their interſtices, muſt be leſs than of ſome definite bigneſs, to render them opake and coloured. 5. The tranſparent parts of *bodies*, according to their ſeveral ſizes, reflect rays of one colour, and tranſmit thoſe of another, for the ſame reaſon that thin plates or bubbles do reflect or tranſmit thoſe rays: and this appears to be the ground of all their colour. 6. The parts of *bodies*, on which their colours depend, are denſer than the medium which pervades their interſtices. 7. The bigneſs of the component parts of natural *bodies*, may be conjectured from their colours: on this principle, that tranſparent corpuſcles, of the ſame thickneſs and denſity with a plate, do exhibit the ſame colour. 8. The cauſe of reflexion is not the impinging of light on the ſolid or impervious parts of *bodies*, as commonly believed. 9. *Bodies* reflect and refract light, by one and the ſame power variouſly exerciſed, in various circumſtances. See COLOUR.

BODY, *fluid*, that whoſe particles cohere, or are ſome way connected to each other. See SOLID.

BODY, *fluid*, that whoſe particles eaſily ſlide over each other, and are of a ſo fine a conſiſtence as to be agitated by heat, or the leaſt force. 2. The cauſe of fluidity is not that whoſe particles do not cohere, but are eaſily put in motion by the ſmalleſt force.

BODY, *hard*, that whoſe ſurface is leſs alternately with eminences and cavities, in contradiſtinction from a *fluid body*.

BODIES, *ductile*, thoſe which being ſtretched, do not break, but extend one way as much as they ſhrink another. Of this ſome are hard and malleable, as metals; others, ſoft or viſcid, as glues, gums, &c. Mem. Acad. Scien. an. 1715. p. 228.

BODIES, *flexible*, thoſe which admit of being bent without breaking; ſuch are threads, wires, fibres, and even glaſs, when ſpun very fine. Theſe are contradiſtinguiſhed from brittle *bodies*.

BODIES, *ſpecific gravity of*. See GRAVITY, and WEIGHT.

BODY, *ſurd*. See DEAFNESS.

BODY, *rare*. See RARE.

BODY, *luminous or lucid*, that which emits its own rays, or ſhines by its own light.

BODY, *illuminated*, that which diffuſes the light of another by reflection, or which ſhines by borrowed light.

BODY, *opake*, that which intercepts the rays of light, or prevents their paſſage through it.

BODIES, *tranſparent, diaphanous, or pellucid*, that which tranſmits the rays of light. See TRANSPARENCY.

BODY, *the inertia of*, denotes that power whereby it reſiſts motion. See VIS inertiæ.

The mutual ACTION of *bodies* on each other is by Bacon reſolved into a principle of aſſimilation; by Hooke, into congruity and incongruity; by Newton, into that of attraction and repulſion; and by others, into that of affinity, or ſimilarity and diſſimilarity, &c. See Mem. Acad. des Scien. an. 1718. p. 256o.

BODIES, *ſimple*, thoſe which are not compounded of others: ſuch are the four elements, and the celeſtial *bodies*, ſuppoſed to be.

BODIES, *mixt*, thoſe formed of a mixture of the ELEMENTS. Theſe are divided by philoſophers into perfectly and imperfectly *mixed*.

Others divide mixt *bodies* into *ſimple* and *organical* MIXTS.

BODIES, *inorganical or ſimply mixt*, are thoſe, whoſe properties, powers, and actions depend ſolely on the temperature of the elements they are compoſed of: ſuch are minerals.

BODIES, *organical mixt*, thoſe whoſe functions are performed by means of the mechaniſcal ſtructure of the parts: ſuch are vegetables and animals.

BODY, *ſimple organical*, that which is not compoſed of any other organical *bodies* or parts.

BODY, *compound organical*, that whoſe component parts are organical *bodies*, being compound beings; and every compound being a machine, it follows, that every body is a machine. On which principle is founded the modern mechaniſcal philoſophy.

We may add, that what the Peripatetics call *mixt bodies*, ſome late writers, after Becker and Stahl, call *compound bodies*; which they ſubdivide into *aggregate*, *mixt*, and *compound* properly ſo called.

Thus, *mixed bodies*, according to theſe writers, are thoſe compoſed merely of principles; *compound bodies*, thoſe formed immediately of mixts into any determinate ſingle things; *aggregate bodies*, thoſe formed of ſeveral compounds into any entire parcel or ſyſtem. See AGGREGATE.

BODIES, *homogeneous*. See HOMOGENEOUS.

BODIES, *congruous*, thoſe whoſe particles have the ſame magnitude and velocity, or at leaſt harmonical proportions of magnitude and velocity.

BODIES, *incongruous*, thoſe which have neither the ſame magnitude, nor the ſame degree of velocity, nor an harmonical proportion of magnitude and velocity.

BODY, *hard*. See HARD.

BODY, *volatile*, that which riſes by the force of heat. See VOLATILE.

BODIES are divided into *animate* and *inanimate*; i. e. into thoſe informed by a ſoul, and thoſe which are not; or thoſe that have life and thoſe that have none.

Some conſider *bodies*, either as *natural* and *ſenſible*; viz. as formed by phyſical cauſes, and clothed by phyſical qualities (in which ſenſe, *body* makes the object of PHYSICS

PHYSICK): or, as *intellectual* or *quantitative*, in the general or abſtract; and according to three dimenſions: in which ſenſe, *body* makes the ſubject of geometry.

BODIES, *ſolidities, conſiſtences, ſolities, ſolids, heterogeneous, atmoſpheres of, deſcent of, mercury of.* See the ſeveral articles.

BODY, with regard to animals, is uſed in oppoſition to *ſpirit*, viz. for that part of an animal, compoſed of bones, muſcles, canals, juices, nerves, &c.

In which ſenſe, *body* makes the ſubject of comparative anatomy.

BODY, *the human*, conſidered with regard to the various voluntary motions it is capable of performing, is an aſſemblage of an infinite number of levers, drawn by cords if conſidered with regard to the motions of the parts it contains, it is another aſſemblage of an infinity of tubes, and hydraulic machines. Laſtly, if conſidered with regard to the generation of theſe ſame fluids, it is another infinite aſſemblage of chemical inſtruments and veſſels; as, phiſters, alembics, retaparets, ſerpentines, &c. and the whole is a compound which we can only admire, and wherein the greateſt part eſcapes our admiration itſelf. The principal chemical apparatus in the whole *body*, is that wonderful laboratory the brain: it is in this, the precious extract, called animal ſpirits, the only material inſtrument of the whole fabric, is ſecreted from the bloud.

In the machine of the animal *body*, the retainers to the doctrine of trituration maintain the *brain* to do the office of the beam of a preſs; the heart, of a piſton; the lungs, of a bellows; the mouth, of a mill-ſtone; and the teeth, of peſtles; the ſtomach, of a preſs; the inteſtines, of a refrigeratory; the veſſels, of ſieves or ſtrainers; and the air, of a *ſpring*, or ſpring, that ſets the machine a going.

The ſoul, Rohault obſerves, is not the form of the human *body*, as the Peripatetics aſſert. So far is animal life from depending on the ſoul, becauſe of its ceaſing when the ſoul is departed, that, on the contrary, the continuance of the ſoul depends entirely on the ſtate of the *body*; the former never quitting the latter, till its œconomy or order is interrupted.

The Carteſians maintain the ſoul and *body* to be too diſproportionate, for thoughts or ideas of the ſoul to be cauſed by the motions of the *body*, and *vice verſa*: thus their reciprocal motions, not being able to be the direct cauſe of the one and the other, are only deemed the occaſion, or occaſional cauſe. God, on occaſion of the motion of a *body*, impreſſes an idea or ſenſation on the ſoul; and again, on occaſion of an idea of the ſoul, communicates a motion to the *body*: of conſequence, God is the only agent in the whole intercourſe between ſoul and *body*.

According to Mr. Locke, there is no contradiction in ſuppoſing, that the firſt eternal thinking Being, ſhould, if he pleaſed, give to certain ſyſtems of created ſenſeleſs matter, put together as he thinks fit, ſome degree of ſenſe, perception, and thought: though it is no leſs than a contradiction, to ſuppoſe that matter (which is evidently in its own nature void of ſenſe and thought), ſhould be that eternal firſt thinking Being. Eſſay of Hum. Underſtand. book iv. chap. 3. § 6.

Phyſicians divide the *body* into ſolids and fluids. Alſo into *venters*, or cavities, the head, *thorax*, and lower venter.

The reſt of the *body* they call members, or extremities.

It appears that both the height and the breadth of the human *body* are actually different in different parts of the day; ordinarily it is an inch more in the morning than at night. The *body* ceaſes to grow in height, when the bones are arrived at a degree of firmneſs and rigidity, which will not allow of farther extenſion by the effort of the heart, and motion of the bloud. Phil. Tranſ. abr. vol. vii. N° 383.

This alternate increaſe and decreaſe of our *bodies* depends very much upon ſleep, meals, exerciſe, &c. and is greatly *involuntary*; but M. L'Abbé de Fontenu diſcovered by attention, that there are alſo alternate increaſes and diminutions both of the height and breadth of our *bodies*, that may be ſaid to be *voluntary*, becauſe they do not depend ſo much on ſleep, eating, &c. but only on the different poſtures into which we put ourſelves. V. *ut ſupra*; and Mem. of the A. D. S. an. 1725. H. 16.

BODY, *faculties of the*, ſee FACULTY.

BODY is alſo applied by anatomiſts to ſeveral particular parts of the animal fabric. As, the callous *body* of the brain, the cavernous or ſpongeous *bodies* of the *penis*, &c. See CORPUS *calloſum*, CORDORA *cavernoſa*, &c.

BODY, *reticular*. See RETICULAR.

BODY, in ſpeaking of a *horſe*, denotes the cheſt, but chiefly the *flanks*.

A horſe is ſaid to have a good *body*, when he is full in the flank; a light *body*, when he is thin or ſlender in the flank. If the laſt of the ſhort ribs be at a conſiderable diſtance from the haunch-bone, though ſuch a horſe may have a tolerable *body* for a time, if he be much labboured, he will loſe it. It is a general rule never to buy a horſe that is light-bodied and hoty, becauſe he will preſently deſtroy himſelf.

BODY *of a piece of ordnance*, that part comprehended between the centre of the trunnions and the eſcheals: ſtraight therein is to be more fortified than the reſt. See CANNON.

BODY *of a pump*, the thick eſt part of the barrel or pipe of a pump, within which the piſton moves.

BODY, in *Geometry*, denotes the ſame with SOLID.

BODIES, *regular or platonic*, are thoſe which have all their ſides, angles, and planes, ſimilar and equal. See REGULAR *bodies*.

Of theſe there are only five; viz. the *tetrahedron*, conſiſting of four angles; the *octahedron*, of eight; the *icoſahedron*, of twenty; the *dodecahedron*, of twelve pentagons; and the cuboe of ſix ſquares. See TETRAHEDRON, &c.

BODIES, *celeſtial*, are by ſome divided into two kinds, *ſolid* and *fluid*. See obſervations on their figures, by M. Maupertuis, in the Mem. of the A. D. S. an. 1734. p. 56.

Celeſtial ſolid bodies, are thoſe which appear or are ſenſible to us, either by their own light, or the light of others reflected from them.

Celeſtial fluid bodies, are only different kinds of ÆTHER, of which Hooke makes ſeveral, ſome more fluid and ſubtile than others.

BODY, *ſpiritual or pneumatic*, that which is not palpable or groſs enough for our feelings, as the air, light, &c.

BODY, in *Law*. A man is ſaid to be bound or held in *body and goods*: that is, he is liable to remain in priſon, in default of payment.

In France, by an ordonnance of 1667, all reſtraints of the *body*, for civil debts, are null after four months, unleſs the ſums exceed two hundred livres.

A woman, though in other reſpects ſhe cannot engage her perſon but to her huſband, may be *taken by the body*, when ſhe carries on a ſeparate trade.

BODY *of the place*, in *Fortification*, denotes either the buildings included, or more generally the incloſure itſelf.

Thus, to conſtruct the *body* of the place, is to fortify or incloſe the place with baſtions and curtains.

BODY is alſo uſed for an aſſemblage of ſeveral different things collected into one; more particularly a number of perſons united into a company or college.

A ſtate or nation, under the adminiſtration of one ſovereign, is called a *body politic*. All large empires are unnatural, becauſe the relation between the head and limbs is here too remote. No *body*, either natural or politic, can long remain ſound without exerciſe. See CORPORATION.

BODY, *corps*, in *War*, is an aggregate or aſſemblage of forces, horſe and foot, united and marching under ſome chief.

An army, ranged in form of battle, is divided into three *bodies*; the van-guard, the rear-guard, and the main *body*; which laſt is ordinarily the general's poſt.

BODY *of reſerve*, in the *Military art*, a draught or detachment of a number of forces out of an army, who are only to engage in caſe of neceſſity.

BODY, in matters of *Literature*, a name given to a collection of whatever relates to any particular ſcience: thus we ſay, the *body* of the canon law; the *body* of the Saxon law. King James I. had a deſign to compile a *body* of the Engliſh law.

The *body* of the civil law conſiſts chiefly of the Inſtitutes, Pandects, Code, and Novels. A *glоſſated* BODY, is that to which gloſſes are added in the margin, compoſed by ſeveral lawyers.

BODY is alſo uſed figuratively for conſiſtence, ſolidity, and ſtrength. In this ſenſe, we ſay the *body* of a cloth, wine, &c.

Vintners have divers arts of increaſing or diminiſhing the *body* of wine.

BODY, among *Painters*.—A COLOUR is ſaid to *bear a body*, when it is capable of being ground ſo fine, and mixing with the oil ſo entirely, as to ſeem only a thick oil of that colour; as white lead, lamp black, vermilion, lake, indigo, &c. But verditers, ſmalts, &c. will not embody with the oil, but are ſtill apt to ſeparate from it in working.

BOEDROMIA, in *Antiquity*, from *βοηδρομεω*, *helper*, derived from *βοαω*, *I cry*, and *δρομος*, *I run*; ſolemn feaſts held at Athens, in memory of the ſuccour brought by Ion to the Athenians, when invaded by Eumolpus ſon of Neptune, in the reign of Erectheus.

Plutarch gives another account of the *Boedromia*, which

according to him, were celebrated in memory of the victory obtained by Theseus over the Amazons, in the month *Boedromion*; which was, in the antient chronology, the third month of the Athenian year. It consisted of thirty days, and answered to the latter part of our August and beginning of September.

BOERHAAVIA, in *Botany*, See HOG-*weed*.

BOG, a moist, rotten spot of earth, which sinks and gives way to the weight of the body, formed of grass and plants putrefied by some spring, frequent, especially in Ireland.

The word may be derived from the Italian *bocca*, a *hollow*, or rather from the Belgic *boegen*, to *bend*, on account of its giving way when trod upon.

In this *sense*, *bog* amounts to much the same with what in other places are called *moffy*, *fourfy*, *fenny*, &c.

In Ireland they diftinguifh between a *curf-bog*, called alſo *red-bog*, out of which turf or peat is dug; and a *quaking-bog*, which will ſink under a man in the place where he ſtands to a conſiderable depth, and rife before and behind proportionably: underneath, is frequently clear water, into which a perſon often falls to the middle, upon breaking the ſurface. *Quaking-bogs* frequently turn into *caſtlebogs*.

Every *red-bog* is encompaſſed with a deep marſhy ſloughy ground, called the *bounds of the bog*. Horns and ſkeletons of moofe-deer are ſometimes found in *bogs* fourteen feet deep.

The inconveniences of *bogs* are, that a conſiderable part of the kingdom is rendered uſeleſs by them: they alſo keep people at a diſtance from each other, and thus hinder buſineſs from going forward. They occaſion the roads to be crooked and circuitous to avoid them: they are a great deſtruction to cattle, the chief commodity of Ireland; which are encouraged by the graſs growing on the ſides of the *bogs*, to venture in, where they are loſt. The ſmell and vapour ariſing from them are accounted unwholeſome, and the logs putrid and ſtinking. Add, that they corrupt the water, both as to its colour and taſte.

Bogs have alſo their uſes: moſt of the people in Ireland have their living from them; the wood being immediately adjoyned, and little procured yet different. The Iriſh could hardly do without ſome *bogs*. The natives had anciently another advantage from *bogs*; viz. that by means of them they were preſerved from the conqueſt of the Engliſh: and it ſeems to be from the remembrance of this that they ſtill chooſe to build near *bogs*.

As to the origin and formation of *bogs*, it is to be obſerved, that there are few places, in the northern world, which have not formerly been as famous for them as Ireland now is: every wild, ill-inhabited country has them: the *loca paluſtria*, or *paluſtres*, to which the ancient Gauls, Germans, and Britons retired when beaten, appear to be no other than what we now call *bogs*. The like may even ſtill be found in the barren parts of Italy, as Liguria.

Boggy lands upon levels are generally called *fens* with us; and what our farmers particularly underſtand by the term *bog-land*, is that ſort of *bog* which lies among hills, or between two eminences, and has deſcent enough to drain it, if the water could get off.

The true cauſe of *bogs*, then, ſeems to be the want of induſtry; at leaſt it is certain induſtry may remove, and much more prevent them. There are many *bogs* of late ſtanding in Ireland, formed through the miſeries of the times, and the deſolation of civil war. It is no wonder if a country remarkable for lazineſs ſhould abound with them.

To ſhew how want of induſtry cauſes *bogs* it muſt be remembered, that Ireland abounds with ſprings; that theſe ſprings are dry, or nearly ſo, in the ſummer time; and that the graſs and weeds grow thick about the places where they burſt out: in the winter the ſame ſprings ſwell again, and run, and ſoften and looſen the earth about them: and the *ſword*, or ſcurf of the earth, which conſiſts of the roots of graſs, being lifted up and made fuzzy by the water, becomes dried againſt the ſpring: and does not fall together, but withers in a tuft, and new graſs ſprings through it; which, the next winter, is again lifted up: thus the ſpring is more and more ſtopt, and the ſcurf grows thicker and thicker, till it firſt makes what we call a *quaking-bog*: and as it grows higher and drier, and the graſs-roots and other vegetables become more putrid, together with the mud and ſlime of the water, it acquires a blackneſs, and grows into what we call a *turf-bog*.

What confirms this account is, that *bogs* are generally found higher than the land about them, and the higheſt in the middle; the chief ſprings which cauſe them being commonly about the middle; from whence they dilate themſelves by degrees, as one would blow a bladder; but not always equally, becauſe they ſometimes meet with greater obſtacles on one ſide, than on the other.—Add, that if a deep trench be cut through a *bog*, you will find the bottom ſtone, and vaſt quantities of water will run from it, and the *bog* will ſubſide; ſometimes a dozen, or fifteen, ſome even forty, thirty feet. Laſtly, thoſe hills which have no ſprings, have no *bogs*; and thoſe which have ſprings, and want culture, are never without them. In brief, wherever *bogs* are, there are great ſprings: the turf generally diſcovers a vegetable fatneſs, and fuperfluous moiſture; and ſuperficial water, where the ground admits it to ſtay perviouſly.

If it ſhould happen that ſome pool or lake caſted other ſoils, as, when a ſtream or ſpring runs through a *bog*; the paſſage is not ſtopped, it is filled with weeds in ſummer, green ſoft aſhes, &c. and dam it up: then, in winter, the water ſtagnates farther and farther every year, till the whole *bog* be overgrown: next, there ariſes a coarſe kind of graſs peculiar to theſe places, it grows in tufts, and the roots conſolidate vegetables and yearly grow higher, inſomuch as ſome ſhoots to reach the height of a man: this graſs lies in winter, and falls on the tufts, and the ſeed with it, which ſprings up next year, and then comes a new addition: ſometimes the tops of flags and graſs are interwoven on the ſurface of the water, and become by degrees thicker and thicker like a cover on the water; other herbs take root in it, and by a plexus of their roots it becomes ſtrong enough to bear the weight of a man.

Another cauſe of *bogs* is moſs, with which Ireland abounds extremely. That which grows in *bogs* is remarkable; the higheſt and more mentioned being nothing but a congeries of the threads of this moſs, which is ſometimes in ſuch quantities, and ſo rough, that the turf-ſpades cannot cut it. In the north of Ireland they call it mid-wives moſs, not being much unlike flax. The turf-holes in time grow up with it again, and all the little gutters in *bogs* are generally filled with it. In reality, to this the red or *turf-bogs* ſeem to be chiefly owing.

For the draining of *bogs*, to render them fit for paſture or arable, it is not impoſſible; the ſame having been performed in England, France, Germany, &c. People commonly diſtinguiſh between *bogs* which have no fall to carry away the water from them, and thoſe which have: the laſt are reputed drainable, the former not. But Mr. King aſſures us, he never obſerved one *bog* without a fall ſufficient to drain it, nor does he believe there is any. In reality, the great objection againſt draining is the charge; which, it is commonly reckoned, will amount to much more than would purchaſe an equal quantity of good ground: for an acre of this laſt, in moſt parts of Ireland, is not worth above *ſix pence*, and fourteen or fifteen years purchaſe; ſo that three pounds will buy an acre of good land: and it is very doubtful with moſt, whether that ſum will reduce a *bog*: this reaſoning paſſes current, and is the great impediment of this work.

To this it is anſwered, that *quaking-bogs*, though land be ever ſo cheap, never fail to be worth draining: one trench will drain many acres; and when dry, it is generally meadow, or the beſt grazing ground. Again, the bounds of a *red bog* never fail to be worth the draining; being done by one deep trench drawn round the *bog*: by this, cattle are kept out of the *bog*, and the bounds turned into meadow. Add, that *even red-bogs* might be made fit for grazing at a much cheaper rate than has hitherto been done, by a proper conduct in the digging of trenches, particularly deſcribed by Mr. King, Phil. Tranſ. N° 170. p. 928. See alſo N° 330. p. 305. and N° 344. p. 59. Plot's Hiſt. Oxf. chap. ix. § 81, &c.

In ruſhy grounds, the ſprings are commonly found to lie within a foot or two of the ſurface, when any thing of ſtony-nets or ſmall gravel is to be found, and ſometimes conſiderably lower in a hungry gravel; but it is always lower in *boggy* ground than in ruſhy, and is deep, according to the weight of earth that pens it in. The beſt way is to begin the drain at the loweſt place, and ſo carry it in towards the ſpring-head, where three muſt be made ſuch trenches, either round or croſs the *bog*, as ſhall be found neceſſary to the draining of it thoroughly.

If it be neceſſary to make ſuch large and deep drains, that there is danger of the cattle's falling into them, they may be filled up with ſtones or brick-bats, and theſe covered with boards, and the turf laid over them. The cavities among the ſtones will give paſſage to the water, and the turf will grow at top, as if nothing had been done.

It

It is a common practice to make a bank with the earth dug out of the trench, laying it on the side; but this is extremely wrong. If the trench be small, the earth dug out of it should be carried away in wheel-barrows; and if large, it should be spread upon the lowest places of the *bog*, where there is room for it.

Another excellent method is to make the trenches about a yard deep, and two feet wide, laying at the bottom of them green black-thorn bushes, and over these a stratum of large and round stones, or at least of such as cannot lie close; over these lay another *stratum* of thorn bushes, and then place a quantity of straw, to keep the dirt from falling in and filling them up. By this means the trench will be kept open, which otherwise will naturally swell, and fill up of itself.

BOG, *moving* or *wagging*. These soft masses of earth have been sometimes known to move out of their place. An instance of this there was in Ireland, in the year 1697, about Charleville in the county of Limerick. There was heard for some time a noise under ground like that of thunder at a great distance, or almost spent; and soon after this the earth of a large *bog* in the neighbours hood began to move, and still all resting situated in the middle of it stood no longer above the level of the full, but sunk flat.

The *bog* not only moved itself, but moved with the neighbouring pasture lands, though separated by a large and deep ditch; the motion continued a considerable time, and the surface of the moving earth rose into a sort of waves, but without breaking up or bursting any where. The pasture-land rose very high, and was carried on in the same motion till it rested upon a neighbouring meadow, the whole surface of which it covered, remaining fifteen feet deep upon its surface. The whole quantity of the *bog* was risen from its former seat, and left great gaps in the earth *where it had joined*, which threw in *fresh water, and very stinking vapours*. Phil. Trans. N° 232.

All the country came in to see so strange a sight as this, for it continued moving a long time; but few guessed the true cause of it, which was this: a more than ordinary wet spring occasioned the rising of the *bog* to a great height in one part, and thence propagated itself through the whole *bog*; so that the hill in the midst was undermined, and naturally sunk flat; this and the more than ordinary weight of this large *bog* pressing upon the adjoining pasture land, forced up its foundations, which were only a loose sand. This was pushed on sideways where there was a descent from the *bog*, and at length having given the *bog* more room, all was quiet and remained in that state. The *bog* was more than forty acres of ground.

BOG-*bean*, see *Bog*-BEAN.

BOG-*berry*, see WHORTLE-*berry*.

BOG-*wood*, see WOOD, *subterraneous*.

BOGA, in *Ichthyology*, a name given by many to a fish caught in the Mediterranean, and sold at Naples and Messina, called among authors BOOPS. It is a species of the SPARUS.

BOGOMILI, or BOGARMITE, a sect sprung from the Manichees, or rather from the Massalians, toward the close of the twelfth century; whose chief, Basil, was burnt alive by order of the emperor Alexius Comnenus.

Du-Cange derives the name from two words in the Bulgarian language; *Bog*, *Deus*, and *milui*, *misereri*, *have mercy*.

The *Bogomili* denied the Trinity; maintaining that God had a human form; that the world was created by evil angels; and that it was the archangel Gabriel that became incarnate. They rejected the books of Moses, and only admitted seven books of scripture: they maintained the Lord's Prayer to be the only eucharist; that the baptism of the Catholics was only that of John, and theirs that of Jesus Christ; and that all those of their sect conceived the Word, or *Logos*, as much as the Virgin, denying the reality of Christ's body. Lastly, that there was no other resurrection but repentance.

BOHEA, see TEA.

BOHEMIAN *Brethren*, is an appellation anciently given to the protestants of Bohemia.

Lutrius has a treatise De Gestis Fratrum Bohemicorum. Camerarius has also given the history of the *Bohemian Brethren*, from whom ecclesiastical historians have derived a large train of sects, as the Hussites, Adamites, Taborites, Calixtins, &c.

BOHEMIAN *chatterer*, in *Ornithology*, a bird that visits this island perhaps once in twenty years. See Phil. Trans. vol. lxii. N° 20. p. 312. an. 1772.

It is also called AMPELIS, GARRULUS, and ROLLER.

BOJA, in *Antiquity*, a collar or chain fastened about the necks of criminals, to prevent their escape.

The word is also written *boye*, *boia*, and *boge*.

BOICININGA, in *Zoology*, a name by which the Brasilians call the RATTLE-SNAKE.

BOIGUACU, in *Zoology*, the name of a species of serpent, called also *boa*, and by the Portuguese *cobra de vonte*.

This is the largest of all serpents, growing to twenty-four feet long and more, and preying on large animals. It is very thick in the middle of the body, and smaller both at the head and tail. It is of a very beautiful variegated colour. Down the middle of the back runs a chain of black spots, about a handsbreadth distant from one another, each having a spot of white in its middle; and below these are two other rows of smaller black spots towards the belly. It has in each jaw two rows of very sharp teeth white as pearl. Its head is very broad, over the eyes it rises into two protuberances; and in some of this species there are two claws, like those of birds, behind the anus towards the tail.

This is a very terrible creature, and will seize on a man, and either lies in ambush in thickets or on the branches of large trees, from which it throws itself on its prey. It has no venom in its bite; and its flesh is eaten, and esteemed a great delicacy.

This serpent is common in the Brasils. Authors give surprising accounts of its size: Bontius preferved the skin of one which himself had killed, which was twelve yards long; and relates, that there was once a serpent of this kind killed in Java, which was thirteen yards and a half long, and had, when killed, a boy in its belly. And De Laet relates, that in the Rio de la Plata, there are some of them to large, that they will swallow a stag whole, horns and all. The natives and Hollanders make them a part of their food.

BOIL, or FURUNCLE, in *Medicine*, is a small swelling preceded with inflammation, redness, and great pain arising in the *membrana adiposa* under the skin. As there is no part of the body free from being the subject of this TUMOUR, so the whole body is sometimes so miserably infested with them, that the patient knows not how to stir, or on what part to lie. Young infants and adults are equally liable to this disorder; and though in adults there is seldom any great danger in it, yet it sometimes happens when they are very numerous in tender infants, that they not only excite violent pains, restlessness, and vomings, with great weakness, convulsions, and epilepsies, but death itself sometimes follows them.

The principal cause of *boils*, is a too plethoric and inspissated state of the blood, and the cure of them principally depends upon the restoring of the blood to its due consistence and proper circulation. People who are very subject to these tumors should bleed and take purging medicines at proper intervals, and drink plentifully of warm and weak liquors, abstaining from wine, strong spirituous liquors, and from the use of tobacco.

When the disorder is recent or not habitual, external remedies alone are sufficient for the cure: honey mixed to a proper consistence with spirit of vitriol is a very good external application. The touching of the *boils* with spirit of vitriol alone, is often also of great service; and sometimes the discutient plasters are to be applied, as the diachylon, spermaceti, and soap plaster. If these applications, however, do not prove successful in the dispersing of a *boil*, the only method to be taken, is that of bringing it to suppuration. This, however, in some cases is no easy talk, but the tumor remains sometimes very hard and troublesome, even after a proper treatment of many weeks, and sometimes the humour that occasions it becomes so acrimonious, by its long tension, and great inspissation, that it produces ulcers, which grow gradually worse and worse, till at length they end in incurable *fistulæ*. To promote and quicken the suppuration, it is generally found of great service to apply plasters of diachylon with the gums, and of honey and flour mixed, and made to a proper consistence; and where these prove insufficient, maturating cataplasms are to be applied, and very frequently repeated. When the *boil* is sufficiently matured by one or other means, which will be known from the softness and yellowness of its head, it must be opened by incision, and when the matter it contained is discharged, the ulcer must be daily cleansed, till perfectly freed from all malignity, and then healed with the vulnerary balsams.

When infants which suck are afflicted with *boils*, the proper method is to give cooling medicines and purges to the nurse, and enjoin her a due regimen in diet; and the infant should at the same time be got to take some gentle laxative, and the absorbent powders, as those of crabs-eyes and the like, to allay the acrimony of its juices.

BOLE, *gum*, see GUM.

BOILED, or BOYLED *fish*, those which have been put, while in the balls, into hot water, to make them wind the better.

In which ſenſe, *boiled fiſh* ſtands oppoſed to *raw*.

BOILER, or BOYLER, a large copper veſſel, wherein things are expoſed over the fire to be boiled.

The *boiler* in the alum-works is a veſſel, in which the liquor is evaporated to a conſiſtence, and is made of lead. The general ſize is about eight feet ſquare, and they contain about twelve tuns each.

They make them in this manner: firſt they lay long pieces of caſt iron, twelve inches ſquare, as long as the breadth of the *boiler*, and about twelve inches diſtance from one another. Theſe are placed twenty four inches above the *ſurface* of the *fire*. On theſe ſmall bars of iron they lay, croſs-wiſe, the common flat bars of iron, as cloſe as they can lie together, and theſe make up the ſides with brick-work. In the middle of the bottom of this *boiler* is laid a trough of lead, wherein they put at firſt about a hundred pound weight of the rock. They uſe Newcaſtle coals in the BOILING; and if they find the liquor not ſtrong enough, they add more of the rock at times, as it boils. Phil. Tranſ. N° 142.

The *boiler* for making colours, &c. muſt be made of pewter; becauſe iron and copper will be corroded by the ſaline ſubſtances uſed in the manufacture of them.

BOILERY, or BOILARY, in the *Salt Works*, denotes a ſalt-houſe, pit, or other place, where SALT is made.

BOILING, or BOYLING, *ebullition*, in *Phyſics*, the agitation of a fluid body, ariſing from the application of fire, &c.

The *phenomenon* of *boiling* may be thus accounted for: the minute particles of the fuel being detached from each other, and impelled in theſe, with a great velocity (i. e. being converted into fire), paſs the pores of the containing veſſel, and mix with the liquid. By the reſiſtance they here meet with, their motion is deſtroyed; i. e. they communicate it wholly to the quieſcent water; hence ariſes, at firſt, a ſmall inteſtine motion in the waters, and from the continued action of the firſt cauſe, the effect is increaſed, and the motion of the water continually accelerated: ſo that this water, by degrees, becomes ſlightly agitated. But now the particles of the fire ſtriking on theſe in the lower ſurface of the water, will not only give them an impulſe upwards, contrary to the laws of *equilibrium*, but will likewiſe render them ſpecifically lighter than before, ſo as to determine them to aſcend according to the laws of *equilibrium*; and this either by inflating them into little veſicles, by the attraction of the particles of water around them; or by breaking and ſeparating the little ſpherules of water, and ſo increaſing the *rare* of their ſurface to their ſolid content. There will therefore be a conſtant flux of water from the bottom of the veſſel to the top, and conſequently a reciprocal flux from the top to the bottom; i. e. the upper and under water will change places; and hence we have the reaſon of that *phenomenon*, of the water's being hot at top ſooner than at bottom.

Again, an intenſe heat will diminiſh the ſpecific gravity of water, ſo as not only to make it mount in water, but alſo in air; whence ariſe the *phenomena* of vapour and ſmoak; though the air incloſed in the interſtices of the water muſt be allowed a good ſhare in this appearance: for that air being dilated, and its ſpring ſtrengthened by the action of the fire, breaks its priſon, and aſcends through the water into the air; carrying with it ſome of the contiguous ſpherules of water, ſo many as ſhall hang in its *wake*, or can adhere immediately to it.

The particles of air in the ſeveral interſtices of the fluid ma's thus expanded, and moving upwards, will meet and coaleſce in their paſſage; by which means great quantities of the water will be heaved up, and fall again alternately, as the air riſes up, and again paſſes from the water: for the air, after coalition, though it may buoy up a great heap of water, by its elaſticity while in the water; yet cannot carry it up, together with itſelf, into the atmoſphere; ſince, when once got free from the upper ſurface of the water in the veſſel, it will unbend itſelf in the atmoſphere, and ſo its ſpring and force will become juſt equal to that of the common unheated air. Add to this, that were the ſpring and motion of the air ſufficient to carry up the water with it, yet it would not have that effect; but the water would run off at the extremities of the air; all, except ſo much as ſhould be either entangled in its *wake*, or immediately adhere to its ſurface by attraction: and hence we ſee the reaſon of the principal *phenomena* of *boiling*, viz. the fluctuating of the ſurface of the water. Boiling water diſpoſes it to freeze more readily. See WATER.

We generally annex the idea of a certain very great degree of heat to the *boiling* of liquids; but this does not ſeem to be a connection of nature's making, but of our own. It is reported by many, that a veſſel of tar being ſet over the fire till it *boils*, a perſon may, while it is *boiling*, put his hand into it without any injury; and that the artificers who uſe and prepare this commodity, know this property of it ſo well, that they uſually take the ſcum from their pots off it, while *boiling*, with their naked hands.

Water, in the receiver of an air-pump, when exhauſted, will *boil* without any great heat. The receiver ſhould, for this experiment, be one part full of water, and three empty; in this caſe, the flame of a candle being placed under the veſſel, the water will *boil* violently, inſomuch the glaſs itſelf is ſcarce warm; and when the water has been thus kept *boiling* a quarter of an hour, the glaſs will ſcarce be any thing the hotter for it. When the candle is taken away, the water will ſtill continue a great while *boiling*, and when it ceaſes firſt, will renew itſelf again from time to time to a very great ebullition. All the bubbles that riſe out of the water on this occaſion, do not raiſe the mercury in a gage to any ſenſible height. Spirit of wine, in the ſame manner, *boils* much ſooner *in vacuo* than the water, and in this ſtate will raiſe the mercury in the gage to an inch higher than its former ſtand. If the receiver containing it in this *boiling* ſtate, be plunged into cold water, the liquor inſtead of becoming calm, *boils* more ſtrongly than before. It might be ſuppoſed that this *phenomenon* was owing to a *freezing*; but we have more ground to ſay it came from hence, that the vapours of the ſpirit were more condenſed, and ſo made the receiver more empty, which is ſufficient to make the ſpirit of wine *boil*, though it were not hot, as liquors uſually do when put into the engine, and the air exhauſted. In all theſe, and many other caſes, *boiling* is induced without that heat, which is ſuppoſed a neceſſary concomitant of it. Phil. Tranſ. N° 152.

ALABASTER, in *boiling*, will ſwell a ſixth or eighth part above the top of the pot.

Different fluids require different degrees of heat to make them *boil*. Dr. Freind gives a table of the different times required to make ſeveral fluids *boil* by the ſame heat.

WATER, when once brought to *boil*, is not ſuſceptible of any further degree of heat, however the fire be increaſed; but this differs according to the weight of the atmoſphere, and the purity of the water.

BOILING *of ſilk with ſoap* is the firſt preparation in order to dying it. Thread is alſo *boiled* in a ſtrong *leyſium* of aſhes, to prepare it for DYEING.

Boiling is alſo part of the proceſs of BLEACHING warp linens.

BOILING *to death*, *cadendæ decoquere*, in the *Middle Age*, a kind of puniſhment inflicted on falſe coiners, thieves, and ſome other criminals.

This puniſhment was inflicted on thoſe who were guilty of murder by poiſon, 22 Hen. VIII. cap. 29. but this act was repealed by 1 Edw. VI. cap. 12.

BOILING is alſo a method of trying or aſſaying the goodneſs or falſeneſs of a colour or a dye, by *boiling* the ſtuff in water with certain drugs, different according to the kind or quality of the colour, to try whether or no it will diſcharge, and give a tincture to the water.

With this intention, red crimſon ſilks are *boiled* with alum, and ſcarlets with ſoap, in quantity equal to the weight of the ſilk.

BOILING *waters*, in *Natural Hiſtory*. See SPRING, and WATER.

BOIOBI, in *Zoology*, the name of a ſpecies of ſerpent found in America, and called by the Portugueſe *cobra de vaad*. It is about an *ell* in length, and of the thickneſs of a man's thumb, and is all over of a very beautiful and ſhining green. Its mouth is very large, and its tongue black. It loves to be about houſes, and never injures any creature unleſs provoked or hurt; but it will then bite, and its poiſon is very fatal. The natives take, as a remedy againſt its poiſon, the root CAA-APIA bruiſed and taken in water.

BOIQUIRA, in *Zoology*, a name by which the natives of ſome parts of America call the RATTLE-SNAKE.

BOITIAPO, in *Zoology*, is a ſerpent of Braſil, called by the Portugueſe *cobra de cipo*. It is ſeven or eight feet long, as thick as a man's arm, round and pointed toward the tail, like a ſhoemaker's awl. It is covered with fine, and as it were, triangular ſcales; and is of an olive colour, and yellowiſh. It lives upon frogs, &c. and its bite is dangerous, like that of many other ſerpents.

Its fleſh might be as effectually uſed as that of the viper for purifying the blood; and as an alexipharmic.

BOLBONACH, in *Botany*. See HONEWORT.

BOLE, in *Medicine*, is applied to ſeveral kinds of earth that enter ſome of the Galenical compoſitions.

Boles are native foſſile earths, uſually ſomewhat unctuous ſo that when mixed up with water they may be wrought into a paſte; but are not ſoluble either by water or fire. Such are argill, or white clay, *cacunpia terræ*, or *cimolia*, *lunæ*, *cimolia*, fuller's earth, *boles* white and Armenia

the Chian, Eretrian, Lemnian, and Maltese earths, ruddle, Samian, Silesian, Tocravian, Bohemian, French, and all the fealed earths. But these are others of a drier and leaner kind, as chalk, ochre, and marle.

The *boles* are flightly ductile, but not viscid, nor do they burn to fuch a ftony fubftance as the clays, which are the diftinguifhing characteriftics between the *boles* and the CLAYS. Mr. De Coſta diſtributes them according to their colour, into the white, the aſh-coloured, the red, the yellow, the brown, and the green; and he again ſubdivides each ſort into ſuch as are not acted upon by acids and the alkaline *boles*.

The chief medicinal uſes of *boles* are as aſtringents to ſtop bleedings. They are generally hurtful in fevers, eſpecially epidemical ones, and externally in the hæmorrhoids, &c. *Bole* earths ſeem diviſible into two ſpecies, according as they are more or leſs tenacious; in which view loam and clay may repreſent them all. Even theſe two ſeem only to differ in reſpect of the fineneſs or coarſeneſs of their component parts, which renders them more or leſs tenacious, clinging or adhering. To make a true judgment of the quality of this kind of earth, the following experiment may be uſeful.

Common loam was mixed into a maſs with water, and then dried, to ſhew that compared with clay, it would eaſily break, crumble, and fall to powder; but beating ſome loam fine in a mortar, and mixing it well with water, it clung like clay; and when dried, adhered more tenaciouſly than before.

This ſhews that not only loam and clay, or all the *bolar* earths, are partly the ſame things, when their component parts, or gravelly and ſandy matters, are reduced to the ſame degree of fineneſs: but alſo ſupplies us with a plain and ſimple rule for the improvement of the art of pottery, and the imitation of China ware; and perhaps certain curious *boles* may afford very delicate matters for pottery wares; and that of variety of colours not leſs curious than the whites: nor is it altogether clear, why that colour called the yellow, muſt be the chief *baſis* of the art. The rule is, to grind or beat the earths employed, to an extreme degree of fineneſs; and accordingly porcelane has been imitated in Europe by tobacco-pipe clay, and other earths, exceedingly fine ground, mixed into a paſte with water, and properly baked and burnt.

Marles, or *boles*, alſo afford a fit matter for the making of crucibles, retorts, &c. They likewiſe ſerve to procure the diſcontinuation and diviſion of certain ſalts, and other materials, that would otherwiſe riſe, and boil over in the operation. Theſe are therefore employed in the diſtillation of NITRE, TURPENTINE, WAX, &c.

They contribute likewiſe more materially, more intimately, and eſſentially as to quantity, in the fixation of certain bodies in chemiſtry; as of oils, for example, of common ſulphur, and even of mercury: for which, ſee Becher's firſt Supplement to his Phyſica Subterranea.

There are chiefly two ſorts of *bole* uſed in medicine, the *Armenian*, and the *common*.

BOLE *Armeniac*, or the *Armenian* BOLE, is a ſoft, friable, fatty earth, uſually of a pale red colour; though there are two other kinds, a yellow and a white. They are all eaſily pulverized, and adhere to the tongue.

This, popularly, though corruptly, called in Engliſh, *bole Armoniac*, is called, by the naturaliſts, *Armenia terra*, or *Armenian clay*.

The true hiſtory of this ſubſtance is this: there are three kinds of it, the *white*, the *yellow*, and the *red*, which have been all in repute in different ages of medicine, but of which the laſt only is now thought of. The firſt or *white* BOLE *Armoniac* was in uſe very early in the world, though under a different name, the ancients calling it the *white Eretrian* EARTH. This was uſed in the days of Dioſcorides. The ſecond, or *yellow*, was introduced by Galen, and given in the great plague at Rome in his time. The third, or *red* kind, is the BOLE *Armoniac* of Avicenna, which we alſo pretend at this time to uſe; but very little of it is to be found genuine among us.

The *white* BOLE *Armoniac*, called *white Eretrian* EARTH by Dioſcorides, to diſtinguiſh it from the grey earth of the ſame place which was recommended as a noble aſtringent and ſudorific, and highly valued on account of its peculiar alkaline quality, is a fine, ſoft, and pure earth, moderately heavy, and of a cloſe, compact texture, of a clear, bright white colour, adhering ſtrongly to the tongue, inſipid to the taſte, and melting like butter in the mouth. It burns to a ſtony hardneſs, without changing colour, and makes no effervescence with acid menſtrua. This ſeems of all foſſile ſubſtances, to approach the neareſt to the nature of pure earth. This *bole* was in high eſteem among the Greek and Roman painters: it is now dug in the eaſtern part of Armenia; but is found in no great plenty, there being only one *ſtratum* known of it, and that not very thick. It is now chiefly ſupplied from Norway, and places nearer of acceſs.

This is eſteemed a ſudorific, and by ſome aſtringent, but without foundation; for, as it appears from Neumann's experiments, that it differs from the two other kinds, in containing no ſtrong matters, it muſt want alſo their aſtringency; and from the ſame experiments it appears, that it can be no more abſorbent than the other *boles*; and laſt as little preſence have any of them all to the antipeſtilential and alexipharmic qualities, for which they have been celebrated. See an account of their examination, both by acids and diſtillation, in Neumann's Works, p. 22, & ſeq.

Some have a method of recovering the luſtre of pearls, eſpecially the Scotch ones, by warming them a little over the fire, and rubbing them with powdered *white* BOLE, Neumann.

The *yellow* BOLE *of Armenia*, or the BOLE *Armenic* of Galen, is a very fine and beautiful earth, of a cloſe, compact texture, naturally of a ſmooth ſurface, and very hard. It is heavier than any other of the yellow earths, and is very ſoft to the touch. It is readily diſſuſible in water, and remains long ſuſpended in it; adheres ſtrongly to the tongue, melts ſlowly in the mouth, and is of a very manifeſtly aſtringent taſte. It ferments very briſkly with acid menſtrua, and does not become red or burning. There have been many diſputes about the place whence this excellent drug was brought: Aetius will have it to be from the mountain Hagiouſa in Armenia; Cardan, only from the iſland of Samos; and others, from other places; but it is found to this day in Armenia; to the north-eaſt of Erzeron, in vaſt abundance. It ſeems the moſt valuable of all the medicinal earths. Experience proves it to be a very noble aſtringent. Many authors extol it highly as a ſudorific and alexipharmic; and Galen reports of it, that it often ſuddenly cured the plague, and that thoſe whom it did not cure, were relieved by no other medicines. It would be extremely worth while to encourage the uſe of this drug as it may be had in any quantities; for much of it is carried to Germany every year, and ſometimes a little of it is brought to us: and, when this is the caſe, our druggiſts, not being uſed to a *pale* earth, *Armenic*, ſell it under the name of red to *Eſpec*.

The *red* BOLE of *Armenia*, or BOLE *Armenic* of Avicenna and of moſt authors ſince his time, is the hardeſt of all the earths of this kind. It is very pure and fine, and in colour is of a ſtrong, but ſomewhat yellowiſh red, much approaching to that of ſaffron in the cake. It is of a ſurface the leaſt ſmooth and gloſſy of all the *boles*. It ſtains the fingers in handling, and is not readily diſſuſible in water. It adheres firmly to the tongue, melts readily in the mouth, and is of a very manifeſtly aſtringent taſte. It does not ferment with acids, and becomes harder and of a brighter colour in burning. Theſe are the ſeveral characters, by which the *Armenian* BOLE may be diſtinguiſhed from all other earths of the ſame colours. This laſt ſpecies is what we now pretend to uſe. It is found in vaſt plenty in the north-eaſt parts of Armenia, and is ſometimes uſed in Germany, but ſcarce ever ſeen in England. What is called *bole Armenic* in our ſhops being no other than a bad compoſition of no better materials than common tobacco-pipe clay, and an ochre known among painters by the name of Spaniſh brown.

BOLE, *Armenian*, is uſed in diarrhœas, dyſenteries, catarrhs, &c. Some alſo give it as alexipharmic virtues, efficacious in peſtilential diſeaſes; but its uſe, in this intention, is at beſt dubious. See above.

The Germans, for the *Armenian* BOLE, uſe that of Tockay, in Upper Hungary, which Crato holds preferable to it. The French uſe a like clay, found in divers provinces of that kingdom; and the Engliſh, *Fuller's* EARTH.

BOLE, *common*. This is a ponderous brittle earth, of a colour between yellow and red, of an aſtringent taſte, and is found in many parts of France. It has the ſame virtues with the former, and is to be met with in the ſhops. As both theſe *boles* are frequently mixed with ſand and grit, the apothecaries prepare them in the following manner. They diſſolve them in water; and after the ſand is ſubſided, they pour the turbid ſolution into another veſſel, where it remains till the water is clear; being poured off, the ſediment is dried in little cakes, and kept for uſe.

They may be preſcribed to be taken inwardly, either alone, or mixed with the ſealed earths.

BOLE *of the Levant* is a medicinal earth brought from the Levant; nearly of the ſame nature, and having the ſame uſes with the *bole Armenic*.

BOLE is alſo uſed for the body or trunk of a tree; and hence *boling* trees are thoſe whoſe heads and branches are cut off.

BOLE, *Bolus Boſentſis*. See BLEBENSIS.

BOLE, *Bohemic*, *Bolus Bohemica*, is a medicinal earth dug in many parts of the kingdom whoſe name it bears. It is a pure and fine *bole*, of a denſe and compact texture, of a yellowiſh pale red colour, with ſome yellow-ish veins,

heavy, of a smooth shining surface; it eaſily breaks between the fingers, does not readily melt in the mouth, leaves no grit when melted, and is of an aſtringent taſte. It does not effervesce with acids, and in the fire acquires a little hardneſs without change of colour. In the German practice it is uſed for haemorrhages, &c. and eſteemed to poſſeſs an alexipharmic virtue.

BOLE, *Bolus Armena*, the ſame with ERYTHRICA *terra*.

BOLE, *Bolus Gothergenſis*, the ſame with *terra* GOTHERGENSIS.

BOLE, *Bolus Lemnia*, the ſame with LEMNIAE *terrae*.

BOLE, *Bolus Livonica*, the ſame with the LIVONICA *terra*.

BOLE, *Bolus Lusitanica*. See LUSITANICA.

BOLE, *Bolus Nocerina*, the ſame with NOCERIANA *terra*.

BOLE, *Boles Veneta*. See VENETA *bolus*. See alſo TERRA and the references under that article.

BOLE *of Virginia*, *Bolus Virginiana*. See VIRGINIANA.

BOLENIÆ, or BOLÆ, in *Natural Hiſtory*, a name given by ancient writers to a ſort of ſtones of a roundiſh figure, and marked with ſeveral ridges and lines. They are ſuppoſed to be the ſame with thoſe called BRONTIÆ and CERAUNIA, both being imagined to fall from the clouds in time of thunder ſtorms; but they are really no other than a common ſpecies of ECHINITÆ.

BOLETO LICHEN, a name given by M. Juſſieu to a plant, which partakes of the nature of the *marcille* and of the *hepatoria*, and which he has accurately deſcribed in the Memoirs of the Academy of Sciences at Paris, 1728.

The whole plant has the ſmell of the common muſhroom, and, when young, has a viſcous liquid contained under the foldings of its head, which finally, when the plant is arrived at maturity, dries into the form of an extremely ſubtle yellow powder, which is the ſeed.

BOLETUS, in *Botany*, a word uſed by Linnæus to expreſs a genus of FUNGUSES, belonging to the claſs of *cryptogamia*, uſually comprehended by authors under the name of AGARICS, though very different from them. The AGARICS and *boleti* are both horizontal muſhrooms; that is they have no pedicle, but grow to trees, &c. by their ſide; but the firſt are lamellated underneath, in the manner of the common muſhrooms; the *boleti* are all ſpongy underneath.

The ſpecies of *boletus*, enumerated by Mr. Tournefort, are ſeven.

The *boletus* is a kind of wood muſhroom, almoſt round, of a white colour, ſpotted with yellow and brown marks; by ſome naturaliſts called FUNGUS *nemorum*.

The *boletus* is the moſt exquiſite of all the FUNGUS-kind. The Roman epicures were particularly fond of it. Nero uſed to call it the food of the gods. The emperor Claudius is ſaid to have been poiſoned with a medicated *boletus*, given him by his wife.

BOLINTHOS, in *Natural Hiſtory*, a name given by Ariſtotle, and ſome of the other ancient Greeks, to the *margo* of Ætius, that is, the BONASUS.

BOLLANDISTS, in *Literary Hiſtory*, a denomination given to certain Jeſuits of Antwerp, who have been a conſiderable time employed in collecting the lives and acts of the ſaints. Thus called from F. Bollandus, one of the firſt and chief of the aſſociation.

BOLLARDS, large poſts fix'd in the ground on each ſide a dock. On docking or undocking ſhips, large blocks are faſtned to them; and through theſe blocks are reeved the tranſporting hawſers to be brought to the capſtans.

BOLLITO, in the *Glaſs Works*, a name by which the Italians call a ſea-green colour of artificial cryſtal.

To prepare this colour, you muſt have in the furnace a pot filled with forty pounds of good cryſtal, firſt carefully ſkimmed, boiled, and purified, without any manganeſe; you muſt then have twelve onnces of the powder of ſmall leaves of copper, thrice calcined, half an ounce of zaffer, in powder; mix them together, and put them at four times into the pot, that they may the better mix with the glaſs; ſtirring them well at each time of putting in the powder, leſt they ſhould ſwell too much, and run over.

BOLLOS, in the mines of Peru, a denomination given to the ingots or bars of ſilver procured there from the ore by the operation of the fire, and the uſe of *aqua fortis*.

BOLOGNA-*bottles*. See UNANNEALED *bottles*.

BOLOGNIAN *ſtone*. See BONONIAN.

BOLSTER, among *Surgeons*, a ſoft yielding ſubſtance, either laid under the head, or a broken limb.

BOLSTER is alſo uſed for a ſtuffing, intended to fill out or raiſe a flat, ſinking, or hollow part.

In which ſenſe, *bolſters* are contrived for crooked, buncheed, and otherwiſe diſtorted backs, ſhoulders, &c.

BOLSTERS *of a ſaddle*, in the *Manage*, thoſe parts which are raiſed on the bows, both before and behind, to reſt the rider's thighs, and keep him in poſture of withſtanding the diſorders which the horſe may occaſion.

Common ſaddles have no *bolſters* behind, or even before.

BOLSTERS, in *Sea Language*, ſmall cuſhions or bags, filled with tarred canvas, and laid between the collars of the ſtays, and the edge of ſome piece of wood on which they lie; they are deſigned to preſerve the ſtays from being chafed by the motion of the maſts, as the ſhip rocks at ſea.

BOLT, in *Building*, an iron faſtening for a door, moved with the hand, and catching in a ſtaple or notch made to receive it.

Bolts are chiefly of three kinds; *plate*, *round*, and *ſpring-bolts*.

BOLT *of a lock*, is the piece of iron, which entering the ſtaple, faſtens the door; being the part which is moved backwards and forwards by turning the KEY.

Of theſe there are two ſorts; one ſhuts of itſelf by only putting to the door, and is called a *ſpring-bolt*; the other, which only moves when the key opens or ſhuts it, is called a *dormant* BOLT.

BOLT is alſo uſed for a large iron pin, having a round head at one end, and at the other a key-hole or ſlit, wherein to put a pin or faſtening, ſerving to make faſt the bar of a door, window-ſhutter, or the like.

This is more particularly called a *round* BOLT, or *ſide-door*-BOLT.

BOLTS, in *Gunnery*, are of ſeveral ſorts; thoſe which go betwixt the cheeks of a carriage, to ſtrengthen the tranſoms, are called *tranſom*-BOLTS. The large iron *bolts* or knobs on the cheeks of a carriage, which keep the handſpike from ſliding, when it is poiſing up the breech of the piece. The two ſhort *bolts*, that being put one in each end of an Engliſh mortar-carriage, ſerve to traverſe her, are called *traverſe-bolts*. The *bolts* that go through the cheeks of the mortar, and by the help of quoins, keep her fixed at the elevation given her, are called *bracket-bolts*. And the four *bolts* that faſten the bracket or cheeks of a mortar to the bed, are called *bed-bolts*.

BOLTS, or iron pins, in a ſhip, are of ſeveral ſorts, frequently diſtinguiſhed according to the places where they are uſed; as, *chain-bolts*, *bolts for carriages*, &c. *ring-bolts*, ſerving for the bringing to of the planks, &c. *drive bolts*, uſed to drive out others; *ſet-bolts*, employed for forcing the planks and other works, and bringing them cloſe to one another; *rag-bolts*, on each ſide full of jags or barbs, to keep them from flying out of their holes; *clench bolts*, thoſe which are clenched or faſtened at the ends where they come through; *fore-lock-bolts*, made like locks with an eye at each end, whereinto a fore-lock of iron is driven to prevent ſtarting out; *fend*, or *ſinker-bolts*, made with long and thick heads, ſtruck into the outermoſt bends or wales of a ſhip, to ſave her ſides from bruiſes and hurts.

BOLT is alſo uſed for a meaſure, or certain quantity of canvas, amounting to twenty-eight ells.

BOLT of ſilk or ſtuff denotes a long narrow piece, of indefinite meaſure.

BOLT, *peaſe*, in Eſſex, denotes the peaſe-ſtraw, when the grain is thraſhed out of it.

BOLT, *thunder*. See THUNDER-*bolt*.

BOLT-*ropes*, in *Sea Language*, is that to which the edges or ſkirts of the ſails are ſewed, to ſtrengthen and prevent them from rending.

BOLTED *flour*, that which has paſſed through the BOLTER.

BOLTEL, in *Building*, any promineence or jetting out, as of a piece of timber, end of a beam or the like, advancing beyond the naked of the wall.

BOLTERS, or BOULTERS, a kind of ſieves for meal, having the bottoms made of woollen, hair, or even wire.

The word ſeems derived from the German *beutel*, a *ſieve*; whence alſo *beutelen*, to *bolt*.

The bakers uſe *bolters*, which are worked by the hand; millers have a large ſort, wrought by the motion of the mill.

BOLT-HEAD, the ſame as MATRASS; a veſſel uſed by the chemiſts.

BOLTING, or BOULTING, the act of ſeparating the flour from the bran, by means of a ſieve or BOLTER.

BOLTING-*cloth*, or BOLTER-*cloth*, ſometimes alſo called *bulting cloth*, denotes a linen or hair cloth for ſifting of meal or flour.

BOLTING-*mill*, a verſatile engine for ſifting with more eaſe and expedition. The cloth round this is called the BOLTER.

BOLTING, or BOULTING, among *Sportſmen*, ſignifies roſing or diſlodging a coney from its reſting place.

They ſay to *bolt* a coney, *ſtart* a hare, *rouſe* a buck, &c.

BOLTING, a method of pleading, or arguing. In uſe in the inns of courts; inferior to mooting. The caſe is argued firſt by three ſtudents, then by two barriſters; the *utter* ſitting judge.

The word comes from the Saxon *bult*, a *houſe*; becauſe done privately within doors, for inſtruction.

BOLUC *boſſi*, in the *Turkiſh Affairs*, denotes the chief of a company, or a captain who has the command of an hundred janizaries.

BOLUS, in *Medicine*, an extemporaneous form of remedy, of a ſoft conſiſtence, ſomewhat more to than that of an electary, and of the quantity of one dofe, or morſel, to be ſwallowed down; contrived principally for the take of ſuch as have an averſion to potable medicines; or alſo for the better conveyance of certain preparations of mercury, antimony, &c. which, by their weight, would ſink to the bottom of the glaſs, were they given in draughts.

There are *boluſes* of various kinds, made with electuaries, confections, conſerves, pulps, powders, ſalts, oils, eſſences, extracts, ſyrups, &c. ſome of which ingredients muſt always have ſolidity or drineſs enough to give a conſiſtence to thoſe that are liquid.

Boluſes are chiefly denominated from their intentions, as emetic *boluſes*, purgative *boluſes*, aſtringent, anodyne, anti-febrile, alexipharmic, &c. *boluſes*.

The choice of the proper ingredients for a *bolus* is regulated by the following conſiderations: a due cohefion, ſoftneſs, and equable mixture, are eſſentially neceſſary to a *bolus*; for this reaſon, dry ſubſtances muſt be put to liquid ones, and liquid ones to dry, to produce the proper conſiſtence; but the thicker electaries, conſerves, and robs, are themſelves naturally in form of a *bolus*.

Acrid ſubſtances, and ſuch as are offenſive either to the ſmell or taſte, or are of a very viſcid nature, are much more properly exhibited in form of *boluſes* than of powders; ſince their offenſive qualities are by this means concealed. The draſtic purges, and mercurial preparations, are therefore very properly given in *boluſes*.

Balſams, and other ſuch liquid ſubſtances, are beſt mixed into a *bolus* with ſugar, becauſe it not only is the means of their going down eaſily, but it aſſiſts their diſſolution in the ſtomach. The alkaline, fixed, and volatile ſalts, and all other ſubſtances which ſoon become liquid, are very improperly made ingredients in *boluſes* which are to ſtand any time; ſince they ſpoil the form of the medicine, and loſe their own virtues; and for the ſame reaſon, ſuch ſubſtances as will ferment when brought together, are very improper for *boluſes*, unleſs they are to be ſwallowed as ſoon as made up. To this it may be added, that the number of ingredients in a *bolus* ſhould never exceed three, or at the moſt four.

The number of *boluſes* made up at once ought only to be one, or at the utmoſt two; but the apothecaries have got an almoſt univerſal cuſtom at preſent of ſending in four at a time; by which means, the laſt which are taken, are uſually too hard to be ſwallowed, and often have loſt all their virtues.

It is the common cuſtom to wrap up *boluſes* in leaf-gold, or in a wafer; but ſome chuſe neither of theſe, but will diſſolve them in ſome liquor before they are taken. The ſignature on each *bolus* is to expreſs its nature and deſign, the liquor to be taken with or after it, and the regimen to be uſed; and it is highly neceſſary to give a convenient liquor after ſome of them, if we ſuſpect they are made of ingredients which will not eaſily diſſolve in the ſtomach; and this caution is to be regarded principally in thoſe of the terebinthinous and other balſamic kinds.

Boluſes are a form of medicines almoſt univerſally uſeful. All we have to conſider in regard to the taking of them is whether the patient is in a condition to ſwallow a ſolid morſel or not; and from hence it is eaſily inferred, that they are not to be given in quinſies, or in ulcers of the *fauces*; apoplexies, epilepſies, and ſyncopes, alſo render them very improper.

BOM, in *Zoology*, the name of an American ſerpent, remarkable for its noiſe, which is like the ſound of the word uſed as its name. It grows to a vaſt ſize, and is perfectly harmleſs, never hurting any one.

BOMARIN, in *Zoology*, a name uſed by ſome for the *hippopotamus*, or river horſe.

BOMB, in the *Military Art*, a hollow iron ball, or ſhell, filled with gun-powder, and furniſhed with a vent for a fuſee, or wooden tube, filled with combuſtible matter; to be thrown out from a mortar.

The word *bomb* comes from the Latin *bombus*, *crepitus*, or *ſibilus ani*: by reaſon of the noiſe it makes.

The method of preparing a *bomb* is as follows: a hollow iron globe AB (*Tab. Gunnery, fig.* 4. & 5.), is caſt pretty thick, having a round aperture A, by which it may be filled and lighted; and circular *anſæ* C, D, of hammered iron fixed in the mould when they are caſt, for the commodious putting it into the mortar. In France the handles are caſt iron.

It has been uſual to make the lower part of the *bomb* the thickeſt, that it may fall on that ſide and never on the fuſee, and that it may alſo better reſiſt the impreſſion of the powder, by which it is diſcharged from the mortar; but Mr. Muller thinks that neither of theſe conſiderations is of any great importance, and recommends rather to make them every where equally thick, becauſe they would thus burſt into a greater number of pieces. Artillery, p. 151. in his Syſtem, &c. vol. v.

To prove whether it be ſtaunch, after heating it red-hot on the coals, it is expoſed to the air, ſo that it may cool gently: for ſince fire dilates iron, if there be any hidden chinks or perforations, they will thus be opened and enlarged; and the rather, becauſe of the ſpring of the included air continually acting from within. This done, the cavity of the globe is filled with hot water, and the aperture well ſtopped, and the outer ſurface waſhed with cold water and ſoap; ſo that if there be the ſmalleſt leak, the air, rarefied by the heat, will now periſpire, and form bubbles on the ſurface.

If no defect be thus found on the globe, its cavity is filled with whole gunpowder; the moſt proper quantity of powder is probably two thirds of the weight which would fill the cavity. A little ſpace or liberty is left, that when a fuſee or wooden tube *ae*, of the figure of a truncated cone, is driven through the aperture, and faſtened with a cement made of quick-lime, aſhes, brick-duſt, and ſteel-filings, worked together in a glutinous water; or of four parts of pitch, two of colophony, one of turpentine, and one of wax; the powder may not be bruiſed. This tube is filled with a combuſtible matter, made of two ounces of nitre, one of ſulphur, and three of gunpowder duſt, well rammed.

This fuſee, ſet on fire, burns ſlowly till it reach the gunpowder, which goes off at once, burſting the ſhell to pieces with incredible violence: whence the uſe of *bombs* in beſieging towns.

Special care, however, muſt be taken that the FUSEE be ſo proportioned, as that the gunpowder do not take fire before the ſhell arrives at the deſtined place; to prevent which, the fuſee is frequently wound round with a wet clammy thread.

The fuſees are driven into the ſhell, ſo as that only about an inch and a half comes out beyond the fuſee hole; and then the ſhell is ſaid to be fixed. They are charged long before there is occaſion to uſe them; and in order to ſecure the compoſition with which they are filled, the two ends are covered with a compoſition of tallow, mixed either with pitch or bees-wax. When the fuſee is to be put into the ſhell, the little end is opened or cut off; but the great end is never opened till the MORTAR is to be fired.

Bombs being made of different magnitudes, it may be proper to exhibit ſome of their dimenſions; as in the following table.

Diam. of Bomb.	Thickneſs of Metal	Diam. of Apert.	Quant. of Gunpow.	Weight of Bomb.
17, In. 10	1 In. 2, 10	,20	48lb.	490lb.
11, 8	, 18	,16	15	130
8 10	, 13	,10	4	40

Others make the thickneſs of the *bomb* $\frac{1}{5}$ or $\frac{1}{6}$, or $\frac{1}{10}$, of the whole diameter; and the diameter of the aperture $\frac{1}{3}$ or $\frac{1}{4}$ of the ſame.

Mr. Muller gives the following proportions, from the 13 inch *bombs* now commonly uſed, and obſerves that they may be eaſily adjuſted to any other calibre by making the diameter of the ſhell to 30, as any part expreſſed in inches, to the ſame part expreſſed in parts of the diameter divided into 30 equal parts.

Diameter of the bore	— —	30
Diameter of the ſhell	— —	29.5
Diameter of the hollow ſphere	—	21
Thickneſs of the metal at the fuſee hole		3.5
Thickneſs at the oppoſite part	—	5
Diameter of the fuſee-hole	— —	$\frac{4}{11.7}$
Weight of the ſhell unloaded,		$\frac{d}{236.5}$
Weight of the powder contained in the ſhell		$\frac{d}{}$

N. B. The letter *d* denotes the cube of the diameter of the bore.

Bombs only differ from GRANADOS, in that the latter are much leſs; and, inſtead of mortars, are thrown out of the hand.

Bombs may be uſed without mortar pieces, as was done by the Venetians at Candia, when the Turks had poſſeſſed themſelves of the ditch, rolling down *bombs* upon them along a plank ſet ſloping towards their works, with ledges on the ſides to keep the *bomb* right forwards. They are ſometimes alſo buried under ground to blow up. See CASSON.

M. Blondel, who has wrote on the art of throwing *bombs*, obſerves, that the firſt *bombs* were thoſe thrown into the city of Watchendonch, in Guelderland, in 1588, though others pretend they were in uſe a century before, viz. at

the siege of Naples by Charles VIII. in 1495. But they came not into common use before the year 1634, and then only in the Dutch and Spanish armies. One Malthus, an English engineer, is said to have first carried them into France, where they were put in use at the siege of Collioure, in 1642.

The art of throwing *bombs* makes a branch of GUNNERY, founded on the theory of PROJECTILES, and the laws and quantities of GUNPOWDER.

Meff. Blondel, Guiniere, de Reffons, de Hire, and others, have written expreſly on the art of throwing *bombs*.

BOMB *battery*. See BATTERY.

BOMB-*veſſel*, is a kind of ſhell filled uſually with *bombs*, ſometimes only with gunpowder, placed under-ground, to tear and blow it up in the air, with thoſe who ſtand on it.

Bomb-veſſels were formerly much uſed to drive enemies from a poſt they had ſeized, or were about to take poſſeſſion of; they were ſet on fire by means of a *ſaucifſe* faſtened at one end, but they are now much diſuſed.

BOMB, *water*. See WATER-*bomb*.

BOMB-*veſſels*, which are ſmall ſhips formed for throwing of *bombs* into a fortreſs, are ſaid to be the invention of M. Reyneau, and to have been firſt uſed at the bombardment of Algiers. Till then, it had been judged impracticable to bombard a place from the ſea. See KETCH.

BOMBARD, BOMBARDA, a piece of artillery anciently in uſe, exceedingly ſhort and thick, and with a very large mouth, by ſome alſo called *baſiliſk*, by the Dutch *donderbuſs*. Some derive the word, by corruption, from *Lombard*, as ſuppoſing this piece firſt uſed in Lombardy. Du-Cange, after Voſſius, derives it from *bombus*, and *arder*. Menage, from the German *bombarder*, the plural of *bomber*, *baliſta*. But we doubt whether the Germans knew any ſuch word. It is no unuſual thing with Menage, and many other etymologiſts, to give derivations from words of their own making.

There were ſome of theſe pieces ſaid to have carried balls of 300 pounds weight. Fenſtart mentions one of fifty feet long. To ſtand them they made uſe of cranes, &c. The *bombard* is ſuppoſed to have been in uſe before the invention of cannons.

Bombards can hardly be ſuppoſed to have been of metal, nor charged with gunpowder. They were rather a ſort of *baliſtæ* for throwing ſtones, and were played with ropes.

BOMBARDIER, an engineer, or perſon, whoſe buſineſs is to take care of the firing and throwing *bombs* out of mortars.—He firſt drives the fuſee, then fixes the ſhell, points, loads, and fires.

BOMBARDIER, in *Zoology*, a name given to a ſpecies of the inſect called EPHESTIS; the wings of which are incloſed in a kind of caſe to cover and wrap them up. It keeps itſelf concealed among the ſtones, and ſeems to make little uſe of its wings; it moves by a ſort of jump, and when touched, makes a noiſe reſembling the diſcharge of a muſquet in miniature, during which, a blue ſmoke may be ſeen to proceed from its *anus*. It may be made at any time to play off its little artillery, by ſcratching its back with a needle. Rolander, who firſt made theſe obſervations upon it, ſays it can give twenty diſcharges ſucceſſively. A bladder placed near the *anus*, is the arſenal whence it derives its ſhot, and this poſſeſſion and furniture afford its chief defence againſt an enemy; although the ſmoke emitted ſeems to be altogether inoffenſive, excepting it be by cauſing a fright, or concealing its courſe.

BOMBARDING, the act or act of attacking a city or fortreſs, by throwing bombs into it, in order to ruin or ſet on fire the houſes and magazines, and do other miſchief. *Bombarding* is not reckoned the moſt honourable method of making war, as it rather tends to do miſchief to the inhabitants than to the works.

BOMBASINE, in *Commerce*, a kind of ſilk-ſtuff manufactured at Milan, and thence ſent into France and other countries. The French alſo uſe the word *bombaſine* for ſtuff made of cotton, more properly called dimity.

BOMBAST, in *Rhetoric*, denotes a STYLE too high and pompous for the ſubject and occaſion; or a certain manner of elocution and action, which is grand when ſupported by dignity in the ſentiment, and force in the expreſſion, but never fails to appear ridiculous, where the ſentiment is mean, and the expreſſion flat.

BOMBAX, in *Botany*, a genus of the *polyandria monogynia* claſs of plants; the ſilk cotton-tree. The characters are, that the flower is quinquefid and ſpreading; that it hath many ſtamina, which are the length of the petals; that a round germen is ſituated in the centre; and that the empalement afterward becomes a large, oblong, turbinated capſule, having five cells, which are lignous, containing many roundiſh ſeeds, wrapped in a ſoft down. There are three ſpecies, which grow naturally in both the Indies. Linnæus enumerates four ſpecies.

Theſe plants require a large ſtove, where they may have room to grow; but as they are ſeveral years old before they flower in the countries where they grow naturally, there is little hope of their producing any in England.

The ſeed is the only part uſed in medicine, which is of a balſamic nature, uſed in coughs, ſhortneſs of breath, and foreneſs of the lungs, cauſing expectoration, and freeing them from tough phlegm. It is alſo reſtringent, and good to ſtop fluxes of all ſorts.

BOMBINA, in *Zoology*, a ſpecies of the RANA belonging to the order of *reptiles*.

BOMBUS, in *Muſic*, an artificial motion with the hands, imitating, in cadence and harmony, the buzzing of bees.

The word is originally Greek, and ſignifies the buz or noiſe of bees, gnats, and the like.

In this ſenſe *bombus* made one of the ſpecies of applauſe uſed by the ancient auditories.

BOMBUS, in *Medicine*, denotes a murmuring noiſe as of wind breaking out of a narrow into a larger cavity, frequently heard in the thick inteſtines.

The *bombus* heard in the ears, in acute diſeaſes, is laid down by Hippocrates as a ſign of death.

BOMBYCINUM, in *Ancient Writers*, properly denoted a ſpecies of ſilk, brought from Aſſyria and the iſland of Cos. In which ſenſe, it ſtood diſtinguiſhed from SERICUM, another ſort of ſilk brought from the Indies.

BOMBYCINUM *velamentum*. See VELAMENTUM.

BOMBYLIUS, in *Natural Hiſtory*, the name of the common *humble-bee*, of which we have a great variety of ſpecies, many of them very beautiful.

Mr. Ray, in his Hiſtory of Inſects, mentions no leſs than nineteen ſpecies, all wholly different from one another.

In the Linnæan ſyſtem, it is a genus of the order of *diptera*.

BOMBYLOPHAGES, *humble-bee eater*, in *Natural Hiſtory*, the name of a fly of the TIPULA, or father-long-legs kind, which is larger and ſtronger than the common kinds; and loving honey, without knowing how to extract it from the flowers, it ſeizes on the *humble-bees*, and deſtroys them, in order to get at the bag of honey which they contain. It is of a blackiſh colour in the body; its head is a bright red, and the eyes very large and prominent. It is chiefly found in mountainous places.

BOMBYLUS *tenax*, in *Natural Hiſtory*, the name of a ſpecies of *humble-bee*, which eats its way into wood, and there makes its neſt.

BOMBYX, in *Natural Hiſtory*, a name given by ſome authors to a ſpecies of winged inſect, armed with a ſting in the manner of the bees and waſps. It is of the ſhape of a waſp, but all over black in colour; it ſtings very ſeverely, always leaving the ſting in the wound. It builds its neſt of clay, which it works up to a very hard conſiſtence, and finally ſaſtens to a ſtone.

BOMBYX is alſo a name given to the SILK-*worm*.

BOMBYX, in the *Ancient Muſic*, a kind of inſtrument, which, in Ariſtotle's time, was made of a reed, *calamus*, and by reaſon of its length, was difficult to play on.

The word ſeems alſo to have been uſed for a contrivance of horn, for ſhutting and opening the holes of wind-inſtruments.

BOMBYX, in the *Ancient Naturaliſts*, ſignifies indifferently either ſilk or cotton.

BOMONICA, in *Antiquity*, an appellation given, at Sparta, to the children, who, in the ſacrifices of Diana, threw who ſhould receive the greateſt number of ſtripes with rods, which they ſometimes continued to do the whole day, and even, as Plutarch relates, to death itſelf.

The word is formed from βωμος, *altar*, and καιω, *uro*; importing as much as *victor ad aras*, or *conqueror at the altars*.

BON, or BAN, in *Botany*, a name given by ſome authors to the tree, the kernel of whoſe fruit is the coffee. The fruit is by the ſame authors called *bunn*.

BON is alſo the name of a yearly feaſt celebrated by the Japoneſe, in honour of the dead.

BONA *fides*, or BONA *fide*, is uſed in ſpeaking of things done with an honeſt intention, in oppoſition to thoſe done with a deſign of fraud and deceit, ſaid to be *mala fide*. In this ſenſe, we ſay, a grant, a conveyance, *bona fide*.

In many caſes, in the civil law, the *bona fide* of an action excuſes the want of ſome of the cuſtomary forms.

Contracts *bonæ fidei*, among *Civilians*, ſtand contradiſtinguiſhed from thoſe *ſtricti juris*; the former being gained by plain honeſty and conſcience, which ſometimes include ſeveral things not expreſly mentioned, whereas the latter are reſtrained to the expreſs terms of the deed.

A buyer *bonæ fidei*, is he who really believed the thing to belong to the ſeller at the time when he purchaſed it.

A poſſeſſor *bonæ fidei*, is he who is in poſſeſſion of a thing belonging to another, but which he truly believes is his own.

To be entitled to the benefits of next acceſſion, it is requiſite the perſons have poſſeſſed the thing *bona fide*, or really thought themſelves the proprietors.

PRESCRIPTION cannot ariſe from acts done *mala fide*; ſince what was unjuſt in its origin, can never be made juſt by time and continuance.

BONÆ *fidei*, *Actiones*, thoſe wherein for farther light, the judge

judge might take cognizance of things not mentioned between the parties.

BONA *fide*, *Judgment*, that wherein the parties are obliged to pay each other what is due *bona fide*, i. e. juſtly and equitably; and the judge has a power of eſtimating what is thus due to the actor or plaintiff; a power given him by the *formula* of the *prætor*, viz. *Ex fide bona, vel quantum æquius melius.*

BONA *gratia*, a phraſe anciently uſed in ſpeaking of divorces, which were brought amicably about for ſome juſt reaſon, with the conſent of both parties, and without any crime on the part of either, as in caſe of old age, diſeaſe, barrenneſs, monachiſm, captivity, or the like.

BONA *defunctî ad collegendum.* See ADMINISTRATION.

BONA *mobilia.* See MOBILIA.

BONA *notabilia*, in *Law.* Where a perſon dying has goods, or good debts, in another dioceſe, but within the ſame province, beſides his goods in the dioceſe where he dies, amounting to the value of five pounds, at leaſt; he is ſaid to have *bona notabilia:* in which caſe, the probate of his will, &c. belongs not to the biſhop of the dioceſe where he dies, whoſe juriſdiction cannot extend beyond the bounds of his own dioceſe, but to the archbiſhop of the province.

Though if a perſon happens to die in another dioceſe, than that wherein he lives, on a journey; what he hath about him above the value of five pounds, &c. ſhall not be *bona notabilia.*

BONA *patria*, a JURY or ASSISE of countrymen, or good neighbours.

BONA *peritura*, periſhable goods. By ſtat. 13 Ed. I. cap. 4. the cargo of a ſhip that has been caſt away ſhall be kept for a year and a day, and reſtored to the rightful owner; but if the goods be ſuch as will not endure ſo long, they are *bona peritura*, which the ſheriff is allowed to ſell, and to account in money for the value.

BONA *vacantia*, goods; ſuch as royal fiſh, ſhipwrecks, treaſure-trove, waiſe, and eſtrays, in which no one can claim a property. Theſe goods by the law of nature, and by the imperial law, belong to the firſt occupant or finder; but in the modern conſtitutions of European governments, they are annexed to the ſupreme power by the poſitive laws of the ſtate.

BONIS *arreſtandis, ne diſſipentur.* See ARRESTANDIS.

BONIS, *non amovendis*, a writ directed to the ſheriffs of London, &c. where a writ of error is brought to charge them that the perſon againſt whom judgment is obtained be not ſuffered to remove his goods, till the error is tried and determined.

BONIS *Terris & catallis rehabendis poſt purgationem.* See TERRIS.

Arreſto factо ſuper BONIS *mercatorum.* See ARRESTO.

BONORUM *attachiamenta.* See ATTACHIAMENTA.

Summum BONUM, ſee *Chief* GOOD.

BONASIA, in *Ornithology*, a ſpecies of the TETRAO.

BONASUS, in *Zoology*, the name of a ſpecies of wild-ox, of the ſize of the tame kind common with us, but of a thicker body, and having on its neck a mane like that of a horſe, and horns very ſhort and crooked, ſo as to be of no uſe to him in fighting.

When he is urged, he is able to throw out his dung a great way, and it is then of a hot and corroſive nature, though not ſo at other times; and this is the method of defending himſelf: a thing hardly credible, as Mr. Ray juſtly obſerved, if we had not inſtances of other animals, which poſſeſs the like faculty. See GLAMA.

BOND. See COUNTER-BOND, and OBLIGATION.

BOND-*tenant*, are the ſame in reſpect to the nature of their tenure with *copy-holders*, and *cuſtomary-tenants.* Blackſtone's Comm. vol. ii. p. 148.

BOND, in MASONRY and *Brick-laying*, is when bricks or ſtones are, as it were, knit and interwoven; and when they ſay, make *good bond*, they mean that the joints are not made over, or upon other joints; but reach at leaſt ſix inches, both within the wall and on the ſurface, as the art of building requires.

BONDAGE properly denotes a ſtate of ſervitude or ſlavery.

BONDAGE, *bondagium*, in *Engliſh Law-Writers*, the ſame with VILLENAGE.

Tenants in *bondage* paid heriots, and did fealty; they were not to fell trees in their own garden, without licence of the lord.

The widow of a *tenant in bondage* held her huſband's eſtate *quamdiu vixerit ſine marito.*

BONDAGE *by the forehead*, or *bondagium per anteriores crines capitis*, was when a freeman renounced his liberty, and became ſlave to ſome great man; which was done by the ceremony of cutting off a lock of hair on the forehead, and delivering it to his lord; denoting that he was to be maintained by him for the future.

Such a *bondman*, if he reclaimed his liberty, or were fugitive from his maſter, might be drawn again to his ſervitude by the noſe: whence the origin of the popular menace, *to pull a man by the noſe.*

BONDMAN, *bondus*, in the *Engliſh Law*, is uſed for a VILLAIN, or tenant in VILLENAGE.

The Romans had two kinds of *bondmen*; one called *ſervi*, who were thoſe either bought for money, taken in war, left by ſucceſſion, or purchaſed by ſome other lawful acquiſition; or elſe born of their *bondwomen*, and called *vernæ.* Both are called in our law *villains in groſs*, as being immediately bound to the perſon and his heirs.

We may add a third kind of *bondmen* mentioned by Juſtinian, called *adſcripticii glebæ*, or *agricenſiti*; who were not bound to the perſon, but to the ground or place, and followed him who had the land. Theſe, in our law, are called *villains regardants*, as belonging to the manor or place.

In the Engliſh as well as Scottiſh laws, thoſe called by the Romans *vernæ* are ſometimes alſo denominated *nativi*, as being born on the land.

The word is formed from the Saxon *bond*, ſignifying a *fetter.*

BONDUC, in *Botany*, the name given by Plumier to a genus of plants, afterwards characteriſed by Linnæus under the name of GUILANDINA.

BONDUCH, in the *Materia Medica*, a name by which many authors have called the Molucca, Marſeo, or Bezoar nuts.

BONE, in *Anatomy*, a white, hard, brittle, inſenſible part of the BODY, framed for the defence of the ſoft parts, and the ſupport of the whole fabric. See BODY, PART, &c.

Bones are divided according to the parts wherein they are found, into the *bones* of the head, the feet, the *thorax*, &c. From their offices, figures, &c. many have likewiſe proper names, as the *os ſacrum*, *jugale*, *lachrymale*, *cuneiforme*, *pubis*, &c. Spongeous *bones*, *oſſa ſpongioſa*, are thoſe full of large bores, formed like honey-combs.

Bones have their veſſels and circulating fluids, and, in ſhort, the ſame general texture which other parts have; ſolidity, and the ſtronger coheſion of parts, are the only evident diſtinguiſhing characters of the compoſition of *bones.* Monro, Med. Eſſ. Ed. vol. v. art. 24.

There is at leaſt one artery for each *bone*, ſeveral having more, for the conveyance and ſecretion of the medullary matter. After the ingreſs of the artery into the *bone*, it divides into a number of branches, which are diſtributed *quoquo verſum* on the internal membrane. The blood, which remains after the ſecretion of the marrow, is returned by proper veins; ſome of which paſs out of the *bone* either at the ſame hole whereby the artery entered it, or very near it.

In a *bone* we conſider divers things; the body, which is the middle or greater part called by Galen *diaphyſis*; the heads, which are the great protuberances at the ends; the neck, the part immediately under the head; *ſuperficies*, the extremities of the ſides of a cavity at the end of a bone; *ridges*, the prominent, fallent parts in the length of the body of the *bone.*

Some cavities are formed for articulation, called *cotyles* and *glenes*, which contain a mucilaginous humour, ſeparated from the glands of that name; others not ſubſervient to articulation, receive different names, according to their figures; ſome being called *foramina*, or holes; others, *foſſæ*, or trenches; others, *ſulci*, or furrows, &c. Heiſter. Comp. Anat. § 45, &c.

Bones, with regard to their form and ſtructure, may be divided into flat or broad, which have thin ſolid ſides, and a thick intermediate ſpongy part; and round, which are more hollow, having the ſolid part thicker and ſtronger.

Bones may be divided with regard to their conſiſtence, 1. Into rocky, *oſſa petroſa*, which are hardeſt of all; as the temple-*bones*, thoſe of the ear, the thigh-*bone*, *tibia*, &c. 2. Soft *bones*, *oſſa mollia*; as the *ethmoides*, *vertebræ*, *carpus*, *tarſus*, and the *epiphyſes.* 3. Solid *bones*, *oſſa ſolida*, thoſe without any cavities; as the *os-palato*, *iſchium*, the teeth, &c.

The *bones*, in reſpect of their internal ſtructure, may be divided into thoſe which have a conſiderable cavity within, filled with marrow, as the bones of the arms and legs; and thoſe which have no ſuch cavity or marrow, as the bones of the ſkull and ribs, &c.

Little *bones* are denominated OSSICLES.

The *bones* are all covered with a peculiar membrane, called the *periſteum*; and are moſt of them hollow, and filled with an oily ſubſtance called *marrow.*

Dr. Havers, deſcribing the texture of the *bones*, obſerves, that they conſiſt of *lamellæ*, or plates lying one upon another; and thoſe, again, of fibres running lengthwiſe, ſome to the extremities of the *bones*, others not ſo far; but none of them terminating there in diſtinct ends, as

they seem to do; but in lieu of that, continued transversely, and as it were arched: the fibres of one side meeting and uniting with those of the other; and this at each extremity. So that the fibres are a continuation of each other; though not in the same uniform order, but in very long ellipses; not all of a length, however, but in each plate shorter and shorter than in another.

These *lamellæ*, or plates, are differently disposed in different *bones*; v. gr. in those that have a large cavity, they are contiguous on each side, and very closely united; in those again, whose cavities are small, or which are altogether spongeous within, many of the internal *laminæ* are placed at a distance from each other, having betwixt them little *bony* cells; and even in *bones* that have a larger cavity, some of these lesser cells are usually found at each extremity. In such *bones* as have their plates contiguous, there are pores through and between the plates, besides those made for the passage of the blood-vessels: the first penetrate the *laminæ* transversely, and look from the cavity to the external surface of the *bone*; the second run longitudinally between the plates: the first are found in every one of the *laminæ*; though the nearer the cavity the greater the number of pores; but they do not lie directly over one another, so as to form any continued passage from the cavity to the surface: the second are seldom found but by good glasses; a medullary oil is diffused, by these, throughout the plates; and to those, the first kind seems only subordinate, serving to bring the oil into them.

On viewing the *bones* with the assistance of good glasses, their superficial part is found to consist of a great many small vessels, and some few of a larger size; which last, when they come to the surface of the *bone*, appear invested with either a membrane or a bony substance, perfectly transparent. The inside of the *bone* is a spongy or cellular substance, consisting of long particles, closely united; and these are composed of numberless small vessels, closely united, and some running lengthways, others taking their course towards the sides of the bony fibres; which, notwithstanding their great number of apertures, are extremely hard, and lie some parallel, and others perpendicular to the length of the *bone*. Mr. Leewenhoeck discovered once, in a small bit of a thin *bone*, four or five vessels, with apertures large enough for a silk to pass through, each whereof formed furnished with a valve, disposed in such a manner as to let out what was contained in the vessel, but suffer nothing to return into it.

The way to examine the *bones*, is to shave off, with a very sharp pen-knife, extremely thin pieces, lengthwise, crosswise, and obliquely, and these from the outside, inside, and middle of the *bone*, and apply these, some dry, others moistened with water, to the focus of the double microscope; and thus the vessels will be seen in all directions: but the best way of seeing the *bony* structure, is by putting the *bones* in a very clear fire till they are red hot, and then taking them out carefully, you will find the bony cells, though tender, perfect and entire; and being now quite empty, they may be viewed with ease and pleasure. Baker's Microsc. p. 143.

The marrow in the cavity of the *bones* is invested with a membrane, wherein are included little bags, or lobules; and in these bags are *utriculæ*, or glandulous bladders, serving both for the secretion of the medullary oil from the blood, and for the reception and conservation of the same. They seem to have passages into each other, as have also the bags; whereby the oil has a freer course to the joints and substance of the *bone*. The use of the marrow is to oil the substance of the *bone*, and to prevent its being too dry and brittle; it also lubricates the articulation of the *bones*, and hinders their ends from being worn, or overheated with motion; and it moistens the ligaments by which they are tied to each other: in which it is assisted by the mucilaginous glands found in all the articulations of the *bones*.

The bones are generally bigger at their extremities than in the middle; that the articulations might be firm, and the *bones* not so easily dislocated: but to render the middle of the *bone* strong withal, so as to sustain its allotted weight, and resist accidents, the fibres are there more closely compacted together, and support one another; to which it may be added, that the *bone* being hollow, is not so easily broken, as if it had been solid, and smaller; for of two *bones* of equal length, and of equal number of fibres, the strength of the one to the strength of the other will be as their diameters.

The *bones* are joined and connected together various ways; according to the various purposes they are to serve: some being intended for motion, others for rest, and the *support of the incumbent parts only.*—That jointure intended for motion, is called DIARTHROSIS, or articulation separated: that for rest, SYNARTHROSIS, or articulation conjoined: and each of these again is subdivided into several others. See ARTICULATION.

Besides the articulation of the *bones*, there is also their union or connection, called by the ancients SYMPHYSIS. The number of the *bones* is various in various subjects: ordinarily it is about 242; some say 300; others 307; others, 318: but the later writers fix it at 249 or 250; 61 of which are in the head, 67 in the trunk, 62 in the arms and hands, and 60 in the legs and feet: the variations are in the number of the *sesamoidea*, the teeth, and the *sternum*.

The *bones* of the human skeleton, enumerated by Winslow, are 54 in the head, without reckoning the *os hyoides*, and *bones* of the ear; 54 in the trunk, taking the *sacrum* for one *bone*, and the *sternum* for two; 124 in the extremities, leaving out all the *sesamoidal bones*; so that the whole number is 232, to which adding the eight *bones* of the ear, and the five principal pieces of the *os hyoides*, we shall have in all 245, the *sesamoidal bones* being still omitted. Winslow's Anat. vol. i. p. 4.

The names of the several *bones* are given in the following table; their figures and places are represented in *Tab. Anat.* P. 1. (*Osteol.*) and particular descriptions of each are given under their proper heads.

Os Frontis	1	*Vertebræ Cervicis*	7	The *Os Femoris*	2
—*Occipitis*	1	—*Dorsi*	12	*Patella*	2
Ossa Parietalia	2	—*Lumborum*	5	*Tibia*	2
—*Temporum*	2	—*Ossis Sacri*	1	*Fibula*	2
Ossicula Auditus	8	*Os Coccygis*	3	*Ossa Tarsi*	14
Os Ethmoides	1	*Scapula*	2	—*Metatarsi*	10
—*Sphenoides*	1	*Clavicula*	2	—*Digitorum*	28
Ossa Mala	2	*Costæ*	24		
—*Maxillaria*	2	*Sternum*	1		60
—*Unguis*	2	*Ossa Innominata*	2		
—*Nasi*	2			In all	245
—*Palati*	2		64		
Vomer	1				
Maxilla Inferior	1			Beside the *Ossa*	
Dentes Incisivi	8	The *Humerus*	2	*Sesamoidea*, which	
—*Canini*	4	*Ulna*	2	are said to be found	
—*Molares*	20	*Radius*	2	to the number of	
Os Hyoides *	1	*Ossa Carpi*	16	48.	
		Metacarpi	8	Of the bones, the	
		Digitorum	30	least is the ORBICULARE; the big-	
	61		60	gest, the FEMUR.	

* To which may be added the *ossa convoluta*, or lower shells of the nose. See CONCHÆ *Narium*.

The blood-vessels of the *bones* Dr. Havers divides into nutritious and medullary; the one furnishing matter for the nutrition, the other for the lubrication of the *bones*. The chief of the nutritious enter the ends of the *bone*, viz. the arteries at one end, and the veins at the other. The medullary commonly enter the sides of the *bone*, and that obliquely; but both by the same foramen.

The medullary oil is dispensed from the cavity where it is deposited, throughout the whole substance of the *bone*; passing first through the transverse pores of the first internal *laminæ* into the longitudinal ones; where it proceeds till it finds other transverse pores, when it alters its course again, and exudes farther: thus it passes alternately through and between the plates, till it is diffused throughout. This is the method of its conveyance in *bones*, whose plates are contiguous: where the plates are at a distance, as in *bones* that have no great cavity, the small caverns above mentioned contain medullary glands; whence the plates have the benefit of the marrow without the former method of conveyance.

Thus are all the *bones* flocked with pores, &c. excepting the TEETH; which have this farther distinction, that they have nerves inserted into them: whereas, in all the other bones, the nerves go no farther than the *periosteum*. Besides the large cavities in the inside, most *bones* have superficial cavities, or *sinuses*, which may be distinguished into *sulci*, or furrows, the longer sort; and *foveæ*, pits, the shorter ones.

On the outside are also observed prominences, whereof there are two kinds; the one a continued part of the *bones*, jutting apparently above its plain surface, for the more commodious insertion of the muscles, &c. called *apophysis*, or *processus*; the other an additional *bone*, growing to another by mere contiguity, being generally more soft and porous than the other, and called an *epiphysis*, or *appendage*. If the protuberance be round, it is called the *caput*, under which is the *cervix*; if flat, *condylus*; if sharp, *corona*.

The natural colour of the fresh *bones* of an adult human *body*, is whitish, with a small mixture of pale red. This red colour is more considerable in children, but decreases by degrees as they grow up, and is lost in old age. It is

is owing to the blood-veſſels of the *bones*, which are larger, and leſs ſurrounded by the bony juices in infancy than in age; ſo that the colour of the blood appears through the ſubſtance of the *bones*. Winſlow.

The general uſe of the *bones* is to ſupport and ſtrengthen the body, like beams and pillars in a building; to defend ſome of the more eſſential parts, as the brain, &c. to give ſhape to the body, and to aſſiſt in motion.

It is demonſtrable, that of whatever figure *bones* are, and in whatever manner their fibres are diſpoſed, their ſtrength muſt always be in a *ratio* compounded of their quantity of bony matter, and of the diſtance of their centre of gravity from the centre of motion.

Hence, on a double account, the part of a *bone*, formerly fractured, muſt be ſtronger than any other part of that ſame *bone*, becauſe the diameter is enlarged, and the quantity of matter is increaſed.

The human *bones* have been ſometimes known to grow ſoft and flexible, ſo as to bend any way with leſs difficulty than the muſcular parts of a healthy perſon's leg. Phil. Tranſ. N° 470. ſect. 3.

Bartholin gives an inſtance of an *anoſteus*, or boneleſs child, ſhewn at Briſtol, whoſe arms and legs were flexible like a glove.

Bones have ſometimes been found incruſted with ſtone, which has given riſe to accounts of ſkeletons petrified. Phil. Tranſ. N° 477. p. 55. &c.

Bones are totally ſoluble in concentrated acids of vitriol, nitre, and ſea-ſalt, and may be ſoftened by theſe or acetous acids diluted. Gradual heat renders them opake, white and friable; but if they are firſt urged with a ſtrong fire, ſuch as are ſufficient to melt iron or copper, they become hard, ſemi-tranſparent, and ſonorous.

By diſtillation in a retort, the *bones* reſolve into phlegm, ſpirit, volatile ſalt, fœtid oil, and *caput mortuum*, which, calcined in an open fire, leaves a white earth, without any fixed ſalt. This laſt appears to be the proper conſtituent part of the *bones*, ſince after the other principles are ſeparated, the earth ſtill retains the former ſhape of the *bone*, though it be ſo brittle, that, on the leaſt touch, it moulders into duſt. When moiſtened with a little water or oil, it recovers ſome degree of tenacity again; but cannot be reſtored to its former firmneſs.

The *origin* and *formation* of *bones* are generally traced from cartilages, which all *bones* are ſuppoſed once to have been; or, according to others, membranous tendons. Some deduce theſe farther from gellies; and others from mere fluids; which ſucceſſively arriving at greater and greater conſiſtence, become firſt gelatinous, then tendinous, then cartilaginous, and laſtly bony. Phil. Tranſ. N° 54. N° 71. and N° 81.

Hence the different ſtates of the *bones* in different ages, ſexes, and the like; which, in children, are found ſoft, moiſt, and cartilaginous; in aged people, hard, dry, and inflexible; the very cartilages in theſe frequently becoming bony.

Bones have been regenerated. See Phil. Tranſ. vol. lix. N° 6. an 1769. p. 41. &c.

Dr. Neſbit, in his Human Oſteology, undertakes to demonſtrate, that the notion of all, or any *bones*, being originally cartilaginous, is without foundation in nature. Some conſider the membrane wherewith the *bones* are lined, as a kind of *periſteum internum*, if the expreſſion may be allowed; which, according to Havers, takes its origin from the muſcular coat of the medullary artery. Be this as it will, it is contiguous with the whole internal ſurface of the *bones*, and enters the tranſverſe pores, as the external *periſteum* does the inuoſities of the *bones*, though it does not adhere ſo cloſe thereto as the external does. Monro, Oſteology, p. 19. &c. &c.

The *bones* are uſually capped at the ends with CARTILAGES, and to them are alſo annexed LIGAMENTS.

The doctrine of the *bones* make a particular branch of *Anatomy*, under the denomination of OSTEOLOGY, or OSTEOGRAPHY.

The formation or geneſis of the *bones* is called OSSIFICATION, or OSTEOGONY.

A ſyſtem of the ſeveral *bones* of a body, dried, whitened, and joined together in their natural order by art, is called a SKELETON.

Animals without *bones*, are ſaid to be *anoſtei*; ſuch are all the ſpecies of reptiles, inſects, &c.

BONES, *extraneous* or *preternatural*, have been found in the *meninges*, the duplicatures of the *dura mater*, between the *cerebrum* and *cerebellum*, in the matrices of women, does, hares, cows, *omentum* of ſowa, &c. Hiſt. Acad. Sc. an. 1711. 1713. Plott's Hiſt. Staff. ch. vii. § 56. 63. and 74.

BONES, *diſeaſes and injuries of the*.—Thoſe to which the *bones* are ſubject, are fractures, luxations, fiſſures, caries, cancers, nodes, rickets, tophi, exoſtoſes, or excreſcences, &c. To which may be added other leſs uſual diſorders, as preternatural hardneſſes, almoſt to a degree of petrifaction, and ſtiffneſſes to the condition of wax, unions or coalitions of all the *bones* of the body into one, creaking of the *bones* in ſcorbutic caſes, worms in the cavities of the *bones*, &c. Mr. Petit gives an inſtance of the carnification of the *bones*; wherein, by a change contrary to that of their firſt formation, they were reconverted from *bones* to fleſh, or cartilages. Phil. Tranſ. N° 251. N° 379. Med. Acad. Scien. an. 1720.

The operations practiſed in diſeaſes of the *bones*, are exciſion, amputation, perforation, trepanation, ſetting, or replacing, exfoliation, ſhaving, filing, &c.

BONES, *wounds of*.—As blunt inſtruments uſually make fractures of the *bones*, ſo ſharp ones, ſuch as ſwords, ſpears, &c. do, properly ſpeaking, ſometimes wound them; and theſe wounds cannot be ſuffered, without a great variety of ſymptoms, which are often very dangerous, according to the ſize and depth of the wound, and the nature of the wounded part. Such ſlight wounds as do not penetrate deep into the *bone*, are often attended with no great danger, eſpecially if proper care be taken in the dreſſing of them, and the injured *bone* be as much as poſſible kept covered with its integuments, from the injuries of the external air. All fat and oily medicines muſt be wholly rejected in wounds of this kind, as great enemies to the *bones*. But when wounds of this kind penetrate deep, and wholly divide the *bone* and its adjacent parts, and violently affect any of the organs neceſſary to life, in the head, neck, back-*bone*, or breaſt, with a puncture, or diviſion of the longer veins, arteries, nerves, and tendons of the upper and lower limbs, the danger is always great, the cure difficult, and death too often the conſequence. Petit has adviſed, that, in wounds of the *bones*, if the ſolution be inflicted lengthwiſe, the lips of the wound are to be cloſed and united by the uniting bandage; but if the wounds are very oblique, or wholly tranſverſe, then they are to be joined together by future, and the eighteen-headed bandage; but this is certainly a wrong method in many caſes of this kind. Indeed, in the firſt kind of theſe wounds, and when they are very ſlight, as when the ſkull is not wholly, nor indeed very deeply penetrated, and that without contuſion, nor the brain much hurt, this method may do very well; but when the contrary of theſe mild ſymptoms are the caſe, a very different method of cure is to be attempted; the wound is to be kept open by lint, and not healed up till thoroughly cleanſed; for, by a too ſpeedy cloſure of ſuch wound, the very worſt ſymptoms, and even death very often, are brought on.

So alſo, in ſlight, oblique, or tranſverſe wounds of the *bones*, the future, or the eighteen-headed bandage, may be uſed with ſafety and ſucceſs; but theſe are ſeldom neceſſary; and in oblique wounds of the head, forehead, and *cranium*, if not violent ones, the parts may be much eaſier cloſed and retained by a common bandage and plaſter, than by ſutures with the needle, or the eighteen-headed bandage; but when the divided part hangs down, the future may indeed be neceſſary.

If the *bones* of the fingers are thus wounded, or wholly divided by a ſword, they may be happily cured without the future, by the following method. Firſt, accurately replace the divided *bone*, then ſecure it in its place, by winding round a ſlip of plaſter, and, over this, applying a compreſs dipped in ſpirit of wine, and laying over all little ſlips of paſte-board, by way of ſplints; then binding up the whole with a proper narrow bandage, and hanging the arm in a ſling from the neck. Once, in about three days, the dreſſing is to be removed, and the wound treated with a vulnerary eſſence; and in a month the cure will be perfected.

If either of the *bones* of the *cubitus* be divided, it uſually is the *ulna*, as that is moſt expoſed to the ſword in fighting. This caſe requires neither the future nor eighteen-headed bandage; but the wound being cleanſed, is to be treated with ſome vulnerary eſſence or balſam, and with lint dipped in the ſame eſſence; after which are to be laid on, in order, the plaſter, compreſs, and paſte-board ſplints, wetted with ſpirit of wine, which are to be bound round the thick part of the *cubitus* near the wound, with a long bandage, that, as they dry, they may accommodate themſelves the better to the figure of the part; and, laſtly, the arm is to be ſuſpended in a ſling hung round the neck: after this, the wound is to be dreſſed every day, or every other day, in proportion to the diſcharge, and a cure without the help of the future will be eaſily effected; the future, in ſuch caſes, being not only unneceſſary but pernicious. But if both *bones* are divided, then indeed the eighteen-headed bandage may be neceſſary, and uſed with advantage; but even in this caſe, the future is much better let alone: for it is always to be avoided, except when perfectly neceſſary, from the dangers of inflammation, convulſions, and other bad ſymptoms that too naturally attend it.

If

If the thigh-*bone*, however, ſhould be cut with a ſword, in that caſe the bloody future will be of ſervice, and is even neceſſary to cloſe and retain thoſe very ſtrong muſcles: the wound is in this caſe to be carefully treated, and the limb laid up in a caſe of ſtraw, as in other fractures. So alſo, if the *bone* of the *humerus*, or arm, ſhould be penetrated with a ſword, that wound alſo ſhould, for the ſame reaſon, be treated by the future; but then it is not to be dreſſed with the eighteen-headed bandage, but with the common long and narrow bandage uſed in other fractures of the arm; the limb is afterwards to be ſupported by a ſhort napkin, faſtened about the neck, by which means the muſcles will be brought to a more ready union, and the cure ſooner perfected.

If it ſhould happen that both *bones* of the *cubitus* or leg ſhould be divided by a ſword, ſo as to leave the limb hanging only by the fleſh, ſkin, and blood-veſſels, which is a caſe that very rarely happens, without wholly amputating the limb, then alſo the future, and the eighteen-headed bandage, are the neceſſary applications; the future, however, can be of no ſervice in a caſe of this kind, when the fleſh and blood-veſſels are divided, and the limb ſo far cut off, as to hang only by a ſkin, eſpecially when the part is ſo conſiderable as the leg or arm; for in theſe caſes, the limb muſt be taken off, and the ſtump dreſſed as in other amputations.

When the lower jaw is ſo cut by a ſword, that the piece ſeparates, and cannot be otherways retained, then alſo the future may be uſed, adding a proper compreſs, plaſters, and the ſuitable bandage. If the clavicle, or *os humeri ſcapulæ*, ſhould in like manner be wounded by a ſword, the treatment and bandage are to be of the ſame kind, gently unbending, cleanſing, and dreſſing the part either every day, or every other day, as the diſcharge ſhall require, till the cure is *perfected*. Heiſter.

No medicines ſo effectually prevent the corruption of *bone* laid bare, and aſſiſt to cover them ſo ſoon with fleſh, as ointments, balſams, and dreſſing ſeldom, in order to have the aſſiſtance of the moſt effectual balſam of all, *fun*. With theſe we ſee the extremities of amputated *bones* covered over with fleſh, part of the ſkull, *tibia*, and other ſolid *bones*, covered in a little time with granulated fleſh after they had been laid quite bare by wounds made even with bruiſing inſtruments; and likewiſe after their carious ſurface had been cut off, and a complete cure made, without the leaſt exfoliation. Monro, Med. Eſſ. Edin. vol. v. art. 24.

BONE-*ſetting*, the art or act of replacing diſlocated *bones*, and the parts of fractured ones.

The Spaniards call their *bone-ſetters algebriſts*.

Bone-ſetting, by ſome called *ανθιστρατος ſynthetiſmus*, includes the four operations of extenſion, coaptation, deligation, and REDUCTION or repoſition.

FRACTURES and DISLOCATIONS of *bones* are ſo frequent, that it ſeems ſurpriſing the ſetting of them ſhould ſo long have been left to quacks and ignorant perſons. It is about 150 years ſince the methodical ſurgeons have applied themſelves to this art; which they have carried to a degree of perfection beyond what it ever arrived at among the Greeks.

A *bone*-ſetter ſhould poſſeſs a perfect knowledge of anatomy and mechanics; the former, to inform him of the ſtate and ſituation of the fractured or diſlocated *bones*; the latter, to furniſh machines, whereby to reinſtate them. The famous bench of Hippocrates was once held the moſt perfect engine of this kind. See AMBE.

M. Petit has contrived another, which not only ſeems more handy and portable, but more powerful, as well as leſs painful to the patient. By means of it, the operator is fully maſter of the powers that pull it, and may proportion them to the ſtrength and weakneſs of the ſubject, and that of the muſcles or tendons which are to be replaced. Add, that as it is neceſſary the power which retains the body be equal to that which pulls the diſlocated member: in this machine, the ſame rope which pulls the limb, repels the body; and that the machines hitherto contrived, have only ſerved for luxations of the ſhoulder, and that of the *hip*, which are made upwards, and where the members are ſhortened; whereas this ſerves for FRACTURES as well as LUXATIONS, and not only where the members are ſhortened, but where they are longer. Mem. Acad. Scienc. ann. 1716, p. 330, &c.

The replacing of a diſlocated *bone* of a horſe, is a work of much difficulty, and requires great force: they uſually caſt the beaſt on a ſoft place, put four ſtrong paſterns on his feet, and draw him from the ground, that his whole weight may, in a manner, reſt on the diſjointed member. Some tie a leathern thong about the paſtern, faſtening the other end of it to a yielding ſhrub, and thus whip the creature to make him ſtrain with all his force, till the *bone* flies into its place.

BONES, *boiling and whitening of*, are neceſſary operations in making SKELETONS: the method of doing which is thus deſcribed by Simon Paulli. They muſt firſt be well boiled, and afterwards expoſed day and night in the open air for a conſiderable time. The beſt ſeaſon for this operation is in wet ſtormy weather, eſpecially in the months of January, February, March, &c. the air being then impregnated with a nitrous ſalt, which contributes much to give them a bright white colour. If it does not rain, they muſt be ſprinkled with a bruſh dipt in rain-water; and even rubbing them gently with the bruſh may be of uſe.

In expoſing them, care muſt be taken to place them on a fir-board, by no means on oak one, which ſhould be covered with a ſtratum of ſlate-ſtone, firſt well ſoaked in water; next, fine ſea-ſand is to be ſprinkled on, an inch or two deep. The uſe of the ſand is to imbibe what marrow or fat remains in the *bones* after boiling.

BONES, *colouring and ſtaining of*.—The *bones* of living animals are capable of acquiring colour by the circulation of the blood and juices from their aliment; many inſtances of this kind, in which they have been changed into a deep red by madder-root, are recorded both in the Philoſophical Tranſactions, and in the Memoirs of the French Academy. *Bones* and horns may be likewiſe artificially ſtained with a variety of colours, by ſteeping or boiling them in decoctions of the vegetable or animal ſubſtances which are uſed for dying. They may be ſtained alſo, without heat, by metallic ſolutions, and in this way may be ſpotted and variegated at pleaſure. Thus ſolution of ſilver in *aqua fortis* gives a brown or a black, according to its quantity; ſolution of gold in *aqua regia*, or in ſpirit of ſalt, a fine purple; ſolution of copper in the acetous acid, a fine green; and ſolutions of the ſame metal in volatile alkalies, a blue, which is at firſt deep and beautiful, but changes on being expoſed to the air into a green or bluiſh-green. If the *bone* or horn is only touched with the firſt two ſolutions, and expoſed to the air, it does not fail to acquire the colour in a few hours: in the two latter, it requires to be ſteeped for a day or longer, in order to its imbibing the colour. In theſe and other caſes, where immerſion is neceſſary, the *bone* may be variegated, by covering ſuch parts as are intended to remain white, with wax, or any other matter, which the liquor will not penetrate and diſſolve. Phil. Tranſ. abr. vol. ix. p. 104, &c. Neumann's Works, by Dr. Lewis, p. 519. Lewis's Com. Phil. Techn. p. 97. 435. See DYING and IVORY.

BONES, *in the funeral ſolemnities of the ancients*.—Divers uſages and ceremonies relating to the *bones* of the dead, have obtained in different ages; as gathering them from the funeral pile, waſhing, anointing, and depoſiting them in urns, and thence into tombs; tranſlating them, which was not to be done without the authority of the pontiffs; not to ſay worſhipping of them, ſtill practiſed to the *bones* of the ſaints in the Romiſh church. Among the ancients, the *bones* of travellers and ſoldiers dying in foreign countries, were brought home to be buried, till, by an expreſs S. C. made during the Italic war, it was forbid, and the ſoldiers *bones* ordered to be buried where they died: the reaſon was, leſt the melancholy ſight ſhould diſcourage the people from venturing their lives. Antiquaries are divided as to the manner of diſtinguiſhing the *bones* of the deceaſed, from thoſe of the beaſts and ſlaves who were ſacrificed at his funeral, and thrown into the ſame fire: probably it was done by diſpoſing the body of the dead in the middle of the pile, and the others towards the ſides. Potter's Archæol. tom. ii. lib. iv. cap. 6.

The Romans had a peculiar deity, under the denomination *Oſſilago*, to whom the care of the induration and knitting of the human *bones* was committed, and who, on that account, was the object of the adoration of all breeding women. Pitiſc. Ant. tom. ii. p. 341.

BONES, in *Commerce*, are very uſeful articles, for making different kinds of toys; and alſo in ſeveral of the chemical arts; as for making caſt iron malleable, for abſorbing the ſulphur of ſulphureous ores, for forming teſts and COPPELS, or veſſels for refining gold and ſilver with lead; for burnt *bones* compoſe a maſs of a porous texture, which abſorbs vitrified lead and other metals, while the unvitrefcible gold and ſilver remain entire behind. They are uſed for the preparation of milky glaſſes and porcelains, for the rectification of volatile ſalts, and of empyreumatic oils, and for making glue. The *bones* of different animals are not equally fit for different uſes; even the glue or gelatinous part of the bones of one animal, is notably different both in quantity and cohefiveneſs, from that of another. Neumann's Works, p. 518.

The *bone* of the cuttle-fiſh is uſed by goldſmiths for making moulds; thoſe of bullocks for painters black; alſo, in lieu of ivory, for toys and cutlers work; where, if

they be leſs white than ivory at firſt, they do not ſo ſoon turn yellow.

Papin has given a method of turning *bones* to ſoot. Phil. Tranſ. N° 187. p. 329.

The Turks are ſaid to have applied *bones* to building, and to have built a wall with the *bones* of the Chriſtians killed at the ſiege of Philadelphia.

A piece of this *bone* wall was ſent to Dr. Woodward, who found the tradition to be an error; the ſubſtance not being *bone*, but a looſe, ſoft, porous earth, formed in an old aqueduct, now in the wall; or rather, an incruſtation of ſeveral bodies, chiefly vegetable, cemented together by ſparry and ſtony matters, found in the ſpring.

BONES, *foſſile*, or *petrified*, are thoſe found in the earth, frequently at great depths, in all the *ſtrata*, even in the bodies of ſtones and rocks.

There are divers ſorts of foſſile *bones*; ſome of a huge ſize, uſually ſuppoſed to be the *bones* of giants, but more truly of elephants, or hippopotami; other ſmaller, as *vertebræ*, teeth, and the like.

It has been diſputed whether theſe be really animal ſubſtances, or mineral; that is, ſtones thus figured. Modern naturaliſts generally allow them to be animal, not merely on account of their figure and reſemblance, but of their chemical principles, which are found to be wholly of the animal kind. It is ſuppoſed they were repoſited in thoſe *ſtrata* at a time when all things were in a ſtate of ſolution, and that they incorporated and petrified with the bodies where they happened to be lodged.

BONE is alſo applied abuſively in ſpeaking of other matters which bear ſome analogy either in reſpect of ſtructure or office to the *bones* of animals.

In this ſenſe rocks are ſometimes called the *bones* of the earth. Divers ſpecies of figured ſtones, as the *ſephoides*, *cardites*, &c. are denominated mineral *bones*, enoſta, oſteocolla, &c. Some naturaliſts conſider ſhells as a ſpecies of *bones*. The lobſter, according to Fontenelle, is an animal which carries its *bones* on its outſide.

BONES, *Giants*. See GIANTS *bones*.

BONES, *Mammoni*. See MAMMOTH.

BONE-*fire*. See *Bone*-FIRE.

BONE-*lace*. See LACE.

BONE, *hurle*, *Neger's*, *quitter*, *ring*, *whale*. See the ſeveral articles.

BONGO *pala*, in *Botany*, a name by which ſome authors have called the tree which produces the nutmeg.

BONIFACIA, in *Botany*, a name uſed by John Bauhine, and ſome others, to expreſs the broad-leafed RUSCUS, or BUTCHER'S-*broom*, commonly called the Alexandrian bay.

BONITO, in *Ichthyology*, the name of a fiſh, of the tunny or THACHURUS kind, and called by ſome *cavvota pinima*.

It is a large ſea-fiſh, with a long, broad, and thick body: its eyes are large, as are alſo its gills, and the greater part of its body is free from ſcales. It is a fiſh of very great beauty. It is an extremely common fiſh in ſome ſeas; our Eaſt India ſhips uſually fall in with immenſe ſhoals of them.

BONNA, in *Natural Hiſtory*, a name given by Pliny, and ſome other of the ancient Latin writers, to the BONASUS.

BONNET, in a general ſenſe. See CAP, HAT, &c.

BONNET, in *Fortification*, a kind of little ravelin, without a ditch, having a parapet three feet high; anciently placed before the points of the ſaliant angles of the *glacis*; being paliſadoed round: of late alſo uſed before the angles of baſtions, and the points of ravelins, and fauſſebrayes. See *Tab. Fortif. fig.* 21. *lit. m.*

The *bonnet* has two faces, from ten to fifteen, or more rods long: the parapet is made of earth, from thirty to thirty-ſix feet thick, and from nine to twelve feet high: it is invironed with a double row of paliſadoes ten or twelve paces diſtant from each other; hath a parapet three feet high, and is like a little advanced *corps du guard*.

BONNET *à prêtre*, or *prieſt's* CAP, is an outwork, having at the head three ſaliant angles, and two inwards.

It differs from the *double* TENAILLE, only in this, that its ſides, inſtead of being parallel, grow narrower, or cloſer at the gorge, and open wider at the front; on which account it is alſo denominated QUEUE D'ARONDE, or ſwallow's tail.

BONNETS, in *Sea-language*, ſmall ſails, ſet on the courſes on the mizen, main-ſail, and fore-ſail of a ſhip, when theſe are too narrow, or ſhallow to clothe the maſt; or in order to make more way in calm weather.

Bonnets are commonly one third of the depth of the ſails they belong to.

What the *bonnet* is to the courſe, that is the drabler to the *bonnet*; being only in uſe when the courſe and *bonnet* are too ſhallow to clothe the maſt: there are alſo *bonnets* in form of ſheaths, being ſmall ſails faſtened by the narrow end to each extremity of the yards, wider at bottom than at top, of good uſe, when the ſea is ſmooth.

The words are, *lace on the bonnet*, that is, faſten it to the courſe; *take off the bonnet*, that is, take it off the courſe.

BONNET *pepper*. See CAPSICUM.

BONNY, in *Mineralogy*, a name given by our miners to a bed of ore found in many places in hills, not forming a vein, nor communicating with any other vein, nor terminating in ſtrings, as the true veins do: it is a bed of ore of five or ſix fathoms deep, and two, or ſomewhat leſs than that, in thickneſs, in the largeſt ſort; but there are ſmaller, to thoſe of a foot long. They have their trains of SHOAD-*ſtones* from them, and often deceive the miners from the expectation of a rich lead vein. They differ from the SQUATTS only in being round beds of ore, whereas thoſe are flat. Phil. Tranſ. N° 69. p. 2098.

BONO *et malo*, *Writ de*, a ſpecial writ of goal-delivery was anciently uſed for each particular priſoner under this title: but theſe being found inconvenient and oppreſſive, a general commiſſion for all the priſoners has long been eſtabliſhed in their ſtead. 2 Inſt. 43.

BONONIAN *ſtone*, a ſmall, grey, ſoft, gloſſy, fibrous, ponderous, ſulphureous ſtone, about the bigneſs of a large walnut: when broken, having a kind of cryſtal, or ſpiry talc within; found in the neighbourhood of Bologna, or Bononia in Italy; and, when duly prepared, making a ſpecies of PHOSPHORUS.

This ſtone is found in divers part of that country, particularly in a river at the foot of Mount Paterno; where a chemiſt, one Vincenzo Caſciarolo, having gathered ſome pieces, and carried them home, in hopes by the fire to draw ſilver out of them, inſtead of what he expected, found that admirable phenomenon they exhibit, which conſiſts in this, that having been expoſed to the light, they retain it, and ſhine for the ſpace of ſix or eight hours in the dark. This diſcovery was made about the year 1630.

M. Homberg is ſaid to be the firſt perſon who taught us the true manner of preparing and calcining the *Bononian ſtone*; having made a journey to Italy on purpoſe to learn it.—Though others alledge, that the true art of preparing and calciting the ſtone is loſt; there having been but one, an eccleſiaſtic, who had the true ſecret, and who is ſince dead, without communicating it to any perſon. See Phil. Tranſ. N° 21.

This property of affording a phoſphorus by calcination, is common to the other gypſums, when pure from metallic, or other heterogeneous mixtures; the artificial gypſums ſucceed equally with the natural, and it is found to belong to a variety of other ſubſtances. M. Margraaf obſerves, that all ſubſtances which have this property, contain a vitriolic acid, united to an alkaline or calcareous earth.

M. Lupigni obſerves, that one Zagonius had a method of making ſtatues and pictures of the *Bononian ſtone*, which would ſhine variouſly in the dark; but he adds, the perſon died without diſcovering his ſecret. See Phil. Tranſ. N° 134.

For the method of preparing this phoſphorus, and other obſervations upon it, ſee LAPIS *Bononienſis*. See alſo the articles LIGHT, and PHOSPHORUS.

BONOSIANI, or BONOSIACI, an ancient branch of ANOPTIANI, in the fourth century, denominated from their leader Bonoſus, a biſhop of Macedonia.

BONPOURNIKEL, a denomination given to a coarſe kind of BREAD uſed in Weſtphalia.

BONS-*hommes*, or BON-*hommes*, a ſort of hermits of St. Auguſtin, founded by F. de Paula. They were brought over into England in 1283, by Edmund, earl of Cornwall, and ſettled at Aſhorug, in Bucks, beſides which they had only one houſe more, at Edington in Wiltſhire. They followed the rule of St. Auſtin, and wore a blue habit.

The name is ſaid to have ariſen from Louis the XI. of France, who uſed to call F. de Paula, prior of the order, *le bon homme*. Till then they had been called the *Minimi*, or the order of *Grammont*. See ALBIGENSES.

BONT-*viſch*, in *Ichthyology*, the name given by the Dutch to an Eaſt Indian fiſh, ſeeming to approach to the nature of the European TURDUS, but that it has no ſcales. See *Tab. V. of Fiſh*, N° 64.

BONTIA, in *Botany*. See *Barbadoes wild* OLIVE.

BONZES, or BONZUS, a name given to the prieſts and religious of China, Japan, and Tonquin.

The *bonzes* are the great adverſaries of the miſſionaries; and to their influence are attributed the perſecutions which have been raiſed in thoſe countries againſt the Chriſtians.

They generally live in a ſort of community, in places apart, or conſigned wholly to them. The iſland Pou-to near Chuſan, is a famous ſeat of *bonzes*, being wholly inhabited by them, to the number of 3000, all of the ſect of Hoſhang, or unmarried *bonzes*.

They live a kind of Pythagorean life, and have not less than four hundred pagods, or temples, in this little island. They have also female *bonzes*, a sort of nuns. Phil. Transf. N° 280.

In order to distinguish themselves from the laity, they wear a chaplet round their necks, consisting of a hundred beads, and carry a staff, at the end of which is a wooden bird; they live upon the alms of the people, and yet are very charitably disposed, maintaining several orphans and widows out of their own collections.

The *bonzes* of China are the priests of the Fohists, or sects of Foh; and it is one of their established tenets, that there are rewards allotted for the righteous, and punishments for the wicked, in the other world; and that there are various mansions, in which the souls of men will reside, according to the different degrees of merit. The *bonzes* of Pegu are generally gentlemen of the highest extraction.

BOOBY, in *Natural History*, the name of a bird common about Jamaica, and in several other parts of the world. It is described by sir Hans Sloane, in his History of Jamaica, under the name of *avis fusca anseri bassano affinis*. It feeds upon fish, and dives under water after them, but is often robbed of its prey by another voracious bird, called the *albatross*, or the man of war bird. The frequent contests between these two birds are very diverting, the one being as unwilling to part with the prey it has so dearly earned, as the other resolute to have it; but the ALBATROSS generally succeeds.

BOOK, a writing composed on some point of knowledge by a person intelligent therein, for the instruction or amusement of the reader.

The word is formed from the Saxon *boc*, which comes from the Northern *beech*, of *beechaws*, a *beech* or *service-tree*, on the bark of which our ancestors used to write.

Book may be defined more precisely, a composition of some man of wit or learning, designed to communicate, to prove, or illustrate some science, art, truth, or invention.

Book is distinguished from PAMPHLET, or single paper, by its great length; and from TOME or VOLUME, by its containing the whole writing. Isidore makes this distinction between *liber* and *codex*; that the former denotes a single book, the latter a collection of several: though, according to Scipio Maffei, *codex* signifies a *book* in the square form; *liber*, a *book* in the roll form.

We say an old *book*, a new *book*; a Latin, a Greek *book*; to read, to write, to publish a *book*; the PREFACE, the TITLE, the DEDICATION, the INDEX of a *book*. To *collate a book*, is to see that it be perfect, and that none of the sheets be either wanting or transposed. Book-binders speak of *folding*, *sewing*, *beating*, *pressing*, *covering*, *gilding*, and *lettering* of *books*. See BOOK-BINDING.

A large collection of *books* is called a LIBRARY. An inventory of a library, in order for the reader's finding any book, is called a CATALOGUE.

The *history* or *notitia* of *books* makes the first part, according to some the whole, of the literary science.—The principal points in the *notitia* of a *book* are, its *author*, *date*, *printer*, *edition*, *versions*, *comments*, *epitomes*, *successes*, *eulogies*, *censures*, *condemnation*, *suppression*, *aspersions*, *vindicators*, *continuators*, and the like.

The history of a *book* is either of its *contents*, which is given by analysing it, as is done by journalists; or of its *appendages* and *accidents*, which is the more immediate province of those called *literators*, and *bibliothecarians*.

The *contents* of a *book* are the matters delivered in it; which make the province of the author. Of these there is one principal matter, called the *subject*; in respect of which the rest are only *incidents*.

The *appendages* of a *book* are, the *title*, *preface*, *epistle dedicatory*, *summaries*, *table of contents*, *index*, and the like, which are the proper province of the editor, unless perhaps the title page, which is frequently usurped by the bookseller.

In the *composition* of a *book*, there occur *sentiments*, which are also the materials of it; *method*, the order wherein these are disposed; and *style*, or *expression*, which is the language wherein they are clothed.

The giving of histories, catalogues, and bibliotheca of *books*, is said to have been first introduced by the Germans: we may add, that they have best succeeded in them; and to them the chief works of this kind are owing. J. Alb. Fabricius has given us the history of the Greek and Latin *books*; Wolfius, that of the Hebrew *books*; Boecler, of the principal *books* in each science and faculty; Struvius, of the *books* of history, law, and philosophy; the abbot Fabricius, of the *books* of his own library; Lambecius of those in the Vienna library; Le Long, of the *books* of Scripture; Mattaire, of the *books* printed before the year 1550; and Morhoff, a general literary history of this kind, under the title of Polyhistor. The various catalogues of choice libraries are useful and necessary for the same purposes: so are likewise the Relationes, &c. and the Reviews which have been periodically published.

As to the *materials* of *books*, they were first written on stones, witness the Decalogue given to Moses (which is the oldest *book* we have any warranted account of); then, on the parts of plants, e. gr. the leaves, chiefly of the palm-tree; the rinds and barks especially of the *tilia* or *philyra*, and the Egyptian PAPYRUS. By degrees, wax, then leather, were introduced, especially the skins of goats and sheep, of which, at length, parchment was prepared: then lead came in use; also linen, silk, horn, and, lastly, PAPER itself.

The parts of vegetables continued long the common matter of *books*; insomuch that most of the names and terms belonging to *books*, in most languages, are taken thence; as the Greek *biblos*, the Latin *liber*, *codex*, *folium*, *tabula*, and the English *book* itself. We may add, that vegetable barks appear still in some measure retained for *books* in certain of the Northern countries, as among the Calmuc Tartars, where a library was discovered by the Russians, of an unusual form as well as matter; the *books* were exceedingly long, but of no breadth; the leaves very thick, and made of barks of trees, smeared over with a double varnish; the ink, or writing, being white on a black ground. Hist. Acad. R. Inscr. t. iii. p. 6.

BOOK, *everlasting*. We find in signior Castagnotta's account of the ASBESTOS, a scheme for the making of a *book*, which from its imperishable nature, he is for calling the *book of eternity*. The leaves of this *book* were to be of the asbestos paper, the covers of a thicker sort of work of the same matter, and the whole sewed together with thread spun from the same substance. The things to be commemorated in this *book* were to be written in letters of gold, so that the whole matter of the *book* being incombustible and everlastingly permanent against the force of all the elements, and subject to no changes from fire, water, or air, must remain for ever, and always preserve the writing committed to it.

BOOKS, *form of*. The first *books* were in form of blocks and tables, of which we find frequent mention in Scripture, under the appellation *sepher*, which the Septuagint render *xoana*, q. d. *square tables*: of which form the *book* of the covenant, *book* of the law, *book* or bill of divorce, *book* of curses, &c. appear to have been. As flexible matters came to be wrote on, they found it more convenient to make their *books* in form of rolls, called by the Greeks *volumina*, by the Latins *volumina*, which appear to have been in use among the ancient Jews as well as Grecians, Romans, Persians, and even Indians. And of such did the libraries chiefly consist, till some centuries after Christ. The form which obtains among us is the square, composed of separate leaves; which was also known, though little used, among the ancients; having been invented by Attalus, king of Pergamus, the same also who invented parchment: but it has now been so long in possession, that the oldest manuscripts are found in it. Montfaucon assures us, that of all the ancient Greek manuscripts he has seen, there are but two in the roll form; the rest being made up much after the manner of the modern *books*. See BOOK-BINDING.

The rolls, or volumes, were composed of several sheets, fastened to each other, and rolled upon a stick, or *umbilicus*; the whole making a kind of column, or cylinder, which was to be managed by the *umbilicus*, as a handle: it being reputed a kind of crime to take hold of the roll itself. The outside of the volume was called *frons*; the ends of the *umbilicus*, were called *cornua*, *horns*; which were usually carved, and adorned likewise with bits of silver, ivory, or even gold and precious stones. The title Σιλλυβος, was stuck on the outside. The whole volume, when extended, might make a yard and half wide, and fifty long. Fabric. Bibl. Antiq. c. 19. §. 7. p. 607.

To the form of *books* belongs also the *œconomy of the inside*, or the order and arrangement of points and letters into lines and pages, with margins, and other appurtenances. This has undergone many varieties: at first, the letters were only divided into lines, then into separate words; which, by degrees were noted with accents, and distributed by points and stops into periods, paragraphs, chapters, and other divisions. In some countries, as among the Orientals, the lines began from the right, and ran to the left; in others, as in Northern and Western nations, from the left to the right: others, as the Grecians, followed both directions alternately, going in the one, and returning in the other, called *boustrophedon*. In the Chinese *books*, the lines ran from top to bottom. Again, the page in some is entire, and uniform; in others, divided into columns; in others, distinguished into text and notes, either margins, or at the bottom; usually it is furnished with signatures and catch-words; also with a register to discover whether the *book* be complete. To these are occasionally added the apparatus of summaries, or side notes; the embellishments

liſhments of red, gold, or figured initial letters, head-pieces, tail-pieces, effigies, ſchemes, maps, and the like. The end of the *book*, now denoted by *finis*, was anciently marked with a ⊰, called *coronis*, and the whole frequently waſhed with an oil drawn from cedar, or citron chips, ſtrewed between the leaves to preſerve it from rotting. There alſo occur certain *formulæ* at the beginning and end of *books*; as, among the Jews, the word פתח, *aſh ſortis*, which we find at the end of the *books* of Exodus, Leviticus, Numbers, Ezekiel, &c. to exhort the reader to be courageous, and proceed on to the following *book*. The concluſions were alſo often guarded with imprecations againſt ſuch as ſhould falſify them; of which we have an inſtance in the Apocalypſe. The Mahometans, for the like reaſon, place the name of God at the beginning of all their *books*, which cannot fail to procure them protection, on account of the infinite regard had among them to that name, wherever found. For the like reaſon it is, that divers of the laws of the ancient emperors begin with the *formula*, *In nomine Dei*. At the end of each *book* the Jews alſo added the number of verſes contained in it, and at the end of the Pentateuch the number of ſections; that it might be tranſmitted to poſterity entire. The Maſoretes and Mahometan doctors have gone farther; ſo as to number the ſeveral words and letters in each book, chapter, verſe, &c. of the old Teſtament, and the Alcoran. See Alcoran, Massora, &c.

The kinds and denominations of *books* are various. With regard to their uſe and authority, *books* may be divided into *human* and *divine*, alſo called *ſacred* and *inſpired books*.

Books, *Sibylline*, thoſe compoſed by certain pretended prophetteſſes, depoſited in the Capitol, under the care of *duumviri*. See Sibyl.

Books, *Canonical*, thoſe received and allowed by the church as parts of holy ſcripture. Such are the *books* of the Old and New Teſtament, as commonly bound up together.

Books, *Apocryphal*, thoſe excluded out of the canon, yet received and read in ſome churches.

Books, *Authentic*, thoſe which are deciſive, and of authority: ſuch, in the civil law, are the Code, Digeſt, &c. in our law, the Statutes, &c. Bacon, de Augm. Sc. l. 8. c. 3.

Books, *Auxiliary*, thoſe leſs eſſential, yet of uſe, as ſubſervient to the others: as in the ſtudy of the law, *books* of Inſtitutes, *Formulæ*, Maxims, Reports, &c.

Books, *Elementary*, thoſe which deliver the firſt principles of ſciences; ſuch are thoſe under the titles of rudiments, Methods, Grammars, &c. by which they ſtand contradiſtinguiſhed from *books of a ſuperior order*, which aim at making farther advances in the ſcience.

Books, *Library*, ſuch as are not ordinarily read over, but turned to, and conſulted occaſionally: ſuch are Dictionaries, &c.

Books, *Exoteric*, thoſe intended for the uſe of popular and ordinary readers.

Books, *Acroamatic*, thoſe containing more ſecret and ſublime matters, calculated for adepts and proficients in the ſubject.

Books, *Public*, the records of paſt times and tranſactions kept by public authority.

Books, *Church*, or *Eccleſiaſtical*, thoſe uſed in the public offices of religion.

Books, again, with regard to their ſcope and ſubject, may be divided into *hiſtorical*, thoſe which relate facts, either of nature or mankind; *dogmatical*, thoſe which lay down doctrines, or general truths; *miſcellaneous*, thoſe of a neutral kind, containing both facts and doctrines; *hiſtorico-dogmatical*, thoſe which only rehearſe doctrines, or, at moſt, indicate the arguments by which they are proved, as Mallet's Geometry; *ſcientifico-dogmatical*, thoſe which not only recite the doctrines, but demonſtrate them, as Euclid's Elements. Wolf. Phil. Rat. § 3. c. 1. § 744, 750, 751, &c.

Books, *Pontifical*, among the Romans, were thoſe appointed by Numa to be kept by the *pontifex maximus*; deſcribing all the ceremonies, ſacrifices, feaſts, prayers, and other religious matters, with the manner, and circumſtances, wherewith each was to be celebrated: theſe were alſo called *indigitamenta*, as containing the names of all the gods, and the occaſions, and *formulæ* of invoking each. Liv. l. 1. p. 23.

Books, *Ritual*, thoſe which directed the order and manner of founding, building, and conſecrating cities, temples, and altars; the ceremonies belonging to walls, gates, tribes, *curiæ*, camps, and the like.

Books, *Augural*, called by Cicero, *reconditi*, were thoſe wherein the ſcience of foretelling futurity from the flight and chattering of birds was contained. Cicer. Orat. pro domo ſua ad pontif. Serv. ad Æn. l. 5. v. 738. Lomei de bibl. c. 6. 9

Books, *Aruſpicine*, thoſe wherein the myſteries of diviſing from the entrails of victims were preſcribed.

Books, *Acheronic*, thoſe wherein the ceremonies and diſcipline of Acheron were contained; ſometimes alſo called *libri Etruſci*, as being ſuppoſed to have been compoſed by *Tages* the Hetruſian; though others pretend, that he had received them from Jupiter himſelf: ſome ſuppoſe theſe to have been the ſame with the *libri fatales*; others, with the *libri aruſpicini*. Serv. ad Æn. l. 8. v. 398. Lomei, ubi ſupra.

Books, *Fulgural*, thoſe written touching thunder and lightning, and their interpretation. As that compoſed by the Tuſcan nymph Bigoia, preſerved in the temple of Apollo. Serv. ad Æn. l. 6. v. 72.

Books, *Fatal*, thoſe wherein the ages, or terms of the life of men were written, according to the Hetruſian diſcipline. Theſe were conſulted by the Romans in all public calamities; and inſtructions taken from them, how to expiate the offended deities. Cenſor. de Die Natal. c 14.

Books, *Black*, thoſe which treat of necromancy and witchcraft; or thoſe which are printed in the old black letter, the Celtic character, now only retained by the Germans. The ſame denomination is alſo given to ſome other *books*, on account of the colour of their backs, or the diſmalneſs of their contents; whence alſo *Red-book*, and *Domeſday book*.

Books, *Good*, in the common uſage, are thoſe of devotion and piety as ſoliloquies, meditations, prayers, &c. Vide Shaftesb. Charact. tom. 1. p. 165. item, tom. iii p. 327. A *good book*, in the bookſeller's language, is a ſaleable one; in the language of the curious, a ſcarce one; in that of men of ſenſe, an uſeful and inſtructive one. Among five principal things which Rabbi Akiba recommended to his ſon, one was, that if he ſtudied the law, he ſhould take care to do it in a *good book*, leſt he ſhould be obliged to unlearn all again. Vide Cren. de Furib. Librar. See alſo farther, on the head of judging and chooſing of Books.

Books, *Spiritual*, thoſe which treat more expreſly of the ſpiritual or Chriſtian life, and their exerciſes, as contemplation, &c.

Books, *Profane*, ſuch as do not treat of matters of religion.

Books, with regard to their authors, may be divided into *anonymous*, thoſe without any author's name; *cryptonymous*, thoſe whoſe author's names are concealed in ſome anagram, or the like; *pſeudonymous*, thoſe which bear falſe names of authors; *poſthumous*, thoſe publiſhed after the author's death; *genuine*, thoſe really written by the perſons whom they pretend for their authors, and ſtill remaining in the ſtate wherein they were left by them; *ſpurious*, or *ſuppoſititious*, thoſe pretended to be written by others than their real authors; *interpolated*, thoſe which ſince their compoſition have been corrupted by ſpurious additions or inſertions.

Books, with regard to their qualities, may be divided into *clear* or *perſpicuous*, which, in the dogmatical kind, are thoſe where the authors define all their terms accurately, and keep ſtrictly to thoſe definitions in the courſe of their works: *obſcure*, thoſe where words are uſed vaguely, and without defining: *prolix*, thoſe which contain more things than were neceſſary to the author's deſign; as if, in a *book* of ſurveying, a man ſhould give all Euclid: *uſeful*, thoſe which deliver things neceſſary to be known, either in other ſciences, or in the buſineſs of life: *complete*, thoſe which contain all that is known concerning the ſubject: *relatively complete*, thoſe which contain all that was known concerning the ſubject, at a certain time; or, if a book were written with any particular deſign, or view, it may be ſaid to be *complete*, if it contain neither more or leſs than is neceſſary for the accompliſhing of that end: in the contrary caſes, *books* are ſaid to be *incomplete*.

Books, with regard to the matter they conſiſt of, may be divided into *paper-books*, thoſe written either on linen and cotton paper, or on the papyrus, of which laſt kind few are now remaining. Montfaucon Pal. Græc l. 1. c. 2. p. 13. *Parchment-books*, *libri in membrana*, thoſe written on ſkins, or pelts, chiefly of ſheep. *Linen-books*, *libri lintei*, among the Romans, were thoſe written on blocks, or tables, covered with a linen cloth. Such were the Sibylline *books*, and divers ancient laws, epiſtles of princes, leagues, annals, &c. Plin. Hiſt. Nat l. xiii. c. 2. —*Leather-books*, *libri in corio*, mentioned by Ulpian, are by Guilandinus taken for ſuch as were written on backs, different from that uſually written on; which was the *tilia*: by Scaliger, with more probability, for ſuch as were written on certain ſkins, or certain parts of ſkins, different from thoſe commonly uſed, which were the pelts, or back-parts of ſheep. Ulp. l. 52. Guiland. Papyr Membr. 3. n. 50. Scaliger, and Guiland. *Black-books*, *libri in ſchedis*, thoſe written on wooden planks, or tablets, ſmoothed for that purpoſe with an *aſcia*, and a plane. Such were the ori-

ordinary *books* among the Romans. *Waxen-books*, *libri in ceris*, mentioned by Pliny, have occasioned some dispute. Herm. Barbarus suspects the term to be a corruption, and inclines to read *in scheis* instead of *in ceris*, on the authority of some ancient MSS. Others see no need of the emendation, since it is known the Romans sometimes covered their planks or *scheda*, with a thin skin of wax, to make them susceptible of erasements and amendments, which the *libri in scheis* were not, and consequently were less fit for works that required elegance and accuracy than the waxen ones, which are also called *cerae*, or *libri cerei*. *Elephantine books*, according to Turnebus, were those written on thin slices, or leaves of ivory; according to Scaliger, those made of the guts of elephants; according to others, those wherein the acts of the senate, relating to the emperors, were written; according to others, certain huge or bulky *books*, consisting of 35 volumes, containing all the names of the 35 tribes. Saimuth. ad Pancirol. p. ii. p. 255. Guiland. Pap. Mem. 7. n. 48. Scal. ad Guil. p. 16. Calv. Lex Jur. p. 534. Fabr. Descrip. Urb. c. 6.

BOOKS, with regard to their manufacture and commerce, may be divided into *manuscript*, those written with the hand, whether originally by the authors, called *autographs*, or at second hand by *librarii*, or *copists*. *Printed*, those wrought off from the press. *Books in quires*, or *sheets*, those not bound, or stitched. *Books in folio*, those wherein a sheet is folded but once, or makes too leaves; or four pages; *books in 4°*, where it makes four leaves; *in 8°*, where eight; *in duodecimo*, where twelve; *in 16°*, where sixteen; *in 24°*, where twenty-four.

BOOKS, with regard to circumstances and accidents, may be divided into *lost*, those which have perished by the injuries of time, or the malice or zeal of enemies. Such are divers even of the ancient *books* of Scripture, written by Solomon, and others of the prophets. Fabr. Cod. Pseud. Vet. Test. tom. ii. p. 171. p. 247. *Books promised*, those which authors have given expectations of, which they have never accomplished. Jani. ab Almeloveen has given a Bibliotheca of *books promised*, but still latent, or not published. *Books fictitious*, those which never existed: to which may be added, divers feigned titles of *books*. Loescher has published a great number of plans, or projects of *books*, many of them good and useful enough, if there were but *books* written correspondent to them. M. Dugono has a whole volume of *schemes*, or *projects of books*, containing no less than 3000.

BOOKS *in Anag. Arch.* &c. See ANAG, ARCH, &c.

The *scope* or *design of books* is various; that of some is to trace the origin of things discovered; of others, to fix and establish some truth, or raise some doctrine to a higher pitch or subtility; of others, to remove some scruple, or prejudice, which had before obtained, or fix more accurate and precise ideas of things: of others, to explain the names and words used in different nations, ages, and sects; of others, to improve our knowledge of facts, and events, and shew the order and ways of Providence: lastly, others aim at divers, or all of these ends. The *uses* of *books* are numerous: they make one of the chief instruments, or means of acquiring knowledge: they are the repositories of laws, and the vehicles of learning of every kind: our religion itself is founded on books: "Without them," says Bartholin. "God is silent, "justice dormant, physic at a stand, philosophy lame, "letters dumb, and all things involved in Cimmerian "darkness." De Libr. Legend. Diff. i. p. 5.

The eulogiums which have been bestowed on *books* are infinite: they are represented, "as the refuge of truth, "which is banished out of conversation; as standing "counsellors, and preachers, always at hand, and always disinterested; having this advantage over oral "instructors, that they are ready to repeat their lesson, "as oft as we please." *Books* supply the want of masters, and even, in some measure, the want of genius and invention; and can raise the dullest person, who have memory, above the level of the brightest, without them. An author, who wrote not inelegantly, though in a barbarous age, sums up all their praises. Vide Lucas de Penna ap. Morhoff Polyhist. lib. i. cap. 3. p. 27. *Liber est lumen cordis, speculum corporis, virtutum magister, vitiorum depulsor, curarum prudentium, comes itineris, domesticus amicus, congerro tenuis, collega & consiliarius praesidentis, mysthicum eloquentiae, hortus plenus fructibus, pratum floribus distinctum, memoriae penus, vitae recordationis; vestutas praperat, jussus festinat, semper praesto est, nunquam non moretur, rogatus confestim respondet: arcana revelat, obscura illustrat, ambigua certorat, perplexa resolvit, contra adversam fortunam defensor, secundae moderator, ofes adjuvat, jacturam propulsat, &c.*

Perhaps their greatest glory is, the affection borne them by many of the greatest men in all ages: M. Cato, the elder Pliny, the emperor Julian, and others, are on record for an excessive devotion to *books*. The last has perpetuated his passion by some Greek epigrams in their praise. Richard Bury, bishop of Durham, and lord chancellor of England, has a treatise expressly on the love of *Books*. Philobiblion, five de Amore Librorum. Vide Plin. Epist. vii. lib. iii. Cato's attachment to *books* may be observed in the following paragraph.

M. Catonem vidi in bibliotheca sedentem multis circumfusum Stoicorum libris. Erat enim, ut scit, in exercitatissima civitate legendi, nec satiari poterat: quippe qui, ne reprehensionem vulgi imanem reformidans, in ipsa curia solerat legere, saepe dum senatus cogeretur, nihil operae reipublicae detrahens. Vide Cic. de Divin. lib. ii. n. 11. See also Cic. Orat. pro Arch. tom. iv. p. 2282.

The *ill effects* objected to *books* are, that they employ too much of our time and attention; engage us in pursuits of no use to the commonwealth, and indispose us for the functions of civil life; that they render men lazy, and prevent their exerting their own talents, by furnishing them, on every occasion, with things the growth of others; and that our natural lights become weakened and extinguished, by inuring ourselves to see only with foreign lights: besides, that ill men are hereby furnished with means of poisoning the people, and propagating superstition, immorality, enthusiasm, or irreligion, which will always spread faster, and be received more greedily, than lessons of truth and virtue. Many other things are added concerning the emptiness of *books*, and the errors, fables and follies they are fraught with; which together with the multitude and perplexity of them, are such, that it may seem easier to discover truth in the nature and reason of things, than in the uncertainty and confusion of *books*. Add, that *books* have turned the other instruments of knowledge out of doors, as experiments, observations, furnaces, and the like, without which the natural sciences can never be cultivated to purpose; and that, in mathematics, *books* have so far superseded the exercise of invention, that the generality of mathematicians are now contented to learn the solution of problems from others; which is to relinquish the chief end of their science: since what is contained in mathematical *books* is properly the history only of mathematics, not the science, art, or talent of solving questions; which is hardly to be had from *books*, but only from nature and meditation.

For the art of *writing* or *composing books*, we have much fewer helps and instructions than for the art of speaking; though the former be the more difficult of the two; as a reader is not so easy to be imposed upon, but has better opportunities of detecting faults than a hearer. A great cardinal, indeed, reduces an author's business to a few heads; were they but as easily practised as prescribed: "Let him consider who it is writes, what, how, why, "and to whom." Augusti. Valer. di Caut. in edend. lib. *The conditions required in a book* are, according to Salden, "Solidity, perspicuity, and brevity:" the first will be best attained, by keeping the piece long by us, often reviewing and correcting it by the advice of friends: the *second*, by disposing the sentiments in a due order, and delivering them under proper and usual expressions: the *third*, by throwing every thing aside that does not immediately concern the subject.

Were these rules observed, it would scarce be possible for any, except an angel from heaven, to write many *books*. *Vix totidem quot Thebarum portae vel divitis ostia Nili.* The custom is much altered since the times of the ancients, who carried their scrupulousness in what relates to the composition of *books* beyond all that has been above expressed: so august was the idea they formed of a *book*, that nothing would suffice less than its being a treasure: *thesaurus oportet esse non liber*: no labour, no assiduity and exactness, were thought enough to fit a work for the public view: every sentiment and expression were to be maturely weighed, and turned on all sides; and not suffered to pass, unless every word were a pearl, and every page beset with gems. So that they put the reader in possession in a single hour, of what had cost them perhaps ten years intense thought and application. Such were those *books*, which were reputed *centre digni*, fit to be anointed with cedar-juice, and thus rendered incorruptible, for the instruction of all future ages.

BOOKS, *for the origin of*, we have nothing that is clear: the *books* of Moses are doubtless the oldest of all that are extant; but there were *books* before them, for Moses cites several.

A *book* of Enoch is cited in the Epistle of Jude, v. 14, and 15, from which some endeavour to prove the reality of antediluvian writings; but the *book* cited by that apostle is generally allowed, both by ancient and modern writers, to be spurious.

Of profane *books*, the oldest extant are Homer's poems, which were even so in the time of Sextus Empiricus; though we find mention in Greek writers of about seventy others prior to Homer; as Hermes, Orpheus, Daphne, Horus, Linus, Musæus, Palamedes, Zoroaster, &c.

&c. but of the greater part of these, there is not the least fragment remaining; and of the others, the pieces which go under their names are generally held by the learned supposititious. F. Hardouin goes farther; charging all the ancient *books*, both Greek and Latin, except Cicero, Pliny, Virgil's Georgics, Horace's Satires and Epistles, Herodotus, and Homer, as spurious, and forged in the thirteenth century, by a club of persons under the direction of one Severus Arcontius. Fabr. Bib. Græc. lib. i. cap 1. § 1. § 6. tom. i. Hardouin. de Num. Herod. in Prolog. Act. Erudit. Lipf. an. 1710, p. 70.

Among the Greeks, it is to be observed, the oldest *books* were in verse, which was prior to profe; Herodotus's hiftory is the oldeft book extant of the profaic kind. Strabo, Geog. lib. i. Heuman. Via ad Hift. Liter. § 20. p. 50. § 21. p. 52.

BOOKS, *the multitude of*, has been long complained of: the complaint is as old as Solomon, who lived three thousand years ago: they are grown too numerous, not only to procure and read, but to fee, to learn the names of, or even to number. England has more to fear on this fcore than other countries; fince, befides our own produce, we have, for fome years paft drained our neighbours. However, as bifhop Caramuel's fcheme miscarried, which was, to write about a hundred volumes in folio, and then prevail on the civil and military powers to oblige all their fubjects to read them, we need not much regret the multitude of *books*.

In reality, there are few of the immenfe number of *books*, which deferve ferioufly to be ftudied: for the reft, part of them, like thir, are only to be occafionally confulted, and the reft read for amufement. A mathematician, for inftance, ought not to be entirely ignorant of what is contained in the mathematical *books*; but then a general knowledge is fufficient, which may eafily be had by running over the chief authors; out of whom references may be made, directing to the places where they may be found, when wanted. For there are many things which are much better preferved in *books* than in the memory: as aftronomical obfervations, tables, rules, theorems, proportions, and, in fine, whatever does not fpontaneoufly adhere to the memory, when once known. For the lefs we croud that faculty, the readier and freer will the genius remain for inventing.

Thus, a few *books* well chofen, and thoroughly ftudied, may fuffice. It may be added, that as knowledge is naturally advantageous, and as every man ought to be in the way of information, even a fuperfluity of *books* is not without its ufe, fince hereby they are brought to obtrude themfelves on us, and engage us when we had leaft defign. This advantage, an ancient father obferves, we owe to the multiplicity of *books* on the fame fubject, that one falls in the way of one man, and another beft fuits the levels of the apprehenfion of another. "Every "thing that is written, fays he, does not come into the "hands of all perfons: perhaps fome may meet with "*my books*, who may hear nothing of others which have "treated better of the fame fubject. It is of fervice, "therefore, that the fame queftions be handled by fe- "veral perfons, and after different methods, though all "on the fame principles, that the explications of diffi- "culties, and arguments for the truth, may come to the "knowledge of every one, by one way or other." Add, that the multitude is the only fecurity againft the total lofs, or deftruction of *books*: it is this that has preferved them againft the injuries of time, the rage of tyrants, the zeal of perfecutors, and the ravages of barbarians; and handed them down, through long intervals of darknefs, and ignorance, fafe to our days. *Saluqua non norunt hæc monumenta mori.* Boc. de Augm. Sc. lib. i. Auguft. de Trin. lib. i. cap. 3. Barthol. lib. cit. Diff. i. p. 8. &c.

To *judge of a book*, thofe who have treated of the fubject direct us to obferve the title, the author's or editor's name, the number of the edition, the place where, and year when it was printed (which in old *books* is frequently marked at the end) and the printer's name, efpecially if it be a celebrated one: proceed then to the preface, and look for the author's defign, and the occafion of his writing: confider alfo his country (each nation having its peculiar genius) which may fometimes be learned from the dedication: if his life be annexed, run it over, and note his profeffion, what rank he was of, and any thing remarkable that attended his education, ftudies, converfation, or correfpondences with learned men: not forgetting the elogies which have been given the author, which often occur at the beginning, or even any critique or cenfure, efpecially if made by a man of judgment. If the preface does not give an account of the method of the work, run briefly over the order and difpofition of it, and note what points the author has handled; obferve whether the things and fentiments he produces be trite and vulgar, or *folid*, and fetched from greater depths. Note, whether he go in the common road, or make any innovation, and introduce any new principle.

But it is a fmall number of *books*, we have opportunity of thus judging of, by perufing them; befides, when we have read a *book* over, the judgment comes too late for many purpofes: it feems neceffary therefore to have other indications, whereby to prevent our being at the charge of procuring, or the pains of perufing a worthlefs *book*. Divers rules of this kind are given by Baillet, Struvius, Stollius, and others; which though, in reality, no more than prefumptions, and frequently liable to be falfified, are not without their ufe. The journalifts de Trevoux objected to them all: "The fhorteft way, fay "they, to judge of a *book* is to read it, if you be quali- "fied in the fubject; otherwife to refer yourfelf to thofe "who are fo." Heuman is fomewhat more explicit; making it a mark that "a *book* is good, when it is "eftcemed by perfons intelligent in the fubject it treats "of; and when thofe who commend it receive no "advantage from the applaufe they beftow on it, nor "are leagued with the author in any cabal, for efpouf- "fing any particular principle, fyftem, or party, in reli- "gion, or learning." Baillet. Jugem. des Scav. tom. i. b. 2. p. 121. Struv. Introd. ad Not Rei Liter. cap. 5. § 3. p. 390. Stoll. Introd. Hift. Liter. p. 1. § 11. p. 9. Bood. de Criteriis boni Libri, paffim. Mem. de Trev. an. 1712. Art. 17. Heuman. Confp. Reipubl. Liter. cap. vi. § 11. p. 280.

But more particularly, it is an indication that a *book* is good, 1. If the author be known to excel in that talent more immediately neceffary for fuch a fubject; or have already publifhed any thing on the fame that is eftcemed. Thus we may conclude, that Julius Cæfar will teach us the art of war better than Peter Ramus; Cato, Palladius, and Columella, agriculture better than Ariftotle; and Cicero, oratory better than M. Varro: add, that it is not enough the author be fkilled in the faculty, but that he be fo in the particular branches of it he treats of; fome for inftance, excel in the civil law, yet not in the public law: Salmafius proved himfelf an excellent critic in his Exercitat. Plinian. but was much inferior to Milton in his Defenfio Regia. 2. If the *book* he on a fubject that requires great reading, it may be prefumed good, if the author had a copious library, or could have accefs to one; or if he lived in a place where *books* were not wanting; though here is danger too of running into excefs in quotations; efpecially, fays Struvius, if the author be a lawyer. 3. A *book* which took up a long time in compofing, cannot often fail of being good. 4. *Books* on points of doctrine by eclectic writers, are to be preferred better than thofe writ by the retainers to particular fects. 5. The age of a writer may alfo give us fome indication: *books*, which require labour, are ufually better performed by younger perfons, than thofe who are far advanced in years. 6. Another indication may be taken from the author's ftate and condition; thus hiftory written by a perfon who was an eye-witnefs to what he relates, or is concerned in public affairs, or has accefs to the public records, or other monuments, from whence intelligence may be drawn; who is not biaffed by party, or any other indirect or finifter motive, will be fuppofed to be good. Thus Salluft and Cicero were well able to write the hiftory of Catiline's confpiracy. D'Avila, de Comines, Guicciardin, Clarendon, &c. were prefent in the civil wars they defcribe: Xenophon, having an employment in the Spartan ftate, has treated excellently of that commonwealth; and Amelot de la Houffaye, by living long at Venice, was enabled to explain the fecrets of their policy. Camden wrote annals of the affairs of his own time; Thuanus had correfpondence with the beft writers in every country; and Puffendorf had accefs to the public archives. So, in literary matters, we give credit to thofe who have the direction of libraries. 7. The time or age wherein the author lived may give fome light, every age having, according to Barclay, its peculiar genius and excellency. See Bartholin. Struv. Budd. Heuman. Baill. lib. cit.

Some judge by the bulk or fize of *books*; following the grammarian Callimachus's rule, that every great *book* is of courfe an ill one, μεγα βιβλιον, μεγα κακον; a fingle leaf of the Sybil was doubtlefs preferable to the vaft annals of Volufius; yet Pliny's obfervations will neverthelefs hold true, that "a good *book* is fo much the better "by how much it is bigger." Plin. Epift. 20. lib. i. Martial prefcribes a remedy againft the largenefs of a *book*, when that is the only complaint, read but a little of it:

Si nimius videar, feroque corondæ longus
Eſſe liber, legito pauca, libellus ero.

Yet is the fmallnefs of a *book* a real prefumption in its favour: he muft be a poor author who cannot furnifh a pamphlet, or loofe fheet, with things curious, and written with fpirit: but to fupport the fame through a

volume in folio, requires very extraordinary abilities indeed. Addif. in Spect. N° 124.

See farther concerning *books*, in the writers on literary hiſtory, libraries, ſtudies, learning, arts, and ſciences; more eſpecially in Salden, Bartholin, Hodannus, Sacchinus, Baillet, Budeus, Swalbach, Putherbeus, Raynaud, Schuſter, Lauſſer, Schwartzius, Crenius, Morhoff, and others, who have written treatiſes expreſs concerning *books*.—Chriſt. The importation of *books* firſt printed in this kingdom, and reprinted abroad, is prohibited. Vide Stat. 12 Geo. II. c. 36. § 1.

There was a clauſe in the ſtatute of the 8th of Q. Anne, ch. 19. impowering the chancellor, and ſome other great officers of ſtate, to ſet the price of *books*, but this is now repealed by 12 Geo. II. ch. 36. ſect. 2.

BOOKS, *burning of*, was a kind of puniſhment much in uſe among the Romans, by legal ſentence: ſometimes the care of the execution was committed to *triumviri* appointed on purpoſe; ſometimes to the PRÆTOR, and ſometimes to the ædiles; Labienus, whom from his ſatirical ſpirit ſome have called *Rabienus*, is ſaid to have been the firſt who underwent the ſeverity of it. His enemies procured a *ſenatus-conſultum*, whereby all his *books*, publiſhed during ſeveral years, were ordered to be collected and burnt: "The thing (ſays Seneca) then appeared new "and ſtrange to take revenge on learning! *Rei nova & inſolita! Supplicium de ſtudiis ſumi.* Caſſius Servius, a friend of Labienus, hearing the ſentence pronounced, cried aloud, "That they muſt burn him too, ſince he "had got all the *books* by heart." *Nunc me quoque cum operibus ejus, quia illos didici.* Labienus could not ſurvive his *books*, but ſhutting himſelf up in the tomb of his anceſtors, pined away, and was buried alive.

Divers other ancient teſtimonies concerning the burning of *books* are given in Reimm. Idea Syſt. Antiq. Liter. p. 389.

BOOKS, *cenſors of*, ſee CENSOR.

BOOKS, *printers of*, ſee PRIVILEGE.

BOOK, *common pleas*, ſee COMMON-PLACE.

BOOK, *text*, ſee TEXT.

BOOK is alſo uſed for a part or diviſion of a volume, or large work.

In this ſenſe we ſay the *book* of Geneſis, the firſt *book* of Kings, the five *books* of Moſes, &c.—The Digeſt is contained in fifty *books*, the Code in twelve *books*.

Books are uſually ſubdivided into chapters, ſometimes into ſections, or paragraphs: accurate writers quote chapter and *book*.

BOOK is alſo uſed for a liſt or catalogue of perſons names.—Such among the ancients were the *cenſorial* BOOKS, being tables or regiſters containing the names of all thoſe who were cenſed or taxed under Auguſtus. Tertullian aſſures us, that our Saviour's name was found in the cenſorial *books* of Auguſtus. Adv. Marcion. lib. iv. cap. 7. See CENSUS.

BOOKS, in *Matters of Commerce*, denote the ſeveral regiſters wherein merchants and other dealers keep their accounts.

We ſay, ſuch a perſon's *books* are in good order: merchants cannot poſſibly do without *books*; they are even obliged by the laws to keep *books*. But more or fewer are required, according to the nature and extent of their dealings, or the preciſion and exactneſs they deſire therein.

The ancients had alſo their *books* of accounts; witneſs the *codex accepti & expenſi*, ſo often mentioned in Roman writers; and the *patrimonial books*, which were rentals, containing an account of the lands, goods, and chattels, and other effects belonging to each perſon.

BOOK-*Keeping*, the art of keeping ACCOUNTS; that is, of recording the tranſactions of a perſon's affairs in ſuch a manner, that the true ſtate of any part, or of the whole, may be thereby known with the greateſt clearneſs, exactneſs, and eaſe.

By the *tranſaction of one's affairs* are meant, either ſuch as relate to the perſons with whom we deal, or the things in which we deal; which laſt are either money, the principal means of commerce, or goods, comprehending all other effects.

All authors agree, that the Italians, particularly thoſe of Venice, Genoa, and Florence, firſt introduced the method of *keeping books* double, or in two parts, probably about the middle of the fifteenth century; hence, among us it is called *The Italian method*: though it was not introduced into England till a century later, the firſt *book* on this art having been publiſhed in London in 1569, by James Peele.—Stevin apprehends, that the art of *book-keeping*, by double entry, was known to the Romans, and originally received from the Greeks.

BOOKS, *merchants*, may be generally divided into *eſſential*, and *auxiliary*—*Eſſential* or *neceſſary*, are thoſe without which regular accounts cannot be kept; in which number ſome include the *journal*, *waſte-book*, and *ledger*; others only the two laſter. Vide Malc. Treat. of Book-Keeping, ch. i. ſect. 2. p. 3.

Subſidiary or *auxiliary*, are ſeparate *books*, wherein particular accounts are kept more diſtinctly, for eaſing the ledger. Such are the *caſh-book*, *debt-book*, *book of expences*, &c.

Theſe *books* are kept in the ſame manner, in effect, in moſt trading cities in Europe; but not as to coin: each being regulated by that ſort of coin which has courſe in the ſtate where they are.

In England, *books* are kept in *pounds*, *ſhillings*, and *pence*: in France, in *livres*, *ſols*, and *deniers*: in Holland, Flanders, Zealand, and Brabant, in *pondem*, pounds, *ſchellingen*, ſhillings, and *groſs*, *great*: they alſo keep them in *guilders*, *ſtivers*, and *penningen*: at Dantzick, and in all Poland, in *rix-dollars*, *groſs*, and *deniers*: they are likewiſe kept in *florins*, *groſs*, and *deniers*: through moſt parts of Germany, in *florins*, *creutzers*, and *pennings*: at Hamburgh, in *marks*, *ſols*, and *deniers lubs*: at Lubeck, in *rees*: at Florence, in *gold crowns*, *ſols*, and *deniers*: in Spain, in *maravedis*; ſometimes in *rials*, or *pieces of eight*: at Meſſina, and through Sicily, in *ounces*, *tarins*, *grains*, and *pieces*: at Venice, in *ducats*: at Muſcovy, in *rubles*, *altins*, and *grives*: through all the ſtates of the Grand Signior, in *piaſters*, *abaquelas*, and *others*.

BOOK, *waſte*, is the firſt, and moſt eſſential: in this, all kinds of matters are mixed together; no order but that of time being preſerved; it being a diurnal regiſter of occurrences in buſineſs, to be afterwards ſeparated and tranſferred into the others; ſo that this may be ſaid to contain the elements of all the reſt. It may be kept two ways; the firſt, by entering things down ſimply as they happen; v. gr. *Bought of ſuch a one, ſold to ſuch a one, paid ſuch a one, lent ſo much*, &c. the ſecond, by entering at once, each article, debtor and creditor: this laſt is eſteemed the beſt; becauſe, forming a kind of little journal, it ſaves the keeping of any other.

The *waſte-book* begins with the inventory of a merchant's effects and debts; the difference between theſe is what the merchant calls his neat ſtock; and contains a complete record of every tranſaction of his affairs, with all the circumſtances, in a plain narration of matter of fact, every tranſaction following another in the order of the dates.

This *book* is in reality a journal, or day-book; but that name being applied to another, the name *waſte-book* is given to this by way of diſtinction: though what relation the word *waſte* bears to the nature of this *book*, is not very obvious. Some authors better call it the *memorial-book*, or *memorandum-book*, as its principal uſe is for taking memorandums.

BOOK, *journal*, or *Day*-BOOK, is that wherein the affairs of each day are entered orderly down, as they happen, from the *waſte-book*.—Each article of this *book* is to conſiſt of ſeven parts; viz. the date, debtor, creditor, ſum, quantity and quality, how payable, and the price.

The journal, ſo far as it differs from the *waſte-book*, is only a *book* of aid to the ledger.—There are two different methods of keeping it: in the firſt, which is that hitherto chiefly in uſe, the journal is a complete tranſcript of the *waſte-book*, in the ſame order of time, but in a different ſtyle; becauſe the *waſte-book* expreſſes every tranſaction in a ſimple narration of what is done; whereas the *journal* diſtinguiſhes the debtors and creditors, as a preparation for the ledger; thus, when any tranſaction is to be tranſferred from the *waſte-book* into the *journal*, they examine

amine it by the rules of the ledger, as if it were to be entered immediately there; and, finding the debtors and creditors to which it belongs, these are distinctly marked by their denominations of *debtor* and *creditor*, in the style of the journal; at least, the accounts that are debtors are expressly so named; and by their being directly connected debtor to some other accounts, these are sufficiently determined to be the creditors, though the word *creditor* be not written.

Model of an article in the Journal.

	15th July, 1723			
Wine Dr. to Cash——*L.* 160:—:—	*Bought of* Duval, *ready Money*, 16 *Pipes of Burgundy, at* ——— *L.* 10	160	0	0

The other form of a journal, which Mr. Malcolm judges preferable in certain respects to the former, makes the journal a complete transcript of the waste-book, without any alteration, leaving on the left side of every page a large margin, about a third part of the page; on which against every transaction, are to be written the names of the debtors and creditors of that transaction, with their titles of debtor and creditor, and sums of money; observing, that where there are sundry debtors or creditors to one creditor, or debtor, they write their names next each other, and the name of the one corresponding debtor or creditor, against the total of the other sums; by which means the balance and connexion appear at sight. Then when the transaction is transferred to the ledger, they write on this margin the numbers of the folios where the account stands in the ledger; for the purposes already mentioned in speaking of the former method.

This *book* may be called either the *waste-book* or *journal*, being in reality both; not only as every *waste-book* is a *journal*, but as there is here also that which distinguishes both a *waste-book* and a *journal*.

By an ordonnance of the year 1673, all traders in France, whether by wholesale or retail, are obliged to keep a journal, containing all their affairs, debts, active and passive, bills of exchange, &c. For want of keeping this, and surrendering it on a failure, they are to be reputed fraudulent bankrupts, and subjected to the penalties thereof.

Ledger, or *Ledger*-Book, sometimes also called the *great-book*, and the *past-book*, is a large volume, containing all the transactions of a man's affairs in such order, as that those belonging to every different subject lie together in one place; making so many distinct or several accounts. The ledger is only the waste-book still farther digested; being extracted either immediately from it, or from the *journal*. It is usually ruled in *six* columns. In it all the accounts dispersed in the journal are drawn out and stated in debtor and creditor. To form each account two pages are required opposite to each other; that on the left serving for debtor, the other for creditor: each article to consist of five parts, or members; the date, the person whom we credit, or are credited by; the subject, i. e. the thing credited or indebted for; the page where it is found, and the sum or amount of the article. Two instances, the one of an article of credit, the other of debt, will illustrate the form and use of this *book*.

Model of an article in debtor.

The management of the ledger being of great importance in accounts, we will subjoin from Mr. Malcolm the following cases relating to it.

1. That for every distinct subject, with which you have an account (i. e. for every person with whom you deal, on mutual trust and credit, or who, by any means becomes your debtor, or you his) as well as for every thing you deal in, there must be a certain separate space, or portion, allowed: wherein are to be written all, and only the transactions relating to that subject, whose *name* is to be inscribed, or written on the head thereof; making thereby distinct particular accounts.

2. Every account is to be distinguished into two parts, taking for each an equal portion (less or more, as you think fit) of right and left pages, of one *folio* or opening: the name of the subject being written on the head of the account, on both sides, which are distinguished by the words *debtor* on the left side, and *creditor* on the right, for the uses following: to which the columns explained below are subservient.

3. Every personal account to contain, on the debtor side, all the articles which that person owes you, and the payments you make of your debts to him: and, on the creditor side, all that you owe to him, and the payments he makes of his debts to you. Or, because this rule considers payments under the notion of mutual opposite debts upon the receiver, if this be once supposed, the rule may be briefly expressed thus: every person is debtor for what he owes me, and creditor for what I owe him.

4. Every real account ought to contain, on the debtor side, the quantity and value of what was upon hand at the beginning of the account, and what was afterwards received, with all costs and charges; and on the creditor side, the quantity and value of what is disposed of, or any way taken away, or gone out of it, with all the returns that subject makes me. Or, more briefly, thus: it is debtor for all received, first costs and charges: and creditor for all gone out of it, with the returns.

5. Every transaction must be entered in the *ledger-book*, with a balance of debt and credit, i. e. so as that every article be placed on the debtor side of one account, and the creditor side of some other, making thereby equal debt and credit in the ledger: and where the personal and real accounts concerned in the transaction do not, in the articles belonging to them, make this balance (as they will in most cases), then some imaginary account must be used to supply the defect.

6. Those accounts, whose articles of debt and credit, in any transaction, balance one another, are, in the ledger, to be connected together in the style of every article, as mutual and corresponding debtors and creditors; by writing in each of the corresponding accounts the name of the other, after the particle *to* in the debtor's account, and *by* in the creditor's, which connects the two; the name of the account, in which the articles are written, with its quality of debtor and creditor, being understood as joined to, and so is read before the word *to*, or *by*, in every article (though it be written only once for all upon the head of the account). Then after the name of the corresponding creditor or debtor, follows a brief narration of the fact; the date and other numbers being placed in their proper columns. Hence we find the use of the column, that stands next to the money columns, which is this, to write in it the number of the folio where stands the corresponding account, with which the account, in which you write, is connected in every article.

To facilitate the use of the ledger, there is an alphabet to serve as an index, or repertory, consisting of twenty-four leaves, each cut on the edge, and marked with one of the twenty-four letters; wherein the initial letters of the persons names, with whom you have accompts, are inserted, with the folio of the ledger, where the account is stated.

The more exact *book*-keepers extend the index to the things or commodities a man has dealings in, as well as the persons he deals with. Generally, it is a letter of a man's surname, and the proper name of the thing, that directs its place in the index; thus John Gordon is put under G; and claret wine under C, unless all sorts of wines be comprehended in one account, in which case it is put under W.

Book, *debt*, Book *of payments*, or *Bill*-Book, a *book* wherein is entered the day whereon all sums fall due, whether to be paid, or received by bills of exchange, merchandizes, or otherwise: to the end that by comparing receipts and payments, provision may be made, in time, of a fund for payment; by receiving bills, &c. due, or taking other precautions.

Two models will suffice for the use and form of this *book*: it is only to be observed, that, like the ledger, it must be on two opposite pages; moneys to be received on the left hand, those to be paid on the right.

The better to conceive the nature of this *book*, it is to be obſerved, that in buſineſs, where cash happens to be an account which has numerous articles, it is convenient to keep a particular account thereof, in a *book* diſtinct from the ledger; and for this reaſon called the *caſh-book*. This is formed, in all reſpects, like the cash account in the ledger, with a debtor and creditor ſide; in which all the cash receives and given out is entered; either in a ſimple ſtyle, or in that of the ledger: but which way ſoever the narration is made, every article muſt be duly entered on the oppoſite ſide of the correſponding account in the ledger; with a reference to the ledger account of cash: for ſuch an account there muſt alſo be, into which the ſums of the debtor and creditor ſides of the particular account muſt be tranſferred once a week or month, as is found convenient: thus, in the *caſh-book*, the ſums being written down againſt them, mine, tranſferred to the ledger, and mark the folios; and in the ledger account, enter the ſum with the date of the tranſfer, debtor *to*, and creditor *by*, ſundry accounts as *per caſh-book*. The cash account in the ledger is neceſſary for the balance of the whole; and the convenience of the ſeparate account of all the particulars is, that we have them all together in one continued account; whereas, the rule of the ledger being not to allow more than one folio for one account, till that be filled up, the account might hereby lie in ſeveral different folios.

Book *of invoices*, a *book* to ſave the journal from the erraſures inevitable in taking accounts or invoices of the ſeveral goods received, ſent, or ſold; where it is neceſſary to be very particular, and to render thoſe invoices eaſier to find than they can be in the *waſte-book* or *journal*. The invoices here entered are to be thoſe of goods bought, and ſet to account of ſome other; thoſe of goods ſold by commiſſion; of goods ſent away to be ſold on our own account; and thoſe of goods ſold in partnerſhip, whereof we have the direction, or whereof others have the direction.

This *book* contains an account or invoice of all the goods which a perſon ſhips off, either for his own account, or for others in commiſſion, according to the bills of lading; with the whole charges till on board; every invoice following after another, in order as they happen.

The invoice *book* is only a copy of what is written in the *waſte-book*, in thoſe caſes. After the date, the narration is to begin thus:—Shipped aboard the ſhip—A. B. maſter; bound for ——, the following goods; conſigned to—for my account, or by order, and the account of—Or, it may be begun thus:—Invoice of goods ſhipped aboard—*&c.*

The deſign of this *book* is for the more ready finding out theſe invoices than can be done in the *waſte-book*.

Book, *factor*, or *Book of Sales*, is an account of what a perſon receives to ſell in commiſſion for others, and of the diſpoſal thereof. It is numbered and diſtinguiſhed into folios, like the ledger; on the left-hand ſide is written, in a plain narrative ſtyle, an account of the goods received, with all charges: and, on the oppoſite ſide, an account of all the ſales and diſpoſals of thoſe goods. So that this is only a copy of the employer's account of goods in the ledger, in the ſtyle of the *waſte-book*. Where a perſon does little in commiſſion, a ſeparate *book* for this purpoſe is needleſs.

Book *of accounts current* is kept in the form of debtor and creditor, like the ledger; and ſerves for accounts ſent to correſpondents, to be regulated in concert with them, before they are entered in the ledger. This is properly a duplicate of the accounts current, kept to have recourſe to on occaſion.

Book *of commiſſions, orders*, or *advices*, is a *book*, in which are entered all the commiſſions, orders, and advices, which a perſon receives from his correſpondents. This ſhould have a broad margin for receiving the entry of remarks concerning their execution.

Book *of acceptances* is deſtined for the regiſtering all bills of exchange, notified by letters of advice from correſpondents; ſo that the merchants may know, when the bills are preſented, whether they have orders to accept them or not. When they chooſe to decline accepting a bill, againſt the article thereof in the *book*, they put P. i. e. proteſt; that, on offering the bill, the bearer may be told he may proteſt it: on the contrary, if they accept it; they write againſt it an A; adding the date, or day of acceptance. And this, upon being tranſferred to the *debt-book*, is cancelled.

Book *of remittances* ſerves to regiſter bills of exchange, as they are remitted by correſpondents, to require the payment thereof. If they be proteſted for want of acceptance, and returned to thoſe who remitted them, mention is made thereof againſt each article, by adding a P. in the margin, and the date of the day when they were returned, then cancelled.

The *books* of acceptances and remittances have ſo near a relation to each other, that many merchants, &c make but one of the two, which they keep in the form of debtor and creditor; putting acceptances on the ſide of the debt, and remittances on that of credit.

Book *of copies of letters*, ſerves to keep copies of letters, which a merchant writes to his correſpondents, that he may have recourſe to them, as occaſion requires.

Book *of expences*, a detail of the petty expences, both domeſtic and mercantile; which at the end of each month are ſummed up, and make an article for the caſh *book*.

This *book*, being a ſeparate account of all the expences of living, ſerves to keep both the profit and loſs account, and alſo the caſh-*book*, more diſtinct: the greater and more conſiderable articles are to be placed here particularly; but the ſeveral ſmall articles, of daily diſburſements, only in totals: though under what denominations, and how general or particular the articles of this *book* are to be made, muſt be left to every one's choice. All that is neceſſary to obſerve here is, that the cash paid out, on ſuch accounts, muſt be carefully entered here; and thence, once a week or month, be tranſferred to the caſh-*book*, and to the profit and loſs account of the ledger; which is debtor to cash for it.

Book *of numero's* or *quires* is kept for the eaſy knowledge of all the goods brought in, ſent out, or remaining in a warehouſe. On the left-hand page are entered the quantity, quality, and number or mark, of the goods brought in; on the right, the diſcharge of the goods out of the warehouſe, againſt the reſpective articles of the firſt. Thus,

N°	1	*A bale of whole paper* —— *weighing*	400*lb.*
	2	*A piece of ſcarlet damaſk* —— *ell*	63

March 1	*Sold to* Charles Mitchell.
Apr. 10	*Sent to* Nichols *of* Briſtol.

Book, *month*, is numbered in folios like the ledger, and divided into ſpaces, on the top of each of which are the names of the twelve months of the year; January, February, &c. allowing a whole folio, or what you pleaſe, to each month; and a different ſet of 12 ſpaces for every different year. On the left hand page enter the payments to be made to you, in that month; and on the right-hand page the payments you are to make. Make a column likewiſe on the left-hand of every page; in which, write the day of payment; and after this, the name of the debtor or creditor; and draw the ſum into the money-columns.

There are alſo *pocket memorandum-books*, publiſhed annually, digeſted into *weeks* and *days*, properly divided, for the clear and methodical entry of occaſional memorandums.

Book *of waſte* is kept in the form of debtor and creditor; a

particular

particular account being kept for each veſſel. To the ſide of debtor, are put victualling, ſitting out, wages, &c. To the ſide of creditor, are put every thing the veſſel has produced; whether by way of freight or otherwiſe. Laſtly, the total of each is entered in the journal, upon balancing the accounts of each veſſel.

Book *of wormes* is particularly in uſe among manufacturers, who have conſiderable works in their hands. It is kept in form of debtor and creditor for each workman employed. On the ſide of debt are put the matters given them to work; and on that of credit, the work they return.

Book *of charge*, or *loading*, *livre de bord*, is kept by the clerk or purſer of a ſhip: wherein are entered all the goods aboard the veſſel, whether thoſe only for freight, or for ſale, or exchange; the whole according to the ſpecification in the maſter's bills of loading.

Book, *bank*. In cities, where there are public banks, or bankers, as at Venice, Amſterdam, Hamburgh, and London, a *book* is neceſſary wherein to keep an account of the ſums paid to, or received from the bank, or bankers.

Book, abſolutely uſed, denotes the waſte-book, ſometimes the journal, or day-book.

In this ſenſe it is, they ſay, I have put down ſuch a ſum in my *book*; you ſhall have an extract of my *book*, &c.

Book-keeping, though chiefly in uſe among merchants and great dealers, is yet applicable with advantage to perſons of all other conditions; as retailers, ſtewards, gentlemen of land-eſtates, &c. with this only difference, that the narrower their affairs and tranſactions are, the fewer *books* they need to keep, and *vice verſa*. The ſame ways of accounting, which in great and diffuſed trade prevent confuſion, by an artful and regular diſpoſing of things, if applied to mean and narrow dealings, will create confuſion, at leaſt will be attended with needleſs trouble; ſince a few things ſhew themſelves readily, and are examined by mere inſpection: ſuppoſing no other method but a waſte-book record; every corner whereof in very ſmall dealings, the owners eye is acquainted with, ſo that he can readily turn to what he wants: but this, in larger accounts, is impoſſible; which makes order, the ſtricteſt form, and much writing, abſolutely neceſſary. Yet this one rule muſt be indiſpenſably obſerved in all caſes; viz. that a true and exact memorial of every thing belonging to the account be made, juſt as things occur; and if buſineſs increaſe, ſo that a nearer approach to the perfection of accounting be neceſſary, this will ſerve as a ground-work, on which you may raiſe the account to what form you pleaſe. But the leaſt a man can do, will be ſome part of the method explained under the article Books; of which all methods whatever are a part; as comprehending the greateſt ſimplicity in the waſte-book, and art in the ledger.

For a perſon in a ſingle ſtate, who has no buſineſs, but the receiving at certain times in the year a ſum of money which he lays out again for his private and perſonal expences, a pocket-book is ſufficient.

For one in a married ſtate, whoſe fortune conſiſts alſo of money, as he has a greater variety of expences, he muſt be careful to keep an exact account of what caſh he receives and pays: and to make this account more diſtinct and orderly, it will be beſt to keep the particulars of the payments in a ſeparate book, and to bring them into a caſh-book once a week, in totals, digeſted under ſuch denominations as he thinks fit, as *bread*, *beer*, *fleſh*, *coals*, *candles*, &c. Things thus brought into the caſh-account, may be again drawn into an abſtract, ſhewing the total of each kind of expences for every month, by dividing a page into twelve columns, with the names of the twelve months; and then in ſo many articles on the margin ſetting the names of the ſeveral heads of expences, and againſt each, under the reſpective month, the ſum of that kind of expences in that month; then will the ſum of the money in the columns under each month be the total expence of that month, and the aggregate of theſe ſums the year's expences.—For artificers, handicrafts-men, and the like, they may keep accounts of the expences of living, as above; but it alſo will be neceſſary to make a diſtinct account of the charges and profit of their buſineſs, which may eaſily be done, by an exact account of all they pay or owe for the materials and inſtruments of their work, with ſervants wages, and taxes upon their trade; and of all they receive or that is due for their work. They may conveniently keep accounts for the materials of their work, to ſatisfy them of the diſpoſal thereof, and to ſerve as a check on ſervants who have acceſs to thoſe things; and they muſt keep accounts for the perſons they deal with, both in buying and ſelling. As for petty traders, who deal in ſome hundreds of trifling wares, and make ſales to the value of a farthing or halfpenny, theſe cannot pretend to keep orderly accounts; the beſt they can do is, to be careful that ſervants do not wrong them; for they have no account of goods; and if you aſk what of any kind remains with them, they muſt examine, if their memory fails. Theſe can only have a caſh-account, which they are to charge once a week with the money received, and diſcharge for what they give out: it is not convenient that they ſhould touch the caſh-box or till, oftener than once a week, when it is completed; but if they do, they muſt keep a ſeparate account of what they take out, to know what was received. Beſides which, they ſhould have a

Book, *Memorandum*, or *Day*-Book, wherein all things delivered on credit are to be entered, and from thence tranſferred to a ledger; in which an account is opened for every debtor or creditor, with a debt and credit both on one ſide with a double money column.

As for more conſiderable ſhop-keepers, who commonly deal in only a few different ſpecies of goods, as drapers, mercers, &c. they uſually keep a ledger for perſons and wares diſtinct, without any formal connection or reference of the accounts, in their ſeveral articles; whereby there can no regular balance be made. In the accounts of perſons, they uſe the formality of a debtor and creditor ſtyle, which is mere ſhew, without the real value of a regular account; there being no oppoſite correſponding debtors and creditors to be found. For their ledger of wares, as they call it, contains nothing of this; and is but an imperfect contrivance, which they ſatisfy themſelves with, to know how much remains. But the worſt is, that in allotting ſpaces for the accounts of wares, they frequently allow no more than they ſuppoſe may ſerve for the retail of the quantity firſt entered on that ſpace; and when this is diſpoſed of, take a new ſpace for a new parcel: which, in a quick trade, is not only troubleſome but confuſed, if there be any of the old parcels remaining; unleſs they carry it to the new account. In reality, dealers in retail, if conſiderable in their way, ought not to come ſhort of the utmoſt pitch of art: at leaſt, they ſhould keep three grand books, a *waſte*, *journal*, and *ledger*; unleſs they ſhall think fit to join the firſt two into one. The *waſte-book* is to contain every thing done in the ſhop, both what is ſold on truſt, and for caſh. This and the *journal* may be made in one, by marking the debtors and creditors on the margin, againſt every tranſaction of value. For the *ledger-book*, becauſe there are commonly many articles of debt to one of credit, on men's accounts with whom they deal, and many articles of credit for one of debt, upon account of wares, they may keep the debt and credit both on one ſide, by double money columns; in one of which let the debt, and in the other the credit be ſet.

For gentlemen of landed eſtates, the books neceſſary to be kept are, 1. A great *waſte-book*, containing a plain narrative of all things as they occur; as receipts, and payments, every thing given and received; and, in ſhort, whatever is done relating to any thing or perſon they are concerned with: out of which are to be made up, 2. A *caſh-book*, containing in a plain narrative ſtyle, upon the debtor-ſide, all receipts of money; and upon the creditor-ſide, all payments; and though there be ſeveral articles received or paid together belonging to the ſame account, which are entered particularly in the waſte, yet they may be ſet down here in a total ſum: for example, there is paid 20*l.* for divers pieces of houſhold furniture, all particularly mentioned in the *waſte-book*, yet in the *caſh-book* there needs no more than to ſay, *paid for houſhold furniture*, &c. 3. A book of accounts with tenants, where, in diſtinct places, every one's charge and diſcharge may be fairly written, without any great formality of ſtyle: and if it hath a ſhew of debtor and creditor ſide, it will be the more diſtinct. 4. A book of petty accounts with ſervants and workmen, &c. 5. A book of real accounts; containing an account of cattle, corn, and other ſtock or furniture, to know at all times what you have, and how it is diſpoſed of. If a gentleman advances no nearer to the artificial part of accounting, he muſt keep an account with every perſon, with whom he has dealings; which may be done in the ſame book with his tenants accounts, only allotting diſtinct parts for them; the laſt will take no great room, compared with the other; theſe books of accounts muſt have indexes.

For factors or ſtewards on land eſtates, a general *waſte-book* will be neceſſary, to contain all matters tranſacted, relating to their maſter's concerns, under their management. Out of which let them make a *caſh-book*, in the manner above directed; alſo a *book* of real accounts, that they may know what real effects, beſides money they have the charge of, and how it is diſpoſed of; particularly the corn-rents, which have been delivered by the tenants, and put in the granaries under their charge, to

be diſpoſed and given out according to order. Malcolm's Treat. of *Book-keeping*, append. p. 7. 30

BOOK *of rates*, is a *Book* eſtabliſhed in parliament, ſhewing at what value goods, which pay POUNDAGE, are to be reckoned at the CUSTOM-HOUSE. See CUSTOM, DUTY, POUNDAGE, and TONNAGE.

The *book of rates* annexed to the act of TONNAGE and POUNDAGE made in the 12th year of king Charles II. is ſubſcribed with the hand of ſir Harbottle Grimſtone, then ſpeaker of the houſe of commons. An additional *book of rates* of goods and merchandizes uſually imported, and not particularly rated in the former, with rules, orders, &c. is ſigned by Spencer Compton, eſq. ſpeaker of the houſe of commons, 11 Geo. I. c. 7.

BOOK-BINDING, the art of ſewing together the ſheets of a *book*, and ſecuring them with a back, and ſtrong paſte-board ſides, covered with leather, &c

Binding is diſtinguiſhed from *ſtitching*, as, in the latter, the leaves are only ſewed, without bands, or backs.

We ſay, French-*binding*, law-*binding*, marble-*binding*, *binding* in parchment, in ſheep, in calves leather, &c. alſo half-*binding*, wherein the leaves are generally left uncut, and only the back covered with leather, the paſte-board ſides being covered with marbled, or blue paper. Dutch-*binding* is where the backs are of vellum. The Italians are ſtill contented to bind in a coarſe, thick paper called *binding alla ruſtica*, the inconvenience of which is its being liable to wear out without careful uſe. Without doubt, the art of *binding* is almoſt as ancient as the ſcience of compoſing *books*; and both the one and the other followed immediately the firſt invention of letters. Whatever the matter might be, on which men firſt wrote, there was a neceſſity of uniting the ſeveral parts together; as well for the making them of one piece, as for the better preſerving them: hence the origin of *book-binding*.

According to Olympiodorus (apud Phot.) it was one Phillatius, a learned man at Athens, who firſt taught the uſe of a kind of glue, to faſten the ſeveral leaves together: on which account a ſtatue was erected to him.

BOOKS, *the manner of binding in volumes*, i. e. of gluing the leaves together; that of rolling them on round pieces, or cylinders of wood, appears the moſt ancient; though that of binding them ſquare, and of ſewing ſeveral quires one over another, lays claim to conſiderable antiquity.

The firſt of the two, which we call *Egyptian-binding*, held a long time after the age of Auguſtus; but it is now diſuſed, excepting in the Jewiſh ſynagogues, where they continue to write the *books* of the law on vellum ſewed together; making, as it were, only one long page, with two rollers, and then claſps of gold and ſilver, at each extremity.

The form now in uſe is the ſquare *binding*, which is ſaid to have been invented by one of the Attali, kings of Pergamus; to whom we likewiſe owe the manner of preparing parchment, called in Latin, from the name of his capital, *Pergamena*, or *Charta Pergamena*.

BOOKS, *manner of binding*. The firſt operation is to fold the ſheets according to the form, viz. into two for folios, four for quartos, eight for octavos, &c. which the workmen do with a flip of ivory or box, called a *folding-ſtick*: in this they are directed by the catch words, and ſignatures at the bottom of the pages. The leaves thus folded, and laid over each other in the order of the ſignatures, are beaten on a ſtone with a heavy *hammer*, to make them ſolid and ſmooth, and then preſſed. Being thus prepared, they are ſewed in a *ſewing-preſs*, upon pack-threads or cords, which are called *bands*, at a proper diſtance from each other, and in a convenient number; which is done by drawing a thread through the middle of each ſheet, and giving it a turn round each band, beginning with the firſt, and proceeding to the laſt. The common number of bands is ſix in folios, and five in quartos, octavos, &c. Sometimes they uſe a ſaw to make places for the bands, which are ſunk into the paper, ſo that the back of the book when bound is ſmooth, without any appearance of bands. After this the backs are glued, the ends of the bands being opened, and ſcraped with a knife, for the more convenient fixing of the paſte-boards; then the back is turned with a hammer, the book being fixed in a preſs between boards, called *backing-boards*, in order to make a groove for admitting the paſte-boards. The boards being then applied, holes are made for drawing the bands through, the ſuperfluous ends being cut off, and the parts hammered ſmooth. Then the book is preſſed, in order for cutting; which is performed by a particular machine called a *plough*, to which is fixed a knife. After this the book is put into a preſs called a *cutting preſs*, betwixt two boards, the one lying even with the preſs, for the knife to run upon; the other above it, for the knife to cut againſt.

The book being cut, the paſte-boards are ſquared with a proper pair of iron ſhears; and it is then ready for ſprinkling, gilding, blacking, or marbling the leaves. The colours, with which it is ſprinkled, are uſually vermilion, or ſap-green; which is done by a bruſh made with hog's briſtles, holding the bruſh in one hand, and moving the hair with the other.

In the French-*binding*, a *back* is put in parchment. i. e. a ſlip of parchment is applied over the back, between each band, and the ends paſted on the inſide of each paſte-board. This preparation, called *indorſing*, ſeems peculiar to the French binders; who are enjoined by ordonnance to back their *books* with parchment on the penalty of 30 livres, and the re-binding of the *book*: it is done in the preſs, where the back being grated to make the paſte take hold, the parchment is applied; and they afterwards add glue to fortify it.

Manner of gilding books on the edges. The *book*, being put tight into the preſs, between two boards, is ſcraped with a knife called a *ſcraper*; and after that with another called a *ſmoother*, in order to take out all ſcratches. Being thus made ſmooth, they ſcrape a little yellow OCHRE upon the *book*, wet it with a little *fize*-water, and rub it off with ſome clean ſhavings. The gilding *fize* is made with the white of an egg, mixed with water, and beat well together. The leaves being wetted with the *fize*-water, with a bruſh, the gold is then laid upon it, and afterwards dried before the fire. When dried, it is burniſhed off with a dog's tooth ſet in a handle. Blacking the leaves is done with fine antimony, the leaves being wet, and the antimony rubbed upon them until quite dry, when it is burniſhed like the gold.

The head-band is now added, which is an ornament of thread or ſilk of two or three colours, placed at each extreme of the back, acroſs the leaves; and woven or twiſted, ſometimes about a ſingle, and ſometimes a double piece of rolled paper, or, what is more laſting, of glued pack-thread.

For the covers; the ſkins uſed undergo ſeveral preparations, which we ſhall explain, in calf, as being the leather moſt uſed; and as being that to which all the reſt, with a little variation, may be referred. The calf-ſkin, being moiſtened in water, is cut to the ſize of the *book*, and the thickneſs of the edges pared off on a marble ſtone kept for that purpoſe. The cover is next ſmeared over with paſte made of wheat-flour: then ſtretched over the paſte-board on the outſide, and doubled over the edges withinſide. They then *card the book*, or *bind it* firmly between two boards, to make the cover ſtick the ſtronger to the paſte-boards, and the back; on the exact performance of which depends a great part of the truth and neatneſs of the *book*. The back is then warmed at the fire to ſoften the glue, and the leather of the back is rubbed down, with a folding-ſtick or bonkin, to ſet and fix it cloſe to the back of the *book*. It is now ſet to dry: and when dry, uncorded: the *book* is then waſhed over with a little paſte and water. the edges and ſquares blacked with ink, and then ſprinkled fine with a bruſh, by ſtriking it either againſt the hand, or a ſtick; or with larger ſpots mixed with virriol, which is called *marbling*. Two blank leaves, on each ſide, are then to be paſted down to the cover; and when dry, the leaves are BURNISHED in the preſs, and the cover rolled on the edges.

The cover is now glazed twice with the white an of egg; it is then filleted plain, or with gold; and at laſt poliſhed with a poliſhing iron, paſſed hot over the glazed colour.

If the *book* be required to be lettered, they paſte a piece of red morocco on the back, between the firſt and ſecond band, to receive the title in gold letters; and ſometimes a ſecond between the next bands underneath, to receive the number of the volume.

The plain *binding*, properly ſo called, is now complete; the gilding on the back and cover, as it makes a part of the *book-binder's* buſineſs among us (though, with the French, &c. it is a diſtinct profeſſion) we ſhall here ſubjoin.

Manner of gilding books on the back and covers. In ordinary *binding*, they gild little elſe but the backs, and the outward edges of the cover. On the backs are gilt the title of the *book*, &c. with flowers, roſes, knots, ſtars, &c. between the bands: on the covers are ſometimes added compartments, aims, &c. All theſe ornaments are made with each its ſeveral gilding tool, engraved in *relievo*; either on the points of puncheons, as thoſe of letters, roſes, ſtars, &c. or around little cylinders of braſs, as the lines, embroideries, &c. The puncheons make their impreſſion by being preſſed flat down; and the cylinders by being rolled along by a handle, to which they are fitted on an iron ſtay, or axis.

To apply the gold, they glaze thoſe parts of the leather, whereon the tools are to be applied, three or four times with

with a liquor made of the whites of eggs diluted with water by means of a ſponge; and, when near dry, they ſlightly oil them, and then lay on pieces of leaf gold, and on theſe apply the tools, with a careful even preſſure of the hand, or roll the cylinders, both the one and the other, reaſonably hot. If the figures be large, and require a great *relievo*, as arms, &c. they are beat or preſſed down. The gilding thus finiſhed, they rub off the ſuperfluous gold, and poliſh the whole; the gloſs of which is greatly aſſiſted by a final preſſing between horns peculiar for the purpoſe.

Our *book-binders*, for gilding on rough leather, make uſe of reſin dried and powdered, inſtead of whites of eggs; and the gold leaf, firſt cut to a proper ſize, is laid on a hot ſomewhat oiled ſtamp, and preſſed down: and thus the reſin melts only in thoſe parts where the hot ſtamp is applied, and the gold fixes on it, whilſt the other parts of the leather remain rough as at firſt. *Dr.* Lewis's Com. Phil. Tech. p. 615. See GILDING.

Ahaſ. Fritſch, chancellor of the univerſity of Jena, has a diſſertation expreſs concerning BOOK-BINDERS, *De Bibliopegis*; wherein he treats of the laws preſcribed by theſe artificers, and the tax or price ſettled by the magiſtrate for *binding books*, of every ſort, in ſheep-ſkin, vellum, &c.—The rates fixed for *binding* in ſheep, throughout the electorate of Saxony, are, for large folios, 1 guilder or florin, three groſſes; common folio, 1 florin; large quarto, 12 groſſes; common quarto, 8 groſſes; large octavo, 5 groſſes; common octavo, 4 groſſes; duodecimo, 3 groſſes; ſedecimo, 2 groſſes.

BOOK-LAND, ſee BOCK-*land*.

BOOK-SELLER, a profeſſed trader in *books*; whether he prints them himſelf, or procures them to be printed by others for ſale.

Book-ſellers, among us, are the ſame with *bibliopolæ* among the ancients, whoſe office was diſtinct from that of *librarii*. Petty dealers, or venders of ſmall ware, like our publiſhers, were more particularly denominated *libellenſes*. At Rome, the Argileturn was the mart of *books*, as Paul's Church-yard, or Fleet-ſtreet, and Paternoſter row, have been among us: whence that of Martial,

Argiletanas movis habitare tabernas,
Cum tibi, parva liber, ſcrinia noſtra vacent.

Book-ſellers are a kind of agents, or curators in the republic of letters: in many places, they are ranked among the members of univerſities, and entitled to the privileges of ſtudents: as at Tubingen, Saliſbürg, and Paris, where they have always been diſtinguiſhed from the vulgar and mechanical traders, and exempted from divers taxes and impoſitions laid on other companies.

Formerly, the offices of *book-ſellers* and printers were united in the ſame perſons. Labbe gives a liſt of learned *book-ſellers*; moſt of whom were alſo authors. Of late days, *book-ſellers* have drawn their buſineſs into leſs compaſs, and leaving the labour of compoſing *books* to one ſet of perſons, and that of printing them to another, content themſelves with the gainful part; thus miniſtering to the republic of letters not with the head, or the hand, but the purſe only.

In this view, they have been very important and uſeful agents between authors and the public; and have contributed, in no ſmall degree, to the encouragement of genius and literary induſtry, and the ſpread of ſcience. There are few authors, who have undertaken the printing and publiſhing of any work likely to be tranſmitted to poſterity, without being connected with ſome *book-ſeller* or *book-ſellers*, eminent in their profeſſion.

The fairs of Frankfort and Leipſic are famous for the reſort of *book-ſellers*, not only from all parts of the empire, but Holland, Flanders, &c. They have each their ſhop or warehouſe, over which is inſcribed the name of ſome celebrated *book-ſeller* of former times: *officina Elzeviriana, Frobeniana, Morelliana, Janſoniana*, &c.

An acquaintance with the *book-ſellers* marks or ſigns, frequently expreſſed on the title-pages of their *books*, is of ſome uſe; becauſe many *books*, eſpecially in the laſt century, have no other deſignation either of printer, *book-ſeller*, or even city. The *anchor* is the mark of Raphelengius at Leyden; and the ſame with a *dolphin* twiſted round it, of the Manutii at Venice and Rome; the *Arion* denotes a *book* printed by Oporinus at Baſil; the *caduceus*, or *pegaſus*, by Cramoiſy; the *compaſs*, by Plantin at Antwerp; the *fountain*, by Valcoſan at Paris; the *ſphere* in a balance, by Janſon or Blaew, at Amſterdam; the *lily*, by the Juntas at Venice, Florence, Lyons, and Rome; the *mulberry-tree*, by Morel at Paris; the *olive-tree*, by the Stephenſes at Paris and Geneva; and the Elzevirs at Amſterdam and Leyden; the *bird between two ſerpents*, by the Frobeniuſes at Baſil; the *trunk*, by the Commelins at Heidelberg and Paris; the *Saturn*, by Colinæus; the *printing-preſs*, by Badius Aſcenſius, &c.

Chevillier ſhews, that the univerſity of Paris had formerly the ſole power of creating and appointing *book-ſellers*, who were to take an oath to the univerſity; and were reputed part of the academical body, and as ſuch entitled to the exemptions of the other members thereof. They were to give ſecurity to the univerſity for their behaviour, and produce atteſtations of their capacity for the diſcharge of their office: the univerſity alſo depoſed and expelled them at diſcretion: they were obliged to appear at all aſſemblies of the univerſity, when ſummoned, and aſſiſted at the public proceſſions thereof: they were obliged to lend their *books* to be read, or even copied by ſuch as were diſpoſed to borrow, on certain conditions, preſcribed by the univerſity. If they kept any *books* by them which were not correct, the univerſity puniſhed them: they were not allowed to buy any *book* of a ſtudent, without leave of the rector: nor where they allowed to gain above four *deniers* in a *livre*, by any copies ſold to the members of the univerſity. Every *book-ſeller* was obliged to have a catalogue of all his *books* hung up in the ſhop, with the prices as rated by the univerſity: no *book-ſeller*, who had not taken the oaths to the univerſity, might ſell a book of above ten *ſols* value. Diſſ. de l'Orig. de l'imprim. t. iv.

This ſtate laſted from the thirteenth century to the invention of printing, and even till the end of the fifteenth century; during which time there were only allowed twenty-four *book-ſellers*, two binders, two illuminers, and two ſworn *book*-writers, or copiſts.—But from that time the kings of France began to take cognizance of them: Lewis XI. thought fit to preſcribe ſome new regulations in 1467: under Francis I. the *book-ſellers* were brought wholly under the royal authority, and received ſtatutes from the king.

The chief ſcience of *book-ſellers*, is the knowledge of the titles, different editions, prices, and ſcarcity of *books*, without regard to their contents, or qualities, otherwiſe than as theſe affect the ſale of them.

BOOK-WORM, is an inſect of the mite kind, which afterwards becomes a fly, bred from eggs depoſited in the month of Auguſt in *books*, eſpecially in the leaves neareſt the covers. It is not unlike the mite or BLATTA found in corn. When the time of its tranſformation approaches, the inſect ſeeks to get into the air, and eats every thing which it finds in its way, till its gets to the extremity of the *book*. The mixture of juice of wormwood and other bitter ingredients in their paſte, which is an expedient uſed by book-binders for this purpoſe, is no ſecurity to books againſt *book-worms*. The beſt and the only ſecurity is from mineral ſalts, which all inſects hate. For this purpoſe book-binders, ought to mix with the paſte employed in binding, the ſalt which is known under the name of ARCANUM *duplicatum*, alum, and vitriol; with this precaution, *books* may be perfectly guarded from all injury and inſult from this miſchievous little creature. We cannot take too much care to preſerve what only can tranſmit our knowledge to poſterity. M. Prediger, among other inſtructions to German book-binders, printed at Leipſic in 1741, recommends their making paſte of ſtarch, inſtead of flour: he wiſhes them to powder ſlightly the books, their covers, and the ſhelves on which they ſtand, with a mixture of powder of alum, and fine pepper; and is alſo of opinion, that in the months of March, July, and September, books ſhould be rubbed with a piece of woollen cloth ſteeped in powdered alum. *Melanges D'Hiſt. Nat.* tom. v. p. 206.

BOOKING, among *Merchants*, &c. the making an entry of any matter in the journal. See BOOK, BOOK-KEEPING, and JOURNAL.

BOOM, in the *Sea-language*, a long pole, wherewith they ſpread out the clue of the ſpreading-ſail, ſometimes alſo that of the main-ſail and fore-ſail, to make them broader, and receive more wind.

Booming of the ſails is never uſed but in quarter winds, or before a wind. By a wind, ſtudding ſails, and *booming* the ſails is not proper.

When a ſhip is ſaid to come *booming* towards us, it imports as much, as that ſhe comes with all the ſail ſhe can make.

BOOM alſo denotes a pole with a buſh or baſket on the top, placed to direct ſhips how to ſteer into a channel: otherwiſe called a *beacon*.

BOOM likewiſe is uſed, in *Marine Fortification*, to denote a cable or cables ſtretched athwart the mouth of a river, or harbour, with yards, top-maſts, buttlings, or ſpars of wood,

wood, lashed to it, and girded with iron hoops rivetted together and nailed to the spurs, to prevent an enemy's entering. Such a *boom* M. Chateau Renault had with diligence and art prepared at Vigo, for the defence of the plate fleet lying there in 1702: but how strong soever, it was forced by Sir Thomas Hobson. The cables of which the *boom* is formed, are bent to a pair of sheet anchors on each side of the channel. Other cables are sometimes fastened to that within the *boom*, and bent to anchors laid down the stream; and these cables are prepared with spurs like the other; where wood is scarce, the *boom* is prepared with old ropes, &c. and iron hoops; every part of it being well covered with pitch strewed with gravel. The *boom* is generally so contrived, as to open at one end for the passage of vessels.

BOOMITES, a term used by some authors to express a kind of agate, of a very remarkable brightness and transparence, which represents the figures of shrubs, trees, mosses, &c. in the manner of the *dendrachates*, a common *mocho-stone*. This is however very different in the degree of transparence and brightness.

BOOMKIN. See BUMKIN.

BOOPHTHALMUS, derived from βοῦς, *an ox*, and ὀφθαλμος, *eye*, *Ox-eye* STONE, in *Natural History*, a name given by Schenchzer to a peculiar AGATE, in which there frequently appear circles of considerable size, resembling some large animal's eyes. The ground-colour of the stone is grey, and the circles of a deep bluish black.

BOOPS, in *Zoology*, the name of a fish caught in the Mediterranean, and sold at Nice, Messina, and Genoa. It is a small fish, seldom exceeding five inches in length, and very remarkable for the largeness of its eyes; and a species of the SPARUS. It is of a rounded, not flat shape, and its scales are large. See *Tab. V. of Fish*, N° 56. Besides this, which is the common species of the *boops*, there are two other kinds, the one commonly called BOUGE-*rouge*. The other a small kind, not above three inches in length, and without scales. Its mouth is small, and its eyes extremely large. Its tail is broad and thick. This, in the taste and consistence of its flesh, no way differs from the common *boops*.

BOOPS is also the name of a species of the WHALE.

BOOR-*worm*, in *Natural History*, a name given by Rumphius, to the *teredo lignorum*, a sea-worm, which bores the bottoms of ships.

BOOT, a leathern cover or defence for the leg, used on horse-back, both to keep the body more firm, and defend the part from the injuries of the weather.

Boots seem to have been called thus, from their resemblance to a sort of jacks, or leathern bottles, formerly in use, and called *botte*, in the old French *boots*. Borel derives the name from the ancient French word *bot*, *a stump*, because the *boot* gives the leg this appearance.

It is not long that the *boots* used on horse-back have been called by this name. In the reign of Charles VII. of France, they were called *houses*, *hose*.

The ancient monks usually wore *boots*; that is, the denomination *botte*, or *botti*, was given to their buskins.

The Chinese had a kind of *boots* made of silk, or fine stuff, lined with cotton, a full inch thick, which they always wear at home and abroad.

There are also chirurgical *boots*, for the cure of *vari* & *valgi*, or crooked and distorted legs.

The *boot* was much used among the ancients, by the foot, as well as bortemen.

The *boot* is the same with what was called by the ancient Romans, *ocreæ*, in middle-age writers, *greves*, *gamberia*, *hainbergo*, *hembarga*, or *himbergæ*. Du-Cange *Lat. Gloss.* The *boot* is said to have been the invention of the Carians: it was at first made of leather, afterwards of brass and iron, and was proof both against cuts and thrusts. It was from this that Homer calls the Greeks *brazen-booted*. Plin. Hist. Nat. lib. vii. cap. 56. Homer. Il. vii. v. 41.

The *boot* only covered half the leg; some say only the right leg, which was more exposed than the left, it being advanced forwards in an attack with the sword; but in reality it appears to have been used on either leg, and sometimes on both. Those who fought with darts, or missive weapons, advanced the left leg foremost; so that this only was *booted*. Veget. lib. i. cap. 20. Pitisc. Lex. Ant. tom. ii p. 309. and Aquin. Lex. Mil. tom. ii. p. 102.

BOOTS, *fishing*, are a thick strong sort, used in dragging ponds, and the like. *Hunting-boots*, a thinner kind, used by sportsmen. *Jack-boots*, a kind of very strong *boots*, used by the troopers.

BOOT, *bordequin*, is likewise a kind of torture for criminals; to extort a confession, by means of a *boot*, stocking, or buskin of parchment; which being put on the leg moist, and brought near the fire, in shrinking squeezes the leg violently, and occasions intolerable pain.

There is also another kind of *boot*, consisting of four thick strong boards bound round with cords: two of these are put between the criminal's legs, and the two others placed one on the outside of one leg, and the other on the other; then, squeezing the legs against the boards by the cords, the criminal's bones are severely pinched or even broken, &c.

The *boot* is now disused in England; but it subsists still, in some other countries.

BOOT-*housing*, see HOUSING.

BOOT-*last*, a wooden cylindric instrument, used by shoemakers for widening the leg of a *boot*. It is slit in two parts, between which a wedge is driven when it is put into the *boot*.

BOOT-*topping*, in *Sea-language*, the act of cleaning the upper part of the ship's bottom, or that part which lies immediately under the surface of the water, and daubing it over with tallow, or with a coat or mixture of tallow, sulphur, resin, &c.

BOOTES, in *Astronomy*, a constellation of the northern hemisphere, whose stars, in Ptolemy's catalogue, are 23; in Tycho's 28; in Bayer's 34; in Hevelius's 52; and in Mr. Flamsteed's catalogue, 54. Their longitudes, latitudes, magnitudes, &c. are as follow:

Names and situations of the stars.	Bayer's Class.	Signs.	Longit.	Latitude	Magnitude.
			° ′ ″	° ′ ″

This

This conſtellation is called by divers other names, as *Arctophylax*, *Bubulcus*, *Bubulus*, *Thygnis*, *Clamator*, *Vociferator*, *Plaraus*, *Planſtri-Coſſus*, *Philometus*, *Arcas*, *Icarus*, *Lycaon* and *Arctturus Minor*; by others, *Septentrio*, *Lanceator*, *Cetonus*; by Heſychius, *Orion*; by others, *Canis Latrans*; by the Arabs, *Aramech*, or *Arcamech*. Schiller, inſtead of *Bootes*, makes the figure of St. Sylveſter; Shickhard, that of Nimrod; and Weigelius, the three Swediſh crowns. Wolf. Lex. Math. p. 266.

BOOTH, *Botha*, denotes a ſtall, or ſtanding in a fair or market: the term is alſo applied to any temporary ſtructure formed of boards and boughs, and deſigned for ſhade and ſhelter.

BOOTY, the moveab'es taken from an enemy in war.

Among the Greeks, the *booty* was divided in common among the army, the general only claiming a larger ſhare. By the military diſcipline of the Romans, ſpoils taken from the enemy belonged to the republic, and particular perſons had no right to them. The generals who piqued themſelves on their probity, carried it wholly to the public treaſury. Sometimes, indeed, they diſtributed it among the ſoldiery, to animate them, and ſerve in lieu of reward. But this diſtribution depended on the generals, who were to conduct themſelves herein with great equity and moderation; otherwiſe it became a crime of peculation to lay hands on the pillage, as regularly belonging only to the ſtate. The conſuls Romulus and Veturius were condemned for having ſold the *booty* taken from the *Æqui*. Liv. lib. iii.

Among the Jews, the *booty* was divided equally between the army and the people, though under the kings a different kind of diſtribution obtained. Numb. xxxi. 27.

Among the Mahometans, two thirds of the ſpoils are allowed to the army; the other third to God, to Mahomet, and his relations, and to the orphans, the poor, and the pilgrims. Calmet. Dict. Bib. tom. i. p. 221.

Among us, formerly, the *booty* was ſometimes divided among the ſoldiery. If the general be in the field, every body takes what he can lay hold on: if the general be abſent, the *booty* is diſtributed among the ſoldiery, two parts being allowed to the cavalry, and one to the infantry. A captain is allowed ten ſhares, a lieutenant ſix, and a cornet four. See PRIZE.

BOQUINII, a ſort of Sacramentarians, who aſſerted that the body of Chriſt was preſent only in the euchariſt to thoſe for whom he died, that is the elect.

They took the denomination from one Boquinus, a Lutheran divine, who was one of the chief of the party.

BORA, in *Natural Hiſtory*, the name of the BUTONITE, in ſome authors; theſe are ſuppoſed by many to be real ſtones, but are truly the teeth of a fiſh.

BORAGO, in *Botany*. See BORRAGE.

BORAK, among *Mahometans*, a fabulous animal, ſuppoſed to be of a middle kind between an aſs and a mule, whereon their prophet was carried in his nocturnal flight from Jeruſalem into the Heavens.

This animal the Arabs called *Al Borah*, q. d. *ſhining*. The night when the journey was performed is called *Lailat al Meeraje*, i. e. *the night of aſcenſion*; and the flight itſelf *Al Miſra*, concerning which, there is a multitude of traditions.

BORAMETZ. See ZOOPHYTE.

BORASSUS, in *Botany*, the name of a genus of plants, deſcribed by Linnæus, but not claſſed, and called in the Hortus Malabaricus, *ampana*, and *carimpana*. The characters are theſe: the male and female flowers grow on ſeparate plants, and give the plant ſuch a different figure, that they are called by the two names before mentioned: the male being the *ampana*, and the female the *carimpana*. The male, or *ampana*, has for the cup of its flower the whole compound *ſpatha*, which is amentaceous and imbricated: the flower is divided into three ſegments, the petals being hollowed, and of an oval figure: the ſtamina are ſix thick filaments, and the *antheræ* are thick and ſtriated: in the female, the cup is the ſame as in the male, but the petals of the flower, which is divided into three parts, in the manner of the male, are very ſmall, of a roundiſh figure, and remain when the piſtil, &c. fall off; the germen of the piſtil is roundiſh; the ſtyles are three in number, and ſmall, and the ſtigmata are ſimple; the fruit is a roundiſh obtuſe berry, of a rigid ſtructure, and containing only one cell; the ſeeds are three in number, and are of an oval compreſſed figure.

BORAX, a ſaline matter, with all the properties of a neutral ſalt, chiefly uſed in ſoldering, and fuſing of metals; ſometimes alſo in medicine, as an emetic, and promoter of delivery.

The word *borax* is formed from the modern Greek, *Βοραξιον*, and this, probably, from the Arabic, *bauracan*, nitre, as being reputed a ſpecies of that ſalt.

The *borax*, now uſed in Europe, is prepared or refined from the TINCAL that is brought from the Eaſt Indies. Dr. Lindolff thinks it might be made in Europe without tincal, by alum, ſoap, and a ſtrong alkaline ley. D. W. Linden thinks that Dr. Lindolff is well acquainted with the nature of *borax*, and that it might be made after his method; but that it would be too expenſive, and not ſuperſede the importation of tincal. He therefore recommends the ſour and acid water that comes out of coal mines, train oil, or any other fiſh oil, or indeed any fat that could be had cheap; the ſtrongeſt alkali of kelp; and all theſe ingredients to be worked in a liquid ſtate, till they are well mixed, and cryſtallize like a ſalt, which, he thinks, would anſwer all the ends of *borax*.

Borax is ſoluble with difficulty, in water, and cryſtallizable as alum, only that it requires more water for its ſolution, and retains leſs of it in its cryſtallizations. It ſuffers no decompoſition by fire; but may be decompoſed by vitriolic, nitrous, and marine acids, which unite with the ſaline alkaline matter that is its baſis, and form with it the ſame neutral ſalts exactly, as thoſe that are produced from the union of theſe acids with the marine alkali; i. e. the vitriolic acid forms Glauber's ſalt, the nitrous acid forms cubic nitre, and the marine acid forms ſea-ſalt. Acids, thus combining with the baſis of *borax*, ſeparate from it a ſaline ſubſtance, ſingular, and little underſtood, called *ſedative* SALT.

This was firſt diſcovered by Homberg, who obtained the ſedative ſalt by diſſolving it with vitriol; but the younger Lemery diſcovered that the ſame ſalt might be alſo obtained by the nitrous and marine acids: theſe chemiſts uſed, for this purpoſe, the embarraſſing and tedious operations of diſtillation and ſublimation: but Mr. Geoffroy has ſhewn the method of obtaining the ſame ſalt from *borax* by acids with evaporation and cryſtallization only, in greater quantity and with leſs trouble. He has alſo demonſtrated that *borax* contains the baſis of ſea-ſalt. M. Baron has ſhewn, that *borax* yields the ſedative ſalt by means of vegetable acids; and that the ſalt is a conſtituent part of the *borax*, and only diſengaged from the alkaline matter with which it is united by the acids, and that it may be reunited with its alkali and again form *borax*. Macquer. Dict. Chem. and Mem. Acad. Sc. An. 1728, 1929, 1732.

Borax is uſually ſuppoſed to have been known to the ancients under the denomination *chryſocolla*: though Mr. Geoffroy gives good reaſons for believing the modern *borax* a different thing from the CHRYSOCOLLA of the ancients.

Pliny divides the ancient *borax* or *chryſocolla* into *natural* and *artificial*: the *natural*, according to him, is only a ſlimy humour running in mines of gold, ſilver, copper, and even lead; which, being congealed and hardened by the winter's cold, becomes of the conſiſtence of pumice ſtone. See BAURAC.

For the *artificial*, it is made by letting water run in the veins of the mine, all the winter long, till June; and letting the mine dry the reſt of the year. So that artificial *borax* is no more than the mineral putrefied and corrupted.

The ſame naturaliſt diſtinguiſhes it into *black*, *green*, *yellow*, and *white*; which aſſume their ſeveral colours, as well as values, from the different mines wherein they are formed. The moderns alſo diſtinguiſh two kinds of *borax*; *natural*, which is crude; and *artificial*, which is purified and refined. Crude, or natural *borax*, *borax non viſtato*, is a mineral ſalt, dug out of the earth in ſeveral parts of Perſia; and found alſo at the bottom of a torrent, running in the mountains of Purbeth, near the frontiers of White Tartary: when taken up, it is expoſed to the air; where it acquires a reddiſh farneſe, which ſerves to ſeed it, and prevent its calcining. When in its perfection, it is ſent to Amadavat, in the territories of the Great Mogul, where the European merchants buy it.

In thoſe places whence it is brought, it is ſaid that there oozes out of the ſides of the hills, containing metals, and particularly copper, a thick turbid water, of a bluiſh grey colour, and of a brackiſh bitter taſte. The courſe of this water is directed into wide and ſhallow pits, lined with a ſtiff clay; here it is left expoſed, in order to evaporate; and the grey fine mud left in its paſſage is daily mixed with it, till it acquires the conſiſtence of a ſoft paſte; and then a large quantity of ſome animal fat melted over the fire is thrown into it, in the middle of a hot day; it is then well ſtirred, and covered with ſticks and branches of trees; and over theſe is laid a cruſt of any common clay. In this ſtate it is left, till it becomes quite dry: it is then ſifted, and what remains in the ſieves is ſent to us under the name of *rough borax*; however, it is not yet certainly known whether this matter be a natural or an artificial ſubſtance, nor whence, nor how it is obtained. Dict. Chem.

There is alſo another kind of natural *borax*, drier, and

of a greenish colour, like English copperas; only differing from the former by its being longer exposed to the air. As for *artificial* or *refined borax*, *borax vitrata*, the Venetians first found out the art of preparing it; or rather, of purifying the natural: it is said to be done by dissolving it in water; then filtrating and cryſtallizing it; using, for that purpoſe, cotton matches; about which the *borax* cryſtallizes like ſugar-candy and cordigriſe on wood.—The Dutch, who are now the only maſters of this manufacture, after refining it, reduce it into little pieces, like tagged points; and it is thus commonly uſed. It is ſaid to be refined by lime-water.

Borax, refined, either in the Dutch or Venetian manner, ſhould be clear and tranſparent, almoſt inſipid to the taſte; and above all, care muſt be taken to have no mixture of Engliſh alum. In this ſtate it conſiſts of large, white, eight-ſided cryſtals, each of which is compoſed of ſmall, ſoft, bitteriſh ſcales.

Borax is of great uſe in collecting the particles of any metal over the fire, and running them into a maſs; and this, with very little diminution of their weight. Dirt or aſhes, though in ever ſo ſmall a quantity, will certainly hinder ſome ſmall particles of gold and ſilver from running together into a maſs over the fire; but if they are ſo diſpoſed by a very ſtrong fire as to meet into a regulus, a great part of the metal will always adhere to the dirt that is thrown away. The leſs perfect metals not only ſuffer the above mentioned accidents, but their ſurfaces being greatly increaſed, copper and iron turn entirely into a *ſcoria*, and are deſtroyed, and lead and tin are ſo in great part. It is therefore very detrimental when theſe baſer metals are mixed in any, even in ever ſo ſmall a quantity, with gold or ſilver; for in the melting, there come upon the ſurfaces light *ſcoriæ*, in which part of the gold or ſilver is retained, as in the pores of a ſponge, and prevented from running into a regulus. To remedy this miſchief, *borax* is added, becauſe as it helps the melting of metals and of all bodies by fire, ſo bringing the baſer maſs into a quick fuſion gives the metals an opportunity to ſink together into a maſs to the bottom, and vitrifies the lighteſt *ſcoriæ*, throwing them off to the ſurface; and the uſe of this ſalt is not reſtrained to gold and ſilver, but takes place as well in regard to iron as copper.

This ſalt alſo cauſes metals to melt in a much leſs fire than they otherwiſe would, and is of very ſingular uſe in preſerving the leſs perfect metals while in fuſion. It flows over them, and covers their ſurface while tortured in the fire, as if it were a kind of very thin glaſs, which defends them againſt the combined force of the fire and air, ſo deſtructive of the imperfect metals.

The aſſayers have a cuſtom of rubbing with *borax* the inſides of veſſels, in which the more precious metals are to be melted, which always fills up the ſmall cavities in their ſides, that might otherwiſe take in a part of the metals. When gold is melted with *borax* alone, it makes it pale; but this is obviated by the adding a ſmall quantity of nitre, or of *ſal ammoniac*. Care muſt be taken, however, not to add both theſe ſalts together, becauſe they would cauſe a detonation. The above mentioned uſe of *borax* has cauſed it to be reckoned, by ſome writers, among the reducing bodies; that is, ſuch bodies as reſtore metals, however deſtroyed, to their priſtine form: but this is an error; for *borax* does not reduce the deſtroyed metals, but only the ſcattered particles of them, while they yet retain their true metallic form.

BORAX is alſo uſed by the dyers to give a gloſs to ſilks; in Italy, by the ladies as a coſmetic; and in making GRAUBER's *ſalt*. See A. D. S. an. 1732. p. 308. H. 52.

A principal uſe of *borax* is to facilitate the ſoldering of metals, by accelerating the fuſion of the ſurfaces of the metals to be joined, and clearing them of any calx or other matter by which they might be prevented from being perfectly applied to each other.

BORAX, in *Medicine*, is uſed to promote delivery. Med. Eſſ. Edinb. vol. i. p. 341.

The uſe of *borax* is that of an inciſive and aperient ſalt, by virtue of which it is effectual againſt diſeaſes which proceed from an inſpiſſation of the humours, and obſtructions thence ariſing. The doſe is a dram.

Its ſtimulus, however, is too weak to be depended upon for preſent relief in a difficult birth, unleſs it be joined with other ingredients of more efficacy. For this reaſon, *borax* is commonly given in powder mixed with ſaffron, myrrh, oil of cinnamon, caſtor, the volatile ſalt of amber, and the like.

Some adviſe a few grains of it to be taken in a poached egg, as a provocative to venery.

Borax calcined is reckoned of ſpecific virtue in fluxes of the belly, or the *lienes*, as being a kind of ſtyptic earth. The doſe is from a ſcruple to half a dram.

Borax is of ſome further uſe in medicine, as it enters the compoſition of the *unguentum citrinum*. It is alſo uſed in the preparation of a *focus* for the ladies.

BORAX, *glaſs of*, is obtained by melting the cryſtals of this ſalt; and it is the only ſalt that aſſumes a vitreous appearance from fire without addition. The glaſs becomes opake, and pulverizes in the air. *Borax* forms with earths different ſorts of glaſs, which are in general very hard and compact, and at firſt extremely tranſparent; but they are liable to become cloudy and opake by being long expoſed to the air.

It is alſo uſed in preparing the imitations of precious ſtones.

BORAX is alſo a name given by ſome to the BUFONITES, or toad-ſtone; a kind of BEZOARD ſaid to be found in the head of the TOAD.

BORBONIA, in *Botany*, a genus of the *diadelphia decandria* claſs of plants. The characters are theſe: the flower hath five leaves, and is of the butterfly ſhape; the ſtandard is obtuſe and reflexed; the wings are heart-ſhaped, and ſhorter than the ſtandard: the keel hath two obtuſe lunulated leaves; it hath nine ſtamina joined in a cylinder, and one upper, ſtanding ſingle; in the centre is ſituated a germen, which afterwards becomes a round-pointed pod, terminated with a ſpine, having one cell including a kidney-ſhaped ſeed. There are three ſpecies, which are natives of the Cape of Good Hope; and as they do not perfect their ſeeds in this country, are with difficulty propagated here. Hiunæus enumerates ſeven ſpecies.

BORBONIA *Aſtra*, a denomination formerly given by ſome writers to the *four* FACULÆ, on a ſuppoſition that they were ſatellites, or ſecondary planets.

Promundus mentions a Frenchman, named Tarde, who had written a book expreſs under the title ASTRA BORBONIA. Phil. Tranſ. N° 330. p. 287.

BORBORITÆ, or BORBORIANI, a branch of the ancient Gnoſtics, in the 11th century, who, to the other errors of that ſect, added this, of denying a future judgment. Their name is derived from *Βορβορος*, *filth*, on account, as it is ſaid, of a cuſtom they had of beſmearing their faces and bodies with it. Epiphan. Hereſ. 25, an. 26. Auguſt. de Hereſ. c. 5.

Some alſo have given this appellation, by way of reproach, to the MENNONITES.

BORBOTHA, in *Ichthyology*, a name given by ſome authors to the MUSTELA *fluviatilis*, or eel-pout. See GADUS.

BORDAGE, the condition or ſervice of the *bordarii*. Du-Cange. Cloſſ. Lat.

BORDARII, often mentioned in the Domeſday inquiſition, were diſtinct from the *ſervi* and *villani*, and ſeem to be thoſe of a leſs ſervile condition, who had a *board* or cottage, with a ſmall parcel of land, allowed to them, on condition they ſhould ſupply the lord with poultry and eggs, and other ſmall proviſions for his board and entertainment. Though, according to Spelman, the *bordarii* were inferior to *villani*, as being limited to a ſmall number of acres.

BORDARII alſo denotes ſervants, or workmen, employed about the houſe in the neceſſary offices of fetching wood, drawing water, grinding corn, cleaning yards, and the like: by which they ſtand diſtinguiſhed from VILLANI, employed in the tillage of lands. See VILLAIN.

BORDAS, a ſmall narrow ſtuff, which is manufactured in ſome parts of Egypt, particularly at Cairo, Alexandria, and Damiata.

BORDER, in *Gardening*, denotes a narrow bed adjoining to a walk, ſerving to bound and incloſe the parterres, and prevent their being injured by the feet.

The uſe of *borders* is to incloſe parterres. They ought always to be laid with a riſing in the middle by which they will have a better effect to the eye than if quite flat, and their breadth ſhould be between four and ſix feet.

Some are continued about parterres, and are wrought with a ſharp riſing in the middle, and planted with low ſhrubs and flowers. Others have only a verge of graſs in the middle, being edged with two ſmall paths, raked ſmooth and ſanded; theſe are ſometimes adorned with vaſes of flowers, of large growth, or flowering ſhrubs, along the middle verge of graſs. Others are quite plain, and are only ſanded, as in the parterres of orangeries; and are filled with caſes ranged with regular order along thoſe *borders*, which are edged with box on the ſides next the walks, and on the other with verges, and graſs-work next the parterre. Sometimes a yew is planted between each caſe, which makes the *border* appear richer, and the parterres handſomer during the winter ſeaſon.

The floriſts make *borders* in any part of their gardens, which they uſually edge with green boards; and this gives them a very neat look: in large parterres, all that is to be expected, is to ſtock them well with flowers, that will ſucceed one another during the ſummer ſeaſon. Miller.

BORDER, in *Heraldry*. See BORDURE.

BORDERS,

BORDERS, among *Florists*, are such leaves as stand about the middle thrum of a FLOWER.

BORD-FREE. See FREE.

BORD-HALFPENNY, or BROD-HALFPENNY, money paid in markets, and fairs, for setting up boards, tables, and stalls, for the sale of wares.

BORD-LANDS, the demesnes anciently kept by the lords in their hands for the maintenance of their *board* or table. This was anciently called *bordage*.

BORD-SERVICE, called also BORDAGE, the tenure of lands, on condition of furnishing provision for the lord's board or table.

Some lands in the manor of Fulham, and elsewhere, are still held of the bishop of London, by the service, that the tenants pay six pence per acre in lieu of finding provision for their lord's table.

BORDURE, or BORDER, in *Heraldry*, a kind of addition on the limb of a shield, in form of a hem, or girdle, encompassing it all round, and parallel to the boundary of the escutcheon, and serving as a DIFFERENCE. See *Tab. Herald. fig.* 10.

The *bordure* must be about one fifth part of the breadth of the field.

Simple bordure is that which is of the same colour or metal throughout; and is the first addition of younger brothers. There are others, *compounded*, *counterved*, *ingrailed*, *indented*, and *charged* with other pieces; which make different additions for younger brothers, in several degrees.

If the line which constitutes the *bordure* be straight, and the *bordure* plain, as they call it in blazoning, the colour of the *bordure* alone is named: as, he beareth gules, a *bordure* or. If a *bordure* be charged with any parts of plants or flowers, they say, *verdy* of trefoils, or of such vegetables and flowers, whatever they be. If it consists of ermines, vairy, or any of the furs, the term is, *per-fleuy* of ermines: if the borders be charged with martlets, the word is, *charged* with an *enaluron* of martlets: *enarmy* is used for beasts; and *entoyre* for things inanimate. A *bordure* is never of metal upon metal, and seldom of colour upon colour; but of the same tincture with the principal bearing or charge.

BORE. The *bore* of a gun or piece of ordnance is used for the chase or barrel; though it seems rather to denote the diameter of the chase. See CALIBER, and CANNON.

BORE, *square*, in *Smithery*, denotes a square steel point, or shank well tempered, fitted in a square socket in an iron wimble, serving to widen holes, and make them truly round and smooth within.

BOREA, an ancient name for a species of JASPER, of a bluish green colour.

BOREAL *Signs*, *Ephemerides*, the first six signs of the zodiac, or those on the northern side of the equinoctial.

BOREALIS, *aurora*. See AURORA *Borealis*.

BOREAS, a Greek name now in popular use, for the north wind. Etymologists usually derive the word from *Βοω*, *clamor*, *misse*; or from *Βορα*, *food*, because it creates an appetite.

Perron observes, that anciently, and with much greater propriety, *Boreas* signified the north-east wind, blowing at the time of the summer solstice: he adds, that the word comes from the Celtic *bore*, *morning*; because their principal light, in that season, came from that quarter, whence also the winds then usually blew.

The Greeks erected an altar to *Boreas*. He is represented on the temple at Athens with his robe before his mouth, as if he felt the cold of the climate over which he presides, agreeably to the description of Ovid, who calls him *gelidus tyrannus*, *the shivering tyrant*. Met. vi. ver. 711. But he is usually described by the Roman poets as violent and impetuous. Ibid. ver. 686 ver. 707.

The qualities allowed by naturalists to this wind are coldness and dryness.

BOREASMI, were feasts instituted at Athens in honour of BOREAS.

BORECH, in *Natural History*, a kind of salt brought from Persia.

BORECOLE, in *Botany*, a species of the BRASSICA, or cabbage. Of this there are three sorts; the common, the green, and the Siberian or curled colewort, called by some Scotch kale. The two former are sown about the middle of April, and are fit for transplanting about two months after. The latter kind may be sown in the middle of July, and will be fit for use from Christmas till April.

Borecole has lately been found to be an excellent food for cattle. See CABBAGE.

BOREE, or BOURRE, a kind of dance, composed of three steps joined together by two motions; and begun with a crotchet, rising. The first couplet contains twice four measures, and the second twice eight. It consists of a balance-step and a coupee: it is supposed to come from Auvergne; others say from Biscay.

BORING, the act of perforating a solid body, or making a hole throughout its whole length or thickness.

Surgeons speak of *boring* the bones of the skull, properly called TREPANNING.

BORING *birch*, and other trees, is practised in the spring for their juice, called also TAPPING and *bleeding*. Phil. Transf. N° 44. p. 880.

BORING, in *Farriery*, an operation sometimes practised for the cure of horses whose shoulders are wrenched. The method is thus: they cut a hole through the skin in the middle of the shoulder, and, with the shank of a tobacco-pipe, blow it as a butcher does a shoulder of veal; then they run a cold flat iron, like a horseman's sword-blade, eight or ten inches up, between the shoulder blade and the ribs, which they call *boring*; after that they burn him round the shoulder with a hot iron. This, says Bartlet, is an absurd and useless as well as a cruel practice.

BORING *of cannon*, in *Foundery*. See CANNON.

BORING *of masts*, from top to bottom, is proposed by Dr. Hooke as a means of strengthening and preserving them; as this would make them dry and harden the better, and prevent their cleaving and cracking. For want of this, the outside drying, when the inside does not, the former shrinks faster than the latter; the consequence of which is prejudicial.

BORING, in *Mineralogy*, a method of piercing the earth by a set of scooping irons, made with joints to as to be lengthened at pleasure. The skilful mineralist will be able to guess where a vein of ore may lie, though there are none of the common outward signs of it upon the surface of the earth; and in this case he has recourse to *boring*, the scooping irons are drawn back at proper times, and the samples of earth and mineral matter they bring up, are examined; and hence it is known whether it will be worth while or not to open a mine in the place.

BORING *of water-pipes*. The method of *boring* alder poles for water-pipes is thus; being furnished with poles of a fit size, hooks, or trestles, are procured of a due height, both to lay the poles, and rest the augre on in *boring*; they also set up a lath, whereby to turn the lesser ends of the poles, and adapt them to the cavities of the greater ends of others, in order to make the joint shut each pair of poles together. The outer or concave part is called the female, and the other, or inner, the male part of the joint. In turning the male part, they make a channel or small groove in it, at a proper distance from the end; and, in the female part, bore a small hole to fit over this channel; they then bore through their poles, flicking up great nails at each end, to guide them right; but they commonly bore a pole at both ends; so that if it be crooked one way, they can nevertheless bore it through, and not spoil it. Neve Build. Dict. in voc. Alder.

This operation is now performed with a horse-mill, as at Dorlet Stairs for the New River company.

Belidor, in his Hydraulics, has described a machine, in which a water-wheel is made use of both to turn the augre, and to bring forward the carriage on which the pipe to be *bored* rests. This machine (See *Tab* II. *Mechanics*, *fig.* 67.) is put into motion by the water-wheel A, in the axis of which there is a cog-wheel B, that turns the lanterns C and D; the trundles of D turn two small wheels E and F; the first of which is vertical and turns the augre; the other is horizontal and moves the carriage by means of the two arms H and I. H draws the wheel G towards F, and I pushes it in a contrary direction; and these combined actions cause the carriage to advance towards F, and the augre to bore the pipe. The augre being about 12 feet long and proportionably heavy is supported by the pieces L, L; and they are prepared so as to give no obstruction in the following manner: C, C, *fig.* 68. are two planks of wood which are fastened to the timber-work of the mill; these encompass another plank hung by a cord, at the bottom of which are fixed the pieces *b*, *b*, with joints at *c* and *c*: and, that they may not move out of the vertical plane, they are joined by tenons to the plank *a*, in which they may work freely: on the side of one of these pieces is fixed a spring *g*, in order to hinder them from uniting, by forcing them into a mortise in *d*; in this situation the two pieces are penetrated with a hole through which the augre is to pass. The cord is fastened to the plank *a*, as in *fig.* 69. and goes over the two pullies *b*, *b*: at the other end of the cord there is hung a weight *e*, resting on the piece N, which is supported on one end by the piece O, and fixed at the other by a joint to the lever K, which has its centre of motion in the piece of wood H; so that, leaning against the extremity M of the lever, N quits the support O, the weight sinks down, and draws up the piece *a*: then the sides *b*, *b*, *fig.* 68. quit the mortise *d*, and the spring *g* separates them: and thus the

supporter

supporter does not in the least hinder the motion of the augre.

BORITH, in the Holy Scriptures, an herb thought to be the *kali* or saltwort; of the ashes of which some make soap, and a very good ley to wash linen with. It is mentioned in Jeremiah, chap. ii. ver. 22.

BOROLYBICUS, the wind which blows in the middle between the north and west points; called also the north-west wind.

BOROUGH, Borough, Borow, or Burgh, is frequently used for a town, or corporation which is not a city. *Borough*, in its original Saxon *burg*, or *burgh*, is by some supposed to have been primarily meant of a tything or company consisting of ten families, who were bound and combined together as each others pledges.

Afterwards, as Verstegan informs us, *borough* came to signify a town that had something of a wall or inclosure about it: so that all places which among our ancestors had the denomination *borough*, were one way or other fenced or fortified.

But, in later times, the same appellation was also bestowed on several of the *villæ ingenuorum*, or country towns of more than ordinary note, though not walled.

The ancient Saxons, according to Spelman, gave the name *burgh* to those called, in other countries, cities. But divers canons being made for removing the episcopal sees from villages and small towns to the chief cities, the name CITY became attributed to episcopal towns, and that of *borough* retained to all the rest; though these too had the appearance of cities, as being governed by their mayors, and having laws of their own making, and sending representatives to parliament, and being fortified with a wall and castle, and the like.

Borough, or *burgh*, is now particularly appropriated to such towns, and villages, as send burgesses or representatives to parliament.

Boroughs are equally such, whether they be incorporate or not; there being great numbers of our English *boroughs* not incorporated; and, on the contrary, several corporations that are not *boroughs*; e. gr. Kingston, Deal, Kendal, &c.

Boroughs are distinguished into those by *charter*, or *prescription*; and those by *prescription*, or *custom*.

The number of *boroughs* in England and Wales, including cities and cinque ports, which elect members, is 215; some whereof send one, some two representatives.

Boroughs, *Royal*, in Scotland, are corporations made for the advantage of trade, by charters granted by several of their kings; having the privilege of sending commissioners to represent them in parliament, besides other peculiar privileges.

These form a body of themselves, and send commissioners, each, to an annual convention at Edinburgh, to consult the benefit of trade, and the general interest of the *boroughs*.

According to Chamberlayne, they have the sole power of trade and merchandize, exclusive of all others, a power of holding courts, exercising the JURISDICTION of sheriffs, making bye laws, &c.

The company of merchants in a *royal borough* make what is called a GUILD; the chief of which is a dean of GUILD, who is next magistrate to the bailiff.

The *royal boroughs* are not only so many distinct corporations, but do also constitute one entire body, governed by, and accountable to one general court, anciently called *the court of four boroughs*, held yearly to treat and determine concerning matters relating to the common advantage of all *boroughs*.

The *four boroughs* which composed this court were, Edinburgh, Stirling, Roxburgh, and Berwick; which two last falling into the hands of the English, Linlithgow and Lanerk were put in their places; with a saving to the former, whenever they should return to their allegiance.

But this court not being sufficient to answer the necessities of the *royal boroughs*, they were all empowered, under James III. in 1487, to send commissioners to a yearly convention of their own, which was then appointed to be held at Inverkeithing, and is now held at Edinburgh, under the denomination of the *convention of boroughs*, vested with great power.

Borough-*Courts* are certain courts held in *boroughs*, by prescription, charter, or act of parliament: such are the sheriff's court, and court of hustings in London.

Borough-*English*, denotes a customary descent of lands or tenements in certain places, whereby they come to the youngest, instead of the eldest son; or if the owner hath no issue, to the youngest, instead of the eldest brother; because the youngest is supposed, in law, the least able to shift for himself. 1 Inst. 140. b. And in support of this reason, other usages in favour of the youngest are alleged, as that in Kent, where the lands being equally divided among all the sons, the youngest is to have the privilege of attre or hearth in the mansion-house, in his share, as being supposed the tenderest, and more in need of warming. Others, notwithstanding, suspect a different reason for the rise of *Borough-English*, viz. that the places, where this custom now obtains, were anciently liable to that custom granted the lords of manors in Scotland by king Eugenius, who had the privilege of enjoying the first night of their tenants brides; so that the eldest son being presumed to be the lord's, they usually settled their lands on the youngest son, whom they thought their own; which, being practised a long time, grew at length into a custom. The custom, however, never obtained in England, though it did in Scotland till it was abolished by Malcolm III. Perhaps, says judge Blackstone, the origin of this practice may be illustrated by that of the Tartars, mentioned by Du Halde, among whom the same custom of descent to the youngest son prevails. As the nation is composed of shepherds and herdsmen, the elder sons migrate from their father with an allotment of cattle, to seek a new habitation. The youngest son, continuing latest with his father, is naturally the heir of his house. This custom of migrating obtained in many other northern nations; and *Borough-English* may be a remnant of that pastoral state of our British and German ancestors, which Cæsar and Tacitus describe. Blakstone's Comm. vol. ii. p. 83, 84.

Borough-English obtains only in some ancient boroughs and copy-hold manors.

Borough-*Head*, or *Head*-Borough, is the chief man of the *decenna* or *hundred*; chosen by the rest to speak and act in their behalf.

In many parishes, *Head-borough* also signifies a kind of head-CONSTABLE, where there are several chosen as his assistants, to serve warrants, &c.

Borough-*Holder*, in *Ancient Law Writers*, the head-man or chief pledge of a tithing, chosen by the rest to speak and act in their common behalf.

The word is formed from *boro-ealder*, as being the senior man of the borough or tithing.

Borough-holders are the same with what are otherwise written, *borsholders*, *burgholders*, *borsholders*, *borow-holders*, *borgholders*, *burghesaldi*, *burgesaldii*; of later days, *borough-heads*, and HEAD-BOROUGHS.

Borough, or *Burge*, denotes a pledge or security for another's keeping the peace, and conforming to the laws.

The word is Saxon, and is sometimes also written *borough*; in Latin writers, *burgha* and *burgho*.

Borough *breach*, *Burghi fractura*, in *Ancient Law-Writers*, denotes a breaking of the pledge or security given by the members of tithings for the behaviour of each other.

This is the same with what is otherwise called *borg-brege*, *burgh-brege*, *burg-breche*, and *burghi-fractura*.

Boroughs, *Laws*, or *Borrows*, in the law of Scotland, the same with what in England is called *binding to the* PEACE. In case of a contravention of *law-boroughs*, the surety or cautioner is equally liable with the principal for the penalty specified therein; the one half to the king, and the other to the complainer.

BOROW-*holes*, the holes, in the remotest corner of which the female rabbits depolite their young, to prevent the males from eating them.

BORRAGE, *borrago*, in *Botany*, a genus of the *pentandria monogynia* class of plants. Its characters are these: the flower is of one leaf, having a short tube, and spread wide open above; the chaps of the flower are crowned by five prominences; it hath five stamina, which are joined together; and four germina situated in the centre, which afterward become so many roundish rough seeds, inserted in the cavities of the receptacle. There are four species; the first of which is the common *borrage*, whose flowers are used in medicine, and the herb for cool tankards in summer. If the seeds are permitted to scatter, plants will come up in plenty.

The common *borrage* has long held its rank as a cordial of the first class, though perhaps it would not be easy to say on what foundation. Its flowers are of the number of the four cordial ones of the shops, and it has been recommended as a medicine of great efficacy in malignant and pestilential fevers, and against the bites of poisonous animals. By the experiments of M. Margraaf, Mem. de Berlin, 1747, it appears that the juice affords a true nitre.

BORRELISTS, a sect or sort of Anabaptists in Holland, who allow of no use of sacraments, public prayers, or other external worship, nor of any human gloss or explication of Scripture; but profess to adhere to the faith and manners of the New Testament times in all their simplicity.

They took their denomination from their founder, *Borrel*, a person of great learning in the Hebrew, Greek, and

and Latin tongues, and brother of M. Bortel, ambaſſador of the States to the French king.

BORSELLA, in the *Gloſs Works*, an inſtrument wherewith they extend or contract the glaſſes at pleaſure; alſo ſmooth and levigate them.

BOS, the *ox*, in the Linnæan ſyſtem of *Zoology*, a genus of quadrupeds of the order of *pecora*; the characters of which are, that the horns are hollow and turned forward, bent like crefcents, and ſmooth on the ſurface; the fore-teeth are eight in number, and there are no canine teeth. Of this genus, beſide the common tame one, there are four ſorts naturally wild; the BISON, BONASUS, BUBALUS, and URUS.

Bos *grunniens*, or *grunting ox*, ſo called becauſe it grunts like a hog, is a ſpecies of the ox, with a mane on the neck, and the whole body covered with long hair, a hunched back, and tail like that of a horſe; it is found in the country of the Calmucs. Pennant.

Bos *Indicus*, or *Indian ox*, is another ſpecies, with a large lump on the ſhoulders, and ſhort horns, bending cloſe to the neck in ſome of the ſpecies, and almoſt upright, bending a little forward in others. In Surat there is a ſmall kind, not bigger than a great dog, with a fierce look, which is uſed for drawing children in ſmall carts. See *Tab. Quadrupeds. fig.* 6.

Bos, in *Antiquity*, was peculiarly uſed for an ancient Greek ſilver coin, which was *didrachmus*, or equivalent to two drachms.

BOSA, in the *Egyptian Medicine*, denoted a maſs prepared of the flower of the lolium, hemp-ſeed, and water; of the ſame inebriating virtue with the *aſſis*, or opium.

BOSCAGE, denotes a place ſet with trees, a grove, or thicket.

BOSCAGE, *boſcagium*, in a *Law ſenſe*, ſignifies *maſt*, or ſuch ſuſtenance as woods and trees yield to cattle.

BOSCAGE, among *Painters*, is ſaid to denote a picture or landſcape repreſenting much wood and trees.

BOSCAGE ſometimes denoted a tax or duty laid on wood brought into the city.

BOSCHAS, in *Zoology*, the name of our common wild DUCK, called alſo by ſome, *anas torquata minor*, or the ſmaller ring DUCK.

BOSCO. See ATTACHIAMENTA *de boſco & ſpinis*.

BOSCOI, or BOSCI, in *Eccleſiaſtical Hiſtory*, denotes a ſpecies or tribe of monks in Paleſtine, who fed on graſs like the beaſts of the field.

The word is Greek, βοσκοι, q. d. *grazers*; formed from βοσκω, *paſco*, *I feed*.

The *Boſcoi* are ranked among the number of Adamites, not ſo much on account of their habit as food. They took no care about proviſion; but when eating-time came, or any of them were hungry, went into the fields, with each his knife in his hand, and gathered and eat what he could find.

BOSCUS, in *Ancient Law-Writers*, ſignifies a wood of any kind. The word is alſo written corruptly *boſcus*, *boſcaria* and *boſcale*. It is formed from the Greek, βοσκω, *I feed*, as ſerving for paſture. In which ſenſe, *boſcus* amounts to the ſame with the Italian *boſco*, and French *bois*. *Boſcus* is divided into high wood, or timber, called alſo *ſaltus*, and *haut-bois*; and *copice*, or underwood, *ſub-boſcus*, or *ſub-bois*.

BOSEA, in *Botany*, or *ſerva mora*, a genus of the *pentandria digynia* claſs of plants; commonly called the *golden red-tree*. Its characters are theſe: the flower hath no petals, but five ſtamina, which are as long as the empalement; in the centre is ſituated an oval, oblong, pointed germen, which afterward becomes a globular berry with one cell, including one pointed ſeed. We have but one ſort of this plant, which is a native of the Canary iſlands. They have not been known to flower in this country, nor will they endure the open air, through the winter.

BOSPHORICUM *Marmor*, a name given by the ancients to a ſpecies of marble, of a yellowiſh white colour, with beautiful veins of a ſomewhat darker hue; called alſo, from its tranſparency, *phengites*.

BOSPHORUS, or BOSPORUS, in *Geography*, a long and narrow ſea which it is ſuppoſed a bullock may ſwim over; in a more general ſenſe, a long narrow ſea running in between two lands, or ſeparating two continents, and by which two ſeas, or a gulf and a ſea, are made to communicate with each other.

In which ſenſe, *boſphorus* amounts to the ſame with what we otherwiſe call an arm of the ſea, channel, or ſtrait; the Italians, *faro*; the Latins, *fretum*; and the French, *pas*, *manche*.

The word is Greek, βοσπορος, formed from βος, *bos*, and πορος, *paſſage*.

The name *boſphorus* is chiefly confined to two ſtreights, in the Mediterranean ſea, viz the *Boſphorus of Thrace*, commonly called the *Streights of Conſtantinople*, or *Channel of the Black Sea*; and the *Cimmerian* or *Scythian Boſphorus*, ſo called, it ſeems, from its reſemblance to the Thracian; now more commonly the *Streights of Kapha*, or *Kiderkeri*, from two cities ſtanding on it.

The origin of the name is better agreed on than the reaſon why it was firſt given to the Thracian *Boſphorus*. Nymphius tells us, on the authority of Accarion, that the Phrygians, deſiring to paſs the Thracian ſtreight, built a veſſel, on whoſe prow was the figure of a bullock; and which was hence called βους, *bullock*; and ſerved them for a ferry-boat.—Dionyſius, *Val.* Flaccus, Callimachus, Apollodorus, Marcellinus, &c. ſay, that Io, being tranſformed into a cow by Juno, paſſed this ſtreight ſwimming, which hence was called *Boſphorus*.—Arrian tells us, that the Phrygians were enjoined by the oracle, to follow the route which a bullock ſhould mark out to them; and that upon ſtirring one up, it jumped into the ſea to avoid their purſuit, and ſwam over this ſtreight. Others ſay, that an ox, tormented by a gadfly, threw itſelf in and ſwam over: and others, that anciently the inhabitants of theſe coaſts, when they would paſs over, joined little boats together, and had them drawn over by bullocks, &c.

Some late writers rather ſuppoſe *Boſphorus* to have been ſo called, becauſe here was anciently the beaſt-market. Tournef. Voyag. tom. ii. let. 12. and let. 14.

BOSQUETS, in *Gardening*, a term for groves included in gardens.

The word is derived from the Italian, *boſchetto*, which is a diminutive of *boſco*, *a wood* or *grove*.

Theſe are ſmall compartments of gardens, which are formed of trees, ſhrubs, and tall flowering plants, ſet in quarters, and either placed regularly in rows, or diſpoſed in a more irregular manner. Theſe quarters ſhould be ſurrounded with ever-green hedges, and the entrances made into porticos with yews. In the inſide there muſt be ſome walks, either ſtraight or winding. Theſe, if the quarters are large, ſhould be eight feet wide, and laid with turf, and kept well mowed and rolled. The hedges of theſe quarters ſhould be kept low; that the heads of the ſhrubs may be ſeen from the outſide. There is a great deal of fancy to be employed in the planting of theſe *boſquets*, which ſhould be ſhewed in ſetting to view at once ſuch ſhrubs as have the moſt differently ſhaped, and differently coloured leaves that may be; as the long, the round and the jagged, and the various ſhades of deep and lighter green, and the mealy or hoary white leaves. Beſides, there is alſo a very great variety of beautiful fruits, which theſe ſhrubs produce in autumn, which give a very elegant and pleaſant proſpect even after the leaves are fallen. The ſhrubs which produce theſe, are, 1. The euonymus, or ſpindle-tree. 2. The opulus, or water-elder. 3. The cock-ſpur hawthorn. And, 4. The flowering-aſh, as it is called; beſides a great number of others. But it is a good rule in this kind of plantation, never to mix the ever-green trees with thoſe which loſe their leaves in winter. Theſe *boſquets* are only fit for large gardens. Miller.

Boſquets are generally laid out into ſome regular figure, as a circle, ſquare, polygon, or the like, and make a conſiderable article in the decoration of a fine GARDEN.

BOSS, or BOSSE, in *Sculpture*, ſignifies RELIEVO, or prominency.

The word is French, *boſſe*, which ſignifies the ſame; whence alſo to emboſs. See EMBOSSING.

BOSS *of a buckler*, among the *Ancients*, the *umbo*, or ομφαλος, which juts out in the middle.

BOSS, among *Bricklayers*, denotes a wooden utenſil wherein the labourers put the mortar to be uſed in tiling. It has an iron hook, whereby it may be hung on the laths, or on a ladder.

BOSSAGE, a projecting ſtone in *Architecture*, laid rough in building, to be afterwards carved into mouldings, capitals, arms, or the like.

BOSSAGES alſo denote ſtones which ſeem to advance beyond the naked of a building, by reaſon of indentures, or channels left in the joinings; uſed chiefly in the corners of buildings, and thence called *ruſtic quoins*.

The cavities or indentures are ſometimes round, ſometimes ſquare, ſometimes chamfrained, or bevelled, ſometimes in the diamond form: ſometimes they are incloſed with a cavetto, ſometimes with a liſtel.

BOSTANGI-*Baſchi*, in the *Turkiſh Affairs*, an officer in the grand ſignior's houſhold, who has the ſuperintendance of all the gardens, water-works, and houſes of pleaſure, with the workmen employed therein. The poſt of *boſtangi-baſchi*, or chief gardener, is one of the moſt conſiderable in the Turkiſh court. He has the emperor's ear, and on that account, is much courted by all who have buſineſs depending at the Porte: he is governor of all the villages on the channel of the Black Sea and has the command of above ten thouſand *boſtangis*, or gardeners, in the ſeraglio, and other places about Conſtantinople. But that which gives him the

greateſt eclat, is the honour he has of holding the rudder whenever the ſultan takes his pleaſure on the water.

BOSTRYCHITES *lapis*, derived from βοστρυχίζω. *I ſold the hair in braids*, in *Natural Hiſtory*, a name given by ſome to a ſtone ſuppoſed to contain women's hair included in it; ſome have underſtood by it, thoſe pieces of cryſtal which have accidental foulneſſes in them, reſembling hair, or pieces of hair, cauſed by earthy or metalline matter; others call by this name thoſe German agates, which contain either the conſervæ or other capillary water-plants, or other ſouleeſſes running into their form: the firſt of theſe very frequently have the conſerve of a great length, and variouſly undulated and turned about, ſo as very elegantly to repreſent a looſely flowing lock of hair.

BOSTRYCHITES is alſo a name given by ſome authors to a ſpecies of pyrites, whoſe irradiations were ſuppoſed to imitate hair.

BOTARGOTA, in *Natural Hiſtory*, a name given by ſome writers, to that ſpecies of ſea-ſwallow, whoſe neſts are ſo famous for ſoups in China, and in ſome parts of Europe. The neſts are ſuppoſed to be reſtorative, and greatly provocative to venery; for which laſt quality it is that the eaſtern nations in general are ſo fond of them.

BOTAGIUM, in *Middle Age Writers*, a fee paid for wine ſold in *botæ*, or *butts*.

Wine that taſtes of the caſk is called *vinum botatum*.

BOTALE *foramen*, in *Anatomy*, an aperture in the heart of a FOETUS, whereby the blood is enabled to circulate, without going into the lungs, or the left ventricle of the heart. See FOETUS, CIRCULATION, and HEART.

BOTANIST, a perſon who underſtands the nature, hiſtory and diſtinction of vegetables, on ſettled and certain principles, and can call every plant by a diſtinct, proper, and intelligible name. Linnæi Fundam. Botan. p. i. See BOTANY.

BOTANOPHILI, among the writers on the ſubject of vegetables, thoſe who have treated of them, not as botaniſts, on their natural and eſtabliſhed diſtinctions, but in regard to different, operations as gardeners, phyſicians, &c.

BOTANY, the ſcience of plants; or that part of phyſiology which treats of plants, their ſeveral kinds, forms, virtues, and uſes.

The word comes from βοτανη, *herb*; and that from βοσκω, of βοω, *I feed*; becauſe moſt animals feed on herbs. See PHYTOLOGY, &c.

Authors are divided about the preciſe object and extent of *Botany*, which ſome will have to include the whole province of plants, in all their ſtates, uſes, and relations; others reſtrain it to the knowledge of the claſſes, genera, ſpecies, external figures, and deſcription of plants, excluſive of their origin and generation, which belong to *Phyſiology*; of their culture and propagation, which belong to *Gardening* and *Agriculture*; and of their virtues, which are objects of conſideration in *Phyſic* and *Pharmacy*.

This ſcience was cultivated in ſome degree among the ancients; but chiefly with reſpect to its medical application and uſe. However, as they adopted no regular ſyſtem of diſtribution and arrangement, they made a ſlow progreſs, and the knowledge they gained was ſoon and eaſily loſt. If we except Solomon, of whom we read that *he ſpake of trees from the cedar-tree that is in Lebanon, even unto the hyſſop that ſpringeth out of the wall*, 1 Kings, chap. iv. ver. 33. and begin only with thoſe writers on the ſubject of *botany*, any of whoſe writings now remain; the firſt, in order of time, is Hippocrates, who flouriſhed in the fifth century before Chriſt, and who has enumerated about 250 different plants. Ariſtotle alſo may be mentioned, though there is reaſon to doubt whether the books concerning the generation of plants, which ſome have aſcribed to him, are his, or a collection by ſome late writer from the works of Theophraſtus. Theophraſtus, the diſciple of Ariſtotle, is therefore properly the next to Hippocrates, on the genuineneſs of whoſe writings we can depend; he flouriſhed about 300 years before Chriſt; there remain nine books of his on the hiſtory of plants, and ſix on the cauſes of them: he reckons about 500 plants.

Among the Romans, Cato, Varro, Virgil, and Columella might be mentioned; but the moſt eminent were Dioſcorides, who lived under Anthony and Cleopatra; he is called the prince of botaniſts, and yet the number of plants which he has deſcribed amount only to 600; and C. Plinius Secundus, under Veſpaſian and Titus, who enumerates more than 1000 plants. Galen, of Pergama in Aſia, who lived at Rome about the year 133, though he did not write profeſſedly on *botany*, has introduced many incidental obſervations on this ſubject; and other phyſicians proſecuted this ſtudy, as far as it was immediately connected with that of their profeſſion, from the ſecond to the ſixth century of the Chriſtian æra; ſuch as Oribaſius, Aetius, Trallianus, and P. Ægineta. The principal Arabian *botaniſts*, who muſtly with the ſame views cultivated this ſcience, from the eighth to the twelfth century, were Meſue, Serapio, Razis, Avicenna, and Averrhoes. The ſucceeding period, till the fifteenth century, was very unfavourable to every kind of ſcience; however, in this century, and eſpecially in the next, *botany* was induſtriouſly reviſed by means of numerous and laboured commentaries on Theophraſtus, Dioſcorides, Pliny, Cato, Avicenna, and Meſue: and the principal perſons who were employed in this way were Leonicenus, Brafavolus, Cordus, Fuchſius, Bauæus, Matthiolus, and Dalechampius. Turner, Gerard, and Tradeſcant were the firſt *botaniſts* in England; they applied themſelves to the culture of medical and rare plants towards the cloſe of the ſixteenth century. It was after this period that *botany* began to acquire a conſiderable degree of importance and reputation; and that ingenuity and induſtry were employed in collecting and claſſing new ſpecies of plants. It would be tedious to much as to account all the names of thoſe who are diſtinguiſhed in this reſpect; let it ſuffice to mention Geſner, Doſoæus, Cæſalpinus, Proſper Alpinus, the two Bauhins, Columna, Parkinſon, Plukenet, Morriſon, Malpighi, Grew, Hermannus, Ray, Magnol, Tournefort, Sloan, Sherrard, Linnæus, and Miller. In a word, *botany* is arrived at a degree of perfection among the moderns, to which the ancients were ſtrangers; not only as to the method of claſſing, diſtributing, and characteriſing plants, but alſo as to the *copia* or number of plants known and deſcribed. The numerous travels and voyages of *botaniſts* have very much contributed to the extent of this ſcience.

This article will terminate with a brief account of the principal ſyſtems, that have been eſtabliſhed by *botanical writers*. Nothing has been more conducive to the ſucceſsful cultivation of this ſcience, than a clear and diſtinct method of arrangement, whereby the ſeveral claſſes, genera, ſpecies, and varieties, may be readily diſtinguiſhed; and it is eaſy to foreſee, that in proportion as the Linnæan ſyſtem prevails, and different writers agree in adopting the ſame language, the ſtudy of *botany* muſt be greatly facilitated and promoted. Linnæus diſtributes the ſyſtems which have already obtained into *heterodox* and *orthodox*. The former are founded in an alphabetical arrangement; in the ſtructure of the root; in the different ſpecies of flowers; in the *habit* of plants; their time of flowering; their native ſoil and climate; their medicinal uſe, and the order of the diſpenſaries. The *orthodox* ſyſtems, as he calls them, are either univerſal or partial; ſuch as belong to plants in general, or ſuch as are accommodated to the nomenclature and arrangement of particular kinds. The univerſal ſyſtems are four; though, by various modifications, this number has been conſiderably augmented. Linnæus has diſtinguiſhed the ſeveral patrons of them under the claſſes and appellations of *Fruſtiſtæ*, *Corolliſtæ*, *Calycifiæ*, and *Sexualiſtæ*. The *Fruſtiſtæ* are ſuch as form the ſeveral claſſes of vegetables from the *pericarpium*, the *ſeed*, and the *receptacle*; of this number are Cæſalpinus, Morriſon, Ray, Knaut, Hermann, and Boerhaave. The *Corolliſtæ* diſtinguiſh the ſeveral claſſes by means of the *corolla* and *petals*; ſuch are Rivinus and Tournefort, and their diſciples. The *calycifiæ* diſtribute them from the *calyx*, as Magnol; and the *Sexualiſts* found their ſyſtem on the different ſexes of plants. To this compendious abſtract of the hiſtory and principal ſyſtems of *botany*, it may be proper to add, that Cæſalpine, who was an Italian phyſician in 1583, was the firſt ſyſtematical writer, and he diſtributed plants into claſſes, according to the form of their ſeeds: Ray, from being firſt a *Fruſtiſt*, became afterwards a *Corolliſt*: Boerhaave endeavoured to combine the ſyſtems of Hermann, Ray, and Tournefort; but as the ſyſtem of the latter was at one time very generally received, and notwithſtanding the prevalence of the Linnæan or ſexual ſyſtem, has ſtill ſome advocates, it may be proper to obſerve, that Tournefort conſiders plants as compoſed of five parts, viz. roots, ſtalks, leaves, flowers, and fruit; neglecting the three former parts, he diſtributes them into various *claſſes*, according to the diſpoſition and ſtructure of the flower; and in reſolving them into genera, he takes into conſideration both the flower and fruit. Mr. Ray, urged chiefly by the ſhort duration of the flower, fought the characters of the ſeveral genera, not merely in the flower and fruit, but in the figure of the organical parts, as the leaves, ſtalks, and roots, and in their colour, ſmell, taſte, and the outward ſurface of the whole plant. See FACE *of a plant*.

See a farther account of theſe ſyſtems under PLANTS, and PETAL.

The claſſes, according to Tournefort's diſtribution, are

the following twenty-four; *viz.* 1. Plants with monopetalous, campaniform, or bell-fashioned flowers. 2. Those with monopetalous, infundibuliform, or funnel-like flowers. 3. Plants with anomalous, monopetalous flowers. 4. Plants with monopetalous, labiated flowers. 5. Plants with polypetalous, cruciform flowers. 6. Plants with polypetalous, rosaceous flowers. 7. Plants with polypetalous, rosaceous, and umbellated flowers. 8. Plants with caryophyllous, or pink-like polypetalous flowers. 9. Plants with liliaceous, or lily-like flowers. 10. Plants with polypetalous, papilionaceous flowers. 11. Plants with polypetalous, anomalous flowers. 12. Plants with flosculous flowers. 13. Plants with semi-flosculous flowers. 14. Plants with radiated flowers. 15. Plants with staminaceous flowers. 16. Plants without flowers, but having visible seeds. 17. Plants with neither visible flowers nor seeds. 18. Trees with apetalous flowers. 19. Trees with apetalous, amentaceous flowers. 20. Trees with monopetalous flowers. 21. Trees with rosaceous flowers. 22. Trees with papilionaceous flowers. For a description of which, see the several articles AMENTACEOUS, APETALOUS, &c.

Each class in this system contains several *genera*, amounting in the whole number to 673, and comprehending 8846 species, to which the author afterwards added 1300 more, referring them to the proper genera in his system. Those who are desirous of farther information with regard to the history and various systems of *Botany* are referred to the preface of Johnson's Herball, fol. 1636; Linnæus's Philosophica Botanica, 1751; Tournefort's Ingogge in Rem Herbariam apud institutiones, &c. tom. i. ed. Paris. 1719. For a particular account of the Linnæan sexual system, see FRUCTIFICATION, and SEXUAL *System*. See also PLANTS, VEGETATION, &c. &c.

BOTANY, *terrestrial*, that employed about the plants growing on the surface of the earth.

BOTANY, *marine*, that concerned in the consideration of sea plants, as fucuses, *ulvæ*, *algæ*, &c.

BOTANY, *subterranean*, that about the plants under ground, as the *tubera terræ*, or truffles, &c.

BOTARGO, a sort of fausage, made of the roes of the mullet-fish; much used on the coasts of the Mediterranean, as an incentive to drink.

The manner of preparing *botargo*, as practised at Martegue in Provence, is described by Mr. Ray.—The mullets, *mugiles*, are taken in *bordigues*, which are places in the shallows inclosed with hedges of reeds. The male mullets are called *allerans*; the female *boter*, of the roes or spawn of which the *botargo* is made, thus.

They first take out the spawn entire, and cover it round with salt for four or five hours; then they press it a little between two boards or stones; then they wash it, and at last dry it in the sun for thirteen or fourteen days, taking it in at night. Ray. Trav. p. 396, seq.

The people of Provence call it *bou-argues*. The best is brought from Alexandria and Tunis. There is also a manufacture of it near Marseilles. It is much used throughout all the Levant.

BOTATRISSA, in *Ichthyology*, a name given by Bellonius, Gesner, and other authors, to that species of the GADUS called by authors the *lota* and *mustela fluviatilis*; by us, the EEL-*pout*. It is distinguished from the other *gadi*, by having two fins on the back, and the two jaws of equal length, with beards at the mouth.

BOTAURUS, in *Ornithology*, a name by which several have called the bird known among us by the name of *bittern*, BITTERN, or *mire-drum*.

BOTE, BOTA, in our old *Law Books*, signifies *compensation*, *recompense*, or *amends*, for any injury done. See ESTOVERS.

Hence *man-bote*, satisfaction due for a man slain.

Hence also *boteless*, where no judgment or favour will acquit a man; as, *v. gr.* for sacrilege, &c. And hence our common phrase to *bote*, speaking of something given by way of compensation.

BOTE, *cart*, *fire-bote*, *hay-bote*, *house-bote*, *kin-bote*, *plough-bote*, *thorn-bote*. See the adjectives.

BOTENALKAITOS, a star in the constellation CETUS, called also BATENKETOS.

BOTESCART, in *Ancient English Writers*, the same with BOATSWAIN.

BOTHAGIUM, *bothage*, or *bothage*, customary dues to the lord of the market, for the liberty of pitching and standing of BOOTHS.

BOTHNA, *botlna*, or *bothona*, in the Scotch *Law*, a park or field wherein cattle are inclosed, and fed.

The word is also written *bordhena*; formed from the ancient Scottish *burh*, a *flock of sheep*.

BOTHENA is also used for a barony, lordship, or sheriffdom.

In which sense it is ordained by statute, that the king's

moot or court of each *bothona*, that is, each sheriffdom, shall be held within forty days.

BOTHRION, βοθριον, denotes the ALVEOLUS or socket of a tooth.

BOTHRION is also used to denote a small, narrow, but deepish ulcer of the cornea of the eye, resembling a round puncture.

The word is also written *bothrias*; by others corruptly, *botryon*. In Latin writers it is sometimes called *fossula*.

BOTIA, *botia*, or *botus*, among *Chemists*, a glass vessel with a round belly and long narrow neck, otherwise called *ary*, *ovum philosophicum*, *cucurbita*, and *urinale*.

BOTIA, in *Medicine*, the same with STRUMÆ and SCROPHULÆ.

BOTIN, or BUTINE, among *Alchemists*, denotes turpentine, or balsam of turpentine, when gathered under the proper influence.

BOTONOMANCY, from βοτανη, *herb*, and μαντεια, *divination*, an ancient species of divination, by means of plants; especially sage, and fig-leaves.

The manner of performing it was thus: the persons who consulted, wrote their own names, and their questions, on leaves, which they exposed to the wind; and as many of the letters as remained in their own places, were taken up, and being joined together, contained an answer to the question. Potter. Arch. Græc. lib. ii. cap. 18. tom. i.

BOTONTINI, in *Middle Age Writers*, denote mounts or hillocks, raised to serve as land-marks, or boundaries of grounds.

The word is also written *botentones*, *botanes*, and *bodones*. Du-Cange Gloss. Lat.

BOTOTOE, in *Natural History*, a name given by the people of the Philippine islands to a very beautiful bird of the parrot kind; it is somewhat smaller than the common parrot, and is all over of a fine deep blue colour.

BOTRYITES, in *Natural History*, a stone of the gem kind, resembling a branch of young grapes.

The word is formed from βοτρυς, a *grape*. In English writers it is sometimes called the *grape-stone*.

BOTRYITES, or BOTRITES, also denotes a sort of burnt CADMIA, found somewhat in the form of a bunch of grapes adhering to the upper parts of furnaces, where the mineral is calcined.

It differs from the *placites*, which is that gathered on the lower parts of the furnace; though Schroder gives a different distinction, viz. into *botrites*, found in the middle of the furnace, *placites* in the upper, and *ostracites* in the lowest part.

BOTT, among *Bone-lace Weavers*, a kind of round cushion of light matter placed on the knee, whereon they work or weave their LACE with bobbins, &c.

Among the French the *bott*, called *oreiller*, is a little square wooden frame or desk, covered ordinarily with green stuff.

BOTTLE, a small vessel proper for holding liquors.

The word is formed from *butellus*, or *botellus*, used in barbarous Latin writers, for a lesser vessel of wine; being a diminutive of *botis*, which denoted a butt or cask of that liquor.

We say a glass *bottle*, a stone *bottle*, a leathern *bottle*, a wooden *bottle*, a sucking *bottle*.

The ancient Jewish *bottles* were cags made of goats or other wild beasts skins, with the hair on the inside, well sewed and pitched together; an aperture in one of the animal's paws serving for the mouth of the vessel. Calmet. Dict. Bib. tom. i. p. 323.

Glass *bottles* are better for cyder than those of stone. Foul glass *bottles* are cured by rolling sand or small shot in them; mussy *bottles*, by boiling them. See GLASS.

Bottles are chiefly made of thick coarse glass; though there are likewise *bottles* of boiled leather made and sold by the case-makers.

Some glass *bottles* covered with straw or wicker, are called *flasks*, or *bottles*.

The quality of the glass has been sometimes found to affect the liquor in the *bottle*. Mem. Acad. Scienc. 1704.

BOTTLE is also a measure at Amsterdam, the same with the MINGLE.

BOTTLE-*flower*, in *Botany*, see CENTAURY.

BOTTLE-*head*, a species of whale.

BOTTLE-*nose*, in *Ornithology*, a name by which the people in some parts of England call the *anas arctica Clusii*.

BOTTLING, or BOTTLING, the operation of putting up liquors in bottles corked, to keep, ripen, and improve.

The writers on good husbandry, give divers rules concerning the *bottling* of beer, cyder, and the like. The virtues of Spa, Pyrmont, Scarborough, and other waters, depend on their being well bottled and corked, otherwise they lose both their taste and smell. To preserve them, it is necessary the bottles be filled up to the

mouth,

mouth, that all the air may be excluded, which is the great enemy of bottled liquors. The cork is alſo farther ſecured by a cement. Some improve their bottled beer, by putting cryſtals of tartar and wine, or malt ſpirits; and others, by putting ſugar boiled up with the eſſence of ſome herb, and cloves, into each bottle.

Cyder requires ſpecial precautions in the *bottling*; being more apt to fly, and burſt the bottle, than other liquors. The beſt way to ſecure them, is to have the liquor thoroughly fine before it be bottled. For want of this, ſome leave the bottles open a while, or open them after two or three days *bottling*, to give them vent. If one bottle break, through fermentation, it is beſt to give them all vent and cork them up again. Mean cyder is apter to break the bottles than rich. Some ſoak the corks in ſcalding water, to render them more pliant and ſerviceable. See CYDER.

Another particular to be obſerved is, to lay the bottles ſo as that the liquor may always keep the cork wet and ſwelled. Something alſo depends on the place where the bottles are ſet; which ought to be ſuch as expoſes them as little as poſſible to the alterations and impreſſions of the air: the ground is better for this purpoſe than a frame; ſand better than the bare ground, and a running water, or a ſpring often changed, beſt of all.

To haſten the ripening of bottled liquors, they are ſometimes ſet in a warm place, or even expoſed to the ſun, when a few days will bring them to maturity.

BOTTOM, the loweſt part of a thing, as contradiſtinguiſhed from the top.

Hydroſtatical writers ſpeak of the preſſure of fluids, on the *bottom* of veſſels; in which caſe, the law of gravitation is, that the altitude remaining the ſame, the preſſure will be as the *bottom*. M. Leibnitz has aſſerted, that a body in falling through a fluid, does not preſs on the *bottom*, that is, does not increaſe the preſſure on it; which is found to be falſe. Phil. Tranſ. N° 351. p. 570. A. D. S. an. 1692. p. 16.

When water boils, the bottom of the veſſel is found conſiderably colder than it was ſome time before boiling; inſomuch that the hand may bear it in the former caſe, not in the latter. Hiſt. Ac. Sc. ann. 1703. p. 29.

BOTTOM, in *Navigation*, denotes the ground or ſurface of the earth under the water.

They ſay, a rocky, ſandy, gravelly, clayey *bottom*; a *bottom* with good hold, with a bad hold, &c.

The *bottom* of the ſea, Ray obſerves, is level, i. e. the deſcent from the ſhore to the deep is equable and uniform: but the *bottoms* of ſome ſeas are found higher than of others. Count Marſigli has made divers enquiries into the ſtructure of the *bottom* of the ſea, and its beds of ſtones, ſalt, bitumen, &c. Ray, Wiſd. of Creat. part i. p. 84. See SEA.

Over the natural *bottom* of the ſea is formed an accidental *bottom*, by the mixture of different matters, ſand, ſhells, mud, &c. ſtrongly compacted by the glutinous quality of the ſea-waters, almoſt to a degree of petrifaction. Theſe incruſtations being neceſſarily formed in *ſtrata*, there are ſome places wherein the fiſhermen can diſtinguiſh the annual augmentations. Hiſt. Acad. Sc. 1710.

BOTTOM *of a ſhip*.—Merchant ſhips are much broader *bottomed* than frigates; men of war are a mean between the two. Sir William Petty preſented the model of a double *bottomed* ſhip.

BOTTOM is alſo uſed to denote a whole ſhip, or other veſſel.

In this ſenſe we ſay, Engliſh *bottoms*, foreign *bottoms*. By the act of navigation, certain commodities imported in foreign *bottoms*, pay a duty called petty cuſtom; from which they are exempt, if imported in Engliſh *bottoms*.

BOTTOM is alſo uſed for what remains at the bottom of a veſſel. In this ſenſe, Paracelſus calls the ſediment of urine, *fundus urinæ*.

BOTTOM-*ſtone*, a kind of iron-ſtone, or ore, in the Staffordſhire mines.

BOTTOM-*nails*. See NAIL.

BOTTOMRY, in *Navigation* and *Commerce*, the act of borrowing money on a ſhip's *bottom*; that is by engaging the veſſel for the repayment of it, ſo as that, if the ſhip miſcarry the lender loſes the money advanced; but if it arrives ſafe at the end of the voyage, the borrower is to repay the money lent with a certain premium or intereſt agreed on; and this on pain of forfeiting the ſhip. See ASSURANCE and POLICY.

The rate or intereſt of money, taken on *bottomry*, follows that of inſurance. In queen Anne's war, when inſurance to the Eaſt Indies and back was 16 *per cent. bottomry* was 45 *per cent.* And in king William's war, when inſurance to the ſame place was 22 *per cent. bottomry* was 55.

Bottomry, if conſidered only as hiring money, would be illegal, and fall under charge of uſury, on account of the exceſſive intereſt: but it is not a mere hiring of money, ſince the lender likewiſe ſtands to the hazard of the voyage. The money here advanced is called *pecunia trajectitia*, as being carried on the lender's hazard or adventure beyond the ſeas; ſo that, if the ſhip be loſt, the lender loſes all; wherras, when money is lent at intereſt, it is delivered at the peril of the borrower. And the profit here is merely the price of the loan; but the profit of the other is a reward for the danger and adventure of the ſea which the lender takes on himſelf, and makes the intereſt lawful.

If money be lent on ſhip-board by a merchant or paſſenger, and before the day of payment the ſhip happens to be caſt away; if there be ſuch a ſaver as will admit of a contribution, the party lending is not to have his whole money, but it ſhall come into the average; becauſe if that money had been ſo lent, it would have been in common danger with the reſt: but, if the time appointed were paſt before the miſfortune happened, then the borrower muſt repay the lender his whole money, free from contribution. Therefore by the maritime laws, in caſe the borrower detains any money thus lent, beyond the appointed time for the repayment, he ſhall at his return from the voyage, not only pay the profit agreed on before, but be obliged alſo to augment the ſame, according to the longer time accrued ſince the day of payment.

A maſter of a ſhip hath no power to take up money on *bottomry* in places where his owners dwell, unleſs he is a part owner, and in that caſe he may take up ſo much only, as his part will anſwer in the ſaid ſhip: for if he exceeds that, his own eſtate ſhall ſtand liable to make ſatisfaction. But when a maſter is in a ſtrange place, where he hath no owners, nor any goods of theirs or of his own; and for want of money, which he cannot procure by exchange or otherwiſe, his voyage might be retarded, there money may be taken upon *bottomry*, and all the owners are liable for it; that is, they are anſwerable by their veſſel, but not in their perſons, by the act of the maſter: and the owners may have their remedy againſt ſuch maſter, whom they put in truſt.

When a maſter or owner of a ſhip takes up money on *bottomry*, and buys in lading, but endeavours to defraud the prince or ſtate of their cuſtoms, or puts ſuch goods on board as incur a forfeiture of the ſhip; in ſuch caſe the borrower only runs the hazard, not the lender. And where bonds or bills of *bottomry* are ſealed, and the money is paid, if the ſhip receives injury by ſtorm, fire, enemy, or any other accident, before the commencement of the voyage; then the perſon borrowing ſhall only run the hazard, unleſs it be otherwiſe provided, by particular words, that the contract is to have its beginning from the time of the ſealing. But if the condition be, that if ſuch ſhall ſail from London to a port abroad, and ſhall not arrive there, &c. then, &c. here the contingency begins not until the departure.

BOTTOMRY, *bill of*, is a contract between two perſons, the one borrowing, and the other lending a ſum of money, by which the borrower ſetting forth his intention to make a voyage in a certain ſhip therein named, acknowledges the receipt of a certain ſum of money from the lender, on this condition, that if the ſhip does happily perform her voyage, without any diſaſter by enemies or otherwiſe, then he is to reſtore that ſum to the lender, with an additional ſum, therein expreſſed, for the intereſt, within a certain time after his return; but that if the ſhip be loſt, or taken by enemies or pirates, then the perſon of the borrower to be for ever diſcharged, and the lender to bear the loſs.

BOTTONY, or BOTONE, in *Heraldry*, is uſed in ſpeaking of a CROSS, which terminates at each end in three knots or buttons, reſembling, in ſome meaſure, three-leaved graſs.

A *croſs bottony*, is the ſame with what Segion terms *croix treffée*; and Baron, *globoſa crux*. Gibbon, the better to explain the form, renders it, *Crux ad ſingulos ejus extremitates in tres gemmas, vel nodos, pro trifolii ſpecie terminata*. He bears argent a croſs *bottony* ſable, by the name of *Winewood*. Vide *Tab. Herald. fig.* 11.

BOTTRYS, in *Botany*, a name given to a ſpecies of the *chenopodium*. See GOOSE-*foot*.

BOTRYTIS, in *Botany*, ſee BYSSUS.

BOTTS, in *Zoology*, a ſpecies of worms which infeſt horſes and other cattle. See HORSE-*worms*.

The name is alſo given to a ſort of grubs which deſtroy the graſs in bowling-greens, &c.

BOVATA *terræ*, in *Ancient Law-Writers*, ſignifies an oxgate of land, or ſo much as may be ploughed in a year with one ox; by ſome reckoned at fifteen acres, by others at eighteen, by others at twenty, and by others at thirteen or twenty ſhillings yearly rent.

This is otherwiſe called *bovatas*, and *bovariata terræ*.

BOVEY *coal*, ſee COAL.

BOUCHE *of court*, the privilege of having meat and drink at court ſcot-free.

The word is alſo written *bouge*, *bouet*, and *budge*; it is mere French, where it ſignifies *mouth*.—The French ſtill uſe the phraſe *Avoir bouche à la cour*; that is, *to have table or diet at court*.

This privilege is ſometimes only extended to bread, beer, and wine: it was a cuſtom anciently in uſe, as well in the houſes of noblemen as in the king's court.

Thomas earl of Lancaſter retained ſir John de Ewre, to ſerve him with ten men at arms in time of war, allowing them *bouge of court*, with livery of hay and oats, horſe-ſhoes and nails. Sir Hugh Merrill had the ſame privilege for life, on condition of ſerving king Edward II. Kennet. Gloſſ. ad Paroch. Ant. p. 378.

BOUDS, a name given in ſome countries to the WEEVIL.

BOUGE-*ravel*, in *Ichthyology*, the name of a fiſh of the BODPS kind, caught in the Mediterranean, and brought to ſome of the Italian markets. Its noſe is long and pointed; its back is of a reddiſh blue, its tail red, and its belly of a fine ſilvery white. Its whole body is ſhorter and broader than the common kind of *boops*. Willughby.

BOUGH, in *Antiquity*.—Green *boughs* made part of the decoration of altars and temples, eſpecially on feſtival occaſions.

Oaken *boughs* were offered to Jupiter; thoſe of laurel to Apollo; of olive to Minerva; myrtle to Venus; ivy to Bacchus; pine to Pan; and cypreſs to Pluto.

BOUGEOIR, the French name for wax candleſticks.

BOUGIE, in *Surgery*, a kind of large medicated tent, worn in the urethra, for the cure of a gonorrhœa, &c.

There was no occaſion for *bougies* till towards the middle of the ſixteenth century, when the *gonorrhœa virulenta* appeared as a ſymptom of the *lues venerea*. An. 1551. Andreas Lacuna of Caſtile, publiſhed at Rome in twelve pages, the method of knowing and extirpating carbuncles in the neck of the bladder, which he owns he learned from a Portugueſe quack of the name of Philippus: he believed him to be the inventor of the *bougies* ſo employed, and that he had cured ſome people of faſhion in Rome by means of them. De Fordyce. *See* Review of the Venereal Diſeaſe, edit. 3. and Dr. Aſtruc, &c. De Morbis Ven. 2d. edit. 4to. Lat. Par. an. 1740

The properties requiſite in the *bougie*, are a ſufficient degree of firmneſs, that it may be introduced with ſome force; a ſuppleneſs and tenacity, that it may conform to the motions of the body without breaking; a lenient ſuppurative diſpoſition, to bring on diſcharge without pain; and, laſtly, a ſmoothneſs of ſurface, that it may not only be introduced with more eaſe, but that it may lie eaſy in the paſſage, until it begins to diſſolve.

The beſt baſis of ſuch a *bougie*, is *diachylon ſimplex*, which may be rendered efficacious by a great variety of mixtures; but though an addition of certain gums, or of the mucilage plaſter, will alone anſwer the purpoſe in ſome diſorders of the urethra; yet as a long uſe of mercurial applications is almoſt a ſpecific for venereal ulcers, and has alſo a powerful effect on every other ſpecies of ſlubborn ulcers, our experiments are naturally directed to mercurial preparations.

Perhaps we may diſcover hereafter the due proportion of quickſilver to the plaſter; at preſent, half an ounce to every ounce of plaſter renders it much more mercurial than any plaſter now in uſe. The *diachylon* muſt be made with oil, and a little *pix Burgundica* added to it, that it may be ſufficiently tenacious: to every ounce of plaſter it is proper to add two drams of crude antimony, finely levigated, which greatly conduces to the ſmoothneſs and good conſiſtence of the *bougie*; beſide that it may poſſibly have other virtues. Upon this plan the preſcription ſtands thus:

Diach. cum pice Burgund. ℥ii.
Argent. viv. ℥i.
Antim crud. pulv. ℥ ß.

The quickſilver, whether it be divided in balſams, ſulphur, or honey, muſt not be put into the plaſter until the moment before the *bougies* are made; nor muſt the plaſter be boiling hot at that time, leſt by the heat the quickſilver ſhould ſeparate from the body it is divided in, and fall down to the bottom in form of globules. When the quickſilver is mingled with the plaſter, moderately hot, ſlips of fine rag muſt lie ready to dip in the compoſition. Theſe ſlips muſt be of different lengths, from ſix to nine or ten inches, and about three inches broad; roll them up looſely, and taking hold of one extremity with the left hand, let it fall upon the ſurface of the plaſter, and then draw it out gently. As it is drawn out it will unroll, and take up a quantity of plaſter on the ſurface equal to the thickneſs of a ſilver groat; though to facilitate the unrolling of the rag, it will be proper to aſſiſt its motion with the end of the *ſpatula*, or ſome other inſtrument. The plaſter, however, muſt be hot enough to ſoak through, and diſcolour the rag, otherwiſe it will not make ſo good a *bougie*.

If the cloth be exactly three inches broad, it will make ſix *bougies* of a moderate ſize; but their ſize may be ſuited to the occaſion. It is generally adviſeable that the *bougie* ſhould be ſmaller at the end which is introduced through the ſtricture, than at that which is left out at the *penis*. For that purpoſe many cut off a part of the oblong ſquare before mentioned, in ſuch manner as to reduce it almoſt into the ſhape of a long right-angled triangle: but as this way of cutting it weakens the *bougie* exceedingly, and as it is not at all neceſſary that the *bougie* ſhould be taper from one extremity to the other, it is much better to cut off a little ſlope of about an inch and a half long from the end that is to be paſſed into the urethra, which will leſſen it where it is neceſſary to be ſmall, and leave it ſtrong in the other part, where the diminution is not neceſſary.

The plaſter taken up by the cloth, when dipped, will have little bubbles upon its ſurface, and not be ſo ſmooth as if it had been ſpread: therefore an iron *ſpatula*, a little warmed, may be paſſed over the plaſter before it be cut into *bougies*, which will render it more compact and even. It is a much more exact and ſpeedy method to cut the *bougies* off with a knife and ruler, than with ſciſſars. When they are rolled up, it muſt be with that ſide outward which is covered with plaſter; and they muſt firſt be rolled by hand as cloſe as poſſible, before they are rolled upon a board or marble; for upon this circumſtance the neatneſs of the *bougie* depends.

BOUILLON, among *Farriers*, a lump or exceſcence of fleſh, growing either on, or juſt by a horſe's ſtruſh, and making him halt.

BOVINA *affectio*. See AFFECTIO.

BOVISTA, in *Botany*, a term uſed by ſome authors to expreſs puff-ball, or duſty muſhrooms, which are ſometimes called the devils ſnuff-boxes.

BOULCOLACA, among the modern Greeks, denotes the ſpectre of ſome wicked perſon who died excommunicated by the patriarch, re-animated by the devil, and cauſing great diſturbance among the people; of which many ſtrange ſtories are told.

The word is Greek, and is ſometimes written βρυκολακας, *brukolakas*; and ſuppoſed to be derived from βορος, or βορα, *mud*, and λακκος, a *ditch*, on account of the filthineſs of the ſpirit.

BOULDER-*walls*, a kind of round walls built of round ſtones or pebbles, laid in a ſtrong mortar; uſed where the ſea has a beach caſt up, or where there is plenty of flints.

BOULIMY, in *Medicine*. See BULIMY.

BOULINIS, or BOULIGNIS, a copper coin ſtruck at Bologna in Italy, equivalent to the BAIOCCO.

BOULTINE, or BOLTEL, in *Architecture*, the workman's term for a convex moulding, whoſe periphery is juſt ¼ of a circle placed next below the plinth, in the Tuſcan and Doric capitals. See *Tab. Archit. fig.* 5.

BOULUKE, in the *Military Orders of the Turks*, a body of the janizaries, with an officer in the place of a colonel at their head, ſent upon ſome particular enterprize; they are ſelected out of the body for this, and, as ſoon as the buſineſs is over, are received again into their former companies.

BOUNCE, in *Ichthyology*, a name given by the people of the weſtern parts of England to a ſpecies of the SQUALUS, diſtinguiſhed by Artedi by the name of the reddiſh variegated *ſqualus* with the *pinnæ ani* in the middle ſpace between the *anus* and tail. This is the fiſh called *ſcymnos* and *ſyſtus* by the old writers, and CATULUS *major* by the later writers. The Italians call it *ſmeriglio*.

BOUND, in *Dancing*, a ſpring from one foot to the other; by which it differs from a hop, where the ſpring is from one foot to the ſame. It alſo differs from a half *coupée*, as, in the latter, the body always bears on the floor, either on one foot or the other; whereas, in the *bound*, it is thrown quite from the floor.

BOUND-*maſonry*. See MASONRY.

BOUND-*hide*. See HIDE-*bound*.

BOUND-*hoof*. See HOOF-*bound*.

BOUND-*bailiff*. See BAILIFF.

BOUNDS *of an eclipſe*. See ECLIPSE.

BOUNDS *of lands*. See ABUTTALS.

BOUNDARY-*column*. See COLUMN.

BOUNTY, in *Commerce*, denotes a premium paid by the government to the exporters of certain commodities, on their taking oath, or, in ſome caſes, giving bond, not to re-land the ſame in England.

There are divers *bounties* ſettled by act of parliament, as a *bounty* of one penny *per* ell on the EXPORTATION of Britiſh fall-cloth; and the like on ſilk ribbands and ſtuffs, on ſilk ſtockings, on fiſh and fleſh, on gold and ſilver lace of Britiſh manufacture; and on ſeveral ſpecies of corn, when not exceeding certain prices, at the port of exportation.

BOUNTY, *Queen Anne's*, for augmenting poor livings under 50*l. per annum*, conſiſts of the produce of the firſt-fruits

and tenths, after the charges and penſions payable out of the ſame are defrayed. A corporation for management of the ſame was ſettled, &c. in 1704. See AUGMENTATION.

BOURDIN, with the epithet *grand*, a name given by Belſonius to a genus of univalve ſhell-fiſh, commonly known among authors by the name of *auris marina*. See EAR-*ſhell*.

BOURDONNE', in *Heraldry*, is underſtood of a croſs, whoſe extremities are turned round like the ends of a pilgrim's ſtaff; more frequently called *pommeé*, *globated*.

BOURGER-*maſters*. See BURGHER-*maſters*.

BOURGUIGNOTTE, a defenſive weapon wherewith to cover the head, being a kind of caſk, open before, and proof againſt either pike or muſket; its name aroſe from the *Bourguignons*, who firſt introduced it.

BOURIGNONISTS, a name given the followers of Antoinette Bourignon, who ſet up a kind of QUIETISM in the Low Countries; pretending to be guided by an immediate revelation.

BOUREE. See BORÉE.

BOUSTROPHEDON, in *Literature*, is uſed in ſpeaking of the ancient method of writing among the Greeks, wherein the lines were continued forwards and backwards, like the furrows in ploughing.

The word is compounded of βους, *bullock*, and στρεφω, *I turn*.

Pauſanias mentions ſeveral ancient inſcriptions written in this manner: the laws of Solon are alſo ſaid to have been thus written; which, as the author laſt cited explains it, is when the ſecond line is turned on the contrary ſide, beginning at the end of the former, thus:

ΕΚΑΙΟΣ ΑΡ
ΑΘΕΜΩΧ

Potter. Arch. Græc. lib. i. cap. 26. tom. i.

BOUTADE, in *Muſic*, an irregular flight or movement, without art or ſtudy.

The word was alſo formerly uſed for a *ſolo* on the *viol di gamba*, thus called as being ſuppoſed to be extemporary. Richelet ſpeaks of a dance called *boutade*, invented by the famous Bocan, in the reign of Lewis XIII. ſo called from the briſk humorous manner of its beginning; but now out of uſe.

BOUTAEL, in *Ichthyology*, the name of an Eaſt Indian fiſh, of the LAMPREY kind, called alſo *megen ogen*, and, by Mr. Ray, *lampetra Indica*. It is caught in lakes, ponds, and other ſtanding waters, and is a very wholeſome and well-taſted fiſh.

Its general deſcription ſeems to make it rather of the *muſtela* than the *lampetra* kind; but if, as its name expreſſes, it has ſeveral apertures for the gills, its Dutch name ſignifying nine eyes, it is abſolutely a new genus of fiſhes.

BOUTANT, in *Architecture*.—An *Arc-*BOUTANT is an arch or buttreſs, ſerving to ſuſtain a vault; and which is itſelf ſuſtained by ſome ſtrong wall or maſſive pile.

The word is French, and comes from the verb *bouter*, *to but*, or *abut*.

A pillar BOUTANT is a large chain or pile of ſtone, made to ſupport a wall, terrace, or vault.

BOUTE, in the *Manage*. A horſe is call'ed *boute*, when his legs are in a ſtraight line from the knee to the coronet; ſhort-jointed horſes are moſt apt to be *boute*.

BOUTS *rimés*, a popular term in the French poetry; ſignifying certain *rhymes*, diſpoſed in order, and given to a poet togethter with a ſubject, to be filled up with verſes ending in the ſame words, and the ſame order.

The invention of the *bouts-rimes* is owing to one Du Lot, a poet in the year 1649. In fixing the *bouts*, it is uſual to chooſe ſuch as ſeem the remoteſt, and have the leaſt connexion.

Some good authors fancy, that theſe rhymes are of all others the eaſieſt, that they aſſiſt the invention, and furniſh the moſt new thoughts of all others. Sarrafin has a poem on the defeat of the *bouts-rimes*.

The academy of Lanterniſts at Thoulouſe have contributed towards keeping in countenance the *bouts-rimes*, by propoſing each year a ſet of fourteen to be filled up on the glories of the grand monarque; the victorious ſonnet to be rewarded with a fine medal.—An inſtance hereof may be given in the following one, filled up by P. Commire.

Tout eſt grand dans le roi, l'aſpect ſeul de ſon	buſte
Rend nos fiers ennemis plus froids que des	glaçons.
Et Guillaume n' attend que le tems des	moiſſons,
Pour ſe voir ſecondé par un bras ſi	robuſte,
Qu'on ne nous vante plus les miracles d'	Auguſte;
Louis de bien regner lui ſervit des	leçons:
Horace en vain l'egale aux dieux dans ſes	chanſons:
Mains que mon heros il étoit ſage &	juſte, &c.

BOUVIERA, in *Ichthyology*, a name given by ſome to a ſmall, broad, and flat freſh-water fiſh, called more uſually BUBULCA.

BOW, *Arcus*, a weapon of offence made of wood, horn, or other elaſtic matter, which after being ſtrongly bent, by means of a ſtring faſtened to its two ends, in returning to its natural ſtate, throws out an arrow with great force.

It is alſo called the *long-bow*; by way of diſtinction from the *croſs-bow*, or *arbalet*.

The *bow* is the moſt ancient, and the moſt univerſal of all weapons. It has been found to obtain among the moſt barbarous and remote people, who had the leaſt communication with the reſt of mankind.

The uſe of the *bow* and arrow was firſt aboliſhed in France under Lewis XI. in 1481, and in their place was introduced the Swiſs ARMS, that is, the halberd, pike, and broad-ſword.

The *long-bow* was formerly in great vogue in England; moſt of our victories in France were acquired by it; and many laws were made to regulate and encourage its uſe. The parliament under Henry VIII. complain, "of the "diſuſe of the *long-bow*, heretofore the ſafe-guard and "defence of this kingdom, and the dread and terror of "its enemies." 33 *Hen.* VIII. cap. 6.

By this act, all men under ſixty years of age, are commanded to exerciſe ſhooting with *long-bows*, and to have a *bow* and arrows always ready. Children from ſeven years old to ſeventeen, are alſo enjoined to be bred up in ſhooting. Servants were not excuſed, but to be ſupplied with a *bow* by their maſters, and the price to be deducted out of their wages. Aliens were forbid the uſe of the *long-bow*, without a ſpecial licence from the king.

The art of uſing *bows* is called ARCHERY, and thoſe practiſed therein, ARCHERS, or *bowmen*.

The two ends or extremities of a *bow*, to which the ſtring is faſtened, are called its horns, *cornua*.

The ſtrength of a *bow* may be calculated on this principle, that its SPRING, i. e. the power whereby it reſtores itſelf to its natural poſition, is always proportionate to the diſtance or ſpace it is removed therefrom.

The moſt barbarous nations often excel in the fabric of the particular things which they have the greateſt neceſſity for in the common offices of life. The Laplanders, who ſupport themſelves almoſt entirely by hunting, have an art of making *bows*, which we, in theſe improved parts of the world, have never arrived at.

Their *bow* is made of two pieces of tough and ſtrong wood, ſhaved down to the ſame ſize, and flatted on each ſide; the two flat ſides of the pieces are brought cloſely and evenly together, and then joined by means of a glue made of the ſkins of pearch, which they have in great plenty, and of which they make a glue ſuperior in ſtrength to any which we have.

The two pieces, when once united in this manner, will never ſeparate, and the *bow* is of much more force to expel the arrow, than it could poſſibly have been under the ſame dimenſions, if made only of one piece.

Among the ancients, the *bow*-ſtring, called τοξευτης, was made of horſe's hair, and hence alſo called ιππειος; though Homer's *bow*-ſtrings are frequently made of hides cut into ſmall thongs; whence ῥαφη βοεια. The uppermoſt part of the *bow* to which the ſtring was faſtened, was called κορωνη, being commonly made of gold, and the laſt thing towards finiſhing the *bow*. The Grecian *bows* were frequently beautified with gold or ſilver; whence we have mention of *aurea arcus*; and Apollo is called Αργυροτοξος. But the matter of which they were ordinarily compoſed, ſeems to have been wood; though they were anciently, Scythian like, made of horn, as appears from that of Pandarus in Homer. Iliad Δ. v. 105. Potter Arch. Græc. tom. ii. cap. 4.

There are two kinds of *bows*, different in ſtructure and manner of uſe, viz. 1. The common or long *bow* among us, beſt made of Spaniſh or Engliſh yew, ſometimes of withen or elm, which is inferior to the former; the ſhaft is made of birch or brazil, with grey or white feathers. 2. The croſs-*bow*, chiefly uſed when, through any imbecility of the arm or back, the former cannot be managed.

The invention of the *bow* is uſually aſcribed to Apollo, and was firſt communicated to the primitive inhabitants of Crete, who are ſaid to have been the firſt of mortals who underſtood the uſe of *bows* and arrows. And hence, even in later ages, the Cretan *bows* were famous, and preferred by the Greeks to all others. Some, however, rather chooſe to honour Perſeus, the ſon of Perſeus, with the invention of the *bow*; while others aſcribe it to Scythes, ſon of Jupiter, and progenitor to the Scythians, who were excellent at this art, and by many reputed the firſt maſters of it. From them it was derived to the Grecians, ſome of whoſe ancient nobility were inſtructed by the Scythians in the uſe of the *bow*, which in thoſe days

days paſſed for a moſt princely education. It was firſt introduced into the Roman army, in the ſecond Punic war. Potter, Arch. Græc. tom. ii. lib. iii. cap. 4. Aquin. Lex. Milit. tom. ii. p. 260.

The Indians ſtill retain the *bow*. In the repoſitory of the Royal Society, we ſee a Weſt Indian *bow* two yards long.

The Scythian *bow* was famous for its incurvation, which diſtinguiſhed it from the *bows* of Greece and other nations; being ſo great as to form a half-moon, or ſemicircle: whence the ſhepherd in Atheneus, being to deſcribe the letters in Theſeus's name, and expreſſing each of them by ſome appoſite reſemblance, compares the third to the Scythian *bow*: meaning not the more modern character Σ, but the ancient C, which is ſemicircular, and bears the third place in ΘΗCEVC.

Bow, *croſs*, is alſo called ARBALET; which word is derived from *arbaliſta*, i. e. *arcubaliſta*, *a bow with a ſling*.

The *arbalet* conſiſts of a ſteel bow, ſet in a ſtaff of wood, furniſhed with a ſtring and a trigger; and is bent with a piece of iron fitted for that purpoſe.—It ſerves to throw bullets, large arrows, darts, &c.

The ancients had large machines uſed for throwing many arrows at once, called *arbaleſts*, or BALLISTÆ.

Bow, in *Muſic*, denotes a machine that ſerves to play, or give the ſound to VIOLS, VIOLINS, and other inſtruments of that kind, by drawing it gently over the ſtrings thereof.

The *bow* conſiſts of three parts; the firſt is the ſtick, or wood to which the hair is faſtened; the ſecond is compoſed of about eighty or an hundred horſe-hairs, or filaments of ſilk; the third is the nut, a ſort of half wheel, which ſerves to keep the hairs in the due degree of tenſion.

The ancients do not appear to have been acquainted with *bows* of hair: in lieu of theſe, they ſtruck their inſtruments with a PLECTRUM; over which our *bows* have great advantage, for giving long and ſhort ſounds, and other modifications, which a plectrum cannot produce.

Bow, in *Trade* and *Manufactures*, denotes a flexible inſtrument, conſiſting of a piece of ſteel or iron, to the two ends of which is faſtened a cat-gut, uſed by ſmiths, watchmakers, and other artificers, for the piercing and turning of divers ſorts of works.

This is more peculiarly called a DRILL-*bow*.

It is ſometimes alſo made of wood, whalebone, and the like.

Operators in moſaic have a ſort of *bow* made of a piece of elaſtic wood, with a braſs wire faſtened to the ends of it, which ſerves to ſaw hard and precious ſtones. Letter-caſters have alſo a *bow*, wherewith to keep the *matrix* even. See FOUNDERY.

Bow, among *Builders*, denotes a beam of wood, or braſs, with three long ſcrews, that govern or direct a lath of wood or ſteel to any arch; chiefly uſed in drawing draughts of ſhips, and projections of the ſphere, or wherever it is requiſite to draw large arches.

Bow is alſo the name of an inſtrument formerly uſed at ſea for taking the ſun's altitude; conſiſting of a large arch of 90 degrees graduated, three vanes, a ſhank or ſtaff, a ſhade-vane, a ſight-vane, and an horizon-vane.—But it is now out of uſe.

Bow-*bearer*, an under officer of the foreſt, who is to obſerve and take notice of all manner of treſpaſs againſt vert or venilon, and to attach, or cauſe to be attached, the offenders, in the next court of attachment.

Bow-*top*, among *Botaniſts*, one of the forms or poſitions of the LEAVES of FLOWERS, wherein the leaves are laid ſomewhat converſely over each other, but not plaited.

Bow-*compaſs*. See COMPASS.

Bow-*dye*, a new kind of ſcarlet red, ſuperior to madder; but inferior to the true ſcarlet grain for fineneſs and duration. It was brought into England, and firſt practiſed at the village of Bow, near London, by Kephler, a Dutchman, in the year 1643.

Bow *of the gills*, a term uſed by ſome *Ichthyologiſts*, to expreſs the convex part of each GILL, each being a long ſemicircle, terminated by many *laminæ*, which form what is called the leaf.

Bow-*grace*, in the *Sea Language*, a frame or compoſition of old ropes, or junks of cables, uſed to be laid out at the *bows*, ſterns, and ſides of ſhips, to preſerve them from great flakes of ice, chiefly when they fail in high north and ſouth latitudes.

Bow-*net*, or *wheel*, an engine for catching fiſh, chiefly lobſters and craw-fiſh, made of two round wicker baſkets, pointed at the end, one of which is thruſt into the other; at the mouth is a little rim, four or five inches broad, ſomewhat bent inwards. It is alſo uſed for catching ſparrows.

Bow, *rain*. See RAIN-*bow*.

Bows *of a ſaddle*, are two pieces of wood laid archwiſe, to receive the upper part of a horſe's back, to give the ſaddle its due form, and to keep it right.

The *fore-bow*, which ſuſtains the pommel, is compoſed of the WITHERS, the BREASTS, the POINTS or toes, and the CORKING.

The *hind-bow* bears the TROUSSEQUIN, or quilted roll.

The *bows* are covered with ſinews, that is, with bull's pizzles beaten, and ſo run all over the *bows*, to make them ſtronger. They are likewiſe ſtrengthened with bands of iron, to keep them tight. It is on the lower ſide of the *bows* that the ſaddle ſtraps are nailed; the uſe of which is to make faſt the girths.

Bow *of a ſhip*, is the rounding part of a ſhip's ſide forward, or that part of her which is broadeſt before: it begins at the place where the planks arch inwards, and compaſſing about towards the ſtem, ends where they cloſe at the ſtem or prow.

If a ſhip has a broad round *bow*, they call it a *bold* or *bluff-bow*; if ſhe has a narrow thin *bow*, they ſay ſhe has a *lean bow*.

The proportioning of the *bow* is of great importance to the ſailing of the ſhip; it being this part that firſt breaks off the ſea, and on which is, in a manner, all the bearing of the ſhip. If the *bow* be too broad, the veſſel will not make her way eaſily through the water, but carry a great load of dead water before her; and if it be too lean or thin, ſhe will pitch or beat much into hollow ſea, for want of breadth to bear her up.

Bouguer obſerves, that a *bow* which meets with the leaſt reſiſtance in a direct and oblique courſe, has alſo the additional property of driving the leaſt to leeward. Traité du Navire.

The piece of ordnance that lies in this place is alſo called the *bow-piece*; and the ANCHORS that hang there, are called her *great and little* BOWER.

Bow, *on the*, in the *Sea Language*, denotes an arch of the horizon, comprehended between ſome diſtant object, and that point of the compaſs which is right a-head, and to which the ſhip's ſtem is directed.

Bow-SPRIT, or BOLT-SPRIT, a kind of maſt in a veſſel, ſtanding foremoſt in the prow, and projecting ſlopeways over the ſtem; its lower end is faſtened to the partners of the fore-maſt, and farther ſupported by the fore-ſtay: it ſerves to carry the ſprit-ſail, ſprit-top-ſail, and jack-ſtaff.—*Vide Tab. Ship. fig.* 1. *n.* 124. *fig.* 2. *n.* 16.

The *bow-ſprit* ſhould be two thirds of the length of the main-maſt, and its thickneſs equal to the mizen-maſt: when it is twelve fathoms five feet long, its yard muſt be eight fathoms two feet long; and the top-maſt of the *bow-ſprit*, three fathoms one foot.

To the *bolt-ſprit* are faſtened all the ſtays belonging to the fore-maſt, fore-top-maſt, and fore-top-gallant, &c. with their bowlines and jacks, beſides the rigging which belongs to its own ſails.

If a ſhip ſpends her *bolt-ſprit*, or, as the term is, if the *bolt-ſprit drop by the board*, the fore-maſt will quickly follow, if it be a rough ſea, eſpecially in ſailing by a wind.

Bow-*ſtaves*. See GARBLING *of Bow-ſtaves*.

Bow-*ſaw*. See SAW.

BOWELLING, *exenteratio*, the act of pulling out the intrails of an animal.

Bowelling makes part of the progreſs of EMBALMING.

BOWELLING is alſo a part of the puniſhment of traitors in England, who are to have their *bowels* ripped open, torn forth, and burnt before them. *Fractioni, ſuſpendio, decollationi, exenterationi, & quaterizationi adjudicatus*. Knyght. ſub Edw. II. in the ſentence of Hugh Spencer.

BOWER. See ANCHOR.

BOWER, in *Gardening*, a ſhady place, under covert of trees or branches interwoven.

A *bower* differs from an ARBOUR, in that the latter is always built long and arched, but a *bower* either round or ſquare at the bottom, and made with a ſort of dome or cieling at the top.

BOWER, *Lady's*, in *Botany*. See VIRGIN's *Bower*.

BOWET, or BOWESS, among *Falconers*, denotes a young hawk when ſhe draws things out of her neſt, and covets to clamber on to the boughs.

BOWGE *of court*. See BOUCHE *of Court*.

BOWL, denotes either a ball of wood for the uſe of BOWLING; or a veſſel of capacity for holding liquors.

Bowl-*veſſel*. See WASSEL-*Bowl*.

BOWLDER-*ſtones*, a ſpecies of ſmall ſtones, of an indeterminate texture and figure, generally roundiſh, found on the ſhores of the ſea and banks of rivers.

Bowlders, or *bowlder*-ſtones, are only lumps and fragments of ſtones or marble, broken from the adjacent cliffs, and rounded by being bowled, and tumbling to and again by the action of the water; whence the name *bowlder* ſtones, as being formed by an action like that of a bowl, and thereby reduced to the ſhape of one.

Neither the *bowlders* nor rubble ſtones are ever inveſted with

with an exterior ſtrong cruſt or ſkin: it is plain from the manner of their formation they cannot. This is one mark by which they are diſtinguiſhed from flints, pebbles, or the other native nodules, which were formed before the ſubſiding of the matter of the *ſtrata*, and are always covered with ſuch a cruſt or ſkin, unleſs it has been worn off.

BOWLING, or Bow-LINE, in *Sea Language*, a rope faſtened to the middle of the leech, or perpendicular edge of the ſquare ſails of a ſhip, ſerving to make the ſail ſtand ſharper or cloſer by a wind.

The *bow-line* is faſtened by two, three, or four ropes, called *bridles*, like a crow's-foot, to as many parts of the ſail; only the mizen *bow*-line is faſtened to the lower end of the yard.

The *bow-line* belongs to all ſails, except the ſprit-ſail, and ſprit-top-ſail; where it is omitted for want of room to hale it forwards by; and thence it is, that thoſe ſails cannot be uſed cloſe by a wind.

The ancients appear to have been acquainted with the uſe of the *bow-line*; which is the reaſon they always ſailed before the wind.

By means of this rope, a ſail may be drawn away, and the wind, when received ſideways, prevented from ſwelling it too much, which would hinder the ſhip's run inſtead of forwarding it: it alſo ſerves to hinder the wind from eſcaping or blowing by on the ſide they are drawn on.

The phraſes peculiar to this rope are: *ſharp the bow-line*, i. e. hale it taught, or pull it hard; *hale up the bow-line*, i. e. pull it harder forward on; *check, eaſe*, or *run up the bow-line*; i. e. let it be more ſlack.

BOW-LINE *bridles*, are the ropes by which the *bow-line* is faſtened to the leech of the ſail.

BOW-LINE *knot*, denotes a knot that will not ſlip, by which the *bow-line-bridle* is faſtened to the crengles.

BOWLING, among *Gameſters*, the act or art of throwing bowls.

Bowling, among us, is chiefly the name of a game or exerciſe, practiſed either in open places, as bares and *bowling-greens*, or in cloſe *bowling alleys*.

The ſkill of *bowling* depends much on a knowledge of the ground, and the right choice of a bowl ſuitable to it: for cloſe alleys the flat bowl; for green ſwards plain and level, the bowl as round as a ball, is preferred.

The terms uſed in *bowling*, are, to *bowl* wide, which is when the bias does not hold, or is not ſtrong enough: *narrow*, when it is too ſtrong, or holds too much; *truly bowled*, is when the ground is well choſen, and the bowl paſſes near the block, even though it goes much beyond it; *bowling through*, or a *yard over*, is done in order to move the block; an *over bowl*, that which goes beyond it; a *bowl laid at bond*, is that put down within the gameſter's reach, to be in the way of the next bowler, and hinder his having the advantage of the beſt ground; *bowling at length*, neither *bowling* through nor ſhort; *a dead length*, a juſt or exact one; *throwing* or *flinging*, is diſcharging a bowl with a ſtrength purpoſely too great for a length, in order to carry off either the block or ſome near bowl; *bowl-room*, or *miſſing-wood*, is when a bowl has a free paſſage, without ſtriking on any other; *get off*, is when a bowl being narrow, is wanted to be wider; *bowl beſt at block*, that neareſt the *block*; *drawing a ſoft or bowl*, is to win it by *bowling* nearer, without ſtirring either the bowl or block; a bowl is ſaid to *rub*, when it meets with ſome obſtacle in the ground, which retards its motion, and weakens its force; *it is gone*, when far beyond the block. *Block* ſignifies a little bowl laid for a mark, alſo called a JACK.

Mark is a proper *bowling* diſtance, not under ſo many *yards*; and being at leaſt a yard and a half from the edge of the *green*.

Ground, a bag or handkerchief laid down to mark where a bowl is to go.

Lead, the advantage of throwing the block, and *bowling* firſt.

Caſt, is one beſt bowl at an end.

End, a hit, or when all the bowls are out.

The *game*, or *up*, is five caſts, or beſt bowls.

BOWLING-*green*, in *Gardening*, a kind of parterre in a grove, laid with fine turf, requiring to be frequently mowed, laid out in compartments of divers figures, with dwarf-trees, and other decorations.

Bowling-greens are of Engliſh origin, but have been adopted by the French and Italians, who have them only for ornament; being unacquainted with, or not fancying the exerciſe, on account of which they were firſt made in England.

BOWSE, a ſea-term, ſignifying as much as *hale*, or pull together.

Thus, haling upon a tack is called *bowſing upon a tack*; and when they would have the men pull all together, they cry, *bowſe away*.

Bowſe is chiefly uſed by the gunners when they hale upon their tackles, to thruſt a piece out of a port; in which caſe they cry, *bowſe hoa*, i. e. pull more on the tackle; alſo when there is occaſion to pull more on the tackle than otherwiſe, they ſay, *bowſe upon the tackle*.

BOWYERS, artificers whoſe buſineſs is to make bows.

In which ſenſe, *bowyers* ſtand diſtinguiſhed from fletchers, who made arrows.

The *bowyers* company was incorporated in 1620, and conſiſts of a maſter, two wardens, twelve aſſiſtants, and thirty on the livery.

BOX, *Buxus*, in *Botany*, the *box-tree*; a genus of the *monoecia tetrandria* claſs of plants, the characters of which are theſe: it hath male and female flowers on the ſame plant; the male flowers having a three-leaved, and the female, a four-leaved empalement; the male flowers have two, and the female three, concave petals; the male flowers have four upright ſtamina, with the rudiment of a germen, but no ſtyle or ſtigma; the female flowers have a roundiſh, blunt, three-cornered germen; the empalement afterward becomes a roundiſh capſule, ſhaped like an inverted pottage-pot, opening in three cells, each having two oblong ſeeds. There are three ſpecies; the *box-tree* with oval leaves, the narrow-leaved *box*, and the dwarf or Dutch *box*. Linnæus mentions only one ſpecies.

The two firſt ſorts have been frequently raiſed from ſeeds, and conſtantly produced plants of the ſame kinds with thoſe from which the ſeeds were taken. The dwarf-*box* will never riſe to conſiderable height with any culture; nor has it been ſeen to flower, where the plants have been encouraged to grow many years in the greateſt luxuriancy.

The ſeaſons for planting this are the autumn, and very early in the ſpring. And the beſt ſpecies for this purpoſe, is the dwarf Dutch *box*. The edgings of *box* are now only planted on the ſides of borders next walks, and not as was ſome time ſince the faſhion, all round borders or fruit-beds, in the middle of gardens, unleſs they have a gravel walk between them, in which caſe it ſerves to keep the earth of the borders from waſhing down on the walks in hard rains, and fouling the gravel.

In the laſt age it was alſo a very common practice to plant borders, or edgings, of aromatic herbs, as thyme, ſavory, hyſſop, lavender, and the like: but theſe are all apt to grow woody, and to be in part, or wholly, deſtroyed in hard winters. Daiſies, thrift, or ſea jelly-flower, and chamomile, are alſo uſed by ſome for this purpoſe; but they require yearly tranſplanting, and a great deal of trouble, elſe they grow out of form; and theſe are alſo ſubject to periſh in very hard ſeaſons.

Box is cultivated for the ornament of gardens, chiefly for hedges and borders, the ſmalneſs of its leaf making it cut very cloſe and even. Its wood is yellow, hard, cloſe, even, very heavy, and eaſily taking a poliſh: whence its uſe in making muſical inſtruments, combs, ſpoons, tooth-pick caſes, and other Turnbridge ware. It does not ſwim in water, nor is it liable to rot or to be worm-eaten; whence its uſes for the axle-trees of wheels. It yields a chemical oil and ſpirit by diſtillation, of ſome uſe in medicine, and its decoction is by ſome held equal in virtue to *guaiacum*.

Among the ancients, the *box-tree* was conſecrated to Cybele, becauſe flutes were then made of its wood, as is done to this day. Pitiſcus imagines it was alſo ſacred to Bacchus, from a paſſage in Statius, *Cum Bacchia mugit buxus*; but without much foundation, the word *buxus* here only denoting flutes; as being the matter they were uſually made of; not that the tree was conſecrated to Bacchus. The honourable Daines Barrington is of opinion, that it is not indigenous in Great Britain. See his paper on this ſubject, Phil. Tranſ. vol. lix. N° 5. an. 1769.

Box-*tree*, *ſand*, *Hura*, in *Botany*, a genus of the *monoecia monadelphia* claſs of plants. Its characters are theſe: it hath male and female flowers on the ſame plant; the male flowers have no petals, but a column of ſtamina, which are joined at bottom into a cylinder; the female flowers have a ſwelling empalement of one leaf, with one tubulous petal; the roundiſh germen is ſituated in the bottom of the empalement, which afterward becomes an orbicular ligneous fruit, depreſſed at top and bottom, having twelve deep furrows, with ſo many cells, which open at the top with an elaſticity, each containing one round flat ſeed. We know but one ſpecies of this genus, which grows naturally in the Spaniſh Weſt Indies. The fruit of this plant, if it remains on until it be fully ripe, will burſt in the heat of the day, with an exploſion like the report of a piſtol; by which the ſeeds are caſt round to a conſiderable diſtance: theſe ſeeds, when green, vomit and purge, and are ſuppoſed to be ſomewhat akin to the *nux vomica*.

This fruit is by the inhabitants of the Weſt Indies cut open on the ſide where the footſtalk grew, and the ſeed

carefully taken out; the ſhell is uſed as a ſtand-iſh to contain ſand for writing, which gave occaſion for the name of *ſand-box* tree.

As this plant has ample leaves which are of a beautiful green colour, it makes an agreeable variety among other tender exotic plants in the ſtove; for where they are kept warm, and duly refreſhed with water, they retain their leaves all the year in verdure. Miller.

Box-*tree*, AFRICAN, *Myſſine*, a genus of the *pentandria monogynia* claſs of plants, the corolla of which is conniveut and divided into five ſegments; the germen ſits the cordils, and the fruit is a five-celled, five-ſeeded berry. There is one ſpecies.

Box is alſo uſed to denote a caſe for holding things; of which there are ſeveral kinds, as a ſalve *box*, *pyxis unguentaria*, that uſed by ſurgeons to carry with them.

Box is ſometimes alſo uſed for a kind of meaſure, though variable according to the commodity. Thus the *box* of quickſilver contains from one to two hundred weight; of pronellas, about fourteen hundred; of rings for keys, two groſs, &c.

Box, *coach*, a place under the coachman's ſeat, wherein he puts what may be wanted for the ſervice of the coach or horſes.

Box, *dice*, a narrow deep cornet, channelled within, wherein the dice are ſhaken and thrown.

This anſwers to what the Romans called *fritillus*; whence *crepitantes fritilli*, and, in Seneca, *reſonante fritillo*. The ſame author alſo uſes *concutere fritillum*, figuratively for playing.

Beſides the *fritillus*, the Romans, for greater ſecurity, had another kind of *dice-box*, called *pyrgus*, and ſometimes *turricula*. It was placed immoveable in the middle of the table, being perforated or open at both ends, and channelled alſo within: over the top was put a kind of funnel, into which the dice were caſt out of the *fritillus*; whence deſcending, they fell through the bottom on the table, by which all practiſing on them with the fingers was effectually prevented. For want of ſome contrivance of this kind our ſharpers have opportunities of playing divers tricks with the *box*, as palming, topping, ſlabbing. Hyde. Hiſt. Nerdiiad. § 5. 27, 28.

Box-*iron*, a kind of caſe wherein the heaters are incloſed for ironing linen.

Box-*money*, at *Hazard*, is that which is paid the box-keeper, or him who furniſhes the *box* and dice. Betters have the advantage over caſters, as they have no *box*-money to pay, which at long run would beggar the moſt fortunate player. Hence ſome gameſters will never caſt, to ſave the expence of *box* money.

Box *of a plough*, a name by which the farmers call that croſs piece in the head of the PLOUGH, through which the ſpindle of the two wheels paſſes, and to which are faſtened the two crow-ſtaves, ſerving by their holes, to regulate the height of the beam, the tow-chain below, the ſtake which ſupports the bridle-chain above, and the gallows behind, into which are fixed the wilds with the crooks of iron, for the drawing of the whole plough along.

This part of the plough is placed croſs-wiſe with the beam, and ſtands much below it, and not far from the ground.

Box, *ſtrong*, a coffer of iron, or of thick wood, ſecured with iron plates, and a lock with ſeveral bolts, difficult either to be opened or forced; chiefly uſed for putting money in.

Box, in *Ichthyology*, a name given by ſome authors to a ſmall fiſh caught in the Mediterranean, and more uſually known by the name of BOOPS, from the largeneſs of its eyes.

Box *and needle*, in *Navigation*, is the ſame with the COMPASS

Box *of a wheel*, the ſpetture wherein the axis turns.

Box-*galls*, ſee GALLS *of the box*.

Box-*ſpecies*, ſee GENUS *of the box*.

Box-*thorn*, in *Botany*, ſee *Box* THORN and LYCIUM.

Box-*hauling*, in *Sea-language*, a particular method of veering a ſhip, when the ſwell of the ſea renders tacking impracticable. It is performed by putting the helm *a lee*, to throw the head up to windward, when by the action of the waves on the weather bow, it falls off or turns to leeward; the after-ſails are at this time diminiſhed, that they may not prevent the ſhip from turning: but they are again extended as ſoon as the ſhip, in veering, brings the wind on the oppoſite quarter, in order to aſſiſt her motion of wheeling. See VEERING.

Boxes in a play-houſe, are little apartments behind and aſide of the pit. We ſay, the front-*boxes*, the ſtage-*boxes*, &c.

BOXERS, a kind of *athletæ*, who combat or contend for victory with their fiſts.

Boxers amount to the ſame with thoſe who, among the Romans, were called *pugiles*.

The ſtrange diſfigurements theſe *boxers* underwent were ſuch, that frequently they could not be known, and rendered them the object of many railleries. In the Greek Anthology, there are four epigrams of the poet Lucillius, and one of Lucian; wherein their diſfigurements are pleaſantly enough expoſed. Anthol. Græc. lib. ii. Ep. 1, 2, 3, 10, 14.

BOXING, the exerciſe of fighting with the fiſts, either naked, or with a ſtone, or leaden ball graſped in them.

In which ſenſe, *boxing* coincides with the *pugilatus* of the Romans, and what, on our amphitheatres, is ſometimes called *trial of manhood*.

When the champions had σφαιραι, or balls, whether of lead or ſtone, it was properly denominated σφαιρομαχια. Potter. Arch. Græc. lib. ii. cap. 21. vol. i.

The ancient *boxing* differed from the *pugna caſtuum*, in which the combatants had leathern thongs on their hands, and bulls to offend their antagoniſts; though this diſtinction is frequently overlooked, and fighting with the *caſtus* ranked as a part of the buſineſs of *pugiles*.

We may diſtinguiſh three ſpecies of *boxing*; viz. where both the head and hands were naked; where the hands were armed and the head naked; and where the head was covered with a kind of cap called ANAPHOTIDES, and the hands alſo furniſhed with the *caſtus*.

Boxing is an ancient exerciſe, having been in uſe in the heroic times, before the invention of iron or weapons.

Thoſe who prepared themſelves for it, uſed all the means that could be contrived to render themſelves fat and fleſhy, that they might be better able to endure blows: whence corpulent men or women were uſually called *pugiles*, according to Terence: *Si qua eſt habitior paulo, pugilem eſſe aiunt*. M. Burette has given the hiſtory of the ancient pugilate, or *boxing*, with great exactneſs. Mem. Acad. Inſcript. tom. iv. p. 353, &c.

BOXING, among *Sailors*, is uſed to denote the rehearſing of the ſeveral points of the compaſs in their proper order.

Boxing likewiſe denotes an operation performed, by laying the head-ſails aback, in order to receive the wind in a direction perpendicular to their ſurfaces, that the ſhip's head may hereby be thrown back into the line of her courſe, after ſhe had inclined to windward of it by neglect of the helmſman, or otherwiſe. Falcon. Mar. Dict.

BOXING is alſo uſed for the tapping of a tree, to make it yields its juice. See BLEEDING and SAP.

The *boxing* of maple is performed, by making a hole with an ax or chiſſel into the ſide of the tree, about a foot from the ground; out of it flows a liquor from which SUGAR is made. Phil. Tranſ. N° 364.

BOXUS, in *Natural Hiſtory*, a name given by ſome authors to the common MISLETOE.

BOYAR, or BOJR, a term uſed for a Ruſſian lord, or grandee. According to Becman, *boyars* are what, in other countries, are called the upper nobility: he adds, that the czar of Muſcovy, in his diplomas, names *boyars* before WAYWODES.

BOYAU, in *Fortification*, a branch of the trenches; or a line or cut, which runs from the trenches to cover ſome ſpot of ground; being drawn parallel to the defence of the place, that it may not be enfiladed, that is, that the ſhot from the town may not ſcour along it.

BOYER, in *Navigation*, a kind of Flemiſh ſloop, or ſmall veſſel of burden, having a bolt-ſprit, a caſtle at each end, and a tall maſt; chiefly fit for the navigation of rivers, and in many of its parts reſembling a SMACK.

The *boyer* has a double bottom, and a forked maſt, that it may run better with the bowling-line, without driving.

BOYES, an order of American prieſts, or magicians, uſed by the ſavages for calling up their gods, either to be revenged on thoſe who have ſtone them any injury, or to be cured of ſome diſeaſe, wherewith they are infeſted, or to drive out ſome devil.

They are alſo conſulted with regard to the event of their wars. Each *boye* has his peculiar duty: who is invoked by certain forms of words, ſung in a quaint tone, accompanied with the fumes of tobacco.

BOYEUPECANGA, in *Zoology*, the name of a very large ſerpent diſtinguiſhed by this name on account of certain prominences on its back. It is a very large and remarkably thick ſerpent, and of very fatal poiſon. Ray.

BOYLE's *Lectures*, a courſe of eight ſermons or lectures, preached annually, ſet on foot by the honourable Robert Boyle, eſq. by a codicil annexed to his will in 1691; whoſe deſign, as expreſſed by the inſtitutor, is to prove the truth of the Chriſtian religion againſt infidels, without deſcending to any controverſies among Chriſtians; and to anſwer new difficulties, ſcruples, &c.

For the ſupport of this lecture, he aſſigned the rent of his houſe in Crooked-lane, to ſome learned divine within the bills of mortality to be elected for a term not exceeding three years, by the late archbiſhop Tenniſon, and others. But the fund proving precarious, the ſalary was ill paid: to remedy which inconveniences, the ſaid archbiſhop procured a yearly ſtipend of fifty pounds, for ever, to be paid quarterly; charged on a farm in the pariſh of Brill, in the county of Bucks.

To this appointment we are indebted for many elaborate defences both of natural and revealed religion.

BOYLING, fee BOILING and EBULLITION.

BOYUNA, in *Zoology*, the name of an American fpecies of ſerpent. It is very long and ſlender, and all over of a black colour. It has exactly the ſmell of a fox, but ſo ſtrong, that nobody can endure to be near it. Raiy.

BRABANCIONES, in *Middle Age Writers*, a kind of Netherland ſoldiery, infamous for rapine, being little better than commiſſioned *banditi*, who hired themſelves to fight for any that could pay them beſt.

The word is variouſly written by the hiſtorians of thoſe days; all given them from the country of Brabant, which was the chief nurſery of thoſe troops. They are alſo frequently confounded with the *Routiers*, *Roturiers*, *Ruptorii*, *Ruterarii*, *Coterauæ*, &c. Daniel. Hiſt. de la Mil. Franc. liv. iii. chap. 8.

BRABE, an herb mentioned by Oribaſius; the deſcription he gives of which is, that it grows a cubit high, ſhooting forth branches on each ſide, with leaves reſembling thoſe of the *lepidium* in ſhape, but ſofter and whiter, and at the top bearing an umbel of flowers like the elder.

BRABEJUM, *African almond*, in *Botany*, a genus of the *tetrandria monogynia* claſs of plants. Its characters are theſe: the flower is compoſed of four narrow obtuſe petals, which are erect, and hath four ſlender ſtamina; in the centre is a ſmall hairy germen, which afterwards becomes an oval, hairy, dry berry, incloſing an oval nut. We have but one ſpecies of this plant, which is a native of the country about the Cape of Good Hope.

In Europe it ſeldom grows above eight or nine feet high; but in its native ſoil, it is a tree of a middling growth: as it is too tender to live through the winter in the open air, ſo we cannot expect to ſee it grow to a great ſize.

BRABEUTES, or BRABEUTA, in *Antiquity*, an officer who preſided at the public games, and decreed the prizes to the victors.

The word is formed from *βραβεῖον*, *prize* or *reward*.

The Latins called him *deſignator* and *munerarius*.

The generality of writers confound the *brabeutes* with the AGONOTHETA, between whom there, however, appears to have been this difference, that the former preſided at the gymnic combats, the latter at the ſacred ones.

BRACE, in *Writing*, a term uſed to ſignify a certain crooked ſtroke or figure of a pen, made at the end of two or more bars in a piece of muſic, or lines in an account, which expreſs two or more articles charged with one and the ſame ſum at the end, which is uſually placed in the centre of the *brace*.

Debts due to me, ſome of which are good, others dubious.

Good Debts.		*Bad Debts.*	
From Mr. James* 300	} 500	From Mr. John **400	} 900
From Mr. Peter* 200		From Mr. Nicolas* 500	

BRACE is commonly taken for a couple, or pair; and in this ſenſe is applied by huntſmen to ſeveral beaſts of game; as a brace of bucks, foxes, hares, &c. They alſo ſay, a *brace* of greyhounds.

BRACE, in *Architecture*, denotes a piece of timber framed in with bevel-joints; ſerving to keep the building from ſwerving either way.

When a *brace* is framed into a king-piece, or principal rafter, it is called by ſome a *ſtrut*.

BRACE, BRACCHIO, or BRASIL, alſo denotes a foreign long meaſure anſwering to our FATHOM.

BRACE is alſo uſed for a meaſure taken from the length of the arm, when extended; and is uſed in divers cities of Italy, in lieu of the foot or yard. Its length is various; the *brace* of Bergamo, according to Scamozzi, is nineteen Paris royal inches, and a half; according to M. Petit, ſixteen inches two thirds; the *brace* of Bologna is fourteen inches; that of Breſſe, ſeventeen inches ſeven lines and a half, according to Scamozzi; and according to M. Petit, ſeventeen inches five lines; the Mantuan *brace* is ſeventeen inches four lines; that of Milan, twenty-two inches; thoſe of Parma, twenty inches one third; of Sienna, twenty-one inches two thirds; of Florence, twenty inches two thirds, according to Maggi; twenty-one inches four lines and a half, according to Lorini; twenty-two inches two thirds, according to Scamozzi; and twenty-one inches one third, according to Picart.

BRACED, in *Heraldry*, is uſed in ſpeaking of chevronels which are intermingled. He bears azure a chief or, and three chevronels *braced*, in the baſe of the eſcutcheon, by the name of *Fitz-Hugh*. See *Tab. Heraldry*, *fig.* 17.

BRACELET, an ornament uſually worn round the wriſt.

The word is French, *bracelet*; which Menage derives farther from *braceletum*, a diminutive of *bracile*, a word occuring in writers of the Juſtinian age; all formed from the Latin *brachium*, *arm*.

Bracelet amounts to the ſame with what was called by the ancients, *armilla*, *brachiale*, *accabus*; in the middle-age, *bigæ*, *bauge*, *armiſpatha*.

Among the ancient Romans, the men as well as the women wore *bracelets*; but the latter, it is to be obſerved, never wore them till they were betrothed.

Bracelets were at firſt properly military ornaments or rewards frequently conferred among the ancients, by generals and princes, on thoſe who behaved gallantly in fight. They became afterwards arbitrary decorations, aſſumed at pleaſure; and are ſometimes ſaid to have been worn for health as well as ornament; and particularly as AMULETS, to break the force of charms and faſcinations.

Among the Romans we meet with divers ſpecies and denominations of *bracelets*; as the *brachiale*, which covered the whole length of the arm; the *dextrale*, or *dextrocherium*, only the wriſt, and that only of the right arm; *viriæ*, or *viriolæ*, peculiar to the male ſex; *ſpumber*, to the women, being worn on the left arm; *vervæ*, uſed as an AMULET; *amphidion*, worn either on the arm or about the neck; *calbeum*, or *galbeum*, worn by generals in their triumphs. Pitiſc. Lex. Ant. tom. i. & ii. Du-Cange. Gloſſ. Lat. tom. i. & ii. Kennet. Rom. Ant. Not. P. II. lib. iv. cap. 16.

Bartholin has a treatiſe on the *bracelets* of the ancients.

The northern people uſed alſo to ſwear on their *bracelets*, to render contracts more inviolable.

Bracelets are ſtill much uſed by the ſavages of Africa and America, made of metal, glaſs-beads, ſhells, and the like.

BRACELET is alſo uſed, in *Anatomy*, to denote the circular ligament which inveſts the *corpus*, called alſo *ligamentum annulare*.

BRACELETS, in ſome *Ancient Law Books*, denote beagles, or hounds of the ſmaller kind.

BRACES, in the *Sea Language*, are ropes belonging to all the yards of a ſhip, except the mizen, two to each yard, except thoſe of the top-gallant, and ſprit-ſail, top-ſail-yards, being reeved through blocks faſtened to pendants ſeized to the yard-arms. See *Tab. Ship. fig.* 1. *n.* 11. 21. 50. 68. 89. 130 139.

The uſe of *braces* is, to *ſquare the yard*; that is, to ſet it ſquare. Hence, *to brace the yard*, is to bring it to either ſide. *To traverſe the yard*, is to ſet it any way overthwart. *To right the yard*, is to bring it to as it may ſtand at right angles with the length of the ſhip.

All *braces* come aftward on; the main *brace* comes to the poop, the main-top-ſail *brace* to the mizen-top, and thence to the main-ſhrouds; the fore and fore-top-ſail *braces* come down by the main, and main-top-ſail-ſtays, and ſo of the reſt.

The mizen-bowline ſerves for a brace to that yard; and the croſs-jack *braces* are brought forward to the main-ſhrouds, whenever a ſhip ſails cloſe by a wind.

BRACHERIUM, or BRACHERIOLUM, a kind of ſteel-bandage worn about the hips, and uſed for the retention and cure of ruptures. Du-Cange. Gloſſ. Lat.

BRACHIÆUS, or BRACHIALIS, a name given to two muſcles of the arm, the one external, the other internal. *Brachæus* is a name given by Spigelius and others to a muſcle of the arm now generally known under the name of *brachialis*, or *brachiæus internus*.

BRACHIÆUS *externus* ariſes about the middle and poſterior part of the *humerus*. It joins its fibres with the *muſculus longus* and *brevis*; and being externally tendinous, they, together, cover all the elbow, and are inſerted into the *olecranum*. See *Tab. Anat. (Myol.) fig.* 7. *n.* 12. The ANCONEUS *externus*, and ſometimes the *internus*, is called by this name.

BRACHIÆUS *internus* lies partly under the *biceps*; it riſes by a fleſhy beginning from the middle and internal part of the *humerus*; and is inſerted into the upper and fore-part of the *cubitus*, by a very ſhort, but ſtrong tendon: it ſerves to bend the arm. See *Tab. Anat. (Myol.) fig.* 1. *n.* 25. *fig.* 2. *n.* 14. *fig.* 7. *n.* 11.

The upper part of this muſcle is forked, or ſloped, and, at the bending of the joint of the elbow, the lower part of it contracts. It is fixed to the ſurface of the *os humeri* by a great number of fleſhy fibres, from the lower inſertion of the *deltoides* almoſt down to the two *foſſæ* at the lower extremity of the bone, and from one edge of the foreſide of this lower extremity to the other. The fibres are for the moſt part longitudinal; thoſe neareſt the ſurface of the muſcle being longeſt, the more internal grow gradually ſhorter.

The lateral fibres are a little oblique, and this obliquity increaſes as they deſcend lower. Theſe lateral fibres are partly fixed in the intermuſcular ligaments of the *os humeri*; of which ligaments, that which lies toward the internal condyle, is longer and broader than that toward the external. The loweſt of theſe fibres are very oblique, and form on each ſide a kind of ſmall ſeparate *faſciculus*. In paſſing over the joint, all theſe fibres contract in breadth, and afterwards end in a ſtrong flat tendon, inſerted in the muſcular impreſſion, which is directly below the *coronoide apophyſis* of the *ulna*.

The ſloped or forked extremity of this muſcle embraces the large tendon of the *deltoides*; the internal part of the

fork meets the inferior infertion of the *coraco-brachialis*, and the foreſide of the whole muſcle is covered by the two fleſhy bodies of the *biceps*. Winſlow.

BRACHIAL *nerves*, ſee NERVE.

BRACHIALIS, *arteria*, ſee CORACO-BRACHIALIS.

BRACHIONUS, in *Zoology*, the name of a genus of ANIMALCULES of the ARTHRODIA kind, containing all the WHEEL-animals.

BRACHTÆ, a branch of MANICHEES, who appeared in the third century.

BRACHIUM, in *Anatomy*, ſee ARM, and HUMERUS.

BRACHIUM, the *arm*, in *Botany*, is the tenth degree in the Linnæan ſcale for meaſuring plants, being twenty-four Paris inches.

BRACHIUM, *proventium ſecundus*, in *Anatomy*, a name given by Veſalius, and other of the old writers, to the muſcle now generally called *deltoides*.

BRACHIUM *motorum quartus*, in *Anatomy*, the name by which Veſalius calls the muſcle now generally known under the name of *latiſſimus dorſi*. Fallopius, and many others, have alſo called it *quartus humeri*.

BRACHII *tertius*, in *Anatomy*, a name given by Veſalius and others to a muſcle ſince called, from its ſhape, *teres major* and *rotundus major*.

BRACHMANS, a branch of the ancient gymnoſophiſts, or philoſophers of India, remarkable for the ſeverity of their lives and manners.

The Greeks uſually give them the name *gymnoſophiſts*; though Clemens, Porphyry, &c. make the *brachmans* only a branch of the gymnoſophiſts, whom they divide into two ſects, *Brachmanes* and *Samanæi*.

There are ſome in the Indies who ſtill bear the name, and live in the ſame manner as the ancient *brachmans*: the Portugueſe call them *bramanes*, or *brameneſ*; we uſually bramins.

Some ſay, they derive their name from the patriarch Abraham, whom, in their language, they call *Brachma*, or *Bruma*. Others deduce it from the name of their God, *Brachma*; which ſome again take to be the ſame with Abraham; whence Poſſel calls them *Abrachmanes*. F. Thomaſin derives the word from the Hebrew *barach*, to *fly* or *eſcape*; becauſe the *brachmans* retire into the country, and live in deſarts. The ſame author gives us another derivation, viz. from the Hebrew *baraich*, *benedicere*, *orare*, to *bleſs*, *pray*; becauſe this is their principal occupation.

Porphyry obſerves that the ancient *brachmans* ſucceeded into the order, by right of family; whereas the Samaneans were elected into it: the former therefore were all of the ſame family, the latter of various.

The *brachmans* were perfectly at liberty, paid no taxes, nor were under the command of any perſon: they lived on herbs, pulſe, and fruits; abſtaining from all animals, and thinking it an impiety to touch them. The greateſt part of the day and night they ſpent in ſinging hymns in honour of the deity; praying and faſting continually. The greateſt part of them lived in ſolitude, without marrying or poſſeſſing any eſtates. There was nothing they appeared to with for ſo earneſtly as death; looking on life as a burthenſome thing, and waiting with impatience for the ſeparation of their ſoul and body. This is the account Porphyry gives of them.

Kircher obſerves, that the *brachmans* held the opinion of Pythagoras, relating to the ſoul and its tranſmigration; and led a life in all reſpects agreeable to his: or rather, it was from the *brachmans* that Pythagoras borrowed his opinions, his manner of living, &c.

The modern *brachmans* are the ſucceſſors of the ancient, and the prieſts or diviners of the idolatrous Indians.

Rogers diſtinguiſhes ſix ſorts of them; the *Weiſſerowa*, the *Seivia*, the *Smaerta*, the *Shaerwaecka*, the *Paſenda*, and the *Tſchectea*.

Theſe are much converſant in aſtrology and aſtronomy. They have ſo great a veneration for cows, that it is ſaid, they look on themſelves as bleſſed, if they can but die with the tail of one of them in their hand. They ſometimes make a proceſſion of four hundred leagues, drawing after them whole cities and towns: feeding the people, when ſtopped at the paſſages of rivers overflowed, in a manner which is ſaid to be miraculous; by giving them every thing they deſire, without making any proviſion.

Mr. Marſhal obſerves, that whenever they write any thing, they put a figure of 1 in the firſt place; to ſhew, as they ſay, that they acknowledge but ONE GOD. They account the world the body of God, the higheſt heavens his head, the fire his mouth, the air his breath, the water his feed, and the earth his legs and feet. They maintain a pre-exiſtent ſtate; and from that account for the tempers and manners of men in this: they alſo maintain the *metempſychoſis*, but in a groſſer ſenſe than Pythagoras; believing that the ſouls of ill men paſs into reptiles, inſects, and vegetables, for their puniſhment and purgation. They compute the world to be about 389,850 years old; and ſeem to have ſome obſcure traditions of the Moſaic paradiſe, Adam, Eve, and the deluge. They have alſo a notion of God's being incarnate, and living ſome time among men.

Their religion conſiſts in leading a pure life, waſhing away their ſins in the river Ganges, muttering over divers prayers, and doing ſtrange and incredible penances.—They burn their dead with much ceremony; and ſtrewing the aſhes on the place where the deceaſed firſt lay after his death, they judge from ſome figure or impreſſions pretended to be made on it, into what body his ſoul is gone; viz. if the impreſſion of a foot of a dog or ox, &c. appear, they give out he is tranſmigrated into one of thoſe animals; if there be no impreſſion, he is then gone to the ſtarry region.

They have alſo abundance of cabbaliſtic notions; v. gr. ſay they, if the numbers 28, 35, 2, 7—6, 3, 32, 31—34, 29, 8, 1—4, 5, 30, 33, be written in the ſame order in the ſquares of a ſquare figure, and your enemy's name, written under it, while you wear it, he cannot hurt you, &c. Phil. Tranſ. N° 268.

The *brachmans* of Indoſtan have a language peculiar to themſelves, which they call *banſcbrit*; in which they have ſeveral ancient books, written, as is alledged, by their great prophet *Brahma*; as the *Shaſtram*, which is their bible, and *Perane*, a hiſtory which they eſteem ſacred, and pretend to have been dictated by God himſelf.

The *brachmans* of Siam and Coromandel maintain, that the earth will be deſtroyed by fire: and the former aſſert, that another will ariſe out of its aſhes, in which there ſhall be no ſea, nor any change of ſeaſons, but an eternal ſpring: and the latter maintain a plurality of worlds, which are alternately deſtroyed and renewed.

Robert de Nobili, an Italian Jeſuit, and one of the Indian miſſionaries, in the beginning of the ſeventeenth century, in order to ſecure ſucceſs to his miſſion, aſſumed the title and appearance of a *brachman*, and at length perſuaded the credulous people, that he was, in reality, a member of that venerable order. He forged a deed in the ancient Indian characters, ſhewing that the *brachmans* of Rome were older than thoſe of India, and that the Jeſuits of Rome deſcended, in a direct line, from the god *Brahma*. He farther declared on oath, that he derived his origin from this Indian deity. By this impoſture he proſelyted twelve eminent *brachmans*, whoſe influence proved very favourable to his miſſion. After his death, the Portugueſe Jeſuits carried on the impoſture with very conſiderable ſucceſs. Theſe miſſions, however, were ſuſpended and abandoned, in conſequence of a papal mandate, iſſued out in the year 1744, by Benedict XIV. who declared his diſapprobation of the artifices that had been uſed in the converſion of the Indians, Moſheim's Eccleſ. Hiſt. vol. iv. p. 211, &c. 8vo edit.

The modern *brachmans* own a Supreme Being, who created *Brahma*, and gave him a power to create the world. They have alſo their ſubaltern deities, their pagods or temples, and idols, whom they ſay to defend from flies, dancing before them, &c.

They hold a feaſt in honour of the ſun, conſidered as the ſource of heat and light, whereby all nature is fecundified.

BRACHURI, in *Zoology*, a name given by Dr. Hill to a genus of ANIMALCULES of the tailed kind.

Theſe *animalcules* are of a roundiſh figure, with tails ſhorter than their bodies; their ſkin is perfectly ſmooth, thin, and colourleſs. They are frequent in water-ponds, in pepper-water, and many other infuſions of vegetable ſubſtances.

BRACHYCOLON, from βραχυς, *ſhort*, and κωλον, *member*, is when one member of a period is ſhorter than another.

In which ſenſe, the word ſtands contradiſtinguiſhed from *iſocolon*, where the members are equal, or conſiſt of the ſame number of ſyllables.

BRACHYGRAPHY (from βραχυς, *ſhort*, and γραφω, *ſcribo, I write*) denotes the art of ſhort-hand writing, called alſo TACHYGRAPHY.

BRACHYLOGY, from βραχυς and λογος, *expreſſion*, in *Rhetoric*, BREVITY, the expreſſing of any thing in the moſt conciſe manner. This, ſo far as conſiſtent with perſpicuity, is a virtue and beauty of ſtyle; but if obſcurity be the conſequence, which is often the caſe, it becomes a blemiſh and inexcuſable defect.

Quintilian gives us an inſtance of *brachylogy* from Salluſt: *Mithridates corpore ingenti perinde armatus*; Mithridates, as it were, armed with the hugeneſs of his ſtature. Inſt. Or. lib. viii. cap. 3.

BRACHYPOTÆ, or BRACHYPOTI, from βραχυς and πινω, *drinker*, thoſe who drink but little and at long intervals.

The word ſometimes alſo ſignifies thoſe who drink ſelſdom, though in greater quantity.

BRACHYPTERA, in *Ornithology*, the name of a genus of birds,

birds, of the clafs of the hawks, diſtinguiſhed by the ſhortneſs of their wings.

The word is derived from βραχυς, *ſhort*, and πτερον, a *wing*.

The hawks of this genus have their wings ſo ſhort, that, when folded, they do not nearly reach to the end of the tail. Of this genus are the goſs-hawk, the ſparrow-hawk, and the three kinds of the butcher-bird. Willughby. Ornith. p. 36.

BRACHYPYRENIA, from βραχυς, and πυρην, *nucleus*, in *Natural Hiſtory*, a genus of foſſils of the clafs of SEPTARIÆ.

The *brachypyrenia* have a ſhort roundiſh *nucleus*, incloſed by and contained within the body of the maſs.

BRACHYTELOSTYLA, in *Natural Hiſtory*, the name of a genus of cryſtals.

The word is derived from βραχυς, *ſhort*, τελειος, *perfect*, and στυλος, a *column*, and expreſſes a perfect cryſtal, with a ſhort intermediate column.

The bodies of this genus are cryſtals compoſed of a ſhort hexangular column, terminated at each end by an hexangular pyramid. Of this genus there are ſix known ſpecies. Hill's Hiſt. Foſſils, p. 163.

BRACKET, in *Building*, denotes a kind of wooden ſtay, in form of a knee or ſhoulder, ſerving for the ſupport of ſhelves, &c. or a cramping iron, which ſerves as a ſtay, in timber-work.

The word is alſo written *braget*, and ſeems derived from the Italian *brachette*, a diminutive of *brachia*, *arms*.

MODILLIONS are a ſort of *brackets* to the *corona* of an entablature.

BRACKETS, in *Artillery*, ſee CHEEKS *of a Mortar*.

BRACKETS, in a ſhip, are ſmall knees uſually carved, and ſerving to ſupport the GALLERY.

The timbers which ſupport the gratings in the head, are alſo called *brackets*. See CHEEKS.

BRACTEA, a thin flake or ſpangle of any ſubſtance; it is uſed by many authors in the ſame ſenſe with the word *lamina*, but uſually in a ſort of diminutive ſenſe, expreſſing a ſmall plate.

BRACTEA, in *Botany*, denotes the floral leaf.

BRACTEARIA, in *Natural Hiſtory*, the name of a genus of foſſils, of the talc clafs; the characters of which are, that they are compoſed of ſmall plates in form of ſpangles, and each of theſe, naturally very thin or fiſſile, compoſed of very thin ones. *Tab. Foſſil. cl.* I.

The word is derived from the Latin *bractea*, a *ſpangle*, or ſmall and thin glittering particle of any thing.

There are many ſpecies of this genus denominated from the variety of their colours; as MICA *aurea*, or gold-glimmer, and MICA *argentea*, ſilver-glimmer, cat's ſilver, &c.

BRACTEATED, among *Antiquaries*, denotes a coin covered over with a thin plate, or leaf of ſome richer metal. See MEDAL.

Bracteated coins, or medals, *nummi bracteati*, are uſually made of iron, copper, or braſs, plated over, and edged with gold or ſilver-leaf, and then ſtamped with the hammer or mill.

Medaliſts find ſome *bracteated* pieces even among the truly ancient coins. The French call them *fourrées*.

BRADS, a ſlender kind of NAIL, uſed in building, having no ſpreading heads as other nails have.

Of theſe, ſome are called *joiners brads*, and are for hard wainſcots; others *batten brads*, for ſoft wainſcot; and ſome *hill brads*, or *quarter-brads*, uſed when a floor is laid in haſte, or for ſhallow joiſts ſubject to warp.

BRADYPEPSIA, from βραδυς, *ſlow*, and πεπτω, *I digeſt*, in the *Medical Writings of the Ancients*, the name of a diſtemper, which conſiſted in a ſlow, weak and languid concoction of the food.

It is cauſed by a diminution of the force or heat of the ſtomach, or a defect in the gaſtric liquors. See DIGESTION.

BRADYPUS, in *Zoology*, the name given to a genus of quadrupeds of the order of Linnæus, called *Bruta*, otherwiſe termed *ſloaws*, and in Engliſh the SLOTH. Its characters are, a mouth without fore-teeth, the canine teeth are obtuſe and longer than the grinders, of which there are five on each ſide; the body is covered with hair; the feet have no great toe, and are made for climbing; and only two paps upon the breaſt. Of this genus there are known two ſpecies; the one is called the American SLOTH, with a ſhort tail, and three toes on each foot; the other is named the Ceylon SLOTH, with only two toes to each foot, and no tail.

BRAG, a name given to a game at cards, from the nature of it: the principal ſtake being won by him who *brags* with moſt confidence and aſſurance; i. e. who challenges the other gameſters to produce cards equal to his. In this game a pair of aces is the beſt *brag*, pair of kings the next, and ſo on: and a pair of any ſort wins the ſtake from the moſt valuable ſingle card. The knave of clubs pairs with any other card in hand; but a hand of cards of leſs value in this game has ſometimes gained the ſtake from one of ſuperior value, by the confidence and art of *bragging*: the conteſt being given upon the part of the latter through fear of loſing. One ſtake is gained by the higheſt card, that is turned up in dealing, three cards being dealt round to each perſon and the laſt turned up; the higheſt card is the ace of diamonds: the other ſtake is won by the perſon, who firſt makes up the cards in his hands one and thirty; each dignified card paſſing for ten, and drawing from the pack. Each gameſter depoſits three ſtakes one for each card.

BRAGGOT, a ſort of drink made in ſome parts of England, of malt, with honey, ſpices, and other ingredients.

It is derived from the old Britiſh word *brag*, which ſignifies *malt*, and *gett*, a *honey-comb*.

BRAILS *in a ſhip*, ſmall ropes uſed in furling the ſails acroſs. The *brails* are reeved through blocks, which are ſeized on either ſide the ties, a little diſtance off upon the yard, ſo that they come down before the ſails of a ſhip, and are faſtened at the ſkirt of the ſail to the creoglas. Their uſe is, when the ſail is furled acroſs to haſe up its bunt, that it may the more readily be taken up, or let fall. See *Tab. Ship. fig.* 5. *n.* 6.

Theſe *brails* belong only to the two courſes and the mizen-ſail.

They ſay, *haſe up the brails*, or, which is all one *hoiſt up the ſails*; the meaning of which is, that the ſail is to be haſed up, in order to be furled, or bound cloſe to the yard.

BRAIN, in a general ſenſe, is that large, *ſoft*, whitiſh maſs, incloſed in the *cranium*, or ſkull; wherein all the organs of ſenſe terminate, and the ſoul is ſuppoſed principally to reſide. See *Tab. Anat. (Oſteol.) fig.* 4. *lit. a. a. a. d. d. d. fig.* 5. *lit. a. a. b. b.*

The *brain* is encompaſſed with two *meninges*, or membranes, called *dura* and *pia mater*.

Its figure is the ſame with that of the bones that contain it, viz. roundiſh, oblong, and flat on the ſides: it is divided into three principal parts; viz. the *cerebrum*, or *brain ſtrictly ſo called*, the CEREBELLUM, and the MEDULLA OBLONGATA; to which ſome add a fourth, viz. the MEDULLA *ſpinalis*, which is a continuation of the latter.

BRAIN, in a more proper ſenſe, is that large globulous part which fills the fore and upper part of the ſkull.

It is divided by a duplicature of the *dura mater*, called from its figure *falx*, into two equal parts, called *right* and *left hemiſpheres*; though the figure of the *brain* be pretty far from a ſphere; and theſe parts are more like quarters of an oblong ſpheroid. It is alſo ſeparated from the CEREBELLUM by another duplicature of the ſame *dura mater*.

It conſiſts of two kinds of ſubſtance; the one cineritious, or aſh-coloured, ſoft and moiſt; which, being the exterior, is alſo called the *cortex* or CORTICAL part of the *brain*: the thickneſs of this is about half an inch, though by reaſon of the ſinuſes and ſutures in the *brain* it appears more. The other, or inner ſubſtance, is white, more ſolid, as well as more dry than the *cortex*, and is called the *marrow* or *medullary*, and ſometimes the *fibrous* part, in contradiſtinction to the other, which is alſo called the *glandulous* part.

The *cortex*, according to Malpighi, is formed from the minute branches of the carotid and vertebral arteries; which, being woven together in the *pia mater*, ſend from each point thereof, as from a baſis, little branches, which being twiſted together into the form of a gland, incloſe the *medulla*, ordinarily to the thickneſs of half an inch; but in ſome places make deeper ſinuſes and furrows within it. Theſe branches make circumvolutions like the inteſtines; each of which may be reſolved into others, like, but leſs than the firſt.

This part, therefore, moſt authors take to be glandulous; or an aſſemblage of innumerable minute glands, contiguous to each other, deſtined for the ſecretion of animal ſpirits from the blood, brought hither by the carotids, &c. Theſe glandules, Malpighi obſerves, are of themſelves oval, but by their mutual compreſſure they become angular; and run waving within each other: ſeveral of theſe connected form others larger, and theſe again unite into others, from the aggregate whereof are formed tubes, of which the outer *cortex* is compoſed. Theſe little glands conſiſt of the branches of the arteries which bring the blood; of the veins ariſing at their extremities, which carry it back again; of ſecretory tubes ſecerning the animal ſpirits, and of excretory ducts for diſcharging them into the *medulla*: though theſe are too minute to have ever been ſeen.

The inner, or medullary part of the *brain*, conſiſts of a number of infinitely fine fibres, ariſing from the leaſt and minuteſt branches or filaments of the glands of the

cortex;

cortex; as is diſtinctly ſeen in the CEREBELLUM, though ſcarce viſible in the *cerebrum*: theſe receive the fluid ſeparated and ſubtilized, from the glands of the *cortex*; and by means of the nerves which are no more than productions of this part, diſtribute it all over the body. Authers here, however, are divided; the generality, with Malpighi, making the ſubſtance of the *cortex* glandulous, as above; others, with Ruyſch and Leewenhoeck, deny any thing like glands in it; and allow nothing but little *cryptæ*, or ſinks, opening laterally to the arteries; and thence receiving a juice already ſecerned from the blood, and tranſmitting it to the MEDULLA. This doctrine, it ſeems, is the reſult of anatomical injections, and microſcopical obſervations; but the other, appearing the moſt conſiſtent with the œconomy of nature, in other things, is generally adhered to.

The *cortex* covers the whole medullary ſubſtance both of the *brain* and CEREBELLUM; ſo that wherever the cortical ſubſtance ends, there the medullary commences; and this in the appendices, ventricles, interſtices, and ſinuſes of the MEDULLA, as well as in the external ſurface. Something medullary, therefore, ariſes from every point of the *cortex*; at its firſt riſe, it muſt needs be exceedingly fine and ſlender: but, being joined with other parts of the ſame kind, it gradually thickens and at length becoming ſenſible, conſtitutes the *medulla cerebri*, the *corpus calloſum*, the MEDULLA *oblongata*, and its *crura*, the *thalami* of the optic nerves, the MEDULLA *cerebelli*, and its production into the MEDULLA *oblongata*; which, with theſe additions, forms the *corpora pyramidalia* and *olivaria*, and is extended into the ſpinal marrow. And from the ſame medullary ſubſtance, both in the *cranium*, and in the caſe formed by the union of the *vertebræ*, ariſe all the nerves.

Though the primary *fibrillæ*, or filaments when united, ſeem to form one compact body or maſs; yet Boerhaave ſhews, they are really diſtinct and ſeparate from each other: that thus ariſing from each part of the *cortex*, and tending, as it were, to the centre of the ſphere, they firſt form the *medullæ*; that others, reflected hence and collected above, form the *corpus calloſum* and *fornix*; and below, form the *corpus calloſum* and legs of the MEDULLA *oblongata*; that the like *fibrillæ*, ariſing from the CEREBELLUM, join with them; the reſult of which junCture is the MEDULLA *ſpinalis*. And laſtly, that the like *fibrillæ* ariſing from the *cortex*, continued within the cavities of the MEDULLA, join with them, and add freſh conſiſtence to them.

Hence we ſee the reaſon of the bulk, figure, and poſition of the *cortex* of the *brain*, as well as the uſe and neceſſity of the cavities called *ventricles* of the *brain*: of theſe ventricles there are four; one in each hemiſphere, ſeparated by a thin tranſparent ſubſtance, running all along from the FORNIX under the *corpus calloſum*, and diſtinguiſhed by the name of the *ſeptum lucidum*: theſe two are called the *lateral ventricles*.

The third is under the FORNIX and called *rima*: the fourth between the CEREBELLUM and MEDULLA *oblongata*.

From the whole, it appears paſt doubt, that the fibres of the *brain* are exceedingly minute canals; that they receive a humour, infinitely the moſt ſubtile, fluid, and moveable, of any of the whole body; prepared and ſecerned by the artful ſtructure of the *cortex*, driven into theſe tubules by the force of the heart, and from every part hereof collected into the MEDULLA *oblongata*. And this is what ſome call *animal ſpirits*, others the *nervous juice*; the great inſtrument of ſenſation, muſcular motion, &c.

In the ſpace between the two hemiſpheres of the *brain*, under the *falx*, or rather under the longitudinal ſinus of the *dura mater*, is a white ſubſtance, of a texture more compact than the reſt of the *medulla* of the *brain*; and for that reaſon called *corpus calloſum*; which runs along the whole tract of the *falx*, and receives from each ſide the terminations of the MEDULLA, interſperſed between the ſeveral windings of the *cortex*, and ſuppoſed by ſome to be a kind of baſe or ſupport to it. The manner wherein this is formed is ſhewn above: we ſhall only add, that, on occaſion hereof, ſome authors, M. Aſtruc for inſtance, inſtead of two ſubſtances, viz. the CORTEX and MEDULLA, divide the *brain* into three; viz. the uppermoſt, or *cinerilious*, which conſtitutes the *cortex*; the middle, which is whiter and denſer than the firſt, and therefore called the *callous*; and the loweſt or inmoſt, which, being intermixed with *radii* or *ſtriæ* of the white and cineritious ſubſtance, he calls the *ſtriated* part. Aſtruc adds that the fluid ſecreted in the *cortex* is conveyed into innumerable minute hollow medullary *fibrillæ*, of the ſame nature with the callous ſubſtance, and contiguous thereto. This middle, or callous part, he obſerves, is not diſtinguiſhed by any appearance of fibres, but is uniform, homogeneous, elaſtic, and not unlike the pith of the elder tree: for which reaſon, he thinks it may be probably conjectured to conſiſt of innumerable cells, communicating with each other, divided by the interpoſition of membranaceous, flexible, elaſtic, vibrative parietes or columns; which being flowed over by the ſpirits, and continually expoſed to the ſhakings thereof, conſtitute the fibres of the *brain*.

Now the ſecreted fluid flowing equally from each point of the cineritious ſubſtance into the callous, muſt equally fill and diſtend the cells thereof; and leſt any place ſhould want its ſhare, proviſion is made for a ſtrict communication; not only by the apertures of the cells into each other, but alſo by the ſtructure of the *brain*; the upper part communicating with the under, by the *ſeptum lucidum*; the lateral with the lateral, by the *lata commiſſura*; laſtly, the fore-parts, with the hind-parts, by the *crura*, *brachia*, and roots of the *fornix*. Theſe cells, he continues, being filled, the ſpirits will proceed to the contiguous *ſtriæ* of the medullary ſubſtance: which, ariſing from the *cortex*, compoſe the ſtriated part of the *brain*: and theſe *ſtriæ* rendered narrower and ſlenderer, and paſſing without the ſurface of the *brain*, conſtitute the firſt principles of the nerves, &c.

The other parts of the *brain* are the FORNIX, a production of the MEDULLA: which, at its extremity next the CEREBELLUM, ſends out two proceſſes or legs, by whoſe junCture is formed a kind of arch thence called *fornix*, which ſeparates the third ventricle from the two upper ones. At the bottom of the *fornix* are two holes, by which the third ventricle has a communication with the others; that before is called *vulva*, and that behind *anus*. The third ventricle, or *rima*, which is in the MEDULLA *oblongata*, has likewiſe two apertures; the one the orifice of the *infundibulum*, or funnel, which is a canal reaching to the *glandula pituitaria*: the other is a duct, whereby the third ventricle communicates with the fourth in the MEDULLA *oblongata*, under the CEREBELLUM. That fourth ventricle is in the form of a quill, whence it is ſometimes called *calamus ſcriptorius*.

In the lateral ventricles are found the *plexus choroides*, which is an aſſemblage of minute veins and arteries; and four eminences, the firſt the *corpora ſtriata*, the others the *thalami nervorum opticorum*.

At the entrance of the canal reaching from the third ventricle to the fourth, is ſituated the *pineal gland*; ſo called from the figure of a pine-apple, which it reſembles: this gland Des Cartes ſuppoſes to be the ſeat of the ſoul. Behind the pineal gland are four eminences: two upper and greater, called NATES; and two ſmaller and lower, called TESTES. See MEDULLA *oblongata*, to which all theſe parts properly belong.

The veſſels of the *brain* are nerves, arteries, and veins. By turning up the *brain*, the origin of the nerves proceeding from it is diſtinctly ſeen: theſe are in number ten pair, viz. the olfactory, optic, movers of the eyes, pathetic; the fifth pair, called *nervi innominati*, or *trigemini*; and ſixth pair, called alſo the *motores oculorum externi*, or *oculares externi*, the auditory nerves, PAR VAGUM; and the ninth pair. See NERVE.

The blood-veſſels of the *brain* are the two internal carotid, and the vertebral arteries. The firſt, piercing the *dura mater*, communicate with the cervicals, and proceeding thence ſend a branch to the *plexus choroides*; till arriving at the *pia mater*, and making ſeveral turns and circumvolutions thereon, they terminate, at laſt, in the little glands that conſtitute the *cortex*. The vertebral arteries paſſing the *dura mater*, go along the under-ſide of the MEDULLA *oblongata*; till giving branches to the ſpinal arteries, they join in one branch called the cervical artery, which communicates with the *carotides* by two branches, as before. The veins of the *brain* do not run along by the ſides of the arteries, as in other parts of the body, but riſe from their extremities in the *cortex*; whence they diſcharge themſelves into the ſinus of the *dura mater*.

For the great bulk of the *brain*, this reaſon may be aſſigned; viz. that on account of the exceeding ſubtility and fineneſs of the animal ſpirits, and the ſlowneſs with which their ſecretion muſt be effected; together with the great quantity of them required in diſcharging the animal functions; there muſt of neceſſity be an infinite number of glands to ſeparate and prepare them. From the ſame principle we ſee why the *brain* is much bigger in men than in other animals: and in other animals, why, *cæteris paribus*, it is generally biggeſt in thoſe which diſcover the greateſt ſhare of ſagacity, v. gr. in monkeys; becauſe a conſiderable ſtock of animal ſpirits is to be employed in the affairs of cogitation, memory, &c. Accordingly, anatomiſts obſerve, that in fools the *brain* is ſmaller (*cæteris paribus*) than in men of ſenſe: this ſome may account for, by ſuppoſing it the cauſe of the folly; a ſufficient ſtock of ſpirits being wanting to reaſon ſtrongly; and others from the œconomy of nature

ture, which proportioned the ſtock of ſpirits to the expence that would be required.

From the texture, diſpoſition, and tone of the fibres of the *brain*, philoſophers ordinarily account for the phenomena of ſenſation and imagination. Dr. Aſtruc goes farther, and from the analogy between the fibres of the *brain*, and thoſe of muſical inſtruments, ſolves the phenomena of judgment and reaſoning, and the defects and perfections of both. He lays it down as an axiom, that every ſimple idea is produced by the oſcillation of one determinate fibre; and every compound idea from contemporary vibrations of ſeveral fibres; that the greater or leſs degree of evidence follows the greater or leſs force where the fibre oſcillates.

He takes occaſion to obſerve, that the fibres of the *brain*, from their natural analogy to thoſe of muſical inſtruments, may be perverted ſeveral ways; viz. by being rendered too dry or too moiſt, too ſtiff or too lax, &c. In a phrenzy, he thinks the fibres too dry, or too much diſtended by the heat of the blood, &c. In a *mania*, theſe fibres he thinks too rigid, as well as too dry and diſtended. In a lethargy, they are too much ſoftened by phlegm; in idiocy, or fooliſhneſs, they are ſometimes too ſoft, and ſometimes too hard. Laſtly, he thinks that in melancholy, by the repeated ſucceſſive vibrations which the attentive meditation of a thing induces, two or more fibres, which of themſelves exhibit diſſimilar and unequal ideas, are (the other parts remaining ſound) ſenſibly brought to an iſochroniſm: ſo that the ſoul, judging well in other reſpects, yet in this always makes a falſe judgment.

Dr. Hartley has likewiſe founded his theory on vibrations excited in the medullary ſubſtance of the *brain*, ſpinal marrow, and nerves. Obſervations on Man, &c. vol. i. See ASSOCIATION, and VIBRATION.

The generality make wit and genius to depend on the conformation, magnitude, and qualities of the *brain*. Des Cartes ſuppoſes the pineal gland, Vieuſſens the *centrum ovale*, to be the part of the *brain* where the ſoul more immediately reſides. Willis lodges common ſenſe in the *corpora ſtriata*, the imagination in the *corpus callioſum*, and the memory in the *cortical* ſubſtance. Dr. Hooke endeavours to ſhew how all ideas may be diſpoſed and mechanically laid up in the *brain*, for the uſe of the MEMORY. Phil. Tranſ. N° 67. Hooke, Poſth. Works, p. 140.

We find great diverſities in reſpect of figure, ſtructure, bulk, &c. in the *brains* of different animals. The *brains* are divided into two parts, with an interval between, as is well known to mountebanks, who, in virtue thereof, ſometimes raiſe an opinion of their ſkill in the vulgar, by running a pin through the middle of a cock's head, without damage to the bird.

Through the whole bird kind, the cortical part of the *brain* is extremely over proportioned to the medullary; ten times more in proportion than in men; add, that it is uſually alſo ſmooth, and without ſinuoſities. Dr. Willis, who diſſected a great variety of *brains*, obſerved a near reſemblance between the *brains* of men and quadrupeds, and between thoſe of birds and fiſhes: though M. Steno obſerves, that the *brains* of birds and fiſhes are not at all like thoſe of men. Winſlow.

The *brain* is ſubject to divers diſorders, as wounds, contuſions, depreſſions, conſtipations, inflammations, petrifactions, diſruptions, &c. Phil. Tranſ. N° 228. Med. Eſſ. Edinb. tom. ii. p. 245. Hiſt. Acad. Scienc. an. 1703. 1710. 1722.

A watery *brain* appears to be the cauſe of the epilepſy; and an extremely dry or rigid one, of the phrenzy; and theſe have been found to be the ſtates of the *brain*, in diſſections of perſons affected with thoſe diſeaſes. Paracelſus even attributes leproſies, conſumptions, and jaundices, to diſorders of the *brain*. Hiſt. Ac. Sc. an. 1705. 1706. Conſ. Lex. Med. p. 159.

Bartholin ſpeaks of divers extraneous bodies found in the *brain*; particularly a point of a dart, an inch long, which remained there, without much inconvenience, fourteen years, and was at length expelled by ſuppuration at the *ſutures*. Act. Med. Hafn. tom. ii. *art.* 132.

Anatomiſts, in their figure and deſcriptions of the *brain*, only repreſent the cavities which are ſeen upon ſeparating the hemiſpheres, and taking away the *corpus callioſum*, without obſerving that the *crura fornicis* ſink down, and then turn forwards on each ſide of the *medulla oblongata*, in cavities which are extended far forwards, under the commonly known anterior ventricles. In theſe inferior cavities, the *crura fornicis* are of a beautiful form, reſembling a white ſilk-worm, or ſea-horſe; on which account they were called *hippocampi* by Julius Cæſar Arantius, who is the only author who has given any deſcription of them, till lately Mr. Du Verney has revived them, by an exact deſcription and delineation. He obſerves likewiſe, that the *ſeptum lucidum* between the anterior ventricles, has a cavity between the two *lamellæ* of which it is compoſed, in which he has often found water; and that the internal ſide of the *ſeptum* is made rough, by a great many ſmall grains and *papillulæ*. Comm. Acad. Petrop. tom. iv. p. 130.

Some are of opinion, that the motion of the *brain* is owing to the air entering by the olfactory nerves into the ventricles of the *brain*; which air, rarefied by the heat, loſes its ſpring, and is expelled by the elaſtic contracting *dura mater*. Med. Eſſ. Edinb. vol. ii. p. 481.

The *brain* does not appear abſolutely neceſſary to animal life. We have ſeveral inſtances in authors, of children brought forth alive, and ſurviving their birth for ſome time, without any *brain*: and there are ſome anatomical inſtances of animals ſurviving the loſs of their *brain*. To which may be added, many inſtances given by Mr. Boyle, not only of animals living a long time after the ſeparation of the head from the body, but even of the copulation and impregnation of ſome inſects under thoſe circumſtances: whence it appears that the ſpinal marrow is ſufficient, on occaſion, for the buſineſs of ſenſation, motion, ſecretion of animal ſpirits, &c.

The *brains* of birds were a great delicacy among the ancients, who yet never touched thoſe of other animals. Some vainly preſcribe hares *brains*, as a remedy againſt difficult dentition. Among the Greeks, calves *brains* were uſed as a ſort of charm to excite love.

The accurate Mr. Leewenhoeck, examined, on ſeveral occaſions, the *brains* of different creatures by his microſcope; as that of the Indian hen, the ſheep, the ox, the ſparrow, &c. He could there always diſtinguiſh multitudes of veſſels ſo extremely ſmall, that if a globule of blood (a million whereof exceed not a grain of ſand in bigneſs) were divided into five hundred parts, thoſe parts would be too large to paſs into ſuch veſſels. He obſerved alſo, that theſe veſſels in the *brain* of a ſparrow, were as large as in that of an ox; and argues from thence, that there is really no other difference between the *brain* of a large animal and that of a ſmall one, but only that the one contains a much greater number of theſe veſſels than the others, and that the globules of the fluid paſſing through them, are in all animals of the ſame ſize.

In examining the *brain* of ſeveral ſorts of fowls, particularly the turkey, what is commonly called the cortical part of the *brain*, conſiſts of a very clear and tranſparent oily matter, which would be much better denoted by the term vitreous than cortical, but a great number of ſmall blood veſſels are found ſpread through every part of this; and where a ſmall parcel of it is cut for a microſcopic examination, there flows a ſmall globule of a pellucid fluid from it. And Mr. Leewenhoeck thinks, that notwithſtanding the minuteneſs of theſe veſſels, there is a circulation carried on through them, and that of a red fluid; for wherever they lie three or four together, without any intervening matter, the congeries of them always appears red.

The medullary part of the *brain* of the ſame animal appears like a fiſher's net, between all the meſhes of which there is placed a very pliable ball-like ſubſtance, which changes its figure into a round or oval, according as the meſhes happen to be pulled or relaxed: theſe balls ſeemed to conſiſt of a clear and watery fluid, contained in a caſe or capſule of a membranous matter. Phil. Tranſ. N° 168. p. 884.

See farther concerning the *brain* in anatomical and medical writers, particularly Steno, Ridley, Willis and Vieuſſens, who have treatiſes expreſs on this ſubject. Phil. Tranſ. N° 215. N° 51. p. 1031.

BRAIN, *fungus of the*, ſee FUNGUS.

BRAIN, *traces of the*, ſee TRACE.

BRAKE, in the *Country Language*, denotes a place where female FERN grows, and ſometimes the FERN itſelf.

BRAKE is alſo uſed for a Farrier's inſtrument, otherwiſe called HARNACLES.

The word alſo occurs for a baker's treading trough.

BRAKE, in the *Hempen Manufacture*, denotes a wooden-toothed implement, wherewith to bruiſe and break the bun of hemp, and ſeparate it from the rind.

BRAKE *of a pump*, ſignifies the handle whereby it is wrought.

BRAMA, BREAM, in *Ichthyology*, a river fiſh of the leather-mouthed kind, eſteemed a ſpecies of carp, and called by the generality of authors *cyprinus latus*.

It is a very broad and thin fiſh; the head is ſmall, the back of it broad and flat, and the back riſing from the head toward the middle, like that of a hog.

BRAMA, *Sunatilis*, in *Ichthyology*, the name of a ſea-fiſh reſembling the common freſh-water BREAM in ſhape, but growing to three or four feet long. Its eyes are large; its ſnout of a pale red, as are alſo its belly-fins and its tail. It is caught among the rocks in deep water, and ſeldom is taken any other way than by hooks, and is a very

very well tasted fish. It is found in Surinam. This fish is a species of the SPARUS.

BRAMBAS, in *Natural History*, a name given by the people of Guinea, and some other parts of Africa, to a peculiar species of lemon-tree. The leaves of this are of a deep green, and of an admirable fragrancy, when rubbed between the hands. The fruit is very small, and has a remarkable thin skin. The juice is used in dying. Phil. Transf. N° 108.

BRAMBLE, or BRAMBLING, in *Ornithology*, the common English name of the MONTIFRINGILLA, or *spatzen*, called in some places the mountain-finch; a small bird somewhat resembling the chaffinch. Ray.

BRAMBLE-*bush*, in *Botany*, a species of the *rubus*. See RASPBERRY-*bush*.

BRAMBLE-*galls*. See GALLS *of the bramble*.

BRAMBLE-*net*, otherwise called *ballier*, is a net used by bird-catchers, of several sizes.

BRAMICIDE, the crime of killing a bramin, reputed in the East Indies one of the five most enormous sins.

BRAMINS, see BRACHMANS.

BRAN, the skins or husks of corn, especially wheat, ground, separated from the *farina*, or flour, by a sieve or boulter.

Wheat bran it is that starch-makers make their starch; which is nothing else but the *fæcula* remaining in the bottom of the vessels, wherein the *bran* has been steeped in water.

Bran is held detergent, and, on that account, is of some medicinal use in gargarisms and glysters. It is also a chief ingredient in the composition of cataplasms. Some apply it hot against the pleurisy; boiled, it purges scurf and dandriff, and cleanses the hands in lieu of soap. Among the ancients, it was also used as an erotic, to excite love.

Dyers rank *bran* in the number of non-colouring drugs; because it yields no colour of itself. It serves for the making of their four waters, used in preparing stuffs to take the dye.

This water is made by boiling wheaten *bran*, and into the decoction putting a little leaven.

BRANC *ursine*, in *Botany*, see BEAR'S-*breech*.

BRANCA, in *Middle Age Writers*, the paw, or extreme part of a foot of a wild beast, or bird of prey. Du-Cange.

BRANCA, or BRANCHIA, also denotes a right of lopping, or cutting off branches of trees in the forest for firing. Du-Cange.

BRANCH, in *Botany*, an arm of a tree, or a part which, sprouting out from the trunk, helps to form the head, or crown thereof.

The word, according to Salmasius, comes from the Latin *brancæ*; in the lower Latin, they used *harpa*. Others derive it from *brachium, an arm*; and others, from *branchia, the gills of fishes*.

The *branches* of trees, some have observed, almost constantly shoot from the trunk at an angle of 45 degrees: the reason is, that the whole spreading being generally confined within an angle of 90 degrees, as the most becoming and useful disposition; that space could not well be filled up any other way than by forming all the interfections which the shoots and *branches* make, with angles of 45 degrees only.

According to M. Dodart, however, the *branches* generally sprout out of the trunk horizontally, or at right angles with the trunk: but, in their ascent, they affect perpendicularity as much as possible, though not in the same degree with trunks.

Branches are distinguished into various kinds.

BRANCH, *wood*, according to Quintiny, is such a one as shooting out from a cut of the preceding year, is naturally of a considerable thickness.

BRANCH, *fruit*, is that which shoots out, of a moderate length and breadth, from the same cut, or pruning.—*Fruit-branches*, he adds, have large eyes, and are very near each other.

BRANCH, *half wood*; is that which, being too slender for a *wood-branch*, and too big for a *fruit-branch*, is cut off, at the length of two or three inches, to make it produce a better shoot, whether wood or fruit.

BRANCHES, *spurious wood*, are such as come contrary to the order of nature; or otherwise than from cuts of the preceding year; or which, coming on such cuts, are big in the place where they should be small.

To understand this order of nature, it must be observed, 1. That *branches* should never come, except on those of the last cut; such, therefore, as shoot from other parts, are spurious. 2. The order of the new *branches* is, if there be more than one, that the extreme *branch* be thicker and longer than that immediately under it; and this bigger and longer again, than the third, &c. Hence if any be big where it should be small, it is called *spurious*.

There are, however, some exceptions: in trees that are vigorous, and yet bear a handsome figure, there cannot well be too many *fruit-branches*, provided they make no confusion; but for *wood-branches*, there should not ordinarily be above one suffered to grow, of the several which shoot from each cut of the preceding year. See PRUNING.

BRANCHES, *engrafting of*, see ENGRAFTING.

Branches of trees bear a near analogy to limbs of animals; and, in certain cases, the amputation of them is found necessary. A. D. S. an. 1707, p. 366.

Some consider *branches* as a sort of roots in the air: in reality, they are only prolongations of the roots; but, being united in the trunk, are re-divided in the *branches*. What shews the conformity between the two species of roots is, that the ends of *branches* being set in the ground while yet adhering to the mother-tree, they will take root, grow on their own bottom; and what is more, there are divers trees, which, if planted upside down, the roots turn to *branches*, with leaves and fruit, and the *branches* to roots and fibres: but whether the *branches*, while such, do the office of roots, and receive any fine kind of nutriment from the air, as Mr De la Hire, Mr. Brotherston, and others, have asserted, is a question not yet fully decided. Mr. Perrault supposes the *branches* to convey a sap for the nourishment of the root, as the root does for the rest of the plant. Phil. Transf. N° 43, and N° 187.

Branches do not spring out of the mere surface of the trunk, but are profoundly rooted therein, so as not only to penetrate the cortical, but also the woody substance, and even the pith.

Anciently, *branches* were carried in the hands at the processions and ceremonies of the gods; whence the *thallephori*, or *branch*-bearers.

The Thespians adored a *branch*. The olive *branch* was the symbol or ensign of peace. The natives of the islands in the South Seas use green boughs, &c. for the same purpose at this day.

BRANCH is also applied to the parts or ramifications of divers other bodies, which, in respect hereof, are considered as stems. Thus chemists speak of the *branches* of their metalline vegetation, *branches* of the *arbor Dianæ*, *arbor Mortis*, &c. Phil. Transf. N° 286. Mem. Acad. Sc. 1692, 1710.

BRANCH, in *Anatomy*, denotes a division of a vein, artery, or nerve. All the veins in the body are only *branches* of the *vena cava*.

BRANCH is also used in the *Military Art*, in speaking of trenches, mines, and their several ducts, ways, returns, and the like, between one well and another. See GALLERY.

BRANCH is also used in speaking of the veins in mines of gold, silver, or other metals, which divide like the veins in the body.

BRANCH, in *Genealogy*, is applied to the several lines or successions arising out of the same stock or origin.

In which sense, *branches* amount to much the same with cadets.

BRANCH also denotes a complex metalline kind of candlestick contrived for the reception of a number of candles. These, in ancient writers, are called *phari*, *candelæ*, JESSE; when made of glass *lustres*; the richer sort, *girandoles*.

BRANCH *of the trenches*, in *Fortification*, see BOYAU.

BRANCH-*stand*, in *Falconry*, signifies to make a hawk leap from tree to tree, till the dog springs the partridge.

BRANCH, in *Scripture*, is an appellation peculiarly given to the Messiah, as being of the *branch* or house of David.

BRANCHES *of wealds*, are sometimes used to denote the ARCHES of them.

BRANCHES *of arches*, denote several portions of arches springing all from the same summer.

BRANCHES *of ogives*, in *Architecture*, the rejnt or arches of Gothic vaults; which traversing from one angle to another, diagonal-wise, form a cross between the other arches which make the sides of the square whereof those arches are diagonals.

BRANCHES *of a bridle*, in the *Manage*, are two crooked pieces of iron which support the mouth-bit, the chain, and the curb; and which are fastened on one side to the head-stall, on the other to the reins serving to keep the horse's head under command.

What way soever the *branches* of the bit incline, the horses mouth goes to the contrary. The duke of Newcastle is very particular on the head of *branches*; explaining their several kinds, and their effects, which are reducible to those of a lever.—The *branch* is always to be accommodated to the design, either of bringing in, or raising a horse's head, and to the necessary degree: accordingly, we have strong and hardy *branches*, gentle *branches*, rude *branches*, &c.

With regard to their form and structure, *branches* are either straight, in form of a pistol, for young horses to form their mouth; or, after the constable of France's fashion,

fashion, for horses that already carry the head well: others are in form of a gigot, or leg; others of a bent knee; others in the French fashion, &c.

These are laws in the *Manege*: 1. That the farther the *branch* is from the horse's neck, the more effect it will have. 2. That short *branches*, *exteris paribus*, are ruder, and their effects more sudden, than those of longer. 3. That the *branch* is to be proportioned to the length of the horse's neck.

That part of the *branch* of a bridle, whereby we judge of its effects, and which discovers its strength or weakness, is called the *line of the banquet*.

A strong and hardy *branch*, is that whose sevil hole, at the lower end of it, is placed on the outside of the line of the banquet.

A gentle *branch* is that, the sevil hole of which is set on the inside of the said line.

A rude and hardy *branch* will bring in a horse's head, proportionably as it is more or less hardy; whereas a gentle *branch*, by diminishing the effect of the bit-mouth, makes a horse more easily to bear the pressure thereof, who before could hardly endure it.

BRANCHED *velvet*, see VELVET.

BRANCHER, among *Fowlers* and *Falconers*, denotes a young bird well fledged, which having quitted the nest, is not yet in a condition to fly far, or shift for itself, but still keeps in the bushes and branches about its native dwelling, where it is fed by the dam.

The *branchers* of hawks are also called *ramage falcons*; those of nightingales, *pushers*; because, as some say, they are thrust out of the nest by the old ones. Canary birds the first year are called *branchers*; when just flown and unable to feed themselves, *pushers*.

BRANCHERY, in the *Anatomy of Vegetables*, denotes the vascular parts of divers fruits, as apples, pears, plums, and berries.

In which sense, the *branchery* stands contradistinguished from the acetary, skin, pulp, &c.

The *branchery* of an apple is only the ramifications of the ligneous body through all the parts of the *parenchyma*; the greater branches being likewise, by the inosculations of the lesser, united together. Grew. Anat. of Plants, lib. i. cap. 6. § 2.

BRANCHIA, βραγχια, a name given, by the *Ancient Naturalists*, to the GILLS of fishes; which are parts composed of cartilages and membranes, in form of leaves; and serving instead of lungs to perspire by.—See *Tab. Anat. (Splanch.) fig.* 14.

The *branchia*, Galen observes, are full of little *foramina*, big enough to admit air and vapours, but too fine to give passage to water. Pliny held, that fishes respired by their gills; but he observes, that Aristotle was of another opinion: to whom we may add, among the moderns, Dr. Needham.

The cetaceous fishes, as they have lungs, have none of these apertures of the *branchiæ*; and in all those fishes that have them, the larger they are, the sooner the fish dies, on being taken out of the water. See GILLS.

BRANCHIALE, in *Natural History*, a name given by Mr. Lhuyd to a peculiar species of FUNGITÆ, which being of a deeply striated texture, is supposed to resemble the gills of a fish.

BRANCHIDÆ, in *Antiquity*, priests of Apollo serving in his temple at Didyma in Miletus; which was famous for its oracle.

The denomination is taken from *Branchus*, or *Branchides*, an epithet given to Apollo as worshipped here; though on what account the title was given, is not agreed on.

In the time of the Persian war, the *Branchidæ* betrayed the temple of its oracle into the hands of the Persians, who pillaged it. They transported themselves into the farthest parts of Asia, to be out of the reach of punishment from the Greeks; which yet they are said to have met with from Alexander, who demolished their city, and put all the inhabitants to the sword. Strabo, lib. xiv. Potter. Arch. Græc. lib. ii. cap. 9.

BRANCHING, the *ramification* or *sprouting* of the HORNS of deer, &c. which bears an analogy with the vegetation of plants. Phil. Trans. N° 227.

The HAIR at the ends is apt to *branch*, or split, and divide into whole brushes, which are easily visible by a microscope.

BRANCHIOSTEGI, in *Ichthyology*, a term used to express one of the general classes of fishes; the characters of which are, that the rays of the fins are of a bony substance; but these fish have no bones or *ossicula* at the *branchiæ*, as the malacopterygious and acanthopterygious fishes all have.

The word is derived from βραγχια, *gills*, and στεγω, *a bone*.

BRANCHUS. βραγχος, in *Medicine*, a species of CATARRH affecting chiefly the jaws, throat, and *aspera arteria*.

Branchus amounts to the same with what is called, by the Latins, RAUCEDO, *raucitas*, sometimes also *ravis*. See HOARSENESS.

BRANCHUS, *or branche*, also denotes a kind of glandular tumor in the *fauces*, resembling two almonds, which render the breathing and hawking difficult.

BRAND-*herring*, a kind of herring caught by the Dutch.

BRAND-*Sunday*, *Dimanche des Brandons*, in *French Ecclesiastical Writers*, denotes the first Sunday in Lent; which is thus called on account of an ancient practice in the Lyonnois, where the peasants, in the night of this day, walked about their orchards, gardens, &c. with torches lighted, or fire-*brands* in their hands; in which plight they visited every tree, and addressing themselves to them one after another, threatened that if they did not bear fruit well the ensuing season, they should be cut down to the ground and burnt. This is evidently a relict of paganism; the like of which was practised by the ancient idolaters in the month of February; hence called *Februarius, à februando*. Menestr. Hist. de Lyon. p. 279. Menag. Orig. p. 126. & Du-Cange Gloss. Lat. tom. i. p. 610.

BRANDARIS, a species of the *frombus* in the order of *testacea*.

BRANDEUM, in *Ecclesiastical Writers*, a linen cloth or veil put over the tombs of the apostles St. Peter and St. Paul, and left there for some time; by which it is supposed to acquire a degree of sanctity, so as to be worshipped as a relic; and for that purpose frequently sent by the pope as a present to some prince. Fleur. Hist. Eccl. lib. xxxv. p. 93. Du-Cange Gloss. Lat. tom. i. p. 609.

In this sense, *brandeum* amounts to the same with what was otherwise called *sanctuarium*, *sudarium*, *oravium*, and *velum*.

The use of *brandea* was introduced as a means of diffusing and propagating the virtues and influences of RELICS, without moving, or any way impairing the substance of them; the translation of RELICS in early days being forbidden.

BRANDING *in the face* or *head*, denotes a punishment inflicted by law on various offences, by burning with a hot iron, after the offender hath been once admitted to benefit of clergy. Blackstone's Comm. vol. iv. p. 360.

BRANDRITH, denotes a trevet, or other iron stand, whereon to set a vessel over the fire.

BRANDRITH, among *Builders*, denotes a fence or rail about the mouth of a well.

BRANDY properly denotes a proof-spirit obtained by simple distillation from real wines, or fermented juices of grapes. The vessels, used herein, are usually of copper; and distillers, to cool the liquor more readily, make the neck of the matrass, which is very long, and winding like a serpent, pass through a vessel of cold water.

Brandy differs from wine spirit, in that the former is drawn from the poorer and thinner sorts of wines, the latter from the richer and fuller bodied wines.

Brandy also differs from spirit of wine, as the former is only what they call proof high, or half pure spirit, half phlegm; whereas spirit of wine is raised higher, or carried by rectification to a farther degree of purity.

Brandy also differs from strong waters, as the latter is a compound, whereof the former, or pure spirit of wine, is only one ingredient.

The Portuguese are lately coming into the way of making *brandy*. The Greek *brandies* are the worst, though made of the best wines.

The too free and frequent use of *brandy* is attended with ill effects, as it attenuates the body, and impairs the strength, and stupifies the brain. In persons who have died hereof, the blood has been found thick and coagulated; the *pancreas* dried; the liver scirrhous, and almost petrified; the glands tumefied beyond their natural bulk, &c. But what shall we say to the Parisian woman, who was burnt to ashes with a fire only kindled from the *brandy* in her body? Conringius even attributes the degeneracy of the modern from the ancient Germans to the prevalency of drinking this liquor. Phil. Trans. N° 97.

In the hot climates of America, they are said to make oysters of *brandy*. A person who had experienced the use of one of these fiery *enemata*, made of a pint of *brandy*, assures us, it not only made him dead drunk, but raving mad. Phil. Trans. N° 37.

Brandy is also applied, in a less proper sense, to all spirituous inflammable liquors, drawn from vegetables by distillation. In which sense *brandy* includes all ardent, or inflammable spirits, used in the way of beverage. Dr. Shaw adds a farther limitation to *brandy* spirits, viz. that they be proof high, or consist of equal quantities of water and alcohol. On which footing, spirits either above or below proof, do not come under the appellation of *brandies*. But in the popular use this distinction is not observed.

Arac, rum, malt, and melaſſes ſpirit, in this ſenſe, are *brandies*, though under another denomination.

In the iſland of Andros, they make *brandies* from the fruits of arbutus and mulberry-trees.

A patent was ſometime ago obtained for making *brandy* from carrots and parſneps; the latter of which is ſaid to have nearly reſembled French *brandy*. Of late we meet with frequent advertiſements of raiſin-*brandy*, which, if really made of that fruit, is neareſt akin to wine-*brandy*.

Apple, or cyder-*brandy*, is alſo praiſed by ſome.

Cyder is found to yield an eighth part of good ſpirits, and if cloſe kept a year or two in a cool place, much more. *Brandy* is alſo uſed to denote certain compound liquors, whereof *brandies* are the baſis. Such are raſpberry-*brandy*, cherry-*brandy*, gooſeberry-*brandy*, &c.

The French method of diſtilling *brandies* is the ſame with that practiſed by our diſtillers, in working from waſh or wines; only that the former throws a little of the natural lee into the ſtill along with the wine, which gives the ſpirit a flavour, on which a great part of its merit depends.

When *brandies* prove foul, feedy, or retain the taſte of certain weeds, apt to grow among the vines, they draw them over again, in order to cleanſe them of that adventitious flavour: in which operation they leave out the faints, or rather change the receiver, as ſoon as the ſtream begins to run proof. Then mixing together all that run off before, they call it *trois cinque*, that is *brandy* conſiſting of five parts alcohol, and three of phlegm; beyond which the French *bruleurs*, or common diſtillers, rarely go.

The yearly export of *brandies* from France is ſaid to amount to 25000 tons; an article of itſelf ſufficient to enrich a moderate country. While the duty on French *brandy* continued at 9*l.* the ton, the Engliſh alone took ten or eleven thouſand tons off their hands; but after the duty was raiſed to 52*l.* the ton, the importation was greatly reduced, to the advantage of the Engliſh diſtillery, except that ſmuggling ſtill intervened.

The colour of their *brandies* is acquired from the caſk, and the length of time they uſually lie in them, which is ſometimes twelve or eighteen months, and often two or three years; during which, it is no wonder if they acquire a yellow or browniſh caſt. Their lying thus long, as it were in a ſtate of ſlow digeſtion, wonderfully takes off from that hot, acid, and foul taſte peculiar to all ſpirits or *brandies*, newly diſtilled; and gives them a coolneſs and a ſoftneſs, not eaſily introduced by art. And on theſe properties are founded ſeveral methods of trying their goodneſs, or diſcovering whether they are debaſed or adulterated by the admixture of coarſer ſpirits. Phil. Tranſ. N° 391.

Brandies are rarely adulterated in France, where they have no cheaper ſpirits wherewith to debaſe them; and the like holds, in great meaſure, in favour of the Dutch, though otherwiſe ſuſpected to be great adulterators.

The chief temptations for adulterating are in England, where the duties are high, and where there are various kinds of ſpirits in plenty to mix with them, as malt, melaſſes, cyder, and ſugar ſpirits, with all which they are often ſophiſticated, and ſo dexterouſly, as frequently to eſcape all the ways of detection. *Brandy* may be imitated, by adding to very pure malt ſpirits, ſome dulcified ſpirit of nitre.

The chief uſe of *brandy* is as a drink; eſpecially in the cold northern countries; among the negroes in Guinea, who ſell one another for a few bottles of *brandy*; and among the ſavages in Canada, and other parts of North America, who are extremely fond of it. It is of ſome uſe too in medicine; being ſaid to ſtrengthen the nerves; and in dying, when raiſed into rectified ſpirit of wine, being one of the dyers non-colouring drugs.

BRANDY, *to diſtil*, they fill the cucurbit half full of the liquor from which it is to be drawn; and raiſe it with a little fire, till about one ſixth part be diſtilled, or till they perceive, that what falls into the receiver is not at all inflammable.

For this operation they uſe ſtoves built with bricks or ſtone, which are made either round or ſquare: when they uſe bricks, they bind them with a ſtrong fine clay, mixed with horſe dung or cow's hair.

Theſe ſtoves muſt always have two bottoms, the uppermoſt to put the fuel on, and the lowermoſt to receive the aſhes. They have alſo the precaution to contrive three or four vents round the copper, which they open or ſhut, as they would forward or retard their diſtillation.

For want of a ſtove, they ſometimes uſe an iron trivet to ſet the copper on, and only put wood under it: but this method is very defective: nor can good diſtillations ever be made if the operator is not maſter of the fire, to manage it with judgment and dexterity, which cannot be done in this laſt method in the open air.

In order to make good *brandy*, there muſt be uſed a large copper cucurbit, to which the head muſt be properly adapted; and having filled it half full with wine, which muſt be neither ſour, nor vented, nor corrupted, the cucurbit muſt be covered with its head, which muſt be exactly luted to it with paper and paſte, or rather with a wet bladder, folded ſeveral times. Then the cucurbit muſt be put into the ſtove, and the branch or neck through which the *brandy* is to diſtil muſt be made to paſs through a ton with one bottom only, filled with freſh water; for which purpoſe the neck muſt be three or four feet long, compoſed of a long tube which muſt paſs obliquely through the tun, and winding again, muſt meet a tube which iſſues out of the head of the cucurbit: theſe two tubes entering one into the other, muſt alſo be luted together with paper and paſte, or a wet bladder as above, to prevent the evaporation of the ſpirits during diſtillation. Care muſt alſo be taken to keep upon the head of the cucurbit a wet cloth, to make the ſpirit condenſe. As ſoon as you obſerve that ſome drops begin to fall at the end of the long tube, you muſt ſuffer about fifty to fall down, after which a recipient muſt be adapted to that end of the tube, capable of receiving the *brandy* which is going to diſtil. The diſtillation muſt not be haſtened by too fierce a fire.

The liquor, thus diſtilled the firſt time, is called *brandy*; which ſpirit, purified by another, or ſeveral more diſtillations, is what we call SPIRIT *of wine rectified*.—The ſecond diſtillation is made in *bolneo Mariæ*, and in a glaſs cucurbit; and the liquor put therein is diſtilled to about one half the quantity; which half is farther rectified, as long as the operator thinks fit.

To abridge theſe ſeveral diſtillations, which are long and troubleſome, they have invented a chemical inſtrument, whereby the rectification of ſpirit of wine is performed, at one ſingle diſtillation: the deſcription and figure of ſuch inſtrument may be ſeen in Glaſer's Chemiſtry.

To try the goodneſs of rectified ſpirit of wine, it muſt be lighted into a blaze: if then it conſumes wholly, without leaving any impurity behind it, which is a ſure ſtill, if after putting a little gunpowder in the bottom of the ſpirit, the gunpowder takes fire when the ſpirit is conſumed; the liquor is good.

Thoſe who deal in *brandy* (we ſpeak only of that made with wine), chooſe it white, clear, of a good taſte, and ſuch as will bear the teſt, or proof; i. e. ſuch as in pouring into a glaſs, forms on the top of it a little white lather, which, as it diminiſhes, makes a circle, called by the French *brandy* merchants the *chapelet*, by the Engliſh the *head*, or *bubbles*; there being no *brandy* but that which is well dephlegmated, and which retains no ſuperfluous humidity, wherein the bead will be entirely formed. For various methods of aſcertaining the ſtrength and goodneſs of *brandy* and other ſpirits, ſee *Proof* SPIRITS.

Before we finiſh this article, we ſhall give an account of the manner of extracting *brandy* from the huſks or ſkins of grapes, after the preſſing; becauſe the benefits that ariſe from this diſtillation, deſerve ſome attention.

After the grapes have been preſſed, what remains in the preſs is coarſely ſeparated into ſmall particles with the hand, and afterward thrown into large tubs, where they preſs it very hard, mix a little water with it, and cover it very cloſely with clay: in that condition they leave it to ferment during four or five weeks, obſerving, however, to ſhut the crevices which might happen to open in the clay, to prevent the evaporation.

After that time they fill a very large copper half full with that mixture, cover it with its head, lute it, and diſtil the whole after the ſame manner as they do *brandy*. By this work they make a great advantage of a matter which they were uſed to caſt on a dunghill. If this *brandy* be not ſo palatable as that which is made of wine, it is excellent for making ſpirit of wine. Both theſe liquors are a conſiderable branch of trade.

The greateſt part of the *brandies* in uſe, and thoſe too the beſt, are prepared in France: of the French *brandies*, thoſe of Nantes and Poictou are the moſt eſteemed; as being of a better taſte, finer and ſtronger, and enduring the bubble-proof longer than any of the reſt: thoſe of Anjou, Touraine, Orleans, Bourdeaux, Rochelle, Cognac, &c. claim the ſecond place. They are chiefly ſent to Paris and Flanders by the river Loire.

Brandy, in *Law-language*, is denominated either ſingle or double, when it is under or above *proof*. By the ſeveral acts 12 Car. II. c. 23. c. 24. 4 and 5 W. c. 3. 4. Ann. c. 6. 6 Geo II. c. 17. every gallon of ſpirituous liquors imported, of the produce and manufacture of the Britiſh plantations, is charged exciſe as follows: ſingle *brandy*, ſpirits, or *aqua vitæ*, 4*l* 8*d*. double *brandy*, ſpirits, or *aqua vitæ*, 8*l* 8*d*. And by the 32 Geo. II. c. 10. an additional duty of 12*d*. in the pound, according to the value of the BOOK of *rates*, is laid on all foreign *brandy* and ſpirits, rum from the produce of the Britiſh ſugar plantations excepted. And by the 33 Geo. II.

2. 9. 6 Geo. III. c. 47. and 22 Geo. III. c. 23. a duty of 2*l.* 6*d.* on every gallon of ſingle *brandy*, &c. and of 5*l.* on every gallon of double *brandy*, &c. beſides the three additional duties of 3*l.* *per cent.* of 19 Geo. III. c. 25. 21 Geo. III. c. 17. and 22 Geo. III. c. 66. See *Foreign* SPIRITS and *Low* WINES.

Of *brandy*, both plain and rectified, are prepared various kinds of ſtrong liquors, with the addition of other ingredients, ſugars, ſpices, flowers, fruits, &c. which are afterwards clarified, by paſſing them through a ſtraining bag, or filtering them through brown paper.—Such are cinnamon waters, aniſeed waters, fennel waters, celery waters, citron waters, &c. A great part of theſe are brought from Montpelier: where they are ſuppoſed to be better prepared than any where elſe. Savar. Dict. Commerce.

BRANDY, *cherry*. See CHERRY.

BRANK, the ſame with *huckle-bone*.

BRANLIN, an Engliſh name for a ſpecies of fiſh of the ſalmon kind, called alſo in ſome places *fingery*.

They obtained this laſt name from ſome ſingular marks they have, which are five or ſix tranſverſe black ſtreaks upon each ſide, appearing as made by the impreſſion of ſo many fingers, and each marked with a ſingle red ſpot. The tail of this fiſh is forked like that of the common ſalmon, and it is ſuppoſed they are all males; they ſeem to impregnate the ſpawn of the common ſalmon, and are found in waters of ſo rapid a current, that ſcarce any other fiſh could live in them. They never grow to any great ſize. Willughby, Hiſt. Piſc. p. 193.

BRASEM, in *Ichthyology*, a name by which ſome have called an American fiſh of the SMARIS kind, more commonly known among authors by its Braſilian name of *acarapeba*.

BRASIDIA, in *Antiquity*, anniverſary feaſts held at Sparta in honour of Braſidas, the ſon of Tellus, famous for his great atchievements in favour of that ſtate.

The *Braſidia* were celebrated with ſacrifices and games, at which none were allowed to contend but free-born Spartans. To be abſent from theſe ſolemnities, is ſaid by ſome to have been held criminal, and puniſhed with fines. Meurſ. Græc. Ferial. Potter. Arch. Græc. lib. ii. cap. 20.

BRASIL, and BRASILETTO. See BRAZIL, and CÆSALPINIA.

BRASMA, in the *Medical Writings of the Ancients*, a name given by Dioſcorides and others to a light, empty, and good for nothing kind of black pepper. This was no peculiar ſpecies of pepper, but as John Bauhine has well obſerved, it was the ſame with the pepper we now frequently meet with, which has decayed upon the plant. Dioſc. lib. ii. cap. 189.

BRASS, a factitious metal, compoſed of copper fuſed with *lapis calaminaris*, which gives it a hardneſs and yellowneſs. The manner of making *braſs* is ſaid to have been kept a ſecret in Germany for many ages.—The method of preparation among us is as follows. The *lapis* CALAMINARIS being calcined, and ground as fine as flour, is mixed with a third or fourth part of ground charcoal; and incorporated, by means of water, into a maſs. To this compoſition of calamine and coal, ſome manufacturers add common ſalt, by which the proceſs of making *braſs* is ſaid to be haſtened: thus prepared, about ſeven pounds of the calamine is put into a melting-pot of about a gallon; and over it, about five pounds of copper, either in plates or grains, which is ſet down into a *wind* FURNACE eight feet deep, remaining there about eleven hours; in which time it is converted into *braſs*.—After melting, it is caſt into plates, or lumps: forty-five pounds of crude calamine produce thirty pounds burnt, or calcined: and ſixty pounds of copper make, with calamine, an hundred pounds of *braſs*.

The proportion of calamine, and the increaſe which the copper receives from it, are different in different works; and hence ariſes the deeper or paler colour of *braſs*. The quantity of *braſs* obtained by the proceſs for making it, has been conſiderably augmented ſince the introduction of the method now commonly practiſed, of uſing granulated copper. See GRANULATION.

The finer and more malleable kinds of *braſs* are made of the pureſt calamine and copper, by cementing the *braſs* a ſecond time with calamine and charcoal, and ſometimes adding to it old *braſs*, by which the new is ſaid to be meliorated.

The word *braſs* ſeems to have been formed from *braſium*, a cant term among alchemiſts for *copper*.

They ſometimes uſe *braſs-ſtruff* inſtead of copper; but that is not always to be procured in quantities ſufficient; being no more than a collection of pieces of old *braſs*.

Braſs may be cleanſed, firſt by rubbing it with a cloth dipped in equal quantities of *aqua fortis* and common water; then with an oily cloth, and laſtly with a dry one dipped in *lapis calaminaris*.

The beſt *braſs* guns are not made of pure copper and calamine alone; but it is neceſſary to add coarſer metals, to make it run cloſe and ſounder; ſuch as lead, and pot-metal.

The beſt proportion for gun-metal, it is ſaid, is for eleven or twelve thouſand weight of metal, to uſe ten thouſand pounds of copper, nine hundred pounds of tin, and ſix hundred pounds of *braſs*; but the proportion is variable, according to the quality and goodneſs of the copper.

Braſs is ſomewhat lighter, harder, and more ſonorous than pure copper; it melts more eaſily, and does not ſcorify ſo ſoon in a moderate red heat. It is ductile only whilſt cold; heated a little, it cracks: and ignited, it falls in pieces under the hammer. This imperfection is derives from the zinc of the calamine; pure copper being malleable when hot, as well as when cold. The beautiful colour of *braſs*, its hardneſs, its malleability, its fuſibility, and its quality of being leſs ſubject to ruſt or verdigriſe than copper, render it fit for the fabrication of many utenſils.

Braſs is tinged of a gold colour, firſt, by burning, then diſſolving it in *aqua fortis*, and, laſtly, reducing it to its metalline ſtate. It may be whitened by heating it red hot, and quenching it in water diſtilled from *ſal ammoniac*, and egg-ſhells. It is ſilvered, or coloured ſuperficially white, by rubbing it with balls made of ſilver diſſolved in *aqua fortis*, with powder of white tartar, ſufficient to abſorb all the moiſture thereof.

BRASS, in *Antiquity*. See *Æs*.

BRASS, in a more extenſive ſenſe, includes copper, and all the mixtures or alloys of copper with other minerals. In which ſenſe, *braſs* amounts nearly to the ſame with the Roman *æs*, and the French *airain*.

BRASS, in the *Glaſs Trade*.—Thrice calcined *braſs* is a preparation which ſerves the glaſs-men to give many very beautiful colours to their metal. The manner of preparing it is this: place thin plates of *braſs* on tiles on the leer of the furnace, near the occhio; let it ſtand to be calcined there for four days, and it will become a black powder ſticking together in lumps. Powder this, and ſift it fine, and recalcine it four or five days more; it will not then ſtick together, but remain a looſe powder of a ruſſet colour. This is to be calcined a third time, in the ſame manner; but great care muſt be taken, in the third calcination, that it be not over-done, nor under-done; the way to be certain of making it right, is to try it ſeveral times in glaſs, while melting. If it makes the glaſs, when well purified, to ſwell, boil, and riſe, it is properly calcined; if not, it requires longer time. This makes, according to the different proportions in which it is uſed, a ſea green, an emerald green, or a turquoiſe colour.

Braſs, by a long calcination alone, and without any mixture, affords a fine blue or green colour for glaſs; but they have a method of calcining it alſo with powdered brimſtone, ſo as to make it afford a red, a yellow, or a chalcedony colour, according to the quantity, and other variations in the uſing of it. The method of making the calcination is this: cut thin plates of *braſs* into ſmall pieces with ſhears, and lay them *ſtratum ſuper ſtratum*, with alternate beds of powdered ſulphur, in a crucible; calcine this for twenty-four hours in a ſtrong fire, then powder and ſift the whole; and, finally, expoſe this powder upon tiles, for twelve days to a reverberating furnace; at the end of this time, powder it fine, and keep it for uſe.

The glaſs-makers have alſo a method of procuring a red powder from *braſs*, by a more ſimple calcination, which ſerves them for many colours. The method of preparing it is this: they put ſmall and thin plates of *braſs* into the arches of the glaſs-furnaces, and leave them there till they are ſufficiently calcined, which the heat in that place, not being enough to melt them, does in great perfection. The calcined matter, powdered, is of a duſky red, and requires no farther preparation. Neri's Art of Glaſs.

BRASS-*lumps*, in *Mineralogy*, a common name given by the miners and diggers of coal, &c. to the globular pyrites. This ſtone, when kept in the air, often ſends forth its efflorescences of ſalt, in form of ſmall and ſlender fibres, perfectly tranſparent, and ſometimes near an inch long. The place where theſe ſtones are expoſed to the air, will greatly alter the figures and colours of their efflorescences; if they are laid in a cellar, the ſhoots will be ſhorter, and green, like the common copperas; and if laid in the way of the ſunſhine, they will be white and duſty. Both are the ſame ſalt, which is the true green vitriol or copperas, and both will, in the ſame manner, turn a decoction of galls into ink. The white ſalt is only the green powdered and calcined by the ſun's heat. The figure of the fibres of theſe efflorescences is not eaſy to be determined; ſometimes they ſeem round, ſometimes angular. Theſe, however, are the natural figures of the ſalts of theſe ſtones; and the other ſhoots

into which they form themſelves after ſolution, and bringing them together in a body by water, are rather their accidental forms, though, under a like courſe of accidents, they generally appear the ſame. Phil. Tranſ. N° 110.

BRASS-*wire*. See WIRE.

BRASSATELLA, BRASSADELLA, or BRASSIDELLA, in *Botany*, a name given by many authors to the plant more uſually known by that of OPHIOGLOSSUM, or ADDER'S *tongue*.

BRASSE. See FRANCH.

BRASSICA, *the cabbage*, in *Botany*, a genus of the *tetradynamia ſiliquoſa* claſs of plants, the characters of which are theſe; the flower is croſs-ſhaped, having four petals, and four oval nectarious glands; it hath ſix ſtamina, which are erect, two of which are oppoſite, and the other four are longer; it hath a taper germen, of the length of the ſtamina, which afterward becomes a long taper pod depreſſed on each ſide, and is terminated by the apex of the intermediate partition, which divides it into two cells filled with round ſeeds. See BROCCOLI, CABBAGE, CAULIFLOWER, SAVOY, &c.

BRASSIDELIC *art*, a term uſed by Paracelſus to denote a method of curing wounds by the application of the herb *braſſidella*, or *ophioglaſſum*, on the freſh wound.

BRAVA *Pareira*. See PAREIRA *brava*.

BRAURONIA, in *Antiquity*, a feaſt held every fifth year in honour of Diana, ſurnamed *Brauronia*, from *Brauron*, a village near Athens, where the famous ſtatue of that goddeſs, brought from Scythia Taurica, was preſerved. The ceremony of the *Brauronia* was managed by ten men, from their office called *Ἱεροποιοὶ*; the victim offered was a goat, and it was cuſtomary for certain men to ſing one of Homer's Iliads, during the ſervice: other miniſters at the ſolemnity were young virgins, from five to ten years of age, habited in yellow, and conſecrated to Diana under the denomination of *Ἀρκτοὶ*. Potter. Arch. Græc. lib. ii. cap. 20.

BRAWN, in the *Cullinary Art*, ſignifies the fleſh of a boar, boned, rolled up, or collared, boiled, and, laſtly, pickled, for the winter's uſe.

Brawn is made only of the ſtitches, without the legs; the oldeſt boars are choſen for this uſe; it being a rule that the older the boar, the more horny the *brawn*.

There is alſo *brawn* of pig, which is made by ſcalding, drawing, and boning the beaſt whole, except the head; then cutting it into two collars, ſoaking it in brine, ſeaſoning, rolling, putting it into a cloth, binding it up, boiling it, and, when boiled, hooping it up in a frame.

BRAZED, in *Heraldry*, is uſed in ſpeaking of three chevrons claſping or folding each other.

The word is doubtleſs formed by corruption from the French word *bras*, *arm*.

BRAZEN *age*, is uſed by the poets to expreſs the third AGE of the world.

BRAZEN *diſh*, among *Miners*, is the ſtandard by which the other diſhes are gauged, and are kept in the king's hall.

BRAZIER, an artificer who makes and ſells pans, pots, kettles, and other kitchen utenſils and braſs ware.

Itinerant *braziers*, who go about with their tools and knapſacks, are called *tinkers*; by the French, *braziers of the whiſtle*, *chaudronniers au ſifflet*.

BRAZIL or BRASIL, an American wood, commonly ſuppoſed to have been thus denominated becauſe firſt brought from Brazil: though Hewet ſhews, it had been known by that name many years before the diſcovery of that country. Vide Hiſtoria, p. 268.

It is denominated variouſly, according to the places whence it is brought. Thus we have *brazil* from Fernambuc, *brazil* of Japon, of Lamon, of St. Martha; and, laſtly, *brazilatto*, or Jamaica wood, brought from the Antilles.

The *brazil* tree ordinarily grows in dry barren places, and in the middle of rocks; it is very thick and large, uſually crooked, and knotty: its flowers, which are of a beautiful red, exhale a very agreeable ſmell, which ſtrengthens the brain. Though the tree be very thick, it is covered with ſo groſs a bark, that when the ſavages have taken it off the wood, or trunk, which before was the thickneſs of a man, it is ſcarce left equal to that of his leg.

Brazil wood is very heavy and dry; it crackles much in the fire, and ſcarce raiſes any ſmoke, by reaſon of its extreme dryneſs. None of the ſeveral kinds have any pith, except that of Japon: that of Fernambuc is eſteemed the beſt. It muſt be choſen in thick pieces, cloſe, ſound, without any bark on it; and ſuch as, upon ſplitting, from pale becomes reddiſh; and, when chewed, has a ſaccharine taſte.—It is much uſed in turned works, and takes a good poliſh; but its chief uſe is in dying, where it ſerves for a red colour: it is a ſpurious colour, however, which it gives; and eaſily evaporates and fades: nor is the wood to be uſed without alum and tartar. Red ink is made of it, boiled in beer, wine, or vinegar, and the colour fixed with alum.

Hellot has given a remarkable proceſs, by which both the beauty and permanency of the dye are improved. He likewiſe directs to fix the colour of *brazil* by aſtringents; for this purpoſe the ſtale decoction of *brazil* is diluted with twice its quantity of water; to which are added, for every pound of cloth, about one ounce of powdered galls, and half an ounce of gum Arabic. The cloth, prepared with alum and tartar, and kept moiſt for fifteen days, is boiled in this liquor for an hour or two, as the colour is wanted lighter or deeper, and ſuffered thoroughly to cool before it is waſhed. Dr. Lewis's edit. 4to. of Neumann's Works. p. 136.

From the *brazil* of Fernambuc is drawn a kind of carmine, by means of acids: there is alſo a liquid lacca made of it for miniature.

Carnation is dyed with *brazil*, and violets are raiſed with *brazil*. Acids turn *brazil* yellow, but by adding an alkali, it becomes purple; ſo that if we put lemon juice, or ſpirit of vinegar, in a decoction of *brazil* wood, it becomes yellow, and, if we add oil of tartar, violet.

Brazil wood differs very obviouſly from the SAUNDERS *wood*; the former gives out its red colour to water, the latter gives no red tinge to any aqueous liquor. Neumann.

Brazil wood is of ſome uſe in medicine; being reputed a ſpecies of the SAUNDERS, and poſſeſſed of the ſame phyſical virtues, though rarely preſcribed.

BRAZING, the ſoldering or joining of two pieces of iron by means of thin plates of braſs, melted between the two pieces to be joined.

If the work be very fine, as when the two leaves of broken ſaws are to be joined, it is to be covered with beaten borax, moiſtened with water, that it may incorporate with the braſs-duſt which is here added; and the piece is expoſed to the fire without touching the coals, till the braſs be obſerved to run. To *braze* with a ſtill greater degree of neceſſity, they uſe a ſolder made of braſs, with a tenth part of tin; or another, one third braſs, and two thirds ſilver; or borax and roſin: obſerving, in all theſe ways of *brazing*, that the pieces be joined cloſe throughout; the ſolder only holding in thoſe places that touch.

The method of *brazing*, among ſmiths, farriers, &c. is, by heating the two pieces, when hot, over one another; this is more properly called *welding*.

BREACH, in a general ſenſe, denotes a break or rupture, in ſome part of a fence or incloſure, whether owing to time or violence.

The word is formed from the French *breche*, which ſignifies the ſame; formed of the German *brechen*, to *break*. Inundations or overflowings of lands are frequently owing to *breaches* in the dikes, or ſea-banks. Dagenham *breach* is famous; it was made in 1707, by a failure of the Thames wall, in a very high tide. The force wherewith it burſt in upon the neighbouring level, tore up a large channel or paſſage for water a hundred yards wide, and in ſome places twenty feet deep, by which a multitude of ſubterranean trees, which had been buried many ages before, were laid bare. Phil. Tranſ. N° 335. p. 478.

BREACH, in *Fortification*, is a hole, gap, or aperture made in any part of the works of a town, either by playing cannon, or ſpringing mines; in order to ſtorm the place, or take it by aſſault.

They ſay, make good the *breach*; fortify the *breach*; make a lodgment on the *breach*: to clear the *breach*, is to remove the ruins, that it may be the better defended.

A practicable *breach*, is that where the men may mount, and make a lodgment.—A *breach* ought to be fifteen or twenty fathoms wide.—The aſſailants make their way to it, by covering themſelves with gabions, earth-bags, &c. When a *breach* in the rampart is practicable, the governor uſually capitulates, to prevent the effects of a ſtorm. Before they mount the *breach*, they frequently widen or enlarge it with fourneaux, and render the acceſs to it practicable, even for cannon, which it is ſometimes neceſſary to plant on the *breach*, in order to ruin the enemies retrenchments on the gorge and epaules of the baſtions.

BREACH *of cloſe*, in *Law*. See CLOSE.

BREACH, *to batter in*, *battre en brèche*. See BATTER.

BREACH, *mounting the*. See MOUNTING.

Pound BREACH. See POUND.

BREAD ordinarily is made of the flour or meal of ſome farinaceous vegetable, ground, and kneaded with water and yeaſt.

Bread is uſually made of the ſeeds, ſometimes alſo of the roots, and even of the piths of plants. The Greeks attribute the invention of *bread* to Ceres, the Egyptians to Iſis, others to Menes. The firſt *bread* is ſuppoſed to have been made of the plant *lotus*. The poor Tartars, near

Sbera-

Sherazoul, ſtill live upon *acorn-bread*. Phil. Tranſ. N° 300. and N° 138. p. 2033. and 943.

In the iſlands of Banda and Amboyna, they make a kind of *bread* called *ſagoen*. or *ſago*, of the pith of a farinaceous tree, whoſe trunk is the thickneſs of a man's thigh, ten feet high, and having a round head a-top like a cabbage; in the middle whereof is a white mealy ſubſtance, which being kneaded with water, fermented, and baked on the coals, ſerves the poorer ſort for *bread*. Phil. Tranſ. N° 26. p. 485.

In the Caribbee iſlands, they make *bread* of the root of a poiſonous plant called *manioc*; probably the ſame with the CASSADA *bread*, which is made of the root of the *yuca Mexicana*. Phil. Tranſ. N° 33. p. 635. and N° 311. p. 2434.

In Benzon's time, all the ſhips bound from Spain to Mexico, when they returned, were victualled with CASSADA *bread*, inſtead of biſcuit.

To the claſs of *breads* made of roots may alſo be added *potato-bread*, frequent in Ireland, and *turnip-bread*, uſed in ſome parts of England. It is made by boiling the roots, and expreſſing the juice, till they become dry, then beating them in a mortar, and adding wheat-flour, aniſeeds, and yeaſt, moulding up the dough in the uſual form and baking it. It looks and taſtes like other *bread*, and is uſed by ſome againſt conſumptions. Phil. Tranſ. N° 205. p. 970.

Among us, *bread* is chiefly divided into *white*, *wheaten*, and *houſhold*; differing only in degrees of purity. In the firſt, all the bran is ſeparated; in the ſecond, only the coarſer; in the third none at all; ſo that *fine bread* is made only of flour; *wheaten bread*, of flour, with a mixture of the finer bran; and *houſhold*, of the whole ſubſtance of the grain, without taking out either the coarſe bran or fine flour. Stat 8 Ann. cap. 18.

We alſo meet with *ſimnel bread*, manchet or roll *bread*, and French *bread*; which are only ſo many denominations of the fineſt or whiteſt *breads*, made of the pureſt flour; except that in roll *bread* there is an addition of milk, and, in French *bread*, of eggs and butter alſo. To which may be added, *ginger-bread*, made of white *bread*, with almonds, liquorice, aniſeed, roſe-water, and ſugar; and *muſſi-a-bread*, *panis mixtus*, made of wheat and rye, or ſometimes of wheat and barley.

The proceſs of making houſhold *bread* among us, is thus: to a peck of meal they add a handful of ſalt, a pint of yeaſt, and three quarts of water, cold in ſummer, hot in winter, and temperate between the two; the whole being kneaded in a bowl or trough by the fire in winter, from it in ſummer, will riſe in about an hour; they then mould it into loaves, and put it into an oven to bake.

For unleavened *bread*, part of the flour intended for it, being made into dough with warm water and a little ſalt, is laid in the reſt of the flour an hour or more, in which time it riſes to three times the bulk; then they mix and knead the whole with more water, till it be brought into a ſtiff dough; which being formed into loaves, is baked in the oven; though the more uſual way is to take a piece of dough kneaded, and leave it in the tub till next time, when they break it ſmall, and mix it with the meal, adding ſome yeaſt. Hought. Collect. tom. i. N° 90. p. 241.

For French *bread*, they take half a buſhel of fine flour, ten eggs, and a pound and an half of freſh butter, into which they put as much yeaſt, with a manchet; and tempering the whole maſs with new milk, pretty hot, let it lie half an hour to riſe; which done, they make it into loaves or rolls, and waſh it over with an egg beaten with milk; care is taken, the oven be not too hot.

In Lancaſhire, and ſeveral other northern counties of England, the people have ſeveral ſorts of *oaten bread*; as, 1. The *bannock*, which is an oat-cake, kneaded only with water, and baked in the embers. 2. *Clap-bread*, which is made in thin hard cakes. 3. *Bitchineſs-bread*, which is made of thin batter, and formed into thin ſoft oat-cakes. 4. *Riddle-cake*, which are thick and ſour, and very little different from the hand-hover *bread*, which has but little leaven, and kneaded ſtiff. And, 5. *Jannock*, which is oaten *bread* made up into loaves.

In the ſtatute of aſſize of *bread* and ale, 51 Hen. III. mention is made of *waſtel-bread*, *cocket-bread*, and *bread* of *treet*; which anſwers to the three ſorts of *bread* now in uſe, called *white*, *wheaten*, and *houſhold bread*.

In religious houſes, they heretofore diſtinguiſhed *breads* by the names, *equiries bread*, *monks bread*, *boys bread*, and *ſervants bread*.

A like diſtribution obtained in the houſholds of nobles and princes; where, however, we find ſome other denominations, as *meſſengers bread*, that given to meſſengers, as a reward of their labour; *court bread*, that allowed by the lord for the maintenance of his houſhold; *eleemoſynary bread*, that diſtributed to the poor in the way of alms. Du-Cange Gloſſ. Lat. tom. iv.

The quantity of *bread* allowed a ſoldier for his day's ſubſiſtence is called a RATION.

For armies the *bread* is either baked in the park of proviſions in the camp, or in the town neareſt the army; for the convenience of ovens, an army ought always to have at leaſt four days *bread* before-hand. In ſome caſes, the diſtance of the places, from whence *bread* is to be had, or the army's march from one country to another, obliges the general to diſtribute *bread* for ſix or even for eight days; a thing never done without abſolute neceſſity, by reaſon of the abuſe which ſome ſoldiers make of it, who ſell their *bread* without regard to future ſubſiſtence. For long marches through an enemy's country, they ſometimes, inſtead of *bread*, make BISKET.

BREAD, *horſe*, is made of wheat, oats, and beans, to which ſometimes are added aniſeed, gentian, liquorice, fenugreek, eggs, and ale; and ſometimes rye and white wine are uſed.

For race horſes, three ſorts of *bread* are uſually given with ſucceſs, for the ſecond, third, and fourth fortnights feeding; they are all made of beans and wheat worked with barm, the difference conſiſting chiefly in the proportion of the two former. In the firſt kind, three times the quantity of beans is uſed to one of wheat, in the ſecond, equal quantities of both; in the third, three times the quantity of wheat to one of beans.

BREAD, *ſacramental*, in the proteſtant churches, is common leavened *bread*, agreeable to the ancient practice. In the Romiſh *maſs*, AZYMUS, or unleavened *bread*, is uſed, particularly in the Gallican church, where a ſort is provided for this purpoſe, called *pain a chanter*, made of the pureſt wheaten flour, preſſed between two iron plates graven like wafer-moulds, being firſt rubbed with white wax, to prevent the paſte ſticking.

Eccleſiaſtical writers enumerate other ſpecies of *bread*, allotted for purpoſes of religion; as, 1. *Cœnobarius*, that anciently offered to the prieſts at the calends. 2. *Prebendarius*, the ſame with *capitularis*, that diſtributed daily to each prebendary or canon. 3. *Benedictus*, that anciently given to catechumens before baptiſm, in lieu of the euchariſtic *bread*, which they were incapable of partaking of. 4. Conſecrated *bread* is a piece of wax, paſte, or even earth, over which ſeveral ceremonies have been performed with benedictions, &c. to be ſet up in an *agnus dei*, or a relic box, and preſented for veneration. 5. Unleavened *bread*, AZYMUS. The Jews eat no other *bread* during their paſſover; and exact ſearch was made in every houſe, to ſee that no leavened *bread* was left. The uſage was introduced in memory of their haſty departure from Egypt, when they had not leiſure to bake leavened. 6. *Shew-bread* was that offered to God every Sabbath-day, being placed on the golden table, in the holy of holies.

BREAD *of St. Hubert*, *St Geneviève*, *St. Nicholas*, &c. denote cakes ſanctified with certain prayers and invocations of thoſe ſaints held by the ſuperſtitious to be of great efficacy in the cure of hydrophobias, agues, and other diſeaſes.

BREAD is alſo uſed to denote certain foods made of animal, or even mineral matters, ſerving to ſupply the place of *bread*.

In divers parts of the North we read of *fiſh-bread*, particularly in Iceland, where dried cod is uſed for *bread*, being firſt beaten to powder, and made up into cakes. The like obtains among the Lapſanders, whoſe country affords no corn; and even among the Crim Tartars. Phil. Tranſ. N° 102. p. 35. Sheff. Hiſt. of Lapl. chap. 14.

BREAD, in a more extenſive ſenſe, includes all the neceſſaries of life, as food, raiment, lodging, &c.

Hence alſo the ſabbath is ſometimes called, in ancient writers, *the day of bread*, by reaſon the euchariſt was then adminiſtered every Lord's day.

BREAD, *ſwine*, *panis porcinus*, a denomination given to TRUFFLES.

BREAD, *ſow's*, is alſo applied to the herb CYCLAMEN.

BREAD, *aſſize of*.—The price and weight of *bread* are regulated by the magiſtrates according to the price of wheat; and, in order to direct them in their allowance to the baker, they are to take notice, that the peck-loaf of each ſort of *bread* is to weigh, when well baked, 17 lb. 6 oz. avoirdupois weight, and the reſt in proportion; and that every tack of meal, or flour, is to weigh two hundred weight and two quarters, neat; and that from every ſack there ought to be made, at an average, twenty ſuch peck-loaves of bread.

We have divers tables of the weights of the loaves both of *wheaten* and *houſhold bread*, at every price of wheat. If *bread* wants one ounce in thirty-ſix, the baker formerly was to ſuffer the pillory; now, to forfeit not more than five ſhillings. nor leſs than one, for every ounce wanting; and for every defect leſs than an ounce, not more than two ſhillings and ſix pence, nor leſs than ſix pence; ſuch *bread* being complained of and weighed before a magiſtrate within twenty-four hours after it is

baked or expofed to fale, within the bills of mortality, or within three days in any other place. Bakers are obliged, under a penalty, to mark their *wheaten-bread* with a large Roman W, and their *houſhold bread* with an H. See BAKING.

It is to be obſerved, *bread* loſes weight by keeping; in ſome experiments recited by Bartholin, the diminiſution was near one-fourth in ſix months.

By 13 Geo. III. cap. 62. a ſtandard *wheaten-bread* was ordered to be made of ſuch flour as is the whole produce of the grain, the hull only excepted, and to be marked SW, but it is little uſed.

TABLE of the Aſſize and Price of *Bread* made of WHEAT.

Note: The weight of loaves of any ſize may be eſtimated from thoſe of the penny loaf, by ſimple addition; e. gr. the ſix-penny loaf weighs ſix times as much, &c. and the wheaten loaves are three-fourths of the weight of the houſhold loaves. See Burn's Juſtice, vol. i. p. 220.

BREAD, in *Medicine*.—Beſides alimentary, *bread* has alſo medical qualities: decoctions, creams, and jellies of *bread*, are directed in ſome diſpenſaries.

There are certain medicated *bread*s, appropriated to the intentions of phyſic; as, aniſeed-*bread*, turnep-*bread*, and vipers-*bread*; which laſt is made of the fleſh of that animal, with wheat-flour, yolks of eggs, ſarſaparilla, yeaſt, and milk, commended in ſcorbutic habits. Some direct acorn-*bread*, dipped in red wine, to be thruſt up the *anus*, in prolapſuſes of that part.

Mr. Boyle aſſures us, he drew a *menſtruum* from *bread* ſtronger than *aqua fortis*, and which would act even upon glaſs itſelf. Phil. Works abr. tom. i. p. 34. 49.

Bread made of good wheat, well leavened, and thoroughly baked, with a little ſalt, is the beſt; that which is not thoroughly baked, ill kneaded, and without ſalt, is hurtful and unwholſome, eſpecially in ſmoaky cities: ſo are unleavened *bread* and cakes baked under the aſhes.

In general, the lighter the *bread*, the better and more agreeable it is; coarſe and barley *bread* is deterſive, and gently purgative, at leaſt to thoſe not uſed to it. Some recommend it for perſons in the gout.

See farther concerning *bread* in the writers on foods and cookery; eſpecially in Hen. Nicolaus, who has a treatiſe expreſs on *bread*. Hen. Nicolai Tract. de Pane Dantiſc 1651. See alſo Fabr. Bibl. Antiq. cap. 19. § 6.

BREAD, in *Chemiſtry*. The chemiſt's art can extract from ſo mild a ſubject as *bread*, an acid, which is a powerful *menſtruum*. It is done in this manner; put two pounds of coarſe *bread*, cut into ſmall pieces, into a glaſs retort; place this in a ſand heat, and, luting on a receiver, diſtil with a gentle fire, and there will be produced a liquor appearing like water, with a ſmall quantity of oil; ſeparate the oil, and filtre and rectify the liquor by a ſecond diſtillation in *balneo Mariæ*, and afterwards diſtil it again in a ſand heat, and there will be produced a moderately ſtrong, clear, acid liquor. This is a *menſtruum* capable of extracting the red colour from coral, and even from garnets. Common *bread* affords it, but coarſe rye-*bread* yields the greateſt quantity. Shaw's Lect. p. 104. Oil of vitriol, poured upon crums of *bread*, will excite a ſurpriſing degree of heat. Boyle's Works abr. vol. i. p. 569.

BREAD, *bonpournichole*, or *bonpournickel*, the name of a very coarſe *bread* eaten in Weſtphalia, and many other places. This *bread* of the Weſtphalians ſtill retains the opprobrious name once given it by a French traveller, of *bonpournichole, good for his horſe Nichole*, but is by no means a contemptible kind.

It is far from being peculiar to this age or country: it has been known in diſtant places, and in different ages, and was called by the ancients *panis furfuraceus*, or *panis impurus*, from its not being ſo thoroughly cleanſed from the huſk or bran, as the fine ſorts of *bread* are.

The wreſtlers of old eat only this ſort of *bread*, to preſerve them in their ſtrength of limbs; and we may learn from Pliny, that the Romans for three hundred years knew no other *bread*: unqueſtionably, this coarſe *bread* nouriſhes more, aſſuages hunger better, and generates humours leſs ſubject to corruption, than the white.

The inhabitants of Weſtphalia, who are a hardy and robuſt people, and capable of enduring the greateſt fatigues, are a living teſtimony of the ſalutary effects of this ſort of *bread*; and it is remarkable, that they are very ſeldom attacked by acute fevers, and thoſe other diſeaſes which ariſe from an ebullition of the humours, and a malignant coliquation of the blood, and of the humours of which it is compoſed.

It is certain, that a leſs ſtrong diet is more proper to weakly conſtitutions, and people of ſedentary lives, than this; but for thoſe who will uſe the neceſſary exerciſe with it, it is eaſy to ſee that it is preferable to all other kinds of *bread*; ſince it remarkably reſtores ſtrength, and has another ſalutary effect, which is, that it renders the belly ſoluble: this was a quality remarked in coarſe *bread*, and highly commended in it, ſo early as in the days of Hippocrates.

The Germans make two ſorts of waters by diſtillation from this *bread*; the one with, the other without, the addition of a ſpirituous liquor: to both which great virtues are aſcribed. That without any thing ſpirituous, is made of the juice of craw-fiſh, May-dew, roſe-water, nutmegs, and ſaffron, diſtilled from a large quantity of this *bread*. This is eſteemed a great reſtorative, and given in hectic habits. The other is diſtilled from this *bread* and Rheniſh wine, with nutmegs and cinnamon. This is given in all the diſorders of the ſtomach, vomiting, and loſs of appetite, and other complaints of the ſame kind; and beſides theſe, there is a ſpirit diſtilled from it by the retort, in the dry way, which, when ſeparated from its fetid oil, is eſteemed a powerful ſudorific, and very valuable medicine, in removing impurities of the blood. Hoffman.

BREAD, *Indian*, or *Caſſada*. See CASSADA.

BREAD, *St. John's*. See CAROB.

BREAD-*room*, in a ſhip, that in which the *bread* or BISKET is kept.

BREAD-*fruit*, at Otaheite, in the South Sea, grows on a tree about the ſize of a middling oak: it is about the ſize and ſhape of a child's head; the ſurface is reticulated, and covered with a thin ſkin; the eatable part lies between the ſkin and the core; it is white as ſnow, and of the conſiſtence of new bread. It has an inſipid, ſweetiſh taſte, reſembling that of the crumb of wheaten bread, mixed with a Jeruſalem artichoke. It is roaſted and baked before it is eaten. Three different diſhes are prepared from this fruit, by beating it into a paſte with water, or the milk of the cocoa-nut, and mixing it with ripe plantains, bananas, or the four paſte which they call *matte*. Hawkeſworth's Voyages, &c. vol. ii. p. 80, and 108.

BREADTH. See LATITUDE, DIMENSION, AREA, &c.

BREADTH, *hair's*. See HAIR.

BREADTH, *finger's*. See FINGER.

BREADTH, *hand's*. See HAND.

BREADTH *of a ſhip* is the meaſure of it from ſide to ſide in any particular place: accordingly the *main-breadth* is

that part of every timber which incloſes the greateſt ſpace from the middle line of the ſhip's length; *top-timber breadth* is the diſtance between the upper part of the ſame timber, and the ſaid middle line; and the *extreme breadth* is the diſtance between her ſides in the *main-breadth* of the midſhip-frame.

BREADTH-*ſtaff*, in *Sea-language*, denotes the radius of the arch which forms part of the curve of a ſhip's timber in the horizontal plane.

BREAK, in Norfolk, denotes land ploughed or broke up the firſt year after it has lain fallow in the ſheep-walks.

In *Architecture*, it denotes a receſs, or giving back of a part behind its ordinary range or projecture.

In which ſenſe, they ſay, a *break* of a PEDIMENT; a *break* of ENTABLATURES, whereby it ſhrinks, as it were, between the columns, is reputed a fault.

BREAK-*in*, among *Carpenters*, is when they break a hole in brick-walls with their ripping chiſſel.

BREAK-*neck*, *Briſe-cou*, in *Building*, a fault in a ſtair-caſe as when a ſtep is made higher or lower than the reſt, and landing place too narrow, or the like.

BREAK-*water*, the hulk or hull of ſome old ſhip, ſunk at the entrance of a ſmall harbour, to *break* the force of the waves in their paſſage to the veſſels moored within. It is alſo uſed for a ſmall buoy faſtened to a large one in the water, and deſigned to ſhew where it ſwims. See BUOY.

BREAKERS, in *Sea-language*, ſignify billows that break violently over rocks, lying under the ſurface of the ſea.

BREAKING, in *Agriculture*, denotes the ploughing up of grounds, eſpecially ſuch as have lain ſome time fallow.

BREAKING *ground*, in the *Military Art*, the beginning of works for carrying on the SIEGE of a place; more eſpecially the beginning to dig TRENCHES, or approaches.

BREAKING *the angles of a battalion*, denotes a military evolution, whereby the four angles turn, and make ſo many fronts towards the enemy; ſo that the battalion, which before was only a ſquare, becomes an octangle, and can fire on all ſides.

This is otherwiſe called *blunting the angles of a battalion*; by the French, *emouſſer les angles d'un bataillon*.

BREAKING *of meaſure*, in *Fencing*, denotes a moderate retiring, or giving of ground, in order to avoid the adverſary's thruſt.

Breaking of meaſures differs much from going back, and loſing or yielding of ground; the latter being reputed a great reproach, the former a mark of judgment and adroitneſs. Some pretend that a man retiring is obliged to forbear, if his adverſary call on him to ſtand.

BREAKING *of the ſea*, BREAKING *of a wave*, or the like, on a rock, a bank, or the like, are a ſufficient indication to the pilots, that it is not ſafe mooring there.

Divers machines and ſtructures have been contrived for *breaking* the force of wind, the ſtream of water, and the like.

BREAKING is alſo uſed for the taming of animals, or reducing them from a wild to a tractable ſtate.

BREAKING *of a horſe to the ſaddle*, See BACKING and TRAVICE.

To *break* a horſe for hunting, is to make him acquire the diſpoſition and habit of running. It is a great fatigue to run horſes full ſpeed before they are *broken*.

BREAKING *herd*, among *Sportſmen* denotes a deer's quitting the herd, and running by itſelf.

In which ſenſe, the word ſtands oppoſed to *herding*.

A deer, when cloſe purſued, is loth to *break* herd. When a hart *breaks* herd, and draws to the thickets and coverts, he is ſaid to *harbour* or take hold.

BREAKING *up a deer*, ſignifies the opening or cutting it up.

BREAKING *of priſon*. See PRISON.

BREAKING *the legs*, *crucifragium*, was an appendage of crucifixion, uſed no where but among the Jews. See CROSS.

BREAKING *bulk*, in the *Sea-language*, ſignifies taking part of the ſhip's loading or cargo out of the hold.

BREAKING *of hemp*. See BRAKE.

BREAKING *of bread*, is ſometimes uſed, in *Eccleſiaſtical Writers*, for celebrating the EUCHARIST.

BREAKING *of wine*, among *Vintners*.—Wine is ſaid to *break*, when being left ſome time in the air, in an open glaſs, it changes colour; an indication that it will not keep.

This is the uſual method of trying the goodneſs of wine, among the merchants and vintners of Paris.

BREAKING is alſo uſed in trade, for a perſon's failing or ſtopping payment.

In which ſenſes, *breaking* differs from becoming BANKRUPT.

Breaking betimes, while there is ſomething left to pay withal, is a mark of honeſty; and, generally, entitles the unhappy perſon to compaſſion and gentler uſage from his creditors, ſaves his credit, and facilitates his retrieving. A late ſenſible writer on trade takes great pains to inculcate this precept, BREAK EARLY. *Compl. Eng. Tradeſman*, vol. i. p. 77. 8o, &c.

BREAM, in *Ichthyology*, the Engliſh name of the CYPRINUS *latus*.

This is but a coarſe fiſh for the table, but it affords great ſport to the angler. The beſt time of angling for *bream* is from St. James's day to Bartholomew-tide; as being then exceeding fat; and the moſt proper bait is the largeſt red garden-worms that can be got. See SPARUS.

BREAMING. See BROOMING.

BREAST, *Mamma*, in *Anatomy*, a prominent fleſhy part of the human body, on the outſide of the *thorax*, ſerving to ſeparate the milk.

Anatomiſts ſometimes divide *breaſts* into perfect, which are compoſed of a multitude of glands, interwoven with veins, arteries, and nerves; ſuch are thoſe of women; and imperfect *breaſts*, compoſed chiefly of fat, with a few glands, ſuch are thoſe of men.

The internal ſubſtance of the *breaſt* is compoſed of a great number of glands, of various ſizes, and an oval figure, intermixed with globules and veſſels of fat. Their excretory ducts, as they approach the nipple, join and unite together, till at laſt they form ſeven, eight, or more ſmall pipes, called *tubuli lactiferi*, which have ſeveral croſs canals, by which they communicate with one another, to obviate the inconveniences that might accrue from the caſual obſtruction of one or more of them. Theſe tubes are not every where of equal capacity, but in ſome places more, in others leſs, dilated; ſo as to form cells, which ſeem contrived to hinder the ſpontaneous efflux, and to create a neceſſity of ſucking, to fetch out the contents.

Of the concurrence of theſe *tubuli*, or pipes, is the ſubſtance of the *papillæ*, in great meaſure, formed; among which is interſperſed a glandulous ſubſtance, ſerving to keep them from preſſing too cloſe on each other; and with it are intermixed abundance of fibres derived from the external teguments of the *papillæ*; by means whereof, the lacteal tubes are conſtringed, and the motion of the milk is modified.

Beſides theſe veſſels, are abundance of fatty globules, called *ductus adipoſi*, which ſome would have only to fill up the interſtices of the glands: but Dr. Drake, after Malpighi, thinks they contribute to the compoſition of the MILK; which ſeems nothing elſe but water and oil artfully united.

The office of the *breaſt* is to ſecrete the milk from the arteries in their glandulous ſubſtance, to collect it in their lacteal tubes, and, at proper ſeaſons, to yield it to the infant through the nipple.

Some, however, aſſert, that the milk is not formed from the blood, but from the chyle, which is immediately conveyed thither by the thoracic, or Pecquet's ducts. And what confirms the ſuggeſtion, is the quick ſupply of milk in nurſes, after a draught of cow's milk. The difficulty is to prove, that the thoracic duct reaches to the *breaſts*, which ſome abſolutely deny. Phil. Tranſ. N° 65. and N° 40. p. 1357, and 805.

Swelling *breaſts*, eſpecially if there be milk found in them, are generally judged a mark of the loſs of VIRGINITY, and a proof that a woman has been with child; though, it is ſaid, it does not hold univerſally.

The ſwelling of the *breaſts*, during the time of geſtation, is owing to the conſent between the *breaſts* and the UTERUS; there being ſo near a communication between the mammary veſſels, and the hypogaſtric veſſels of the womb, that dilatation in the latter is attended with a ſimilar one in the former. See PREGNANCY, &c.

In virgins, the tubes which compoſe the glands of the *breaſt*, like ſphincter-muſcles, contract ſo cloſely, that no part of the blood can enter them: but when the womb grows big with a FOETUS, and compreſſes the deſcending trunk of the great artery, the blood flows in greater quantity, and with a greater force, through the arteries of the *breaſts*, and forces a paſſage into their glands, which, being at firſt narrow, admits only of a thin water; by growing wider by degrees, as the womb grows bigger, the glands receive a thicker *ſerum*; and after birth they run with a thick milk; becauſe that blood which before flowed to the *fœtus*, and for three or four days afterwards by the *uterus*, beginning then to ſtop, does more dilate the mamillary glands.

The *breaſts*, eſpecially after delivery, are liable to divers diſeaſes; as inflammations, excoriations, indurations, tumefactions, nodes, abſceſſes, ſcirrhuſes, and cancers; to which may be added certain peculiar diſorders, as the *ſpargonoſis*, *ſtrongulides*, and *gynæcomaſton*. See CANCER, SCIRRHUS, &c.

In men, the *breaſts* are very ſmall, and are chiefly for ornament; though phyſical hiſtories give inſtances of thoſe who have had milk in them.

The ancients repreſented Diana of Epheſus with many *breaſts*, as appears from ſeveral medals of that city; whence

whence ſhe had the epither *Mammoſa*; q. d. having many *breaſts*; an appellation which is alſo given to Iſis, and to Ceres.

BREAST, applied to the correſpondent parts of other animals, is more properly called *udders*, *dugs*, *uberæ*, &c.

BREAST alſo denotes that cavity or region of the body, by anatomiſts more frequently called THORAX. Though, in propriety, the *breaſt* is rather reſtrained to the anterior part of the *thorax* where the ribs meet: called alſo *ſternum*, and *pectus*; in Engliſh, popularly the *boſom*. We ſay, a flat, a narrow, a ſtrait *breaſt*; a broad *breaſt*, not high, is ranked among the ſigns of longevity. Defluctions on the *breaſt* and lungs are dangerous.

Smiting the *breaſt* is one of the expreſſions of penitence. In the Romiſh church, the prieſt beats his *breaſt* in rehearſing the general confeſſion at the beginning of maſs. Coughs, catarrhs, aſthmas, phthiſes, peripneumonies, &c. are diſeaſes of the *breaſt*. See COUGH, and ASTHMA.

Phyſicians alſo ſpeak of a dropſy of the *breaſt*, *hydrops pectoris*. See DROPSY.

Medicines for diſorders of the *breaſt* are called *pectorals*. See PECTORAL.

BREAST-*bone*. See STERNUM.

BREAST *of a* CHIMNEY, denotes the fore-part under the mantle or chimney-piece, commonly made inclined.

BREAST-*ſail*, or BREAT-*ſail*, denotes a rope or hawſer employed to confine a ſhip ſideways to a wharf or key, or ſome other ſhip.

BREAST-*hooks*, the compaſſing timbers before, in a ſhip, which help to ſtrengthen her ſtem, and all her fore-part.

BREAST-*pain*, called by the Italians *grandezza di petto*, is a diſtemper in horſes proceeding from ſuperfluity of blood and other groſs humours, which being diſſolved by ſome extreme and diſorderly heat, reſort downward to the *breaſt*, and pain them extremely.

The ſigns of the *breaſt*-pain are, a ſtiff, ſtuggering, and weak-going with his fore-legs, beſides, that he can hardly, if at all, bow his head to the ground.

BREAST-*plate*, a piece of defenſive armour, wherewith to cover the *breaſt*.

The *breaſt*-plate is ſaid to be the invention of Jaſon. It was originally made of leather, afterwards of mail, and laſtly of a brazen or iron-plate. When made of this laſt matter, it is more particularly called *cuiranus*, by the moderns CUIRASS; when made of braſs, with a Gorgon's head in the middle, it is denominated AGIS.

The *breaſt*-plate, called alſo by the Roman's *pectorale*, is frequently confounded with the *thorax* and *lorica*; from both which it ought to be diſtinguiſhed, as being properly a half-*thorax*, or half-*lorica*, covering only the breaſt; whereas the *thorax* inveſted the body.

As the whole *thorax* might be a temptation to the ſoldiery to turn their backs, when equally guarded with their *breaſts*, the *thorax* was thrown away, and the *hemi-thoracion*, or *breaſt*-plate, only retained. Polyæn. Stratag. lib. vii.

BREAST-*plate*, in the *Manege*, denotes a leathern ſtrap running from one ſide of the ſaddle, croſs the horſe's *breaſt*, to the other; intended to keep the ſaddle from ſlipping backwards in mounting up riſing grounds. It is otherwiſe called *tee*; ſometimes the *poitrail*.

BREAST-*plate*, among *Artificers*, denotes a drill-plate, againſt which to ſet the blunt end of the drill.

BREAST-*plough*, in *Agriculture*, a ſmall plough ſo conſtructed, that a man may puſh it before him. It conſiſts of a cutting-iron about eight or nine inches long, with one of its ſides turned up to cut the turf, which is fixed to a pole about five or ſix feet long, forked at the upper end, with a croſs handle. It is uſed in the operation called BURN-BAKING.

BREASTS *of a ſaddle*, are part of the BOW, being the two ſides of it down from the arch or upper part.

BREAST-*work*, in the *Military Art*. See LORICA, and PARAPET.

BREAST-*work of a ſhip*, is a ſort of balluſtrade or fence, compoſed of rails or mouldings, and often decorated with ſculpture; it terminates the quarter-deck and poop at the fore-ends, and incloſes the fore-caſtle both before and behind.

BREATH, the WIND or AIR which is received and expelled by the mouth and noſtrils, in the act of RESPIRATION.

In which ſenſe, the word amounts to the ſame with the Greek πνοια, and Latin *ſpiritus*.

A ſtinking *breath* is one of the ſymptoms uſually preceding the accels of an intermitting fever.

In ſome perſons, a ſtinking *breath* is an indication of the *menſes* being at hand.

It is diſputed among the civilians, whether a ſtinking *breath*, called *fœtor*, owing to rotten teeth or gums, ſhould be reputed a diſeaſe. Calvin. Lex. Jur.

BREATH is more particularly uſed to denote a ſtrength of lungs, whereby a man is enabled to hold out without taking wind ſo often.

In this ſenſe, we ſay, a long, a ſhort *breath*. The ordinary term of holding the *breath* does not exceed one third of a minute. Bacon. Hiſt. of Life and Death, Ap. Works, tom. ii. p. 176.

For the pearl fiſhery they chooſe ſlaves who have the beſt *breath*, or can continue the longeſt under water without fetching their *breath*. Pechlin has a diſſertation expreſs on living long without *breathing*. J. Nic. Pechlin De Aeris & Alimenti Defectu, & Vita ſub Aquis diuturna, Meditatio ad Joel Langelot, 1676.

The ancients were very watchful over the laſt *breath* of dying perſons; which the neareſt relations, as the mother, father, brother, or the like, received in their mouths. Pitiſc. Lex. Antiq. voc. *Spiritus*.

BREATH is alſo ſometimes extended to the odorous EFFLUVIA of plants, and even exhalations of minerals.

BREATHING. See RESPIRATION.

Fighting a cock to *breathe* him, is called SPARING.

To *breathe* a running horſe, and bring him to his wind, they give him a HEAT.

BREATHING, *inſufflatio*, a ceremony in BAPTISM.

BREATHING, *diffidulty of*, in *Medicine*, a diſeaſe called by phyſicians DYSPNŒA.

BREDEWITE, in *Ancient Law Writers*, an amercement ariſing from ſome default in the aſſize of bread.

BREECH *of a gun*, in *Artillery*, denotes the diſtance from the hind part of the baſe ring to the beginning of the bore, and is always equal to the thickneſs of the metal at the vent. See A C, *fig.* 1. *Tab. Gunnery*.

Engineers have contrived a ſort of cannons, which are charged by the *breech*.

BREECH-*mouldings*. See MOULDINGS.

BREECHES, a garment worn by males, reaching from the girdle to the knees, and ſerving to cover the hips, thighs, &c.

The ancient Romans had nothing in their dreſs anſwering to our *breeches* and ſtockings; inſtead of which, under their lower tunics and waiſtcoats, they ſometimes bound their thighs and legs round with ſilken ſcarfs, or *faſciæ*, called *tibialia* and *femoralia*. Salmuth. ad Pancirolli. p. i. p. 161. Kennet. Rom. Ant. Not. p. ii. lib. v. cap. 8.

Breeches appear to be a habit peculiar to the barbarous nations, eſpecially thoſe inhabiting the colder countries of the North; whence Tacitus calls them *barbarum tegmen*. We find mention made of them among the ancient Getæ, Sarmatæ, Gauls, Germans, and Britons; they alſo obtained among the Medes and Perſians, as being a people of Scythian origin: they alſo afterwards got footing in Italy, ſome pretend as early as the time of Auguſtus; but without much foundation, that emperor's *breeches*, mentioned by Suetonius, being apparently only ſwaths tied over his thighs. Tacit. Hiſt. lib. ii. cap. 20. Perſ. Sat. iii. ver. 51. Ovid. Triſt. lib. v. Eleg. 11. Suet. in Auguſt. cap. 82.

However this be, *breeches* were at length received into Italy, and grew ſo highly into faſhion, that it was thought neceſſary under Honorius and Arcadius, to reſtrain them by law, and expel the *braccarii*, or *breeches*-makers, out of the city; it appearing a thing unworthy, that a nation, which commanded the world, ſhould wear the habit of barbarians.

We find frequent mention of *bracæ*, *braccæ*, or *bracchæ*, in claſſic writers, but the form of this habit is not agreed on: ſome will have it to have been a rough party-coloured coat.

BREECHINGS, in the *Sea-Language*, thoſe ropes with which the great guns are laſhed, or faſtened to the ſhip's ſide.

They are thus called, becauſe brought from the *breech* of the piece; they prevent the cannon from recoiling too much in time of battle, and are employed for ſecuring it during the courſe of a voyage.

BREEDING is uſed for the care of rearing or bringing up the young of divers animals.

BREEDING, in a moral ſenſe, denotes a perſon's deportment or behaviour in the external offices and decorums of ſocial life.

In this ſenſe, we ſay, well-*bred*, ill-*bred*, a man of *breeding*, &c.

Good-*breeding* amounts to much the ſame with what otherwiſe called *politeneſs*, among the ancient Romans, *urbanity*. Good-*breeding* is near to virtue, and will of itſelf lead a man a great part of the way towards the ſame; it teaches him to rejoice in acts of civility, to ſeek out objects of compaſſion, and be pleaſed with every occaſion of doing good offices.

Lord Shafteſbury compares the well-*bred* man with the real philoſopher: both characters aim at what is excellent, aſpire to a juſt taſte, and carry in view the model

of

of what is beautiful and becoming. The conduct and manners of the one are formed according to the moſt perfect eaſe, and good entertainment of company; of the other according to the ſtricteſt intereſt of mankind; the one according to his rank and quality in his private ſtation, the other according to his rank and dignity in nature. Horace ſeems to have united both characters.

Quid verum atque decens curo & rogo, & omnis in hoc ſum.

Shafteſ. Charact. vol. i. p. 64. vol. ii. p. 242. vol. iii. p. 161. Hor. lib. i. ep. i. ver. 11.

BREEDING-*ſtone*, in *Mineralogy*, a ſort of maſs of pebbles, joined by a ſparry cement; frequent in divers parts of Herefordſhire. See PEBBLE.

BREEDING *of fiſh*. See FISH-*pond*.

BREEDING *of horſes, dogs, &c.* See HORSE, &c.

BREEF-*cards*, denote a kind of falſe cards, either longer or broader than the reſt, whereby they may be known and diſtinguiſhed.

BREEZE, a ſhifting wind, blowing from the ſea and land alternately, during certain hours of the day or night; only ſenſible near the coaſts.

The ſea *breeze*, Dampier obſerves, commonly riſes in the morning about nine, proceeding ſlowly in a fine ſmall black curl on the water towards the ſhore: it increaſes gradually till twelve, and dies about five. Upon its ceaſing, the land-*breeze* commences which increaſes till twelve; and is ſucceeded in the morning by the ſea-*breeze* again.

The ſea-*breezes* rule by day, and the land-*breezes* by night; ſo that dividing their empire, they remain as conſtant as the ſeaſons of the year, or courſe of the ſun, on which they ſeem alone to depend; not but that they appear ſooner or later, ſtronger or weaker, in ſome places than others, and vary the alternative according to the ſeveral latitudes, ſituations, ſoils, mountains, valleys, woods, and other circumſtances of the countries where they are found.

In ſome countries, the ſea-*breezes* appear only to be efforts of the general or trade-wind, as at Barbadoes, and in many places between the tropics, where the general wind, if not impeded by mountains, or iſlands, blows freſh in the day-time, but, after ſun-ſet, the terreſtrial exhalations becoming precipitated, beget a new wind, which is not only able to make head againſt the trade-wind but to repel it from their coaſts.

The *ſea-breezes* do not all come from the ſame point of the compaſs, but from different points as the land lies.

In Brazil, and many of the Caribbee iſlands, they have no land-*breeze*, eſpecially if the ſhores lie low, as at Barbadoes, where the general or eaſtern wind blows from one end of the iſle to the other, and ſerves inſtead of the land-*breeze*. In other places they want the ſea *breeze*, eſpecially between the tropics, on coaſts which lie weſterly, as in the weſtern kingdoms of Africa.

If either the eaſterly or weſterly winds blow freſh, they hinder both the land and ſea *breezes* in the Mediterranean; of which thoſe are always found the weakeſt which riſe lateſt. In England, in very hot days, and when no other winds are ſtirring, the like alternation of land and ſea *breezes* may be obſerved on our coaſts, though with little certitude, any where to the northward of Portugal.

Breezes are more conſtant in ſummer than in winter, and more between the tropics than in the temperate zone.

The general cauſe of thoſe alternate *breezes* which ſet on and off the coaſts in hot countries, is the greater rarefaction of the air by reflected heat, and by fermenting exhalations over the land than over the water: the denſer air from the water becomes a ſea-*breeze* in the day; but this air condenſed again by the cold of the night, may then occaſion a land-*breeze*.

Breezes differ from *eteſiæ*, or TRADE WINDS, as the former are diurnal, or have their periods each day; and, beſides, they are only perceived near the ſhore or coaſt; whereas the latter are anniverſary, and blow at a diſtance from land. Phil. Tranſ. N° 183, p. 158.

BREEZE, in *Brick making*, are ſmall aſhes and cinders ſometimes made uſe of inſtead of coals, for the burning of bricks. But as this does not ſo well anſwer the end, the uſe of it was prohibited by 12 Geo. I. cap. 35; but allowed by 3 Geo. II. cap. 22. 10 Geo. III. cap. 49.

BREEZE *fly*. See OESTRUM and GAD *bee*.

BREGMA, in *Anatomy*, the ſame with SINCIPUT.

The *bregma* conſiſts chiefly of two bones, hence alſo called *bregma*, or *bregmatis oſſa*, which are two bones of the *cranium*, otherwiſe called *oſſa parietalia*.

Bregma properly denotes the middle and fore part of the head, ſituate over the forehead, and extending on both ſides to the temples.

The origin of the word is obſcure, and has been much controverted between Hoffman and Lindenius.

BREHONS, the provincial judges among the ancient Iriſh, by whom juſtice was adminiſtered, and controverſies decided.

Theſe ſages were a diſtinct tribe or family, to whom competent lands were allowed in inheritance. In criminal caſes, the *brehon* had the eleventh part of all fines; which could not be but conſiderable, at a time when murders, rapes, robberies, and the like offences, were only ſubject to pecuniary commutations.

BREHON *laws*, denote the general maxims, or rules of law, obſerved by the *brehons*, and having the force of laws throughout all the provinces of Ireland.

Several fragments of the *leges brehonicæ* are ſtill extant in public and private libraries. The moſt complete collection is that belonging to the duke of Chandos, containing twenty two ſheets and an half, cloſe written, full of abbreviated words, and not very legible. The publication of theſe laws has been much wiſhed for.

By the ſtatute of Kilkenny, 40 Edward III. it is enacted, that no Engliſh ſubject ſhall ſubmit to a trial by the *brehon* law, on the penalty of high treaſon. Notwithſtanding which, many were ſtill under a neceſſity of being concluded by the Iriſh laws and cuſtoms, till the whole kingdom was ſettled on an Engliſh foundation under king James I.

BRENNAGE, *Brennagium*, in *Middle Age Writers*, a kind of tribute paid, in lieu of bran, or bran itſelf, which the tenants were obliged to furniſh for ſupport of the lord's hounds.

The word is alſo written *brenage*, *brenagium*, and *brenaige*, *bernagium*, *brenaticum*, and *brennaticum*. Du-Cange Lat. Gloſſ.

BRENNING. See BURNING.

BRENTA, in *Ornithology*, the name of a fowl of the gooſe-kind, known among us by that of the *brent-gooſe*, and, by ſome, ſuppoſed to differ from the barnacle no other way than in ſex; but this is erroneous. It is ſomewhat larger than the barnacle and is longer bodied. Ray. See *Tab.* IV. *of Birds*. N° 49.

BREPHOTROPHIUM, from βρεφος, *infant*, and τρεφω, *I nouriſh*, an hoſpital for foundlings, a place wherein children, expoſed by their parents, are brought up at the public charge.

BRESILIA, in *Ornithology*, a ſpecies of *tanagra*, in the order of *paſſeres*.

BRESMA, in *Ichthyology*, a name given by Hildegard, and ſeveral other writers on fiſh, to the BREAM, a ſpecies of CYPRINUS.

BREST, or BREAST, in *Architecture*, a term uſed by ſome, for that member of a column otherwiſe called the *tore*.

BREST-SUMMERS, or BRESSUMERS, in *Building*, are pieces of timber deſigned for the ſupport of the brick-work in the front or rear wall of a building, for carrying arches, &c.

In the inner parts of a building, the pieces into which the girders are framed are called SUMMERS.

BRET, a name which the people on the coaſts of Lincolnſhire give to the common turbot, a fiſh extremely plentiful with them, and taken in vaſt abundance. The way of catching them is in a net, trailed on the ground by two horſes; the one going up to the middle of his body in the water, the other on the ſhore.

BRETACHIÆ, in *Middle Age Writers*, denote wooden towers or caſtles, wherewith towns or camps were defended. Du-Cange Gloſſ. Lat.

BRETESSE, in *Heraldry*, a term uſed to expreſs a line in ſome coats of arms, of the ſame nature with what is uſually called the *crenelle*, or EMBATTLED *line*; except that this laſt is only embattled on one ſide, and the *breteſſe*, or *crenelle* on both ſides. Some authors ſeem, however, to have underſtood the terms *breteſſe* and *crenelle* as ſynonymous words, and when they would expreſs ſuch a line, they call it, if embattled on both ſides, *contre-breteſſe*.

BRETHREN *and Siſters of the Free Spirit*, in *Eccleſiaſtical Hiſtory*, an appellation aſſumed by a new ſect which ſprung up towards the cloſe of the thirteenth century, and gained many adherents in Italy, France and Germany. They took their denomination from the words of St. Paul. Rom. chap. viii. ver. 2. 14. and maintained, that the true children of God were inveſted with the privilege of a full and perfect freedom from the juriſdiction of the law. They were enthuſiaſts to a degree of diſtraction, both in their principles and practice. They reſembled the BEGHARDS, by which name they were ſometimes called, in their aſpect, apparel, and manner of living. Some of their profeſſed principles reſembled thoſe of the *Panthiſts*; for they held, that all things flowed by emanation from God; that rational ſouls were portions of the Deity; and that the univerſe was God; and that by the power of contemplation, they were united to the Deity, and acquired hereby a glorious and ſublime liberty, both from the ſinful luſts and the common inſtincts of nature: and hence they con-

concluded, that the perſon, who was thus abſorbed in the abyſs of the Deity, became a part of the Godhead, and was the ſon of God in the ſame ſenſe and manner that Chriſt was, and that he was freed from the obligation of all laws, human and divine. They treated with contempt all Chriſtian ordinances, and all external acts of religion, as unſuitable to the ſtate of perfection at which they were arrived. Some of them were honeſt but deluded enthuſiaſts; and they endured the torments inflicted upon them by the inquiſitors with aſtoniſhing calmneſs and triumph. Others proceeded to the moſt extravagant licentiouſneſs of conduct. They held their ſecret aſſemblies ſtark naked, and lay in the ſame beds with their ſpiritual ſiſters, and indiſcriminately with other women, without the leaſt ſcruple or heſitation: modeſty and decency being, according to their creed, marks of inward corruption. And ſome of them proceeded ſtill farther, and maintained, that the *divine man*, or believer, could not ſin, let his conduct be ever ſo horrible or atrocious. Many edicts were publiſhed againſt them; but notwithſtanding the ſeverities they ſuffered, they continued till about the middle of the fifteenth century. They were called by ſeveral other names, ſuch as Schwenkfeldians, Picards, Adamites, and Turlupins. Moſheim's Eccl. Hiſt. vol. iii. p. 122, &c. 202, &c. 273, &c.

BRETHREN *and Clerks of the Common Life*, a denomination aſſumed by a religious fraternity towards the latter end of the fifteenth century. They lived under the rule of St. Auguſtin, and were eminently uſeful in promoting the cauſe of religion and learning. Their ſociety was firſt formed, in the preceding century, by Gerrard de Groote, a native of Deventer; but did not flouriſh till about the period above mentioned, when it obtained the approbation of the council of Conſtance, and became very reſpectable in Holland, the lower Germany, and the adjacent provinces. It was divided into two claſſes; the *lettered brethren* or *clerks*, and the *illiterate*: they lived in ſeparate habitations, but maintained the cloſeſt fraternal union. The former applied to the ſtudy of polite literature, and the education of youth; whilſt the latter were employed in manual labour, and the mechanic arts. They were frequently called *Beghards*, and *Lollards*, by way of reproach. Moſheim, vol. iii. p. 253.

BRETHREN, *White, fratres albati*, were the followers of a leader about the beginning of the fifteenth century, who was arrayed in a white garment; and as they were alſo clothed in white linen, they were diſtinguiſhed by this title. Their leader was a prieſt from the Alps, who carried about a croſs, like a ſtandard, and whoſe apparent ſanctity and devotion drew together a number of followers. This deluded enthuſiaſt practiſed many acts of mortification and penance, endeavoured to perſuade the European nations to renew the holy war, and pretended that he was favoured with divine viſions. Boniface IX. ordered him to be apprehended and committed to the flames, upon which his followers diſperſed. Moſheim, vol. iii. p. 278.

BRETHREN *of the Obſervance*, ſee OBSERVANCE.

BRETOYSE, or BRETOIS, the law of the marches of Wales; in uſe among the ancient Britons.

BREVE, BREVIS, *ſhort*, in *Grammar*.—Syllables are diſtinguiſhed into *longæ* and *breves*, according as they are pronounced more ſlow or quicker; the time of a *breve* is half that of a *long*, or as the grammarians expreſs it a *breve* is one time, and a *long* two. See ACCENT.

BREVE, in *Muſic*, is a note or character of time, formed ſquare without any tail; and equivalent to two meaſures, or ſemibreves. See CHARACTERS *of muſic*, and SEMIBREVE.

BREVE is uſed in the *Civil Law*, for a ſhort note or minute.

In which ſenſe, the word is alſo written *brevis* (ſubaudi *libellus*) and in Engliſh BRIEF or *breve*; amounting to much the ſame with what is otherwiſe called *ſchedula* and *brevicula*.

BREVE more particularly denotes a liſt or regiſter of the names of the ſoldiers under the command of a general.

BREVE is more particularly uſed in *Common Law* for a WRIT or BRIEF. Hence,

BREVE *perquirere*, is to purchaſe a writ or licence of trial in the king's courts by the plaintiff; and on this depends the uſage of paying to the king in ſuits for money due on bond, 6s. 8d. when the debt is 40l. and 10s. when it is 100l.

Fitzherbert has given a new Natura Brevium; thus called by way of diſtinction from an old Natura Brevium, compoſed about the time of Henry III. There is a copy of this book of Fitzherbert's filled with manuſcript notes by ſir M. Hales, in Dr. Williams's Library in Red Croſs Street.

BREVE *de recto*, ſee RECTO.

BREVE *vas*, ſee VAS *breve*.

BREVET, in the *French Laws*, denotes an act iſſued by a ſecretary of ſtate, importing a grant of ſome favour or donation from the king.

The word is formed from the middle age Latin, *brevetum*, of *breve*, *ſhort*.

In which ſenſe, *brevet* amounts to much the ſame with our WARRANT.

They ſay, a *brevet* of nomination, a duke by *brevet*; ſuch a perſon had a *brevet* of a marſhal of France.

BREVET more particularly denotes the commiſſion of a ſubaltern officer, being only written on parchment, and without ſeal.

BREVET, in the *Sea-language*, is ſometimes uſed for a BILL of loading.

BREVIA *teſtata*, mentioned by *Feodal Writers*, were written memorandums, introduced, to perpetuate the tenor of the conveyance and inveſtiture of lands, when grants by parol only became the occaſion of diſpute and uncertainty. To this end they regiſtered in the deed the perſons who attended as witneſſes, and heard it read without ſigning their names; the clerk adding their names in a ſort of memorandum. Modern *deeds* are an improvement and amplification of theſe. Blackſtone's Com. vol. ii. p. 307.

BREVIARE, to abbreviate or reduce a thing into a ſhorter compaſs.

This is otherwiſe called *abbreviare* and *imbreviare*.

BREVIARIUM is more particularly uſed among Roman writers, to denote a book introduced by Auguſtus, containing the accounts of the empire.

The deſign of it was for giving an account to the people how the monies levied on them were applied. The emperor Tiberius laid aſide the *breviarium*, but it was reſumed by Caligula.

BREVIARY, is an EPITOME, or ABRIDGMENT, or ſhort ſtate of a thing.

The word is Latin, *breviarium*, though not pure, as appears from Seneca, who obſerves, that the ancients, in lieu of it, uſed *ſummarium*.

BREVIARY was alſo uſed among the ancients for the place where the briefs, or what was written abbreviately, were preſerved.

BREVIARY, among *Eccleſiaſtical Writers*, denotes the office or ſervice both for day and night, as performed in the Romiſh churches.

BREVIARY is more frequently uſed for a church-book, containing the office of the *breviary*, that is, the prayers, and other parts of the ſervice, with the ſeveral variations to be made therein, according to the ſeveral days, canonical hours, feaſts, and the like.

D. Mege derives the name *breviary* from hence, that the ancient monks in their journeys, &c. had little books, wherein were the pſalms and leſſons, read in the choir, collected out of large volumes: and P. Mabillon tells us, he has ſeen two ſuch books in the archives of Ciſteaux; they were not above three fingers broad; their letter was exceedingly ſmall, and confiſted moſtly in abbreviations, expreſſing a whole period in a few ſyllables; whence they had a good title to the appellation of *breviaries*, q. d. *abridgments*.

Some deduce the appellation *breviary* hence, that when the popes reſided in the Lateran palace, the office read in the papal palace was much ſhorter than that ſaid in the other churches of Rome; which office, thus abbreviated, was compiled by Innocent III. and called *officium capellare*, till ſuch time as the Franciſcan friars adopting the ſame, in conformity to the papal chapel, it became denominated *breviarium*, and ſhortly after was in general uſe. Magr. Vocab. Eccleſ. p. 38. Menag. Orig. Franc.

The firſt time the word *breviary* occurs, in the ſenſe of a church-book, is in a letter of the archbiſhop of Lyons to the biſhop of Langres, in 1099; or rather by Micrologus, who lived in 1080.

The Roman *breviary* is general, and may be uſed in every place: but on the model of this have been formed various others, peculiarly appropriated to each dioceſe, and each order of religious.

The *breviary* conſiſts of the ſervices of matins, lauds, prime, third, ſixth, nones, veſpers, and the compline, or *poſt-communio*; that is, of ſeven different HOURS: on account of that ſaying of David, *Septies in die laudem dixi tibi*.

The obligation of reciting the *breviary* every day, which was at firſt univerſal, by degrees was reduced to the beneficiary clergy alone, who are bound to do it on pain of mortal ſin, and of reſunding their revenues, in proportion as they are delinquent therein. In the fourteenth century, there was a particular reſervation in favour of biſhops, for paſſing, on occaſion, three days without rehearſing the *breviary*.

The inſtitution of the *breviary* not being very ancient, the

lives of the saints were inserted in it, agreeable to the opinions of the times; i. e. full of ridiculous ill-attested facts; which gave a handle to several purgations, or reformations thereof, by several councils, particularly those of Trent and Cologne; by several popes, as Pius V. Clement VIII. and Urban VIII. as also by several cardinals and bishops, each of whom lopped off some of the extravagancies, and brought the work nearer to the simplicity of the primitive offices; as acknowledging, that in the ancient church there was nothing read but scripture itself.—Cardinal Quignon carried the reformation the farthest; leaving out the little office of the Virgin, the verses, responses, and a great part of the lives of the *saints*.

The *breviaries* now in use are almost innumerable: the difference between them consists principally in the number and order of the psalms, hymns, pater-nosters, ave-marys, credo's, magnificats, cantemus's, benedictus's, canticamus's, nunc dimittis's, miserere's, hallelujah's, gloria patri's, &c.

The most eminent, after the Roman *breviary*, are, that of the Benedictins, that of the Bernardines, of the Chartreux, of the Præmonstratenses, of the Dominicans, the Carmelites, the Franciscans, and Jesuits; also that of Cluny, of the church of Lyons, the church of Milan, and the Mosarabic *breviary* used in Spain.—But in reality there is scarce a church in the communion of Rome, in France, Flanders, Spain, Germany, &c. that has not something particular in the form and manner of its *breviary*: though the differences are generally inconsiderable. See AMBROSIAN, GALLICAN, &c.

The *breviary* of the Greeks, which they call ὡρολόγιον *horologium*, q. d. *dial*, is nearly the same, in almost all the churches and monasteries that follow the Greek rite. The Greeks divide the psalter into twenty parts, καθίσματα; which are a kind of rests, pauses, or stations: and each pause is again subdivided into three parts.—In general, the Greek *breviary* consists of two parts; the one containing the office for the evening, called ἑσπερινὸν; the other that for the morning, consisting of matins, lauds, prime, tierce, sixth, none, vespers, and complines.—The *breviary* of the Maronites contains some more considerable variations.

Among the people who speak the Sclavonic language, or any of its dialects, the *breviary* is rehearsed in the vulgar tongue; as among the Maronites in Syriac, among the Armenians in Armenian, &c.—Those who rehearse the *breviary* in the Sclavonic, are divided as to the rite: some following the Roman or Latin rite, as the inhabitants of Dalmatia, and the neighbouring coasts; whereas those who live farther within the continent, as in Hungary, Bosnia, Sclavonia, &c. and in Poland, Lithuania, and Muscovy, follow the Greek rite.—The *breviaries* of the Cophts and Abyssinians are much alike.

BREVIATE, is sometimes used for an ABRIDGMENT, or short extract of a book or paper. Phil. Trans. N° 37. p. 2212.

BREVIATOR, an officer under the eastern empire; whose business was to write and transcribe briefs.—At Rome, those are still called *breviators*, or ABBREVIATORS, who dictate, and draw up the pope's briefs.

BREVIER, among *Printers*, is the denomination of a small species of letters between *minion* and *burgeois*. See PRINTING.

BREVIS *cubiti*, in *Anatomy*, one of the extensor muscles of the *cubitus*, arising from the external spine of the *humerus*.

BREVIS *radii*, one of the supinator muscles of the *radius*, arising partly from the external condylus of the *humerus*, and partly from the upper and exterior part of the *ulna*; and inserted into the superior part of the *radius*, which it embraces wholly: and serves to turn the palm of the hand upwards.

BREVIS is also used by some for the third of the extensors of the *carpus*, which, arising from the lower part of the *humerus*, and running along the *radius*, terminates in the bone of the *carpus* which sustains the middle finger. Some anatomists join this with the second EXTENSOR, and call them *bicornis*, or *radialis externus*: others choose to distinguish them because they have different origins and insertions; and that their bellies are separable.

BREVIS-*extensor pollicis pedis*, see EXTENSOR.

BREVIS *flexor pollicis pedis*, see FLEXOR.

BREVIS *peronæus*, see PERONÆUS.

BREVIS *pronator radii*, see PRONATOR.

BREVITY, in a general sense, that which denominates a thing brief or short.

BREVITY is more particularly used in speaking of the style or composition of discourse. *Brevity* of discourse is by some called *brachylogia*, and *brevilocuentia*; sometimes *locutionum*. Tacitus and Persius are remarkable for the *brevity* of their style. There are two kinds of *brevity*, one arising from dryness, poverty, and narrowness of genius; the other from judgment and reflection; which latter alone is laudable. *Brevity* is so essential to a tale, a song, and an epigram, that without it, they necessarily languish and become dull.

Rhetoricians make *brevity* one of the principal marks or conditions of eloquence; but the rules they prescribe for attaining it, are difficult to apply, so as still to keep the due medium between too much and too little.

A just *brevity* is attained by using all the words which are necessary, and none but those which are necessary. Sometimes it may also be had, by choosing a word which has the force of several. It is this last kind which Quintilian admires so much in Sallust; and the imitation of which, by other writers, has caused so much OBSCURITY.

BREVIUM *iustus*, see CUSTOS.

BREVIUM *falsi returni*, see FALSO.

BREWED *wine*, see WINE.

BREWER, an operator who professes the art of BREWING.

Brewers are called, in *Middle Age Writers*, *braciatores*, *braciatrices*, *braciatorii*, *braciatrices*, *braxatrices*, and *cambarii*. Du-Cange Gloss. Lat tom i.

The *brewers* of London make a COMPANY, incorporated by Henry VI. in 1438, consisting of a master, three wardens, twenty-eight assistants, and one hundred and eight liverymen.

At Paris, they have a company of *brewers*, which is one of the oldest in the city, having statutes as early as 1268.

The apparatus and utensils of a *brewer*, or a brewhouse, are a furnace made close and hollow for saving fuel, and with a vent for the passage of the smoke, left it taint the liquor; a copper, which is preferable to lead; a mash-fat near the head, a cooler near the mash-fat, and guile-fat under the cooler; adjoining to all, are several clean tubs, to receive the worts and liquors.

Brewers use BALLS for fining, feeding, preserving, refining, and colouring MALT-*drinks*, wines, and cyders. They are of two kinds, and denominated from their colours *brown* and *pale* BALLS.

The ingredients in the composition of these BALLS, of the brown kind are as follow:

Alabaster, or marble, calcined into powder, two pounds; oyster-shells a little calcined, and freed from their dirty-coloured outside, one pound; pure fat chalk well dried, one pound; horse-bean flour, freed from the hulls, one pound; red saunders, four ounces; grains of paradise, half an ounce; Florentine orris root, half an ounce; coriander seed, one quarter of an ounce; six cloves; half an ounce of hops; two ounces of the best staple incised isinglass; and two pounds of the first runnings of molasses or treacle.

Pale *balls* are made after the same manner, and with the same quantities of all the ingredients; except that the saunders is left out, and a pound or two of fine sugar made into a syrup is used in room of the molasses.

The powders are to be very fine, and the BALLS must be dried very gradually without heat for the first three or four days; afterwards they may be put into the sun, or at a proper distance from the fire, in order to be thoroughly dried; the quantity of hops may be omitted or increased at discretion as the liquor requires.

Put as much water to the isinglass as will just cover it, in order to open its body, and so let it stand for twelve hours. Add then the following infusion to it, and gradually dissolve the whole over a gentle fire. It is then to be strained off hot. upon some of the powder, the remainder of which is to be added by little and little, with some of the syrup or treacle alternately, till the whole be converted into a stiff mass, of which the BALLS, weighing four ounces each, are to be formed.

To make the infusion before spoken of, a pint of boiling water is to be poured on the coriander seed, and cloves bruised, and on the hops well rubbed. They are then to be close covered, and suffered to stand so for twelve hours, when they may be strained off for the purpose above mentioned.

What follows may serve for a direction with respect to the number of balls which are to be put into casks of different sizes.

Powder one of the balls; and put it into a half firkin; into a firkin, two; into a kilderkin, three; into a barrel, six; and so on, in proportion. It is to be stirred well into the liquor, which should be racked off, if it be of age to bear racking.

BREWING, the operation of preparing ale, or beer, from malt.

The usual process of *brewing* is as follows.—A quantity of water being boiled, is left to cool, till the height of the steam be over; when so much is poured to a quantity of malt in the mashing tub, as makes it of a consistence, still enough to be just well rowed up: after standing thus a quarter of an hour, a second quantity of the

water is added, and rowed up as before. Laſtly, the full quantity of water is added; and that in proportion as the liquor is intended to be ſtrong or weak. This part of the operation is called *mashing*. The whole now ſtands two or three hours, more or leſs, according to the ſtrength of the wort, or the difference of weather, and is then drawn off into a receiver; and the mashing is repeated for a ſecond wort, in the ſame manner as for the firſt; only the water to be cooler than before, and not to ſtand above half the time.

The two worts are then to be mixed, the intended quantity of hops added, and the liquor cloſe covered up, gently boiled in a copper the ſpace of an hour or two; then let into the receiver, and the HOPS ſtrained from it into the coolers.—When cool the barm or yeſt is applied; and it is left to work, or ferment, till it be fit to tun up.

For ſmall beer, there is a third mashing, with the water near cold, and not left to ſtand above three quarters of an hour, to be hopped and boiled at diſcretion.—For double beer or ale, the two liquors reſulting from the two firſt mashings, muſt be uſed as liquor for a third mashing of freſh malt.—For ſtrong ale, the liquor thus *brewed*, is farther prepared with molaſſes; but liable to forfeiture of 20*l.* by ſtat. 1 Ann. cap. 3.

Inſtead of YEAST, ſome uſe Caſtile ſoap, others flour and eggs, others an eſſential oil of barley: others a quinteſſence of malt, others of wine, and others the *ſal panacriſtus*.

For the properties of the liquors thus *brewed*, ſee MALT-*liquor*. For duty on ale and beer, ſee ALE.

Brewing is an art depending on chemiſtry, and capable of being improved various ways, both with regard to the preparation of the malt, the uſe of hops, and the management of the working or fermentation. Some have introduced the uſe of vegetable ſaps, as birch and ſycamore waters, to good purpoſe into the art of *brewing*. Honey, treacle, and ſugar are alſo capable of being applied to advantage in *brewing*. Phil. Tranſ. N° 68. p. 2071. N° 34. p. 917.

The ſap or juice of trees is a very valuable article in *brewing*, and not only improves malt liquor, but renders it much cheaper. The ſycamore is the beſt tree for tapping for this purpoſe; it yields a great quantity, and that without any other trouble than boring a hole properly, and placing a veſſel under it. One buſhel of malt, *brewed* with this juice, will make as good beer as four buſhels in the ordinary way. The beſt way of procuring the ſap is this: take a large auger, and with it bore two holes on the oppoſite ſides of the tree, each ſo deep as to the pith. Each hole is to be bored ſloping upwards, and the beſt place for it is immediately under a large arm of the tree near the ground; and if the arm be pierced through with the auger in the way to the tree, it will be ſo much the better: in this manner, there needs no ſpigot or ſtone to keep open the hole, or to direct the courſe of the liquor, for it will of itſelf run down into a veſſel placed to receive it; and one tree will thus, in a few days, yield a ſufficient quantity of liquor to *brew* with.

In order to preſerve the ſap in a proper condition for *brewing*, what is firſt gathered muſt be inſolated by a conſtant expoſition of it to the ſun, in proper glaſſes, till the reſt be obtained; otherwiſe the firſt will contract an acidity that will ſpoil it. When a ſufficient quantity of the ſap is thus collected, as much rye-bread muſt be put into it, cut thin and well toaſted, but not burnt, as will ſerve to ferment it; when it works well, the bread is to be taken out, and, at a convenient time, it is to be bottled up, and will thus afford a pleaſant liquor, of conſiderable ſtrength, without malt or any other addition. Some people add ſage to this liquor, baking it in their cruſts of rye-bread, till thoroughly dry, and then adding it with the bread to the working liquor. If a few cloves be tied up in a rag, and put into the veſſels into which the ſap is received from the tree, they will preſerve it the year round, without any fermentation: they are very apt to give a taſte to the liquor; but if it be ſo contrived that they are taken out before they give this taſte, the liquor will keep as well, without any flavour of them. The adding a few drops of oil of ſulphur will have the ſame effect; and ſo will the fuming with ſulphur itſelf. A little ſpirit of wine, poured on the top of the juice in every bottle, will alſo be very inſtrumental in preſerving it.

Many people, inſtead of adding malt, and *brewing* the ſap of the ſycamore or birch into ale, uſe raiſins, and make a ſort of wine of it; and ſome add ſugar. Some have uſed the rye-toaſts with very good ſucceſs, though they were not put into the liquor, but only hung over it, at ſuch a diſtance as to give a warmth and motion to the ſurface. Common ale yeſt has been tried by ſome to ferment the juice of the birch; but it uſually ſpoils it, turning the liquor into a very bad ſmall beer. The Flemiſh wheat-ferment would probably in time excellently mature the bottled juice of the birch or ſycamore: but it would require a conſiderable time for it. Cinnamon is worthy to be tried in the room of cloves, as of a much more agreeable flavour. Honey has no effect on cyder at all; for it will not mix with it, though boiled in it, to make mead; but, after a time, the cyder lets fall the honey, and becomes ſimple cyder again: it is a queſtion whether it would mix with theſe juices; but if it would, it might probably make a great improvement in them. The tops and young leaves of birch, boiled in the ſap, are ſaid by ſome to preſerve it. Phil. Tranſ. N° 146.

BREWING, among *Diſtillers*, denotes the method of extracting the more ſoluble parts of vegetables with hot water, and thus procuring a ſolution or decoction fitted for vinous fermentation.

In which ſenſe *brewing* is a neceſſary ſtep towards DISTILLATION.

A fermentable ſolution, fit for yielding a ſpirit, or brandy, is obtainable from any vegetable, under proper management; but the more readily and perfectly the ſubject diſſolves, the better it is diſpoſed for fermentation, and the production of brandies. Thus, ſugar, honey, treacle, manna, and other inſpiſſated vegetable juices, which totally unite with water, into a clear and uniform ſolution, are more immediate, more perfect, and better adapted ſubjects of fermentation, than roots, fruits, or herbs, in ſubſtance, the grains, or even malt itſelf; all which diſſolve but very imperfectly, in hot water.

Yet MALT, for its cheapneſs, is generally preferred in England, and *brewed* for this purpoſe, much after the common manner of *brewing* for beer; only the wort of malt will ſerve for diſtillation: and the tincture, without the addition of hops, and the trouble of boiling, is here directly cooled and fermented.

The grain intended for *brewing* is previouſly malted, to prepare it for diſſolving more eaſily and copiouſly in the water, ſo as to afford a richer tincture or ſolution, which, after due fermentation, will yield about one half more of proof ſpirit than the tincture of an equal weight of unmalted corn.

Brewing is alſo uſed, in an ill ſenſe, for the counterfeiting and compounding eſpecially of wines. Vintners and wine-coopers are ſuſpected of *brewing* wines, or mixing divers inferior ſorts, to imitate ſome better kind. The neceſſity of accommodating their liquors to the palates of their gueſts, is another cauſe of *brewing*; inſomuch that ſome have confeſſed they commonly draw out of two or three caſks for every pint.

BREWING, in *Sea-language*, the appearance of black tempeſtuous clouds, ariſing gradually from a particular part of the hemiſphere, and indicating an approaching ſtorm.

BREYNIA, in *Botany*, a genus of the *polyandria monogynia* claſs of plants, the characters of which are theſe: the flower hath four oval petals, which are a little longer than the empalement. It hath a great number of ſlender ſtamina. In the centre is ſituated a ſlender, oblong, obtuſe germen, which afterward becomes a long ſoft fleſhy pod, opening in two valves with one cell, enclоſing a row of fleſhy kidney-ſhaped ſeeds. There are two ſpecies, which being natives of the Weſt Indies, are impatient of the cold, and therefore muſt be preſerved in ſtoves.

BRIAR, in *Botany*, a name given to many ſpecies of the ROSE.

BRIBE, ſee BRIBERY.

The word is French, *bribe*, which originally denotes a *bit*, fragment, or the relic of meat taken off the table; on which footing *bribe* imports as much as *panis mendicatus*, and ſtill keeps up the idea of the matter whereof *bribes* anciently conſiſted. Hence alſo the Spaniards uſe *bribar* and *brivar* for *begging*; and *brivia*, *brivoneria*, and *brivoniſmo*, for *beggary*. Menag. Orig. Franc. p. 131. Skinner Etym. in voc.

In *Middle Age Writers*, a *bribe* given to a judge, is called *quota litis*, and the receiver *campi particeps*, or *cambi particeps*; becauſe the ſpoils of the field, i. e. the profits of the cauſe, were thus ſhared with the giver. Du Cange, Gloſſ. Lat. tom. i.

BRIBERY, in *Common Law*, is when a perſon in judicial places takes a gift or reward of any perſon who has buſineſs before him, for doing his office, or by colour of his office, except the king only, unleſs it be meat and drink: and it is puniſhable by fine and impriſonment, and the loſs of office; and it was anciently deemed treaſon in a judge.

In a larger ſenſe, *bribery* denotes the receiving or offering any undue reward, to or by any perſon concerned in the adminiſtration of public juſtice, as an inducement for acting contrary to duty; and ſometimes it ſignifies the

the taking or giving a reward for a public office. Officers of the cuſtoms taking any *bribe*, whereby the crown may be defrauded, forfeit 100*l.* and are rendered incapable of any office. Candidates that *bribe* electors, after the date or *teſte* of the writs, or after the vacancy, are diſabled to ſerve in parliament; and he that takes, as well as he that offers a *bribe*, forfeits 500*l.* and is diſabled from voting, and holding any office in any corporation; unleſs, before conviction, he diſcovers ſome other offender of the ſame kind, whereby he is indemniſied for his own offence. Blackſtone's Com. vol. i. p. 179. vol. iv. p. 139.

BRICIANI, *Knights of St. Bridget*, a military order reſembling that of Malta, eſtabliſhed by St. Bridget, princeſs of Sweden, in 1366, and approved of by pope Urban V. who gave it the rule of St. Auguſtine.

The arms of the *Briciani* were a croſs azure, like that of the knights of Malta; under which was a tongue of fire, to expreſs the ardour of their zeal: their office was to fight againſt hereticks, bury the dead, aſſiſt widows and orphans, &c.

BRICK, a kind of factitious ſtone, of a reddiſh or yellow colour, made of a fatty earth, formed into long ſquares, four inches in breadth, and eight or nine in length, by means of a wooden mould; and then burnt or baked in a kiln, to ſerve for the uſes of building.

There are alſo *bricks* of a whitiſh colour. Wulpit, in Suffolk, is famed for this ſort.

Bricks appear to be of a very ancient ſtanding, the tower of Babel and the walls of Babylon being built thereof; as appears both from ſacred hiſtory, and from the remains thereof, ſtill ſaid to be in being. Under the firſt kings of Rome, they built with maſſive ſquare ſtones, which they learnt from the Tuſcans: towards the latter time of the republic, they began to uſe *brick*; borrowing the practice from the Greeks; and the greateſt, as well as the moſt durable buildings of the ſucceeding emperors, as the Pantheon, &c. were built therewith.—In the time of Gallienus, the buildings were compoſed of a row of *brick*, and a row of ſoft gritty ſtone, alternately. After him they laid aſide the uſe of *bricks*, and reſumed that of ſtone.

In the Eaſt they baked their *bricks* in the ſun: the Romans uſed them crude: only leaving them to dry in the air a long ſpace of time; viz. four or five years.

The *bricks* uſed by the Greeks were principally of three kinds: the firſt called *Πεντοπα*, i. e. of two palms; the ſecond *τετραπαλα*, of four palms; and the third *πεντεπαλα*, of five palms.—They had other *bricks*, juſt half each of theſe, which they joined together to render their work more ſolid, as well as more agreeable to the eye, by the diverſity of figures and ſizes of the *bricks*.

Bricks, among us, acquire various names, according to their forms, dimenſions, uſes, method of making, place, &c. The principal are; *Compaſs bricks*, of a circular form, uſed in fleecing of walls. *Concave*, or *hollow bricks*, on one ſide flat, like a common *brick*, on the other hollowed, about three quarters of an inch deep, and half an inch broad; uſed for conveying water under ground: they are uſually a foot long, four inches and a half broad, and two and a quarter thick. *Cogging bricks*, uſed for making the indented work, under the coping of walls built with great *bricks*: they are about ten inches long, four broad, and two and a quarter thick. *Coping bricks*, formed on purpoſe for coping of walls, are about twelve inches ſquare, and four thick, flat underneath, one third above ſemicircular, and the two ends flat. *Dutch* or *Flemiſh bricks*, uſed to pave yards and ſtables, and for ſoap-boilers vats, and ciſterns. *Brique de Chantignole*, or *Demibrique*, is that only an inch thick, but otherwiſe of the ſame dimenſions as the whole *brick*; uſed in paving between borders of ſtones, and alſo for the making of hearths and chimney backs. *Clinkers*, ſuch *bricks* as are glazed by the heat of the fire in making: theſe lie in the middle of the kiln of clamps; and are the moſt durable. *Feather-edged bricks*, are made like the common ſtatute *bricks*, only thinner on one edge than on the other, and uſed to pen up the brick pannels in timber buildings. *Samel*, or *ſandal bricks*, are ſuch as be outmoſt in a kiln or clamp, and conſequently are ſoft and liable to moulder; as not being thoroughly burnt. *Great bricks*, are thoſe which are twelve inches long, ſix broad, and three thick: the weight of one being about fifteen pounds: ſo that 100 weigh 1500, and 1000 of them 15000 pounds: their uſe is to build fence-walls; together with *pilaſter*, or *buttreſs bricks*, which are of the ſame dimenſions with the great *bricks*, only they have a notch at one end, half the breadth of the *brick*: their uſe is to bind the work at the pilaſters of fence-walls, which are built of great *bricks*. *Paving bricks*, or *tyles*, are of ſeveral ſizes in ſeveral counties and places, from ſix to twelve inches ſquare, and one and a quarter, more or leſs, thick. See PAVEMENT, and TYLE.

Place-bricks, ſuch as are made in a place prepared on purpoſe for them, near the building in which they are to be uſed. *Statute*, or *ſmall common bricks*, when burnt, by ſtat. 19 Geo. III. c. 49. ought to be eight inches and a half long, four broad, and two and a half thick: 100 of theſe uſually weigh about 550 pounds; and 1000, 5500 pounds; about 407 in number make a ton weight. Theſe are commonly uſed in paving cellars, hearths, ſinks, &c. Thirty, or thirty-two, if true meaſure, will pave a yard ſquare, and 330 will pave a ſquare of 100 feet laid flat; but if laid edgeways, there muſt be near double the number. *Stock-bricks* are to be of the ſame dimenſions; only one eighth of an inch thicker; and they are either marle or grey ſtocks. Theſe and the *ſamel bricks* are moſtly uſed in building: *rubbing bricks* are for gauged work; *clinkers* for paving; Windſor and Welſh *bricks* for furnaces, as being the fitteſt to bear intenſe heat.

Barbaro, in his commentary on Vitruvius, recommends another form of *bricks*: viz. *triangular* ones, every ſide a foot long, and only an inch and half thick. Theſe, he obſerves, would have many conveniencies above others; as being more commodious in the management, of leſs expence, and of fairer ſhew; adding much beauty and ſtrength to the mural angles, where they fall gracefully into an indented work. Sir H. Wotton wonders they have never been taken into uſe, being recommended by ſo great an authority.

The earth, whereof *bricks* are made, muſt not be ſandy, which will render them both heavy and brittle; nor muſt it be too fat, which will make them crack in drying. They ſhould be made either in the ſpring, or autumnal ſeaſon; and when made, they muſt be ſheltered from the ſun, if it be too hot, and yet be expoſed to the air to dry. If they be made in froſty weather, they are to be covered with ſand; if in hot weather, with wet ſtraw.

The ſeveral ſteps in the proceſs of our *brick*-making, are, caſting the clay or earth; treading or tempering the ſame with water; ſanding the *brick*, which is to riddle or caſt dry ſand on the wet *brick* lying on the ground; raiſing the *bricks* on one ſide, that they may dry the better and ſooner; walling the *bricks*, which is to lay one upon another, after the manner of a wall, to keep them from foul weather, and that they may dry thoroughly; ſodding the *bricks*, which is to cover them up with turf; ſetting the *bricks* in the kiln, or the laying of ſtuck or ſmall coal between every courſe or row of *bricks*; daubing the kiln, which is the claying of it all about the top, to keep the fire in, and ſecure the kiln from weather; firing, which is to ſet the fuel put into the arches on fire; earthing, which implies to put earth about it, to ſtop the arches, that the fire may take upwards to the top of the kiln; cooling the kiln after it has done burning; breaking the kiln; counting of the *bricks*; carrying the *bricks*, which is to bring them to the place where they are to be uſed, either on horſeback or on trumbrels.

The burning of *bricks* is performed either in a kiln, or a clamp. In the former, the *bricks* being ſet in, and the kiln covered with pieces of *bricks*, they put in wood, to dry them with a gentle fire; and this they continue till they are pretty dry, which is known by the ſmoke's turning from a whitiſh to a thin black ſmoke. They then ceaſe to put in wood, and proceed to burn with bruſh, furze, ſtraw, heath brake, or fern faggots; having firſt dammed up the mouth of the kiln with a thin-log, i. e. pieces of *bricks* piled upon one another, and cloſed with wet *brick* earth inſtead of mortar: then they continue to put in more faggots, till the kiln and its arches look white, and the fire appears at the top of the kiln: upon which they ſlacken the fire for an hour, and let all cool by degrees. This they continue to do alternately heating and ſlacking, till the ware be thoroughly burnt; which is uſually effected in forty-eight hours.

About London they chiefly burn in clamps, built of the *bricks* themſelves, after the manner of arches in kilns; with a vacancy between each brick's breadth, for the fire to play through: but with this difference, that inſtead of arching, they truſs or ſpan it over, by making the bricks project one over another, on both ſides of the place, for the wood and coals to lie in, till they meet and are bounded by the *bricks* at the top, which cloſe all up. The place for the fuel is carried up ſtraight on both ſides, till about three feet high: then they fill it almoſt with wood, and over that lay a covering of ſea-coal; and then over-ſpan the arch: but they ſtrew ſea-coal alſo over the clamp, between all the rows of *bricks*; laſtly, they kindle the wood, which gives fire to the coal: and when all is burnt out, they conclude that the *bricks* are ſufficiently burnt.

The *arches* of a kiln of *bricks*, are the hollow places at the bottom where the fire is; *pigeon-holes* are apertures in the fire-arches; *ſcratch-caſe* denotes the lower row

of *bricks* in the arch; *tying-courſe*, thoſe which cover the top of the arch; *binding-courſe*, is the laying of *bricks* over the joints of the under-courſe; *dividing-courſe*, is the diviſions or parts of a kiln; *ſtarting-courſe*, is the top of all the kiln: the *wheeler*, is he who carries the clay from the pit to the moulding-board foot, and there turns it off the wheelbarrow: *ſtoker*, he who puts the clay off the ground upon the board; *moulder*, he who works the clay into the *brick*-moulds, and ſtrikes the ſuperfluous clay off the top of the moulds; *breaker-off*, he who takes the mould, with the clay in it, from the moulder, and lays it on the ground to dry; *moulder*, he who parts off the clay from the mould; *off-bearer*, he who pulls off the empty mould into the tub of water or ſand; *taker-up* of the *bricks* has his work alſo to dreſs and ſmooth them from irregular edges.

In burning *bricks*, much depends on the alternate raiſing and abating of the fire. *Brick*-burners, who continue the heat without intermiſſion, uſually make their lower ware extremely hard and good, but the upper bad: and beſides, the lower ones will ſometimes run ſo with the exceſſive heat, as alſo to unite into one body. Then for cooling kilns of ware, ſome unwiſe burners, as ſoon as the *bricks* are burnt, immediately ſtop up the reſt of the mouth of the kiln, which was left open above the thin-log, by which means the air being ſhut out, it is long in cooling; ſo that ſuch burners are commonly a fortnight, or almoſt three weeks, in ſetting, burning, and drawing off a kiln of ware; all which may be done in one week.

By ſtat. 12 Geo. I cap. 35. earth or clay, deſigned for making *bricks* for ſale, ſhall be dug, and turned at leaſt once between the firſt of November and the firſt of February, and not be made into *bricks* till after the firſt of March: and no *bricks* be made for ſale, but between the firſt of March and twenty-ninth of September. But by ſtat. 10 Geo. III. cap. 49. earth may be dug for making *bricks*, at any time in the year; provided ſuch earth be turned once before it be made into *bricks*. And by the former ſtatute, no Spaniſh is to be mixed with the earth; or breeze uſed in the burning of *bricks*. And all *bricks* are to be burnt either in kilns or diſtinct clamps, each ſort by itſelf.

By ſtat. 3 Geo. II. cap. 22. there may be mixed with the *brick* earth any quantity of ſea-coal aſhes, ſifted or ſcreened through a ſieve, or ſcreen half an inch wide, and not exceeding twenty loads, to the making of one hundred thouſand *bricks*: each load not exceeding thirty-ſix buſhels. And breeze may be mixed with coal in the burning of *bricks* in clamps for ſale, &c. Stock-*bricks* and place-*bricks* may be burnt in one and the ſame clamp, ſo that the ſtock-*bricks* be ſet in one diſtinct parcel, and not mixed and ſurrounded with place-*bricks*.

For the more effectual ſecuring the obſervation of theſe laws, it was enacted, by 12 Geo. I. cap. 35. for the better diſcovering of offenders, that the maſter and wardens of the company of tylers and bricklayers ſhould have power to ſearch *brick* kilns, &c. but they having permitted, and even encouraged divers perſons to make *bricks* contrary to the directions in the ſaid act, by 2 Geo II. cap. 15. they are diveſted of that power; and any two, three, or more perſons, appointed by the juſtices of peace, are empowered, within fifteen miles of London, to go, in the day-time, into any grounds, ſheds, or places, where any clay or earth ſhall be digged, or digging, for *bricks* or pan-tyles; or any *bricks* or pantyles ſhall be making, or made for ſale; and there to view, ſearch, and inſpect the ſame, &c. Offenders to forfeit twenty ſhillings for every thouſand of unſtatuable *bricks*, and ten ſhillings for every thouſand of ſuch tyles: one moiety to the uſe of the proſecutor, the other to the poor of the pariſh, where the offence ſhall be committed. By 17 Geo. III c. 42. all *bricks* made for ſale ſhall, when burned, be not leſs than 8½ inches long, 2½ inches thick, and 4 inches wide.

Goldman obſerves, that *bricks* will have double the ſtrength, if, after one burning, they be ſteeped in water, and burnt afreſh. If the *brick* earth be too fat, it muſt be tempered with ſand; and that trodden out again, firſt by cattle, then by men. *Bricks* made of common earth, melt, nay vitrify, by too much heat: for which reaſon, the kilns are made of ſtones, that will themſelves calcine, that the vehemence of the fire may be broken by them: beſides which, they uſually place other *bricks*, made of an argillous earth, which will melt next the fire.

Brick work is found ſtronger and more durable than ſtone-work; and eſpecially better fitted to reſiſt the force of guns and engines of war. The Greeks are ſaid to have carried *brick*-makers with them in their armies, to be in readineſs for camp works and fortifications. The Romans intermixed *brick* with their ſquare ſtone, in order to ſtrengthen it. In reality, *brick* buildings were generally conſidered by the ancients as perpetual; ſo that, in Rome, abatement was always made for the age of ſtone building, none for that of *bricks*. *Brick* walls are alſo found warmer and wholeſomer than thoſe of free ſtone and marble, as not being liable to ſweat, or collect humidities on their ſurface, which they rather imbibe. We may add, that *bricks* are found the beſt materials for vaults and edifices under ground, not only on account of their durableneſs, but the eaſineſs of their expence, and ſafety from fire. *Phil. Tranſ.* N° 93. N° 149. Sir Henry Wotton ſpeaks of a ſort of *bricks* at Venice, of which ſtately columns were built; they were firſt formed in a circular mould, and cut before they were burnt, into four or more quarters or ſides; afterwards, in laying, they were joined ſo cloſe, and the points concentred ſo exactly, that the pillars appeared one entire piece. Elem. Archit. lib. ii.

The ordinary Paris *brick* is eight inches long, four broad, and two thick, French meaſure. This ſmallneſs is an advantage to a building, the ſtrength and firmneſs of which conſiſts much in the multitude of angles and joints, at leaſt if well laid, and in good bond. The Romans were guilty of a great overſight in this reſpect; their *bricks* being above double of the French ones; though they had a better ſort, called *lateres beſſales*, only meaſuring eight inches in length: but theſe were properly only their half-*bricks*. In England we alſo ſometimes make *bricks* of an unuſual length, meaſuring twenty-two inches long, and only ſix broad, ſerving to ſupply the office of laths or ſpars in malt kilns.

Bricks may be made of any earth that is clear of ſtones, even ſea-ooſe; but all earth will not burn red, a property peculiar to earths which contain ferruginous particles. In England, *bricks* are chiefly made of a hazely yellowiſh coloured fatty earth, ſomewhat reddiſh, vulgarly called *loam*, which is a mixture of clay and ſand. The earth according to Leyboin, ought to be dug before winter, but not made into *bricks* till ſpring.

Worlidge, and others after him, have laboured to excite *brick*-makers to try their ſkill in making a new ſort of *brick*, or a compoſition of clay and ſand, whereof to form window-frames, chimney-pieces, door-caſes, and the like. It is to be made in pieces faſhioned in moulds, which, when burnt, may be ſet together with a fine red cement, and ſeem as one entire piece, by which may be imitated all manner of ſtone-work.

The thing ſhould ſeem feaſible by the earthen pipes made fine, thin, and durable, to carry water under ground at Portſmouth, and by the earthen backs and grates for chimneys, formerly made by ſir John Winter, of a great bigneſs and thickneſs.

In reality, much might be done towards making chimney-pieces, ſtone mouldings, architraves, faſcias for fronts of buildings, and the like, if men of this profeſſion had a little tincture of chemiſtry, which would enable them to contrive ſome good compoſition of earth, and a proper way to manage it in the moulding, burning, &c. *Brick*-making, among the Romans, was conducted with great care and choice; by which means their *bricks* were rendered of much longer duration than ours. In this reſpect moſt of our neighbours excel us: the *bricks* which we import from Holland, Denmark, &c. being better than our own. Phil. Tranſ. N° 351. Houghton Collect. tom. ii. N° 168. p. 96.

With reſpect to the poſition, or manner in which *bricks* are laid we meet with

BRICKS *in bond, Briques en liaiſon*, thoſe laid flatwiſe, and ſo as to over-reach each other by half their length.

BRICKS, *Floor, Briques de champ*, thoſe laid edgewiſe, to ſerve as a pavement.

BRICKS, *Spicated, Briques en epi*, thoſe placed diagonalwiſe, after the manner of Hungarian point. Such is the pavement of Venice.

BRICK *Walls*. See WALL.

BRICKS, in *Medicine* and *Chemiſtry*, are not only uſed in the preparation of the oil, which takes its denomination from them; but heated *bricks* are frequently added in diſtillation, to increaſe the fervour of bodies in boiling. Some adulterate the *ſoda*, or kali aſhes, for glaſs, with *brick*-duſt.

BRICKS, *Oil of*, is oil of olive, imbibed by the ſubſtance of *bricks*, and afterwards diſtilled from it.—The pieces of *bricks*, being heated red-hot in live-coals, are extinguiſhed in a trough half filled with oil of olives; being then ſeparated, and the *brick* thus ſaturated with oil, and groſsly pounded, it is put into a retort, and placed in a reverberatory furnace; and thus is drawn an oil, which the apothecaries call *oleum de lateribus*, and ſome chemiſts *oil of the philoſophers*: it is uſed for reſolving tumors in the ſpleen, alſo againſt paſſies, epilepſies, &c. See OIL.

ſome extol it as a ſeptic, excellent for taking away callouſes, cleanſing and removing ulcers, &c. It is now fallen much into diſuſe. Juncker. Conſp. Chirurg.

BRICK-*duſt*. It is a cuſtom with ſome perſons to reduce this ſubſtance to a very fine powder, and give it, inſtead of chalk, in the heart-burn. Many of the lozenges, ſo much famed for the cure of this diſorder, and ſold under the pompous names of coral lozenges, are only made of a mixture of this uncouth medicine, and ſugar, made into the conſiſtence of a paſte, with gum tragacanth reduced to a mucilage with roſe-water. But it is to be obſerved, that this, as well as chalk, is a very dangerous remedy. It has grown into an opinion, that the ſole cauſe of this complaint was an acid humour in the ſtomach, and thence an abſorbent was judged alone ſufficient for a cure: chalk was the firſt ſubſtance pitched upon for this purpoſe; but ſome miſchievous events having happened from the taking of it, recourſe was had by ſome to this odd medicine. But ſuch ſhould have obſerved, that as chalk did all its miſchief by being an aſtringent, this new medicine was qualified to do much more harm, on the ſame principle; it being a much more powerful one. Juncker Med. Conſ. p. 589.

BRICK *is* alſo uſed in ſpeaking of divers other matters made in the form of *bricks*.

In which ſenſe, we ſay a penny *brick*, or *brick*-BREAD. Some alſo mention *brick*-TIN, a ſort of tin in that ſhape brought from Germany; and *brick*-SOAP, made in oblong pieces, from a pound and an half to three pounds.

BRICKS, or BRIQUES, in *Heraldry*, are figures or bearings in arms, reſembling a building of *bricks*; being of a ſquare form, like billets and tablets; from which they only differ in this, that they ſhew their thickneſs, which the others do not.

BRICK, in *Ichthyology*, the name of a ſort of lamprey, called by the writers on theſe ſubjects, *lampetræ medium genus*; and diſtinguiſhed from the other lampreys by having a number of black tranſverſe ſpots, very narrow and long.

BRICK *earth*, in *Agriculture*. See *Brickiſh* SOIL.

BRICK *kiln*, a place to burn bricks in.

BRICK-*layer*, an artificer whoſe buſineſs it is to build with bricks, or make brick work.

Brick-layers work or buſineſs, in London, includes tyling, walling, chimney work, and paving with bricks and tyles. In the country, it alſo includes the maſon's and plaiſterer's buſineſs.

The materials uſed by *brick-layers*, are bricks, tyles, mortar, laths, nails, and tyle-pins.

Their tools are, a brick-trowel, wherewith to take up mortar; a brick ax, to cut bricks to the determined ſhape; a ſaw, for ſawing bricks; a rub-ſtone, on which to rub them; alſo a ſquare, wherewith to lay the bed or bottom, and face or ſurface of the brick, to ſee whether they be at right angles; a bevel, by which to cut the under ſides of bricks to the angles required; a ſmall trannel of iron, wherewith to mark the bricks; a float ſtone, with which to rub a moulding of brick to the pattern deſcribed; a banker, to cut the bricks on; line-pins, to lay their rows or courſes by; plumb rule, whereby to carry their work upright; level, to conduct it horizontal; ſquare to ſet off right angles; ten foot rod, wherewith to take dimenſions; jointer, wherewith to run the long joints; rammer, wherewith to beat the foundation; crow and pick-ax, wherewith to dig through walls.

The London *brick-layers* and TYLERS make a a regular company, which was incorporated in 1568, and conſiſts of a maſter, two wardens, twenty-eight aſſiſtants, and one hundred and eight on the livery.

A *brick-layer* and his labourer will lay in a day about a thouſand bricks, in whole work, on a ſolid place, when the wall is but a brick and a half, or two bricks thick; and ſince a cubic yard contains 460 bricks, he will lay above two cubic yards in a day: and hence it may be eaſily computed how many *brick-layers* are required to finiſh a certain piece of work in a given time.

Brick-laying is one of the arts ſubſervient to architecture. Moxon has an exerciſe preſs on the art of *brick-laying* wherein he deſcribes the materials, tools, and methods of working uſed by *brick-layers*. See *Brick* WALLS.

BRICKING popularly ſignifies building a thing up with brick; but, more properly, the act or art of counterfeiting of brick on plaiſter, by ſmearing it over with red oker colour, and marking the joints with an edged inſtrument.

This anſwers to what the French call *briqueter*, which is ſometimes alſo performed by uſing a layer of plaiſter, mixed with red oker, and, while it is freſh laid on, drawing deep lines for joints, and then filling them with fine plaiſter. Some even ſmear bricks themſelves with a red colour, and repair the joints with plaiſter, to make an antiquated building look freſh.

When bricks are rubbed to a particular dimenſion, and ſet with a neat joint, this is by way of eminence called *gauged work*.

BRIDE, a woman juſt married, or a wife in the firſt days of her matrimonial ſtate. See MARRIAGE.

Among the Romans, the maid eſpouſed remained a *bride*, *ſponſa*, till the entered the huſband's houſe; from which time ſhe commenced a wife, *uxor*.

The bridegroom was attended by a brideman, *paranymphus*; the *bride* by a *pronuba*, or bridemaid, whoſe buſineſs was to inſtruct her young miſtreſs in the duties of the genial bed, and to prepare every thing for a proſperous copulation.

The ancient ceremonies practiſed in reſpect of a *bride* were numerous; moſt of them emblematical, or ſignificant of ſome part of her duty: as, dreſſing her hair after a peculiar manner, and parting it with a ſpear; putting on her a crown; girding her with a girdle, which the bridegroom was to looſen; putting a yoke on her neck; dreſſing her in yellow ſocks; and veiling her with the *flammeum*. She was to ſeem to be raviſhed or torn by force from her mother, in memory of the rape of the Sabines under Romulus; ſhe was to be carried home in the night-time to the bridegroom's houſe, accompanied by three boys, called *patrimi* and *matrimi*, one of whom carried a torch, and the other two, called *paranymphi*, led the *bride*, a ſpindle and a diſtaff being carried with her: ſhe brought three pieces of money, called *aſſes*, in her hand to the bridegroom, whoſe doors, on this occaſion, were adorned with flowers and branches of trees: being here interrogated who ſhe was, ſhe was to anſwer, *Caia*, in memory of Caia Cæcilia, wife of Tarquin the elder, who was an excellent *lanifica*, or ſpinſtreſs; for the like reaſon, before her entrance, ſhe lined the door-poſts with wool and ſmeared them with greaſe.

Fire and water being ſet on the threſhold, ſhe touched both; but ſtarting back from the door, refuſed to enter, till at length ſhe paſſed the threſhold, being careful to ſtep over, without touching it: here the keys were given her; a nuptial ſupper was prepared for her, and minſtrels to divert her; ſhe was ſeated on the figure of a Priapus, and here the *patrimi* and *matrimi* reſigned her to the *pronuba*, who brought her into the nuptial chamber, and put her into the genial bed. This office was to be performed by matrons who had only been once married, to denote that the marriage was to be for perpetuity. When the bridegroom was brought to her, to drown the cries and ſqualling of a coy maid at the firſt conflict, epithalamia were ſung by the women, who were divided for that purpoſe into two bands, one whereof ſung in the evening, the other the next morning; and, for the like purpoſe, nuts were alſo thrown about for the boys to ſcramble for. Potter Archæol. lib. iv. cap. 11. tom. ii. Val. Max. 10. Plut. Quæſt. Rom. 30. Serv. ad Æn. lib. iv. ver. 450. Kenn. Rom Ant. p. ii. lib. i. c. 9. Fabr. Bibl. Ant. cap. 10. § 5.

BRIDEGROOM, the ſpouſe or mate of a bride.

Among the Romans, the *bridegroom* was decked to receive his bride; his hair was combed and cut in a peculiar form; he had a coronet or chaplet on his head, and was dreſſed in a white garment. Pitiſc. Lex. Ant. tom. i.

By the ancient canons, the *bridegroom* was to forbear the enjoyment of his bride the firſt night, in honour of the nuptial benediction given by the prieſt on that day. Johnſ. Eccleſ. Law, ann. 740. § 88.

In Scotland, and perhaps alſo ſome parts of England, a cuſtom called *marchet*, obtained, by which the lord of the manor was entitled to the firſt night's habitation with his tenant's brides. See BOROUGH *Engliſh*, and MARCHET.

BRIDEMIF, in the *Perſian Tables*, the conſtellation Lupus, or the Wolf.

BRIDEWELL, in our *Cuſtoms*, denotes a work-houſe, partly for the correction of vagrants and partly for the employment of the pariſh poor.

Bridewell, near Fleet-ſtreet, is a foundation of a mixt and ſingular nature, partaking of the hoſpital, the priſon, and work-houſe; it was founded in 1553, by Edward VI. who gave the place, where king John had formerly kept his court, and which had been repaired by Henry VIII. to the city of London, with 700 marks of land, bedding, and other furniture.

Several youths are ſent to this hoſpital as apprentices to manufacturers, who reſide there; they are clothed in blue doublets and breeches, with white hats. Having faithfully ſerved their time of ſeven years, they have their freedom, and a donation of ten pounds each, for carrying on their reſpective trades.

BRIDGE, an edifice either of ſtone or timber, conſiſting of one or more arches, erected over a river, canal, or the like, for the conveniency of croſſing, or paſſing over from one ſide to the other.

A *bridge* may be conſidered as a ROAD over water.

Janu

Janus is made, by ſome learned men, the firſt inventor of *bridges*, as well as of ſhips and crowns: their reaſon is, that in ſeveral ancient Greek, Sicilian, and Italian coins, there are repreſented on one ſide a Janus, with two faces, and on the other, a *bridge*, or a crown, or a ſhip.

The parts of a *bridge* are the *piers*, or legs, *pilæ*; the *arches*, the *pavement*, or way over for cattle and carriages; the *foot-banks* on each ſide for foot-paſſengers; the *rail* or parapet, which incloſes the whole; and the *butments*, or ends of the *bridge* on the banks.

Bridges are a ſort of edifices very difficult to execute, on account of the inconvenience of laying foundations, and walling under water. The earlieſt rules and inſtructions relating to the building of *bridges*, are given by Leon Baptiſta Alberti. Others were afterwards laid down by Palladio, and Scammozzi; all of which are collected by M. Biondel. The beſt of them are alſo given by Goldman, and Hawkſmoor. M. Gautier has a piece expreſs on *bridges*, ancient and modern. M. Belidor has likewiſe treated on this ſubject in his Architect. Hyd. Mr. Riou publiſhed a treatiſe in 1760, entitled, "Short Principles for the Architecture of Stone-bridges, &c." Muller, Labelye, Hutton, and others, have written on this ſubject.

The conditions required in *bridges* are, that they be well deſigned, commodious, durable, and ſuitably decorated. The PIERS of ſtone-*bridges* are to be equal in number, that there may be one arch in the middle, where commonly the current is ſtrongeſt. Their thickneſs is not to be leſs than a fixth part of the ſpan of the arch, nor more than a fourth. They are commonly guarded in front with an angular ſtarling, or ſpur, to break the force of the current; though this defence is ſometimes alſo turned ſemicircularly: in the ancient *bridges*, it is always a right angle; which has the advantage of being ſtronger and more durable than acute ones; though now ſeldom uſed, but in bridges over ſmall rivers, whereby their height and the quantity of maſonry are conſiderably reduced. The ſtrongeſt arches, according to ſome, are thoſe whoſe ſweep is a whole ſemicircle; though others prefer elliptic arches. Others recommend thoſe in form of the CATENARIAN curve. For the rails, the height, ornaments, and the like, they are left to diſcretion. It is even complained, that no demonſtrative reaſons are given of the ſeveral proportions of the moſt eſſential parts of *bridges*: much of which is ſtill left to the diſcretion of the builder, to be regulated according to the circumſtances, deſign, place, magnitude, &c. of the deſigned edifice. Mr. Gautier wiſhes, that mathematical perſons would take the ſtructure and proportion of *bridges* into their conſideration, in order to bring things to more certainty and preciſion, founded on invariable geometrical truth. Something of which kind has been attempted by M. de la Hire, in Mem. Acad. R. Scienc. an 1712. p. 70, and the Marquis De L'Hopital, in Act. Erud. Lipſ. 1695. p. 56.

The breadth of a *bridge*, according to Baptiſta Alberti, ought to be the ſame as that of the highway which abuts on it: the breadth of the piers is to be one third of the aperture of the arches; the ſtarlings to be one half the breadth of the piers, and to riſe above the greateſt height, to which the water ever mounts.

To ſecure the piers of *bridges*, they ſometimes diminiſh the current of the river, either by lengthening its courſe, by making it more winding (a method ſometimes uſed by the ancients in rendering their rivers navigable), or by ſtopping the bottom of a rapid river, with rows of banks, ſtakes, or piles, which break the current.

The piers of a *bridge* always diminiſh the bed of a river: ſuppoſe this diminution one fifth, it will follow, that in caſe of inundations, the bed muſt be ſunk or hollowed one fifth more than before, ſince the waters gain in depth what they have loſt in breadth. Add, that as the quantity of the water remains ſtill the ſame, it will paſs with greater velocity by one fifth in the place where ſuch contraction is: all which conduces to waſh away the foundation. The ſtream, thus augmented in velocity, will carry away flints and ſtones, which before it could not move.

The foundation of *bridges* is to be laid at the ſeaſon of the year when the waters are loweſt, as in autumn; and if the ground be rocky, hard gravel, or ſtony, the firſt ſtones of the foundation may be laid on the ſurface, without digging deeper; but if the ſoil be ſoft ſand, or gravel, it will be neceſſary to turn off the water, and dig till you come at a firm bottom; at leaſt, if this cannot be done, part of the water muſt be carried off, and the reſt kept dry, and piled: that ſide of the river where you are to work, is to be incloſed with coffer-dams, and the current to have its liberty on the other ſide. Palladio's directions are, firſt, to make choice of that place in a river, which has the leaſt depth of water, and where the ground is even and firm, eſpecially rock or gravel ſtone; ſecondly, to avoid thoſe places where there are voragos, or whirpools, and where the bottom is ſoft ſand, or gravel, in regard ſuch matters are eaſily carried away by the violence of water, which in time alters the bed of a river, and ſaps the foundation of the piers; thirdly, to pitch on a ſtrait part of a river, ſince otherwiſe, the turns and winding being worn away in time, the *bridge* is in danger of being left inſulate; beſides being liable to be choaked up with the filth and other matters commonly gathered in the turns of rivers. The building, and repairing of *bridges*, was one of thoſe ſervices to which all orders and ranks were ſubject; though the clergy have ſometimes got exemptions from it. See PONTAGE.

The ſtructure of the Roman *bridges* is beſt deſcribed by Bergier; they conſiſted of *pilæ*, or piers; *fornices*, or arches; *ſubſtructiones*, or butments; *pavimenta*, and *aggeres*; the roads over them in the middle for carriages; on each ſide whereof were *decurſoria*, or banquettes, ſomewhat higher than the reſt, for foot paſſengers, and ſeparated from it by a *founda*, or rail, and ſometimes even covered over to ſhelter paſſengers from the rain, as in the Pons Ælius.

The Trajan *bridge*, over the Danube, was the moſt magnificent of all the works of this kind in the world. It was erected by that emperor for the conveniency of ſending ſuccours to the Roman legions on the other ſide of the Danube, in caſe they ſhould be ſuddenly attacked by the Daci; but demoliſhed by the next ſucceſſor Adrian, for fear the Barbarians, overpowering the guards ſet to defend it, ſhould by means of it, pour into Mœſia, and cut off the garriſons there; or rather as ſome think, out of envy, as deſpairing ever to do any thing like it himſelf. The arches were broken down by Adrian; but the ruins of it are ſtill ſeen in the middle of the Danube, near the city Warkel in Hungary. The piers were twenty in number, of ſquare ſtone; each of them 150 feet high above the foundation, 60 feet in breadth, and diſtant from one another 170 feet; ſo that the whole length of it was above 1530 yards. Dion Caſſius, lib. lxviii. cap. 13. Modern architects are abſolutely at a loſs to conceive how the foundation of ſuch a *bridge* could be laid in ſo vaſt and rapid a river, and ſo deep a channel as the Danube. Scammozzi imagines that the river muſt have been turned out of its courſe. But to divert the Danube ſeems impoſſible. That author conjectures, that choice was made of ſome ſhort bend of the river, where it made almoſt a peninſula, and a canal was cut acroſs the iſthmus or neck thereof, through which the river took its courſe; ſo that the *bridge* was built on dry land, and, when finiſhed, the river was returned to its ancient channel. Some writers have added, that this *bridge* was built in one ſummer, and that Apollodorus of Damaſcus was the architect.

The Trajan *bridge*, at Salamanca, over the river Formus, popularly attributed to the giants, by ſome to Hercules, appears rather to be a Roman work, though when, and by whom erected, is not known; but it was repaired by Trajan, whoſe denomination it ſtill bears. It is 1500 feet long; conſiſts of 26 arches, each 72 feet wide; the piers that ſuſtain them being 23 feet thick, and 200 high.

Among the Romans, the building and repairing of *bridges* was firſt committed to the pontifices, or prieſts; then to the cenſors, and curators of the roads; laſtly, the emperors took the care of *bridges* into their own hands. Thus Antoninus Pius built the Pons Janiculenſis of marble; Gordian reſtored the Pons Cæſius; and Adrian built a new one, denominated from him.

In the middle age, *bridge*-building was ranked in the number of acts of religion; and a regular order of Hoſpitallers was founded by St. Benezet, towards the cloſe of the twelfth century, under the denomination of *Pontifices*, or *Bridge-builders*; whoſe chief object was to be aſſiſtant to travellers, by making *bridges*, ſettling ferries, and receiving ſtrangers in hoſpitals, or houſes built on the banks of rivers. But the order was too good to thrive. We read of one hoſpital of the kind at Avignon, where the Hoſpitallers dwelt under the direction of their firſt ſuperior St. Benezet. The Jeſuit Raynaldus has a treatiſe expreſs on St. John the *Bridge*-builder.

In France, the Pont de Garde is a very bold work; the piers being only thirteen feet thick, yet ſerving to ſupport an immenſe weight of a triplicated arcade; and ſerves to join two mountains. It conſiſts of three *bridges*, one over another; the uppermoſt of which is an aqueduct.

The *bridge* of Avignon was begun in the year 1176, and finiſhed 1188; conſiſting of eighteen arches, meaſuring 1340 paces in length, or about 500 fathoms.

Divers

Divers of its arches have been fince demoliſhed by the ice, &c. ſo that only part of it now ſubſiſts.

The *bridge* of St. Eſprit is the fineſt and boldeſt in France, conſiſting of nineteen great arches, beſides ſeven ſmaller ones, the aperture of the arches being from fifteen to twenty fathoms, which makes the length of the *bridge* upwards of 400 fathoms.

The famous *bridge* of Venice, called the Rialto, conſiſts but of a ſingle arch, and that a flat or low one; paſſing for a maſter piece of art, being built in 1591, on the deſign of Michael Angelo; the ſpan of the arch is ninety-eight feet one half, and its height above the water only twenty-three feet. Pouſet alſo mentions a *bridge* with a ſingle arch, in the city of Munſter in Bothnia, much bolder than that of the Rialto at Venice. But theſe are nothing to a *bridge* in China, built from one mountain to another, conſiſting of one ſingle arch, 400 cubits long, and 500 cubits high, whence it is called the *flying-bridge*, a figure of it is given in the Philoſophical Tranſactions. Kircher alſo ſpeaks of a *bridge* in the ſame country 360 perches long, without any arch; ſupported only by 300 pillars. The accounts given by ſome of the popiſh miſſionaries of *bridges* in China, have much the air of fables.

We have many *bridges* of conſiderable note in our own country, ſuch as the *bridge* at York, whoſe maſter arch in the middle is 82 feet and a half in the clear wide and 27 feet high. Rocheſter *bridge* is built in the ſame ſtyle with that of London; it is 550 feet long, and conſiſts of 11 arches, the biggeſt of which is more than 50 feet. It was erected at the charge of ſir Robert Knowles, who died in the midſt of the reign of king Henry the IV. The *bridges* at Durham and Biſhop-Auckland may alſo be mentioned, whoſe largeſt arches are near 90 feet in the clear. The *bridge* at Berwick is an admirable work, begun under queen Elizabeth; it conſiſts of 17 arches, the largeſt upwards of 80 feet. That of Blenheim conſiſts of three arches, the chief of which ſpans 100 feet, and a half.

There is a *bridge* over the river Don, near Old Aberdeen, very much celebrated, in the taſte, and on the plan of the Rialto at Venice. There is alſo in the ſame ſtyle a very remarkable *bridge* in Wales, built by William Edwards, a country maſon, over the river Taaf, near Caerphilly, in Glamorganſhire. It is no more than eight feet broad, but it conſiſts of a ſingle arch no leſs than 140 feet wide, part of a circle of 175 feet diameter, ſo as to make the altitude 35 feet. The arch of this *bridge* is between 40 and 50 feet wider than the celebrated Rialto of Venice, and probably the wideſt arch in Europe, if not in the world. In order to leſſen the quantity of matter in the abutments preſſing upon the arch, and thereby to bring it to an equipoiſe with that in the crown, he contrived three circular arches in the abutments, which paſs through from ſide to ſide like round windows, and gradually decreaſe in the aſcent.

The longeſt *bridge* in England is that over the Trent at Burton, built by Bernard abbot of Burton, in the twelfth century; it is all of ſquared free-ſtone, ſtrong and lofty, 1545 feet in length, and conſiſting of 34 arches. Yet this comes far ſhort of the wooden *bridge* over the Drave, which, according to Dr. Brown, is at leaſt five miles long.

The triangular *bridge* at Crowland in Lincolnſhire, which was probably intended as an emblem of the Trinity, is the moſt ancient Gothic ſtructure, remaining entire, in the kingdom. It was erected about the year of our Lord 860.

London *bridge* conſiſts of 20 locks or arches, whereof 19 are open, and one filled up or obſcured; it is 900 feet long, 60 high, and 74 broad, and almoſt 20 feet aperture in each arch. It is ſupported by 18 piers or ſolids, from 34 to 25 feet thick; ſo that the greateſt water-way, when the tide is above the ſterlings, is 450 feet, ſcarce half the width of the river; and below the ſterlings, the water-way is reduced to 194 feet. Thus a river 900 feet wide, is here forced through a channel of 194 feet.

London *bridge* was firſt built with timber, in the reign of Ethelred, between the years 993 and 1016. It was repaired, or rather new built of timber, in 1163. The ſtone-*bridge* was begun by king Henry II. in 1176, and finiſhed under king John in the year 1209. The architect was Peter of Colechurch, a prieſt; though he died before it was finiſhed.

For the charge of keeping it in repair, a large houſe is allotted with a great number of offices, and a vaſt revenue in land, &c. The chief officers are two *bridge*-maſters, choſen yearly out of the body of the livery.

The foundation is ſaid to be on a ſoft oozy ground. Stow alledges, that during the time of building, the river was turned from Batterſea to Rotherhithe; but this is not warranted. Some imagine that the tide did not then riſe ſo high at the *bridge* as it does now, by which the work would be facilitated. However this be, the piers were erected on wooden piles driven under water, over which planks were laid, and the feet of the piers on the planks. The defects of this *bridge* are the narrowneſs and irregularity of the arches, and the largeneſs of the piers, which, together with the ſterlings, turn the current of the Thames into many frightful cataracts, which moſt obſtruct and endanger the navigation through the *bridge*.

It is pretty certain, there were no houſes on the *bridge* ſix upwards of 200 years; ſince we read of a tilt and tournament held on it in 1395. Houſes were built upon it afterwards, but being found a great inconveniency and nuiſance, they were removed in 1758, and the avenues to it enlarged and made more commodious, by ſtat. 29 Geo II. cap. 40. This act alſo directed, that there ſhould be a paſſage of 31 feet for carriages, and 7 feet on each ſide for foot-paſſengers, guarded with ſtone baluſtrades. Two of the middle arches were thrown into one ſemicircular arch, by taking up the pier between them. The repairs amounted to above 80,000*l.* The ſterlings have been added, to hinder the piers from being undermined by the rotting of the piles upon which they are built; for, by means of theſe ſterlings, the piles are kept conſtantly wet; and thus the timber is kept from decaying, which always happens when it is alternately wet and dry.

One of the nobleſt *bridges* known is that at Weſtminſter, for the building of which an act of parliament was obtained in the year 1736, and it began to be erected in January 1738; and it was opened the 18th of November, 1750. The whole amount of the neat expence that attended building this *bridge*, was 218,800*l.*

The breadth of the river Thames, between the Woolſtaple dock and the oppoſite ſhore, the place where the *bridge* is built, is about 1220 feet. This *bridge* conſiſts of thirteen large arches and two ſmaller ones, the fourteen intermediate piers, and two abutments.

The length of each abutment is 76 feet; the ſpan or opening of each of the ſmaller arches of the abutments is 25 feet; the opening or ſpan of the firſt of the large arches from each ſhore is 52 feet; the ſpan of the next arch is 56 feet, and ſo on, increaſing by four feet in every arch to the middle arch, the ſpan of which is 76 feet. The tranſverſe ſection, or breadth of the two firſt piers on each ſide, is 12 feet; of the next 13, and ſo on, to the piers ſupporting the middle arch, the ſection of each of which is 17 feet. Thus the length of the two abutments being 152 feet, the ſection of the fourteen piers 198 feet, and the ſpan or opening of the fifteen arches 870 feet, the whole length of the *bridge*, including abutments, is 1220 feet, which is the breadth of the river.

The arches are ſemicircular, and ſpring from about the height of two feet above low-water mark.

Theſe arches give, as has been ſaid, a water way of 870 feet; the proportion of the water-way being ſo conſiderable with reſpect to the breadth of the piers, it follows, that the fall of water under this *bridge* muſt be very ſmall. And, in effect, thoſe who attempted to calculate it before the *bridge* was built, after making all poſſible allowances, could never find the perpendicular height of this fall to exceed three inches and three fourths; but, in truth, it now appears by experience, that the height of the greateſt fall is ſcarce half an inch; whereas the height of the fall at London *bridge* is from four feet and nine inches to five feet.

The whole breadth of the *bridge* is 44 feet; which is divided into three walks; the middle one for carriages, &c. is 28 feet broad, and the ſide walks near 7 feet each in the clear.

The foundation of the piers of Weſtminſter *bridge* are laid on a ſtrong grating of timber, planked underneath, and at leaſt five feet below the ſurface of the bed of the river. This grating was made of the bottom of a veſſel, ſuch as the French call *caiſſon*; the ſides of which were ſo contrived, that they might be taken off after a pier was finiſhed. The bed of the river was dug to a ſufficient depth, and made level, in order to lay the bottom of the *caiſſon*, and the bottom of the piers, out of all dangers of the ground, by all trials that could be contrived, ſeemed ſo good, being every where a bed of gravel, that piling was thought unneceſſary. Whether there be any ſofter *ſtratum* under this or not, we cannot pretend to determine: neither does it appear from experience, that piling is an abſolute ſecurity againſt all accidents. By what Gautier ſays, it would ſeem otherwiſe; for he aſſures us, that let the architect of a *bridge* do his beſt, yet he can no more be ſure of the ſucceſs of his work than a phyſician is. And, in effect, we find, that notwithſtanding the care that was taken in examining the ground on which Weſtminſter *bridge* was built, yet one

of the piers funk considerably. This damage was repaired, and its beauty and convenience are justly admired. See Labelye's description of Westminster *bridge*.

In the year 1756, an act was obtained for building a new *bridge* at Blackfryers, from the end of Fleet-ditch on the oppoite fhore in the county of Surry. It was begun in 1760, and completed in the years and three quarters; the neat expence of building it amounted to 152,840/. This *bridge* conſiſts of nine elliptical arches; the central arch is 400 feet wide, and the four arches on each ſide, reckoning from the central one to the ſhores, are 98, 93, 82, and 70 feet reſpectively. The breadth of the carriage-way is 28 feet, and that of the raiſed foot-way on each ſide 7 feet: the height of the baſtriades on the ſame is 4 feet 10 inches: and the whole length of the *bridge*, from ſhore to ſhore, is 995 feet. The upper ſurfaces of this *bridge*, is a portion of a very large circle; over each pier is a receſs or balcony, ſupported by two ionic pillars and two pilaſters, which ſtand on a ſemicircular projection of the pier, above high-water mark. The *bridge* is rounded off at each extremity to the right and left, in form of a quadrant of a circle, whereby the acceſs to it is rendered commodious and agreeable.

BRIDGES, *ſtone*, are compoſed of piers, arches, and buttments, made of hewn ſtone, ſometimes alſo intermixed with brick; as the *bridge* of Thoioniſe, the plinths whereof are of ſtone, as alſo the quoins of the arches, and ſome bonding courſes, and copings; but the reſt, as the arches, walls, and buttments, of brick.

BRIDGES, *wooden*, called by the Latins *pontes ſublicii*, conſiſt of beams and joiſts faſtened by pantheons, well cramped and bound together.

Simmons has a diſſertation expreſs on the ſtructure of a wooden *bridge*.

BRIDGE, *rope*, *pont de jonc*, is made of large ſheaves of rushes, growing in marſhy grounds, which they cover over with boards or planks. They ſerve for croſſing ground that is boggy, miry, or tottern.

The Romans had alſo a ſort of ſubitaneous *bridges* made by the ſoldiers, of boats, or ſometimes of caſks, leathern bottles, or bags, or even of bullock's leathers blown up, and faſtened together, called *ſcorpiones*. M. Couplet gives the ſtructure of a portable *bridge*, 200 feet long, eaſily taken aſunder and put together again, and which forty men may carry. Vide Du Hamel Hiſt. Reg. Acad. Scien. lib. iii. ſect. 3. c. 4. p. 223.

Frezier ſpeaks of a wonderful kind of *bridge* at Apurima in Lima, made of ropes, formed of the bark of a tree.

BRIDGES, *pendent*, or *hanging*, called alſo *Philoſophical* BRIDGES, are thoſe not ſupported either by poſts or pillars, but hung at large in the air, only ſuſtained at the two ends or buttments.—Inſtances of ſuch *bridges* are given by Palladio, and others.

Dr. Wallace gives the deſign of a timber-*bridge*, ſeventy feet long, without any pillars, which may be uſeful in ſome places, where pillars cannot conveniently be erected. Phil. Tranſ. N° 193. p. 714.—Dr. Plott obſerves of, that there was formerly a large *bridge* over the caſtle-ditch at Tutbury in Staffordſhire, made of pieces of timber, nine inch above a yard long, and yet not ſupported underneath, either with pillars, or arch-work, or any other ſort of prop whatever.

BRIDGE, *draw*, *pont ſubducteurius*, is ſuch an one as is made ſaſt only at one end, with hinges; ſo that the other end may be lifted up or let down by ſome eaſy contrivance: the moſt common way is by a kind of balance, called PLYARES; in which caſe the *bridge* ſtands upright, to hinder the paſſage of a moat, or the like. The breadth of this *bridge* is uſually about nine or ten feet, and its length about fifteen feet.

There are others made to draw back, to hinder the paſſage, and to thruſt over again to afford a paſſage. And others, which open in the middle; half of which turns away to one ſide, and the other half to the other; being joined again at pleaſure: but theſe have this inconvenience, that one half of them remains on the enemy's ſide.

The marquis De L'Hopital has given the conſtruction of a curve, in which a weight will always be a counterbalance to a *draw-bridge*; which the younger Bernouilli has ſhewn to be no other than the cycloid. Act. Erud. Lipſ. an. 1695.

BRIDGE, *flying*, *pont volant*, or *pont ambulatoire*, an appellation given to a *bridge* made of pontoons, leather boats, hollow beams, caſks, or the like, laid on a river, and covered with planks for the paſſage of an army.

BRIDGE, *flying*, *pont volant*, more particularly denotes a *bridge* compoſed of one or two boats joined together, by a ſort of flooring, and ſurrounded with a rail or baluſtrade; having alſo one or more maſts, to which is faſtened a cable, ſupported at proper diſtances by boats, and extended to an anchor, to which the other end is faſtened, in the middle of the water. By which contrivance, the *bridge* becomes moveable like a pendulum, from one ſide of the river to the other, without other help than the paſſage.—Such *bridges* ſometimes alſo conſiſt of two boats, for the quicker paſſage of a great number of men; or that both infantry and cavalry may paſs at the ſame time.

BRIDGE, *ſpring* or *ſpringing*, is ordinarily made of two ſmall *bridges*, laid one over the other, in ſuch manner, as that the uppermoſt ſtretches and runs out, by the help of certain cords running through pullies placed along the ſides of the under *bridge*, which puſh it forwards, till the end of it joins the place it is deſigned to be faſtened on. When the two *bridges* are ſtretched out at their full length, ſo that the two middle ends meet, they are not to be above four or five fathoms long, becauſe, if longer, they will break.

Their chief uſe is for ſurpriſing out-works, or paſſing ſhort but narrow moats.

In the Memoirs of the Royal Academy of Sciences, we find a new contrivance of a *ſpringing bridge*, which lays itſelf on the other ſide of the river. Vide Hiſt. Acad. R. Scienc. an. 1713. p. 102.

BRIDGE *of communication*, is a *bridge* made over a river, by which two armies, or parts, ſeparated by the river, have a free communication with one another.

BRIDGES *of boats* are either made of copper or wooden boats faſtened with chaines, or anchors, and laid over with planks.

Of the firſt and moſt notable expedition of Julius Cæſar, was the expeditious making of a *bridge* of boats over the Rhine. Modern armies carry copper-boats, called *pontons*, to be in readineſs for the making of *bridges* of boats of theſe being joined ſide by ſide, till they reach across the river, and planks laid over them, make all plain for the paſſage of horſe and foot.

There are fine *bridges of boats* at Bezancaire and Rouen, which riſe and fall with the waters; and that at Seville is laid to exceed them both.

The *bridge of boats* at Rouen, built in lieu of the ſtately ſtone-bridge erected there by the Romans, is reprehended by a modern writer, as the wonder of the preſent age; it always ſtinks; and rifes and falls with the tide, or as land-waters fill the river. It is near 300 yards long, and it paved with ſtone, juſt as the ſtreets are: carriages with the greateſt burdens go over it with eaſe, and men and horſes with ſafety, though there are no rails on either hand. The boats are very ſtrong, and well moored with ſtrong chains; and the whole well looked to, and conſtantly repaired, though now very old.

BRIDGE, in *Gunnery*, the two pieces of timber which go between the two tranſoms of a gun-carriage, on which the bed reſts.

BRIDGE, in *Muſic*, that part of a ſtringed inſtrument over which the ſtrings are ſtretched.

BRIDLE *of an horſe*, is an aſſemblage of various members, or parts; as the *bit*, *the chaffes*; the *head-ſtall*, or leathers from the top of the head to the rings of the bit; the *fillet*, over the forehead, and under the *head-ſtall*; *throat-band*, which buttons from the head-band under the throat; *reins*, the part held in the hand; *caſt-band*, going through loops at the back of the head-ſtall, and buckled under the cheeks; to which add the *crowns*, the *cheeks*, *martingal*, and *chaffe-band*.

In ſhes of a *bridle*, the maſters frequently uſe the word *hold!* thus, *for pull the bridle*, they ſay, *bear the bridle*. To cleave to, or hold by the *bridle*, is the fault of a bad horſeman, who, when a horſe is diſorderly, inſtead of ſtucking his hand, clings to it, as if it were to the mane or pommel of the ſaddle; wanting the habit, or ſtrength, to keep himſelf faſt by clinging with his thighs.

Checks of the *bridle* are called KNEE-CAUSE and SACKANDS.

The beſt horſemen being unacquainted with the art of governing horſes by *bridles*, managed them only with a rope, or a wiſpeh, and the accent of the voice. This was the practice of the Numidians, Getulians, Libyans, and Maſſilians.

The Roman youth alſo learned the art of fighting without *bridles*, which was an exercile or leſſon in the *Manege*; and hence it is, that, on the Trajan columns, ſoldiers are repreſented riding at full ſpeed, without any *bridles* on. Phil. Tranſ. N° 322.

BRIDLE, in *Anatomy*. See FRENUM.

BRIDLE, among *Surgeons*, is a kind of BANDAGE contrived for retaining the lower jaw in its place.

BRIDLE, *ſcolding*.—In Staffordſhire, they have a *bridle* for correcting ſcolding women. It is put into the mouth, and takes particular hold of the tongue, which it effectually keeps from ſtirring: this barnatled, the offender is led in triumph through the ſtreets. A figure and deſcription of this Staffordſhire *bridle* is given by Dr. Plott, who ſeems to wiſh the uſe of it more univerſal.

BRIDLE-*hand* ſignifies the horſeman's left-hand, in reſpect

of which the right-hand is called the spear or sword-hand.

BEILE-*chain*, in *Husbandry*, a name given by our farmers to a part of the fleechies of their PLOUGH. This is an iron chain of several links, fastened at one end to the beam of the plough, near that part where the coulter is, and the other end to the stake of the plough, or to the middle piece which runs parallel to the bar cross-bars, and at the bottom joins to the cross chain: this stake is fastened to the cross-bars sometimes by the end of this *beil-chain*, and sometimes by a wythe or rundle.

BEILINGS, in *Sea-affairs*, denote the upper part of the moorings in the king's harbours, or the bays of war.

BEISANT *of the low-class*. See BOW-*mes*.

BEISDON, or BEISDOR, in the *Manege*, properly denotes a SNAFFLE, in contradistinction from a BIT or BRIDLE.

The French say that the English use no bridles, but only *brideons*, except in the army: a body never gone to war, nor to dare with a *bridon*, unless he has been first broke to the bit.

BRIEF, a thing of short extent or duration.

The word is formed from the French *bref*, of the Latin *brevis*, which denotes the same.

BRIEF is more particularly used for a summary or short view of a thing.

BRIEF is also used for an act or writing drawn up by a notary.

BRIEF *apostolic*, *Breve Apostolicum*, a public instrument clothed with the proper formalities.

BRIEF *of dereliction*, *Breve Desolationis*, denotes a lay will or testament, or DEVISE.

BRIEF *of an oath*, *Breve Juramenti*, an instrument made on oath, and authenticated by the subscription of witnesses.

BRIEF is also used for a particular epistle directed by a lord or other superior, to his subjects or dependants, enjoining something to be done or forborn.

In which sense, we say, the lord's, king's, bishop's, or pope's *brief*.

BRIEF also denotes the territory or district within which the lord's *brief* had course. In which sense, we meet with the bishop's *brief*, *breve episcopi*; the count's *brief*, *breve comitis*, &c.

BRIEF also denotes the yearly revenue arising out of the lands usually described in *briefs*.

BRIEF, *Breve*, in *Common Law*, a writ whereby a man is summoned or attached to answer any action; or more largely, it is taken for a writing issued out of any of the king's courts of record at Westminster, whereby something is commanded to be done in order to justice, or the execution of the king's command.

It is called *brief*, *breve*, *quia brevitate intentionem profitentis cognoscit*, because couched in a few plain words, without preamble, &c.

BRIEF is also used for a letter patent, granting a licence to a subject, to make a collection for any public or private use.

BRIEFS, *apostolical*, denote letters which the pope dispatches to princes and other magistrates, touching any public affairs.

They are thus called, as being very concise, and written on paper, without preface or preamble; by which they are distinguished from *bulls*, which are more ample and always written on parchment, and sealed with lead or green wax, whereas *briefs* are sealed with red wax, and with the seal of the fisherman, or St. Peter in a boat; a seal never applied but in the pope's presence.

The *brief* is headed with the name of the pope, apart; and commences with *Dilecte fili salutem, & apostolicam benedictionem*, &c. after which he proceeds directly to the matter in hand, without further preamble.

Briefs are not subscribed by the pope, nor with his name, but with that of his secretary. Pope Alexander VI. instituted a college of secretaries for *briefs*; since which time they have been made much longer, and more ample than before. See ABBREVIATOR.

Formerly *briefs* were only dispatched about affairs of justice; but now they are likewise used in matters of benefices, expective graces, and dispensations.

BRIEFS *of the dead*, *breves mortuorum*, were letters sent by the monks of one monastery to those of another, with whom they were in fraternity, to inform them of the deaths or obits of their monks, for whom they were to say the usual and customary prayers and masses.

These were also called *literæ correntes*, a formula of which we have in the book of the usages of the Cistercian order.

BRIEF *of remembrance*, *Breve recordationis*, *or remembrator-rium*, or *memorandle*, denotes a charter, otherwise called NOTITIA.

BRIG. See BRIGANTINE.

BRIG-*bot*, BRIGG-*bot*, BRIGH-*bot*, in *Ancient Law*, *Writers*, signifies a being freed from contributing to the reparation of bridges. See PONTAGE.

The word is formed from the Saxon *brig*, a *bridge*, and *bot*, *compensation*. It is sometimes also written *brigh bot*, or *brugh-bot*.

BRIGADE, in the *Military Art*, a party or division of a body of soldiers, whether horse or foot, under the command of a brigadier.

The word is French; some derive it from the Latin *briga*, or *brigæ*, or *secret intrigue*: Du Cange derives it from *brigare*, an ill disciplined soldier, who leaves the country, and plunders it of every thing, without waiting for the enemy: as the armies of Attila, Tamerlane, &c.

The origin of *brigade* is again deduced from *brigantine*, a fleet of pinnaces used in the army: and by the Parisians, during the captivity of their king John in England, notorious for their robberies.

There are two sorts of *brigades*, according to the French way of accounting: 1. A *brigade of an army*, which is a body of 8 or 10 or more squadrons of horse, or 10 or 12 battalions.—And in this way, an army is sometimes divided into eight *brigades*, four of horse, and four of foot.

2. A *brigade of a troop of guards*, which is a third part thereof, when the troop consists of fifty soldiers; but only a sixth, when it consists of an hundred: that is, in the former case the troop is divided into three *brigades*; in the latter, into six.

BRIGADIER-*general*, in the *Military Art*, an officer chosen from among the most ingenious and expert captains. *Brigadiers-general* are to visit, at proper times, to receive the word and orders, which they carry back to their *brigades*, and afterwards to the adjutants of regiments or the lieutenant of the *brigade*, where they regulate together the guards, parties, detachments, and convoys, and appoint them the hour and place of rendezvous at the head of the *brigade*, where the *brigade major* takes and marches them to the place of the general rendezvous. A *major of brigade* ought to keep a roll of the colonels, lieutenant-colonels, majors, and adjutants, belonging to the *brigade*. When a detachment is to be made, the major-general of the day regulates with the *brigade-majors*, how many men and officers each *brigade* shall furnish; and they again with the adjutants of the regiments, how many each battalion is to send, which the adjutants divide among the companies. The commissaries each regiment is to furnish, are sworn by the adjutant at the head of each regiment, at the hour appointed, who delivers them to the *brigade-major* at the head of the *brigade*, who again delivers them to the major-general of the day, and he requires them to the officer who is to command the detachment.

BRIGADIER-*general*, an officer who commands a brigade of horse, or foot, in an army.

The *brigadier* is an officer of importance, being the next in order below a major-general, or, in the French army, to the *marechal de camp*.

Brigadiers are only general officers in their respective corps. They have no particular command out of their brigades, nor any place or vote in councils of war; they have no aids de camp to carry their orders, but only a major of brigades, to see their orders executed, within the extent only of their own brigade.

Brigadiers of the horse-guards command as youngest cornets.

Sub-BRIGADIER of a troop of horse-guards, an assistant of the *brigadier*.

BRIGANDINE, a coat of mail; a kind of ancient defensive armour, consisting of many-jointed scales or plates, pliant and easy to the body.

Some confound it with HABERGEON; and others with *brigantine*, a low long vessel.

BRIGANDINI, BRIGANTINI, BRIGANDIERS, or BRIGANERS, in *British Law Writers*, military thieves, or highwaymen, who infested France and the Netherlands. See BRABANTIONS.

BRIGANTINE, a small, light, flat, open vessel, which goes both with sails and oars, and is either for fighting, or giving chace.

It has usually twelve or fifteen benches on a side for the rowers, a mast and an oar to each bench. *Brigantines* are principally used by the corsairs, all the hands aboard being soldiers, and each having his musquet ready under his oar.

But the term is generally used for a merchant-ship with two masts, though mariners of different nations apply it to a peculiar sort of veiled of their own marines. Among English seamen, the *brigantine* is distinguished by having her main-sail far nearly in the plane of her keel, the foremast edge of it being fastened in different places to hoops which encircle the main-mast, and slide up and down as the sail is hoisted or lowered.

BRIGG's *Logarithms*. See LOGARITHM.

BRIGITTINS, or BRIDGETINS, more properly BIRGITTINS, a religious order, denominated from their founderess St. *Birgitt*, or *Bridget*, a Swedish lady in the fourteenth century, whom some represent as a princess, the daughter of king Birgerus, legislator of Upland: she is famous for his revelations.

The *Birgittins* are sometimes also called the *Order of our Saviour*, in being commended that Church hath declared the rules and constitutions observed by them, to St. Bridget, in the main, the rule is that of St. Augustin; only some certain additions, supposed to have been revealed by Christ; whence they also denominate it the *Rule of our Saviour*.

The first monastery of the *Birgittin* order was erected by the foundress, about the year 1344, in the diocese of Lincopen; at the sound of which all the rest were formed.

The *Birgittins* perform great mortifications, poverty, and self-denial, as were also enjoined; and that are not to possess any thing in the world, not so much as a halfpenny, nor even to touch money on any account.

They order (except much through Sweden, Germany, the Netherlands, &c. in England we read but of one monastery of *Birgittins*, and this built by Henry V. in 1415, opposite to Richmond, now called Shenfield, the ancient inhabitants of which, since the dissolution, are stalled at Isleworth. The revenues were reckoned at 1911 *l.* per annum.

BRIGNOLES, or PRUNEAUX, a kind of dried prunes, brought from Provence, chiefly from the town of *Brignoles*, from which the denomination is given to them all.

BRILLIANT *cut*. See DIAMOND.

BRIM, the utmost edge of a thing, as of a glass, plate or the like.

The *brim* of vessels are made to project a little over, to hinder liquors, in pouring out, from running down the side of the vessel.

The *brimming*, or *brimming* of vessels, was contrived by the ancient potters, in imitation of the superciliums or drip of the cornices of columns; it is done by turning over some of the double matter when the work is on the wheel.

Among florists, the *brim* of a FLOWER denotes the outward edge of the petals, or that part about which turns.

A *low* is said to *brim*, or go to *brim*, when she rakes the hair.

The hart goes to *rut*, the roe to *tourn*, the boar to *brim*.

BRIMSTONE. See SULPHUR.

BRIMSTONE *butterfly*, or *brimstone*. See BUTTERFLY.

BRIMSTONE *marble*, a preparation of *brimstone* in imitation of MARBLE.

BRIMSTONE *match*, *fewters*, &c. may be call in the following manner: melt half a pound of *brimstone* over a gentle fire; with this mix half a pound of fine vermilion, and when you have cleared the two, take it off the fire, stir it well together, and it will diffolve like oil; then caft it into the moulds, which muft firft be anointed with oil. When cool, the figure may be taken out; and, in cafe it fhould change to a yellowifh colour, you need only wipe it over with *aqua fortis*, and it will look like the fineft coral.

BRIMSTONE *water*, in *Nature*. See *Hepar-Waters*.

BRINDLONES, in *Natural Hiftory*, the name of a fruit of the Eaft Indies, called by John Banhine, and fome other botanical writers, *fructus feudlus rotundus maximus*. It is by many accounted a delicious fruit, notwithftanding its great ftargenefs, and is ufed by the dyers, and in making vinegar.

BRINE, water replete with faline particles.

By ftat. 1 Ann. cap. 21. are prohibited, *brine* taken out of *brine*-pits, or *brine*-pans, ufed by fome for curing or packing of fifh, without boiling the fame into SALT; and rock-fait, without refining it into white-fait.

Brine is either natural, as the fea-water, which by coction turns to fait; or factitious, formed by diffolving fait in water.

In the fait-works at Upwich, in Worcefterfhire, there are found, at the fame times, and in the fame pit, three forts of *brine*, each of a different ftrength. They are drawn by a pump, and that in the bottom, firft brought up, is called *firft mote*, the next, *middle mote*; and the third, *laft mote*. Phil. Tranf. N° 149.

BRINE, *broth*, a name given to what drops from the corned fait in draining and drying, which they preferve and boil again; being ftronger than any *brine* in the pit. Hought. Collect. tom. ii. N° 211. p. 81.

There is fand found in all the Staffordfhire *brines* after coction; but naturalifts obferve, it did not pre-exift in the water, but rather is the product of the boiling. Phil. Tranf. N° 144. p. 96.

The *brine* at Northwich is found to ftink of fulphur. *Brine* recovers with great difficulty. Some fteep their falt-meat in it, to prevent the fmut. *Brine* is alfo commended as of efficacy againft gangrenes. Phil. Tranf. ibid. 1696.

BRINE *tub*, a tub to pickle pregnant wah-fat, wherein things are ftirred to keep.

BRINE-*pan*, the pit wherein the falt-water is reduced, and inftead of fhells, to bear the action of the fun, whereby it is converted into fait.

There are divers forts of fale-pans, as the water-pan, fteem-pan, fun-pan; the water being tranfferred orderly from one to another.

BRINE-*pit*, in *Salt-making*, the fait fpring from whence the water to be let into fait is taken. There are in thefe things in many places; that at Nantwich, in Cheshire, is almoft bottomlefs, according to the account of the people of the place, to yield fait for the whole kingdom; but it is under the government of certain bonds and regulations, that the market may not be overftocked, leaft not fuffer more than a certain quantity of the fait to be made yearly. See PIT.

BRINE-*fpring*. See SALT.

BRINE-*worm*, are red coloured infects, which breed both in fummer and in winter, in the ftanding *brine* of the fait-pans. They never become flies, but are of the clafs of APTERA, or *animalia infecta*.

BRINER, or BRINNER, in *Ornithology*, the bright blue or the conftellation Lyra; more frequently called *Lanier*. See LANIER.

BRINGERS-UP, in a *battalion*, are the whole laft rank of men in it, or the hindmoft man in every file.

BRINGING-IN *a horfe*, in the *Manege*, is the ftopping down of his nofe, when he bears, and toffes it up to the wind. A horfe is *brought in* by a ftrong hard hand.

BRINGING-TO, in *Sea-language*, fignifies to check the courfe of a fhip when fhe is advancing, by arranging the fails in fuch a manner, as that they fhall counteract each other, and prevent her either from retreating or moving forward. In this ftuation the fhip is faid to *lie-by*, or *to lie-to*.

BRINING *of corn*, in *Hufbandry*, an operation performed on the wheat-feed, in order to prevent the fmut. A liquor is to be prepared for this purpofe, by putting 70 gallons of water into a tub ftuck a inches round for brewing, and a competent of unflaked lime-ftone. This is to be well ftirred till the whole is diffolved, and left to ftand for 30 hours; after which it is to be drawn off into another tub, in the manner of pouring off beer. In this way about a bufhel of ftrong lime-water will be obtained, to which muft be added three pecks of foot. The wheat muft be fteeped in this mixture by meafuring it gently, and in fmall quantities into a round-bottomed basket of about 22 inches in diameter, and 20 inches deep, and ftirring it. The ftuff that floats muft be ftrained off with a ftrainer, and muft not be fown. When the bafket has been drawn up and drained of the pickle, the wheat will be fit for fowing in two hours after the *brining*.

BRINING *of hay-rods*, a practice common in America, of raifing fait with the hay as it is ftacked.

BRINOY. See BRINOY.

BRISKET, that part of a horfe extended from the two fhoulders to the bottom of the fhaft.

BRISSOMIDES, in *Natural Hiftory*, the name of one of the genera of the ECHINI *marini*; the diftinguifhing characters of thefe are, that they are of an oval figure, and have their backs ftriated, not furrowed, and their rays fmooth, not marked with ridges. Of this genus there are two known fpecies: 1. A flat one, called by fome the *cranium*. 2. A high one, called by fome the *amygdala*, and ufually found fofftile, and mineralized in ftone.

BRISSUS, in *Natural Hiftory*, the name of a genus of the ECHINI *marini*, the characters of which are, that they are of an oval figure, and have the apertures for the anus on one of the fides of the fuperficies; their backs is fmooth and even, not furrowed, but on the contrary they have feveral very elegant, crenated, and dotted lines. Their head is at leaft cut off on the end neareft the mouth, and is not fo as in the *fpatangi*, but raifed in the manner of a cuthion.

BRISTLE, a thick ghofly kind of hair, wherewith the fwine and more efpecially are covered.

The name is fometimes alfo applied to the quills of porcupines, and the muftaches or whifkers of cats.

Hoga *briftles* are hard, tranfparent, horny fubftances, of a prifmatical figure, without any appearance of cavities or pores in them, difcoverable even by the microfcope.

Cats briftles have a large folid pith in the middle.

BRISTLE-*die*, a fort of tafle dice, furnifhed with a piece of

of bog's *briſtles* ſtuck in the corners, or other places, to hinder their falling on certain tides, and make them run high or low as pleaſure.

BRISTOL, *River*. See CAMFION.

BRISTOL *Waters*. See WATER.

BRITANNIC *figure*, a name given by ſome writers to the AWAITING *Sickneſs*, or *Malignant Fever*.

BRITANNICA, in the *Materia Medica of the Ancients*, the name of a plant reſembling a barley leaves of a dark colour, very large, and in ſhape reſembling thoſe of the common wild-dock, but ſomewhat long, and of an aſtringent taſte: the root ſmall and ſlender, and the ſtalk not large. This is the deſcription of Dioſcorides, who attributes to its inſpiſſated juice great virtues as an aſtringent, and a remedy for ulcers of the mouth and noſtrils; and Pliny acquaints us of its prodigious efficacy in a diſtemper attending the army of Germanicus, who, when they had croſſed the Rhine, encamped in a place where there was only one ſpring of water, the drinking of which affected them in a terrible manner in their mouths, and made their teeth drop out; and that the phyſicians, who called the diſeaſe *Stomacace* and *Sideroſis*, were at length directed to a remedy by the Britons who were in their camp, which was the herb *Britannica*.

The virtues aſcribed to this plant are obſerved, by the later phyſicians, to agree very well with thoſe of the *hydrolapathum minus*, or great water-dock, a plant poſſeſſed very abundantly with us, but at preſent neglected in the practice of phyſic: and Matthiolus, who has written profeſſedly of the *Britannica* of the ancients, is perſuaded that this is a true and genuine plant.

There is no doubt but that the real plant is our water-dock; but the conſequences in the Greek phyſicians, and the authors who have written ſince, and have borrowed the greateſt part of their knowledge from them, have occaſioned great perplexities to their readers, by ſuppoſing that the *Britannica* and *hermion* were the ſame plant; whereas one was a dock, and the other the plant we call *forrocks*, or *ſow-graſs*.

BRITT, or BRIGHT, in *Huſbandry*.—Wheat, barley, or other grain, is ſaid to *britt*, when it grows over-ripe and ſhatters.

BRITISH *ores*. See CROWN.

BRITISH *language*, the ſame with the Welch.

The ancient *Britiſh*, or *Cambro-Britiſh*, is a dialect of the Celtic. Some preſume, but with no probability, that the *Britiſh* is formed immediately from the Teutonic. Cooper abſurdly enough calls the Engliſh language the *Britiſh*.

BRITTLENESS, in *Natural Philoſophy*, that quality of bodies by which they are eaſily and eaſily broken by preſſure or percuſſion. It ſtands oppoſed to TENACITY. *Britle* bodies are extremely hard; the leaſt percuſſion exerts a force on them equivalent to the greateſt preſſure, and may conſequently eaſily break them. This effect is particularly remarkable in glaſs ſuddenly cooled, the *brittleneſs* of which is thereby much increaſed.

TIN, though in itſelf tough, gives a *brittleneſs* to all the other metals when mixed therewith.

The *brittleneſs* of CLAYS ſeems to ariſe from the heterogeneity of the parts wherein it is compoſed, ſalt and ſand, which can never bind intimately together.

In TIMBER, *brittleneſs* ſeems to be connected with durableneſs; the more *britle* any ſort of wood is, the more laſting it is found. Thus it is, oak is at ſo long duration, while beech and birch, as being tough, preſently rot, and are of little ſervice for building.

BRITTLENESS *of the hoof*, in horſes. See HOOF.

BRIZA, in the Linnæan ſyſtem of *Botany*, the name of that kind of graſs called the *trembler*, or quaking-graſs. It belongs to the *triandrous digynia* claſs.

BRIZE, in the *Materia Medica*, a name uſed for the grain of the *ſea monnacules*, or St. Peter's oves.

BRIZE, in the *Country Language*, a ſort of ground which has lain long untilled.

BRIZE, or BRISE, in *Navigation*. See BREEZE.

BRIZE-*nets*, or BRISE-*nets*, a kind of ſhelters uſed by gardeners, who have no walls on the north ſide, to keep the cold winds from damaging their melon-beds.

Brize-nets are incloſures ſix or ſeven feet high, and an inch thick, made of ſtraw, ſupported by ſtakes fixed into the ground, and props across both inſide and outſide, faſtened together with willow-twigs or iron wire.

BROACH, BROCHA, in *Middle Age Writers*, denotes an awl or bodkin. Among us, *broach* is chiefly uſed for a ſteel inſtrument wherewith to open holes in metals. It is ſometimes alſo applied to a ſtick on which thread or yarn is wound; and, in the North, to a ſort of wooden needles uſed in knitting certain coarſe things.

See an account of the *broach* uſed in weaving tapeſtry, under TAPESTRY.

In ſome parts of England a pike is called a *broach*.

Hence alſo to *broach* a barrel, is to tap it. The ancient lords received from their tenants a fee or tribute called *perragium*, for the liberty of *broaching* a cag of ale.

BROACH-TO, in *Sea-language*, is uſed for inclining ſuddenly to windward of the ſhip's courſe, when ſhe ſails with a large wind; or for deviating from the line of her courſe, when ſhe ſails directly before the wind, ſo as to bring her ſide to windward, and expoſe her to the danger of overturning.

BROAD-*ſail*, as oppoſed to the *Drill Huſbandry*, denotes the method of ſowing corn, turnips, peaſe, clover, the foreign graſſes, and moſt other field plants, that are not tranſplanted, by caſting them with the hand at large; in which method they are ſown upon the ground at large, and thence ſaid to be ſown in *broad-caſt*. This is called the *Old Huſbandry*, to diſtinguiſh it from the *Drill Huſbandry*, or *New Huſbandry*. See DRILL, and HUSBANDRY.

BROAD-*piece*, a denomination given to certain gold pieces *broader* than a guinea; particularly *Carolus*, and *Jacobus*.

BROAD-*ſide*, in the *Sea-language*, a diſcharge of all the guns on one ſide of a ſhip at the ſame time.

A *broad-ſide* is a kind of volley of cannon, and ought never to be given at a diſtance from the enemy above muſket-ſhot at moſt leaſt.

BROAD-*ſtone*, in *Building*, a ſpecies of free-ſtone, thus denominated, becauſe it is called *broad* and thin out of the quarries; it not exceeding two or three inches in thickneſs: chiefly uſed for paving.

BROAD-*worm*, *tomentoſus lumbi*, a name given to the TAENIA, or *tape-worm*.

BROCADE, in *Commerce*, a ſort of ſtuff, or cloth of gold, ſilver, or ſilk, raiſed and enriched with flowers, foliages, or other figures, according to the fancy of the manufacturer.

Formerly the term was reſtrained to cloths wrought either wholly of gold, both woof and warp, or of ſilks, or of both together: but by degrees it came likewiſe to paſs for ſuch as had ſilk intermixed, to fill up, and repreſent the flowers of gold and ſilver.

At preſent, any ſtuff of ſilk, ſatin, or even ſimple taffety, when wrought, and enriched with the flowers, &c. obtains the denomination of BROCADE.

Rich *brocade* may be cleaned, and the luſtre of them recovered by waſhing them with a ſoft breſh, dipped in warm ſpirit of wine.

BROCADO-*ſtuff*, a name given to a freeſes of the CYTISUS. It is of a ſilver colour, variegated with browns.

BROCARDICS, BROCARDICA, denote maxims or principles in *Law*; ſuch as thoſe publiſhed by *Azo*, under the title of *Brocardica Juris*.

Voſſius derives the word from the Greek πρόκρασις, q. d. *firſt elements*. Others, with more probability, from *Burchard*, or *Brochard*, biſhop of Worms, who made a collection of canons, called from hence *Brocardica*; and as this work abounded much in ſentences and proverbs, the appellation *brocardica* became hence extended to every thing.

BROCATELLE, called by the French *brocatel*, an ordinary kind of ſtuff made of cotton, or courſe ſilk, in imitation of BROCADE; chiefly uſed for tapeſtry and other furniture. That manufactured at Venice is the moſt eſteemed.

BROCATELLO, a name given by lapidaries to the white and gold veined red MARBLE.

BROCCOLI, among *Gardeners*, the ſhoot of a ſort of cabbage. There are ſeveral ſorts of it, as the Roman, the Neapolitan, and the black; but the Roman is far the beſt, and is therefore the only ſort now in uſe.

The ſeeds of this muſt be ſown about the middle of May, in a bode ſmall bed, when the young plants have eight leaves, they are to be tranſplanted, and ſet at three inches diſtance; and when they have grown about till the middle of July, they will be fit to plant out for ſtanding. They muſt be now ſet in ſome well-dittered ground, but not under the drip of trees, and at a foot and a half diſtance from one another. The ſeaſon muſt be light, and about the beginning of December they will begin to ſhew their heads, which look ſomewhat like a cauliflower; from this time they will continue eatable till the end of March. When the heads divide, and begin to run up, they are to be cut, with about four inches of the ſtem to them; and when theſe are cut off, about a month's time furniſhes a freſh crop from the ſame ſtock. They are to be ſtripped of their outer leaf, and boiled; and when perfectly done, they are very little inferior to aſparagus. The beſt way to have them fine, is to get freſh ſeed every year from Italy: for they are very apt to degenerate.

BROCHOS, in *Surgery*, a name uſed by ſome writers for bandages in general: in ſcorn of the old writers, the ſame word is alſo uſed to expreſs a perſon who has a very prominent upper lip, or very prominent teeth, and a thick mouth.

BROCK, among *Sportsmen*, sometimes denotes a badger, otherwise called a grey *brock*. See BADGER.

BROCK, and BROCKET, is also used to denote a hart of the third year.

BRODIATORES, in the *Middle Age*, a kind of *librarii*, or copists, who did not write the words and letters plain, but variously flourished and decorated, after the manner of embroidery. Du-Cange Gloss. Lat. tom. i.

BRODIUM, a term used by some writers in *Pharmacy*, for a liquor in which any solid substance has been boiled, is to be preserved, or with which a medicine too strong for use alone is to be diluted.

BROGLING, a method of fishing for eels, otherwise called SWIGGLING.

BROKEN-*backed*, in *Sea Language*, denotes the state of a ship which is so impaired, and loosened in her frame, as to droop at each end: a disorder to which the French ships are most exposed, on account of their length, &c.

BROKEN *knee*. Among *Horse-jockies*, *broken knees* are a mark of a stumbler. *A broken* wind is discovered by a horse's blowing at the nose in the stable, and his flanks beating quick, double and irregular, especially after motion. There are divers ways of concealing a *broken* wind. A quart of new milk given to a horse on an empty stomach will elude it for an hour. A heathing gallop discovers it; no medicine can prevent his coughing and wheezing in that case, if his wind be *broken*. This disorder frequently happens to horses which have stood long in the stable, without exercise; and it may be relieved by careful feeding, and moderate exercise. The following ball may be given once in a fortnight, or three weeks, with warm meal and water, whenever it is used, and it may be continued for two or three months, viz. six drams of succorine aloes; myrrh, galbanum, and ammoniacum, of each two drams; bay berries, half an ounce; a spoonful of oil of amber; the whole to be made into a ball, with a sufficient quantity of syrup of black thorn. Bartlet's Farriery, p. 58.

BROKEN *numbers*. See NUMBER and FRACTION.

Among *Painters*, a colour is said to be *broken*, when it is taken down or degraded by the mixture of some other.

BROKEN *ray*, in *Dioptrics*, the same with *ray of refraction*.

BROKER. The origin of the word is controlled; some derive it from the French *broier*, *to grind*; others from *brocarder*, *to cavil*, or *trifle*; others deduce *broker* from a trader *broken*, and that from the Saxon *brac*, *misfortune*; which is often the true reason of a man's breaking. In which sense, a *broker* is a broken trader by misfortune; and it is said none but such were formerly admitted to that employment.

BROKERS are of three kinds; *exchange-brokers*, *stock-brokers*, and *pawnbrokers*.

BROKERS, *exchange*, are a sort of negociators, who contrive, make and conclude bargains between merchants and tradesmen, in matters of money or merchandise, for which they have a fee, or *premium*. See EXCHANGE.

These, in our old law-books, are called *braggers*, and in Scotland, *brocarii*, i. e. according to Skeyne, mediators or intermedlers in any contract, &c. See PROXENETA. They make it their business to know the alteration of the course of exchange, to inform merchants how it goes, and to notify to those who have money to receive or pay beyond sea, who are proper persons for negociating the exchange with; and when the matter is accomplished, that is, when the money is paid, they have for brokage, two shillings per cent. pound sterling.

These, by the statute 5 and 6 William III. are to be licensed in London by the lord-mayor; and any person acting without such a license, is liable to the forfeiture of 500*l.* and persons employing them forfeit 50*l.* They are also to register contracts, &c. under the like penalty; and not to deal for themselves on pain of forfeiting 200*l.* They are likewise to carry about with them a silver medal, having the king's arms, and the arms of the city, &c. and to pay 40*s.* a year to the chamber of the city. 6 Ann. cap. 16.

In France, till the middle of the seventeenth century, their *exchange-brokers* were called *courriers de change*; but by an arrêt of council in 1639, the name was changed for that more creditable one of *agent de change, banque, & finance*; and in the beginning of the eighteenth century, to render the office still more honourable, the title of *king's counsellor* was added.

At Grand Cairo, and several places of the Levant, the Arabs, who do the office of *exchange-brokers*, are called *seraffs*: the manner of whose negociating with the European merchants, has something in it so very particular, that we have referred it to a distinct article.

The *exchange-brokers* at Amsterdam, called *meddelaers*, are of two kinds; the one, like the English, called *sworn brokers*, because of the oath they take before the *burgomasters*; but the other negociate without any commission, and are called *scolding brokers*.—The first are in number 375; whereof 375 are Christians, and 20 Jews: the others are near double that number; so that in Amsterdam there are near 1000 *exchange-brokers*.—The difference between the two consists in this; that the books and persons of the former were allowed as evidence in the courts of justice; whereas in case of dispute, the latter are disowned, and their bargains disannulled.

The fee of the (sworn *exchange-brokers*) of Amsterdam is fixed by two regulations, of 1613, and 1623, with regard to matters of exchange, to eighteen sols for 100 livres de gros, or 600 florins; i. e. three sols for 100 florins; payable, half by the drawer, and half by the person who pays the money. But custom has made considerable alterations herein.

The Jews, Armenians, and Banians, are the chief *brokers* throughout most parts of the Levant and the Indies. In Persia, all affairs are transacted by a sort of *brokers*, whom they call *dalal*, i. e. *great talkers*. The manner of making their markets is very singular: after the *brokers* have launched out into long, and usually impertinent discourse, coming towards a conclusion, they only converse with their fingers. The buyer and seller's *broker*, each take the other by the right hand, which they cover with their coat, or a handkerchief: the finger stretched out, stands for six; bent, for five; the tip of the finger for one; the whole hand for 100; and the hand clenched for 1000. They will expend even pounds, shillings, and pence, by their hands. During all this mystic commerce, the two *brokers* appear as cold and composed, as if there were nothing passing between them.

The French distinguish two kinds of *brokers*; one for the service of merchants, the other of manufacturers, artificers, and workmen. The business of the former is to facilitate the sale of goods in the wholesale and mercantile way; that of the other, to procure the goods wanted for manufacturers, artificers, &c. or to sell their goods when made. At Paris there is scarce a company of tradesmen, or even mechanics, but have their *brokers*, who are usually taken out of their body, and make it their sole business to negociate in the particular kinds of goods to which such company is by statutes restrained. There are *brokers* for drapery, *brokers* for grocery, *brokers* for mercery, &c. There are even *brokers* for tanners, cuirasiers, cutlers, and the like. Dict. of Commerce.

BROKER, *cloth*.—At Paris they have a regular company of these *brokers*, or *frippiers*, who are governed by statutes first given them under Francis I. in 1544.

BROKERS, *petit*, a sort of petty dealers in drapery, who sell fragments or remnants of cloths, stuffs, silks, and the like, at under price.

BROKERS, *fish*, are those employed to buy and sell fishes in the joint stock of a COMPANY or corporation. The negociations, &c. of these *brokers* are regulated by stat. 9 Geo. II. cap. 18. and 7 and 10 Geo. II. cap. 8. which, among other things, enact, that contracts in the nature of wagers, &c incur a penalty of 500*l.* and by the sale of stock, of which the seller is not possessed, a forfeit of 100*l.* and that *brokers* keep a book, in which all contracts, with their dates, and the names of the parties concerned, shall be entered, on pain of 50*l.* See SUBSCRIPTION and AGENT.

BROKERS *of household furniture*. See APPRAISERS.

BROKERS, *pawn*, are persons who keep shops, and let out money to necessitous people upon pledges, for the most part on usurious conditions.

These are more properly called *pawn-brokers*, or *tally-men*, sometimes *frippers*, or *frippierers*.

By 30 Geo. II. to be understood the statute of 5 Jac. I. cap. 21. by which it is enacted, that the sale of goods, wrongfully gotten, to any *broker* in London, Westminster, Southwark, or within two miles of London, shall not alter the property thereof.—If a *broker*, having received such goods, shall not, upon the request of the right owner, truly discover them, how and when he came by them, and to whom they are conveyed, he shall forfeit the double value thereof to the said owner.

But there are several excellent regulations respecting *pawnbrokers*, of later date; for which, see 30 Geo. II. cap. 24. 32 Geo. II. cap. 24. and 24 Geo. III. c. 42.

In the cities of Italy, there are companies established by authority for the letting out money in pawns; called *monts of piety*, an honourable title, like that of the *charitable corporation*, but little becoming such institutions; inasmuch as the loan is not *gratis*.

In some parts of Italy, they have likewise *monts of piety* of another kind, wherein they only receive ready money, and return it again, with interest, as to such *pawnbrokers*. At Bologna they have several such *monts*; which are distinguished into *franc* and *percentuel*: the interest of the former is only four *per cent.* in the latter, seven.

BROKERAGE, the fee paid to a BROKER.

BROMELIA, in *Botany*, *Plum.* a genus of the *hexandria monogynia* class of plants. Its characters are these: the flower hath three long, narrow petals, each having a *nectarium* joined to it above the base, and hath six stamina;

mina; the germen is situated below the receptacle, which afterward becomes an oblong capsule, divided by a partition in the middle, to which the seeds are fixed quite round; these are smooth, and almost cylindrical. There are two species, which make a pretty variety in the hothouse. Linnæus enumerates seven species.

BROMUS, in *Botany*, a name used by some authors for that kind of grass, called by others *festuca* and *agilops*, or *oat-grass*.

BRONCHIA, in *Anatomy*, the little tubes into which the *trachea* is branched, at its entrance into the lungs; and which are distributed through every part thereof, serving for the conveyance of the air in respiration.

The *bronchia* consist of cartilages like the *trachea*; only here the cartilages are perfectly circular, without any membranous hard part: they are joined together by the membranes that invest them, and are capable of being shut our lengthwise in inspiration; and of being drawn into each other in expiration.

BRONCHIAL, *artery* is an artery of the lungs, which arises from the descending trunk of the *aorta*, or intercostals; and, embracing the *trachea*, pursues the course of the *bronchia*, accompanying all the branches thereof through their whole progress. *See Tab. Anat. (Angeiol.) fig. 1. n. 29.*

BRONCHIAL *glands* are a soft, succulent, blackish sort of glands, adhering externally to the lower part of the *trachea*, the greater divisions of the *bronchia* and the *œsophagus*, some larger, some smaller; said to be discovered by Verheyen.

Their use is uncertain: the generality hold them to furnish an unctuous liquor, to moisten and line the inside of the *bronchia*. Vercellon will rather have them to secrete a juice for the service of digestion, conveyed by minute ducts to the *œsophagus* and stomach; which, however, is called in question by Haller.

Verheyen is of opinion, that the hoarseness which arises from a cold, may proceed from an obstruction of these glands; and that the benefit which accrues from taking oil of almonds, or other smooth medicaments, may proceed from their supplying the defect of this juice, and lubricating artificially the inside of the *bronchia*. But it should rather seem, that the humidity furnishing the *trachea* and *bronchia*, comes from the miliary glands of those parts, which are only lymphatics, and become tumid in morbid cases, inasmuch that they frequently press the wind-pipe, or some of its branches, and cause an ASTHMA.

BRONCHIAL *vein* arises from the intercostals, or the azygos, accompanies the artery, and divides into the same number of branches with it.

The artery brings blood to the *bronchia*, for the nutrition thereof, and of the vesicles of the lungs: and the vein carries it back again to the *cava*, where it soon terminates.

The *bronchial* artery is sometimes single, but more frequently double; sometimes triple.

BRONCHOCELE, a pendent tumour, with a large round neck, rising on the bronchial part of the *trachea*.

The word is formed from βρογχος, *wind-pipe*, and κηλη, *swelling*.

The *bronchocele* is common in Lombardy, Savoy, and about the Alps; whence Horace,

Quis tumidum guttur miratur in Alpibus.

It is commonly supposed to derive its origin from the Alpine waters, which, being impregnated and chilled with ice and snow, or deprived, by the process of freezing, of their fixed air, cause a *stasis* in the *lymphæ*, about the muscles of the throat, whereby the vessels are contracted, and the circulating humours thickened, whence an obstruction, &c. Though there are some species of it supposed also to arise from strums, bruises, and other accidents. Several physicians have now rejected the notion, that wens of this kind are owing to the use of snow-water. For in Greenland, where snow-water is commonly used, these unsightly protuberances are never met with; nor are they seen in Westmoreland, where the mountains are higher and the snow greater in quantity than in Derbyshire, where they are common. Besides, they are common in Sumatra, where there is no snow during any part of the year. Phil. Trans. vol. lxxiii. part. i. p. 367.

The *bronchocele* has been called by some *hernia guttural*, or *bronchialis*, *gutturis*, and *gongrona*. Some medical writers have confounded it with the *strume*, *scrophulæ*, or king's evil, and others have made it only a species of STRUMA. It has been described by Celsus, Albucalis, Heister, and many later writers. Some ascribe it to a rupture of a lymphatic vessel; others to some extravasated, nutritious juice, converted into a fleshy substance; and the tumor has been observed to consist partly of a fluid, and partly of a more firm and glandular substance; but its consistence is different in different cases.

The English *bronchocele*, as Mr. Pressor has termed it, or, as it is otherwise called, the *Derby-neck*, because many of the women in the hills of Derbyshire are subject to it, is a tumor arising on the fore-part of the neck, seated in the body of the neck, between the skin and wind-pipe, in the thyroid gland, and thus differs from the former, or Alpine *bronchocele*, which commonly hangs under the chin like dew-laps. Mr. Pressor distinguishes it also from the similar disease, which is caused by loud crying, coughing, or other means of straining the neck; this, he says, is incurable; whereas the other, called the natural or spontaneous *bronchocele*, is easily cured by proper and timely application. Dr. Hunter has observed, that it appears two or three years before or after menstruating; and Mr. Pressor has made the same observation, that it commonly appears first between the age of eight or twelve years. When the menstruation approaches kindly, it sometimes spontaneously disappears. This disease is almost peculiar to women; it is soft, or rather flabby to the touch, and moveable; but when it has continued for some years after the time of its growing, it becomes more firm. It is attended with a considerable difficulty of breathing, in some cases, to such a degree, as to occasion a bad wheezing. The situation of this tumor is such, that all attempts to extirpate it are extremely dangerous, and therefore the only method of cure is by discussion. The most celebrated remedy for this disorder is one which is prepared and sold at Coventry, and which Mr. Pressor believes consists of equal parts of sponge, cork, and pumice-stone, calcined; half a dram of this is mixed with sugar, and made into a bolus, and laid under the tongue every night. Mr. Pressor recommends the following powders:

℞ Cinnab. Antimon. opt. levig. ʒj. Milleped. ppti & pulv. Spong. calcin. aa grr. xx. m. f. pulvis.

One of these is to be taken an hour or two before breakfast, and at five or six in the evening, for two or three weeks; and, after the interval of about a fortnight, they are to be again renewed; and three of the following pills are to be taken at bed-time, during the second course of the powders:

℞ Pil. Mercurial. ph. nov. ʒ ß. Pil. N° 48. æquales.

The dose is to be adjusted to the age and constitution of the patient, who should be prepared for this course by two or three previous purges, and avoid taking cold, by washing much in cold water &c. If these means are used for about a month or six weeks, without any external application, he has no doubt of success. However, the patient should be under twenty-five years of age. At this age the cure is uncertain; but, at a more advanced period of life, much more improbable, and seldom or ever successful. Gooch, in his Medical Observations, mentions an *aneurism* BRONCHOCELE. Phil. Trans. N° 505. p. 634. Pressor's Account and Method of Cure of the *Bronchocele*. 1771.

BRONCHOTOMY, in *Chirurgery*, the operation of cutting into the wind-pipe, to prevent suffocation, in the quinsy; or an incision made in the *trachea*, or wind-pipe, between two of its annular rings, in order to make a passage for the breath, when there is danger of suffocation, from an inflammation of the *tonsils*, &c.

The word comes from βρογχος, *wind-pipe*, and τεμνω, *I cut*. *Bronchotomy*, called also *Laryngotomy*, is thus performed.—The body of the patient being prepared, an incision is made between the third and fourth annuli, or rings, of the *asperia arteria*, an inch below the bottom of the *larynx*; the skin and integuments divided, and the muscles removed; a silver tube is applied, and the cause of the disease removed, and the wound healed; nourishing clysters being applied in the mean time, if deglutition be impracticable.

Dr. Musgrave observes, that in all medicine there is not one method that works to greater advantage, for the better, in so short a time.—However, it is seldom practised, because that gap which appears on the cutting of a throat (the divided parts being then drawn towards their more fixed ends), together with the great effux of blood when the jugular and carotid arteries are also wounded, create in most men a dread of the operation, and make many believe all wounds of the trachea mortal.—But the same author makes no scruple, however, to say, it ought to be practised in quinsies, and other dangers of suffocation from causes of a like nature with these; from an extraordinary case which he himself had wrought in this way. *Bronchotomy* is likewise recommended as the best thing to be done, in order to recover drowned people to life; and in this operation many have been indebted for their recovery. In the Philosophical Transactions, vol. lx. part. ii. N° 87. there is an account of the case of a *cat thrown*, that may serve to make us somewhat more ready and resolute in the operation of *bronchotomy*, when it is necessary; such is the very inference that Dr. Hoadman, who relates it, draws from it. P. 531.

BRONCHUS, in *Anatomy*, properly denotes the lower part of the *aspera arteria*, dividing into *bronchiæ*, or branches.

The

In which sense, *bronchus* stands contradistinguished from LARYNX.

The name *bronchi* is also extended to the whole *asperæ arteriæ*, or TRACHEÆ.

BRONCHOCELE also denotes a person afflicted with a BRONCHOCELE, or manner of the throat, called by Ulpius *cynanche*.

BRONCINI, in *Zoology*, a name given by some to the *lupus*, or lox-wolf, called in English the LYNX.

BRONTEUM, in *Antiquity*, that part of the theatre underneath its floor, wherein brazen vessels, full of stones and other materials, to imitate the noise of thunder, were kept. Potter. Arch. Græc. *lib. ii.* cap. 8.

BRONTIÆ, among *Naturalists*, a kind of figured stones, commonly hemispherical, and divided by five grooved zones.

The word is formed from βροντη, *thunder*, alluding to the popular tradition, that those stones fall in thunderstorms: whence they are also denominated thunderstones, sometimes pole-stones, fairy-stones, and also *cerauniæ*, by naturalists.

Some take the *brontiæ* for the petrified shells of the *echinus spatagus*, or *hystrix*, or Artifulle. Dr. Woodward rather supposes them to have been formed, and received their shape in the shell of the *echinus spatagus*; on which footing they are also ranked in the number of ECHINITES. Dr. Plot contends both.

BRONTIÆ are sometimes also used in England for a kind of figured stones shaped like arrow-heads, less properly called BELEMNITES, and popularly *thunder-bolts*.

Dr. Woodward takes not these for natural stones, but supposes them to have been fashioned thus by art, or ferre as spoons before the invention of iron.

Some also give the denomination *brontiæ* to the BATRACHITES and CHELONITES.

BRONTOLOGY, books containing the doctrine of thunder, and of the prognosticks drawn therefrom. See THUNDER.

BRONZE, in *Chemistry*, a factitious metal, compounded of copper and tin, to which sometimes other metallic substances are added, particularly zinc. It is brittle, hard, and sonorous.

The word is French, in which language it bears a very extensive signification; including all the compositions of copper or brass, as for guns, bells, pots, or the like.

It is formed from the Italian *bronzo*, which has the same signification. Copper medals are frequently called medals of *bronze*. Medallists distinguish the *large*, *middle*, and *little* BRONZE.

Bronze is employed for various uses, as for making bells, cannons, and statues; and the proportions of the component metals are varied, to suit the several uses to which it is applied. For the fourth reason, the mixture in the composition of *bronze* is half *copper*, and half *brass*, or LATTEN.

The Egyptians, who are said by some to have invented the art of making it, use two thirds of *brass* and one third of *copper*.

The compound of *copper* and *tin*, it is observed in the Dictionary of Chemistry, has a greater than the intermediate specific gravity; whence it is inferred, that in the union of *copper* and *tin* there is a penetration of parts, i. e. that one metal enters into the pores of the other, and perhaps even this effect is reciprocal. See on this subject Gellert's Metallurgic Chemistry.

Bronze is less apt to be covered with verdigrise than pure *copper* is; for as *tin* is less liable to the action of salts of moisture, and of the air, than *copper*, it is also less liable to rust; hence arises one reason why this ALLAY of *bronze* is used for cannons, statues, and works exposed to the air and weather. The greater fusibility of *bronze* than of *copper*, is also an advantageous property, and much facilitates the casting of large works, as statues, bells, and cannon. See BELL-*metal*.

The operation by which large works of *bronze* are cast, is sufficiently simple. For this purpose a brick-furnace is used nearly of the shape of an oven for baking bread. The floor of it is concave, and consists of a composition of sand and clay; in which the metals to be fused are put. The furnace has three openings; the first is a lateral mouth, at which enters the flame of wood, placed in a second furnace on one side of the first; the second opening is a chimney placed on the side opposite to the mouth, by means of which the flame is drawn over the metal; the third opening is a hole opened and shut at pleasure, through which the inner part of the furnace may be occasionally inspected, that the state of the metal may be observed. When the metal is in the state required, a fourth opening is then unclosed, communicating with the hollow floor, and through which the melted metal flows by channels into the moulds prepared to receive it. Dict. of Chemistry.

BRONZE, in *Painting*, denotes a colour prepared by the colourmen of Paris, in imitation of *bronze*. There are two sorts of it, the *red* and the *yellow*, or *golden*: the latter, the *yellow*, is made solely of the finest and brightest copper-dust that can be had; and in the former there is only added a small quantity of red ochre, well pulverised. They are both applied with varnish, and, to prevent its turning greenish, the work is dried over a chafing-dish, as soon as painted.

BRONZES. Thus *antiquaries* denominate figures of men or beasts, urns, and every piece of sculpture, which the ancients made of the above metal. Statues, busts, &c. cast of this metal, are called by this name, whether they be originals or copies.

BRONZING is the art of imitating *bronze*. See BRONZE, in *Painting*.

BROOD, the young of fish and fowls.

The word is derived from the Saxon *brodan*, *to breed*; which alludes to *Spawn*, *to be big with young*.

Multitude had the curiosity to break several times all the eggs of a *brood*, one half an hour after another, and observe with a microscope the successive alterations produced therein, till the moment of hatching; of all which he has given figures, curiously engraven.

The word is also used for a set of any young. In which sense we say, a *brood* of vipers, a *brood* of oysters. A *brood* of pheasants is more properly called an *eye*. Phil. Trans. N° 369.

BROOD of fish is spawned, and lies in still waters, where it may have rest to receive nourishment, and grow to perfection. And here it is often destroyed by weirs, drawnets, and nets with canvas, or like engines in the bottoms of them, in harbours, haven, and creeks.—Every weir near the main sea-coast, in twelve hours, sometimes five pulpits, sometimes six, sometimes twenty or thirty. For the preventing hereof, by 3 Jac. I. cap. 12. it is enacted, that none shall erect a weir, or weirs, along the sea-shore, or in any haven or creek, or shall willingly destroy the spawn, or fry of fish, on pain of 20*l.* to be divided betwixt the King and the prosecutor. Neither shall any one fish in any of the said places, with any net of a less mesh than three inches and an half betwixt knot and knot (except for the taking smoults in Norfolk only), or with a canvas net, or other engine, whereby the spawn or fry of fish may be destroyed; on pain to forfeit the said engine or net, and 10*s.* in money, to be divided betwixt the poor of the parish, and the prosecutor.

BROOD, or BROOD-*comb*, called by the French *couvain*, is that part of the comb of a bee-hive which contains in its cells the future progeny of the hive, in the three different stages of eggs, worms, and nymphæ. See BEE, and OVUM-*bee*.

BROODING, the act of a hen, or other bird, sitting on a number of *eggs*, to keep them warm till they hatch, or produce young ones. See HATCHING.

In which sense, the word answers to the same with *incubation*.

Insects have also a method of *brooding* on their ova. Some even pretend, that snakes sit on the eggs; which seems without foundation. Phil. Trans. N° 5.

There is a difference between *brooding* of SNAKES and VIPERS; the former being oviparous, and the latter bringing forth their young alive.

BROOKLIME, in *Botany*, a species of SPEEDWELL.

Brooklime bears a resemblance in its flowers to the *Paul's betony*, though its leaves are larger, and the ridges entire.

Its chief use is to abrade and clear away those little viscosities which obstruct the capillaries, and occasion scabs and blotches, though it has also a diuretic virtue, and serves as a cleanser of all the viscera; whence it is frequently an ingredient in antiscorbutic and deobstruent compositions. Quincy. Disp. p. 11. § 4.

BROOM, *Spartium*, *Genista*, in *Botany*, a genus of the *decandria monogynia* class of plants. Its characters are these: the flower is of the butterfly kind; the standard long, and wholly reflexed; the wings are a little shorter, and loose; the keel erect, and longer than the standard; it hath ten stamina joined, which are situated in the keel; in the centre is an oblong germen, which afterwards becomes a roundish, turgid pod, with one cell, opening with two valves, enclosing kidney-shaped seeds. There are thirteen species. It grows plentifully on heathy grounds.

Among *Husbandmen*, *broom* is considered as a weed very pernicious to the culture of lands; and, on that account, to be grubbed up and destroyed.

It roots deep, and, shedding no leaves, is continually sucking the moisture from the earth. The best method of destroying it, is the burning of the land, then plowing it deep, and manuring it very well with dung and ashes; the spreading on the land chalk or marle, or the manuring it with urine. If the ground be designed for pasture-land, it is best to cut it close to the ground in May, when the sap is rising in it. By this artifice, the roots are destroyed,

destroyed; whereas, in the common way of pulling up the young plants, some shrigs will be left, and the least of these will grow. Fodderings of cattle upon *broomy* land, is one very good way of destroying the *broom*, their urine killing the roots, and their treading the land making it less proper for the roots of this plant; for the *broom* is never observed to grow in trodden places. This troublesome and pernicious plant is not, however, without its use to the farmer; for, when well laid, it will make an excellent and lasting kind of thatch for barns.

Broom-makers make a principal ingredient in divers medicated ales. These ales are extolled for purging off waters in dropsies; in which respect, however, Dr. Quincy assures us, they are no better than any other lixivious ashes.

Some pickle the yellow buds with vinegar and salt, &c. after the manner of capers, from which they are then scarce to be distinguished.

Broom is an attenuant, abstergent, and aperient. The juice of the green shoots of *broom*, or a strong infusion of them in wine, is an excellent diuretic, and cleanses the breezes and kidneys. If taken in large doses it purges by stool, and therefore is doubly proper in dropsical cases. The seed of *broom* is also a purge, and that of no weak kind; sixdrans and half of it being a sufficient dose. The *tinctura de broom* with white wine, is a powerful diuretic, but must be taken with caution.

BROOM, *African*. See ALEALATHUS.

BROOM, *Butcher's*, in *Botany*. See BUTCHER'S *Broom*.

BROOM-*staves*, gives the denomination to an order of knights instituted by St. Lewis of France, on occasion of his marriage. The motto was, *Exaltat humiles*, and the collar of the order made up of *broom-flowers* and bulks enamelled and intermixed with hearts-de-lys of gold, *set* in open lozenges, enamelled white, chained together, and at 0 hung a *cross fleurie* of gold. This answers to what the French call *Orden du Genest*, from the name of a species of *broom* so called; different from the common *broom*, as being lower, the stalk smaller, and leaf narrower; the flower is yellow, and bears a long bulk.

Some also speak of another order of the *Genest*, or *Broom*, established by Charles Martel, or rather Charles VI.

BROOM also denotes a well known houshold besom, or implement wherewith to keep away dirt, dust, and the like.

We say, a *birch-broom*, a *bass-broom*, a *rush-broom*, a *heath-broom*. The primitive kind of *broom*, from whence the denomination is given to all the rest, was made of the *genista*, or wild *broom*, growing on commons.

BROOM-*gall*, in *Natural History*, a name given by authors to a remarkable species of galls found on the *genista tinctoria*, or common *broom*. This is occasioned, like all other galls, by the puncture and eating of an insect, and when opened, is found to contain a small oblong worm, of a red colour, but whose size requires the use of a glass in order to see it distinctly.

BROOM-*rape*, in *Botany*. See *Orobanche* RAPE.

BROOM-*tree*, *Spartium*, *Cytisus Genista*, in *Botany*, a genus of the *decadelphia decandria* class of plants. Its characters are these: the empalement of the flower is heart-shaped; the flower of the butterfly kind; the standard almost heart-shaped, large, and wholly reflexed; the wings are oblong, shorter than the standard, and annexed to the stamina; the keel is oblong, longer than the wings; the borders hairy, and connected together; to which the stamina are inserted. It has ten unequal stamina, nine of which are jointed together, and the under stands apart; with an oblong hairy germen, supporting a sling awl-shaped style, to which is fastened an oblong, hairy, inflexed stigma. The germen afterward becomes a long, cylindrical, obtuse pod, of one cell, opening with two valves, including several globular kidney shaped seeds. There are eleven species, natives of different parts; the best known of which is the Spanish *broom*, which is common in gardens, and flowers in June and July; the parts in use are the branches, flowers, and seeds, which agree in virtues with the common *broom*; only are more efficacious.

BROOMING, or BREAMING *of a ship*, the burning off the filth she has contracted on her sides with straw, reeds, broom, or the like, when she is on a careen, or on the ground. See CAREENING.

BROSSAEA, in *Botany*, the name of a genus of plants of the *pentandria monogynia* class; the characters of which are these: the corol is one-leaved *pentanthium*, divided into five segments, each of which terminates in a long points of the same length with the petals; the flower is monopetalous, of the shape of a tunnicated cone, and undivided at the edge; the germen is divided into five parts; the style is pointed, as long as the flower, and its stigma simple. The fruit is a roundish capsule, divided by five deep furrows, into five cells; it is covered with a large cup, which closes over its top; it is succulent and fleshy; and, finally, opening at the sides, it discharges a great number of minute seeds.

BROTHEL, *See* STEWS.

BROTHER, *Frater*, a term of relation between two male children, arising from the same father, or mother, or both. Scaliger and Vossius derive *frater* from φρατηρ, or φρατηρ, which properly signifies a person who draws water in the same well; φρεαρ, in Greek, signifying *well*, and φρατρια, a company of people, who have a right to draw water out of the same well. The word, it is said, came originally from the city Argos, where there were only a few wells distributed in certain quarters of the city, to which those of the same neighbourhood alone repaired.

By the civil laws, *brothers* and sisters stand in the second degree of consanguinity; by the canon law, they are in the first degree.

By the Mosaic law, the *brother* of a man who died without issue was obliged to marry the widow of the deceased. Deuter. xxv. 7. See LEVIRATE.

The ancients applied the term *brother* indifferently to almost all who stood related to the collateral line, as uncles and nephews, cousin-germans, &c.—This we learn not but also from profane authors; Cicero, in his Philippics, says, "Antonia was both wife and sister of Mark Antony; "because she was daughter of his brother C. Antonius." And as to cousins, Tanaquil Faber, in Dionysius Halicarnassæus, calls the Horatii and Curiatii, *brothers*, because they were sisters children.

The language of the Jews, bishop Pearson observes, included in the name of *brethren* not only the first relation of fraternity, but also the larger of consanguinity. We are brethren, says Abraham to Lot, Gen. xiii. 8. whereas Lot was only his nephew.—So Jacob told Rachel that he was her father's *brother*, Gen. xxix. 12. whereas he was only her father's nephew. This consideration has been urged with good advantage against the Anticlementians, who, from the mention made of the *brethren of Jesus* (John ii. 12. Matth. xii. 46.) have impugned the perpetual virginity of the mother of Christ: for which however there seems to be no sufficient foundation.

Among us it is customary for kings to give the title *brother to each other*; the unction in coronation being effected to create a kind of *brotherhood*. Nor is the custom modern: Menander mentions a letter of Cosroes king of Persia, to the emperor Justinus, beginning thus: Cosroes king of kings, &c. to the emperor Justinian *my brother*. Kings now also give the same appellation to the electors of the empire; and the like was given, by the king of France, to the late king of Sardinia, while only duke of Savoy.

In the civil law, *brothers*, *frateres*, in the plural, sometimes comprehend sisters: as *Titius & Titia*, *frateres*; *tres fratres*, *Titius*, *Maevius*, & *Seia*.

BROTHERS, *fosterers*, those which sucked the same nurse. The French call them *freres de lait*, or *brothers by milk*; which is most properly used in respect of a person who sucked a nurse at the same time with the nurse's own child.

BRTOTHERS, *German*, *Freres Germani*. See GERMAN.

BROTHER was also used in *Middle Age Writers*, for a *consul*, or governor of a province.

BROTHER is applied, in a less proper *sense*, to denote a person of the same profession. In which sense, judges, bishops, priests, &c. call each other *brothers*.

BROTHER *in Christ*, *fratres in Christo*, the same with *spiritual brother*, a person admitted into a monastic society or fraternity.

BROTHER is more particularly used to denote the relation between monks of the same convent.

In which sense they say, *brother Zachary*, *brother Buonaventure*, &c. In English we more usually say, *friar Zachary*, &c. from the French word *frere*, *brother*. This appellation is borrowed from the primitive Christians, who all called each other *brothers*: but it is principally used for such of the religious as are not priests; those in orders are generally honoured with the title of *fathers*, *patres*, whereas the rest are only simply *brothers*. The monks of St. Dominic are particularly called *preaching brothers*, or *friars preachers*: those of St. Francis, *minor brothers*; those of charity, *ignorant brothers*, &c.

BROTHERS, *conscripti*, *fratres conscripti*, denote laymen and others entered in the catalogue of the *brothers* of a monastery, or rather partakers of the fraternity thereof.

BROTHER, *outer*, *frater exterior*, sometimes denotes a *lay-brother*.

BROTHER, *strange*, *frater advenus*, a foft or guest belonging to another monastery.

BROTHER, *former*, *frater externus*, either a monk, priest, or canon of some other monastery, to whom the prayers of the society are granted.

BROTHER, *mature*, *frater maturus*, one distinguished by his age, gravity, or probity, above the rest.

BROTHERS, *spiritual*, laymen admitted into a monastic fraternity.

family. The name was also given to those otherwise called *nature brothers*, and sometimes also to a sort of adopted *brothers*, or persons who communicated a kind of *brotherhood*, with the ceremony of breaking bread together in the church before the priest.

BROTHER, *lay, frater laicus, or conversus.* See LAY *Brother.*

BROTHER, *grise, frater dentur*, among the Carthusians, denotes a young person admitted to assume cloth, and wearing a hair, whose office is to serve in the house, answering to what in other orders is called the *second brother*, *frater medius.*

BROTHER is also an appellation more peculiarly given to certain orders of religious than the

BROTHERS *of St. Anne*, in the Low Countries, were an order of persons who attend on trade who lay dying, and take care of the burial of the dead.

BROTHERS *of Mercy.* See SERVITES.

BROTHERS *of Christian Love*, a sort of religious fraternity founded about the year 1540, by one commonly called *Borromeo*. They took the third order of St. Francis, and the hospitality, making three usual vows but without confinement.

BROTHERS *of Charity* all denote an order of Hospitallers still subsisting in Romish countries, whose business is to attend the sick poor, and minister to them both spiritual and temporal succour.

They are all laymen, except a few priests, for administering the sacrament to the sick in their hospitals. The *Brothers of Charity* of the reformation have no vows, discipline, habit, or monastery, which they profess with strictness.

They were first founded at Grenada, by St. John de Deus; and a second establishment was made at Madrid in the year 1567. Another was established by Gregory XIII. in 1572. Clement XV. pulled down the whole body of them, but by Bull V. in 1605 gave a form of the rules and constitutions to them they were governed by before the dissolution of the order. These orders are dispersed throughout Spain, and there, as well as the Low Countries, Germany, Poland, and Italy, are under different governments, with names of distinction. They were first erected into a congregation by Martin Alphonsus de Porres, and have since been established in Portugal, Germany, and the Indies.

BROTHERS *of Charity of St. Hippolytus*, a religious congregation established in Germany, and confirmed by Sixtus V. in 1587, who obliged them to the rules of St. Austin. They are distinguished from all other orders of religious by the habit, and colour of it, being of *Isabella* colour, or a dirty white. They were introduced into England by Queen Henrietta Maria, and have a house in Hog-lane, Westminster, by the name of the Fraternity of Charity.

BROTHERS *of Charity of St. Alexander*, a religious congregation established in Germany, and confirmed by Sixtus V. in 1587, who obliged them to the rules of St. Austin. They are distinguished from all other orders of religious by the habit, and colour of it, being of *Isabella* colour, or a dirty white. They were introduced into England by Queen Henrietta Maria, and have a house in Hog-lane, Westminster, by the name of the Fraternity of Charity of St. Alexander.

BROTHERS *of Penance*, or *of the Penitents of Jesus Christ*, a name given to Tiraboschi to the religious of the third order of St. Francis called also *Regulars*; and also a fraternity of Penitents held in the chapel of the church of the third order, under the direction of the Regulars. See REGULARS.

BROTHERS, *of poor, barefoot*, a denomination given to all monks, who either are partly woollen, partly linen; they were otherwise called *Sandaliati*.

BROTHERS *of St. Gregory the Illuminator*, a religious order established in Armenia, in the fourteenth century, which being much reduced and thrown by the conquests of the Turks and Persians, was, in 1750, united to the Order of St. Basilius.

BROTHERS, *Trinitarian*, or *Mathurins*, denote the Religious of the order of the Virgin Mary, first instituted at Cerfroy in 1201, for whom a rule was prescribed by pope Urban IV.

BROTHERS, *lay*, in the CAMBRIDGE UNIVERSITY, a denomination given to decayed gentlemen, to the number of eighty, who are subsisted with diet, clothing, and lodging, at the establishment.

The *poor brothers* are to be gentlemen by descent, come to poverty, or decayed merchants, scholars, or officers of the king's household. The conditions of admission are that they have an estate in land worth 300*l.* per annum, in case of widows 240*l.* per annum; and that they be fifty years old unless they have been examined in the public lectures, in which case the age of forty suffices. They wear a livery-gown within doors.

BROTHERS, *White*, the name of a sect which appeared in Russia towards the beginning of the fourteenth century; so called from their white cloaks on which was a St. Andrew's cross of a green colour. See HERETICS.

BROTHERS *of Peace*, an appellation given to those who consult a habit of forbearance in word, judging themselves to the utmost farthest and sufferance of evil rather.

In the military orders the knights are also called brothers. In the order of MALTA there is a particular class who are called *serving brothers*, consisting of such of the sons grow great of their family, but can they are of noble and genteel parents.

BROTHERS *by adoption.* See ADOPTION.

BROTHERS, those who have only the same father, are called *brothers consanguineous*; and those who are only descended from the same mother, *germans uterine.*

BROTHERS, *of the holy cords.* See ROSY-CRUCIANS.

BROTHERS, *of the sanctuary.* See SANCTUARY.

BROTHERS, in Heraldry, are *cantons* across the imperial bearing which are to be cared in their turnings by the garter chaplains, are to be *gentils*, and separated from their bearing *sec* by the principal's name.

BROTHERHOOD. See FRATERNITY.

BROW, among the Fish branch of the term of a hill, or high ground, and from the horse, or main land, near the bay.

BROW, *of the ferry*, a term which gives people at ferry-boats landing.

BROWELLIA, in *Botany*, a genus of the *Didynamia Angiospermia* class. Its characters are: The flower is of funnel shape, of one leaf, having a cylindrical tube, twice the length of the empalement, the upper part divided into five parts, of which the upper three are erect, and divided into five parts, and the lower narrower, in the shape of the petal; the two uppermost are shorter than the other three, and turned backwards; the lowermost is longer, and spreading; the stamina are four, inserted into the tube of the flower, and are shorter than the petals; the antheræ are small and roundish; the germen is oval, supporting the style, which is the length of the stamina, and crowned by the stigma, which is obtuse; the empalement remains; the capsule is oval, and has two cells; the seeds are numerous, and roundish.

BROWN, a dusky kind of colour, including under it various shades.

Dusky differently diversified and graduated is termed, *brown, fuscus, ferrugineus, cinereus, fuscus, ferrugineus, cinereus, fuscus, ferrugineus, cinereus

from the favorities of the bishops, began to differ among themselves, and stumble into so many parties, that Brown, their pastor, grew weary of his office; and, returning to England in 1585, renounced his principles of separation; and was preferred to the vicarage of a church in Northamptonshire, and died, after leading a very idle and dissolute life, in 1630.

The errors of Brown was amended with the dissolution of the church at Middleburgh; but the seeds of *Brownism*, which he had sown in England, were so far from being destroyed, that Sir Walter Raleigh, in a speech in 1593, computed in his time twenty thousand Englishmen of the separation; and was preferred to the favours of a church and reformation of the members that composed similary and separation of the members that composed it; on account of the toleration of sinners, with whom it is not lawful to eat, or converse, or communicate. They thus maintained it an impiety to communicate. They condemned the solemn celebration of marriages in the church; maintaining, that matrimony being a political contract, the consideration thereof ought to come from the civil magistrate. They would not allow any children to be baptised if such as were not members of the church, or of such as did not take sufficient care of their baptised before. They rejected all forms of prayer; and held, that the Lord's prayer was not to be recited as a prayer; being only given for a rule, or model, wherein all our prayers are to be framed.

The form of church government which they established was *democratical*. When a church was to be gathered, such as desired to be members of it made a confession of it; and signed a covenant, by which they obliged themselves to walk together in the order of the Gospel. The whole power of admitting and excluding members, with the decision of all controversies, was lodged in the brotherhood. Their church-officers were chosen from among themselves, for preaching the word, and taking care of the poor, and ordained to their several offices by fasting, prayer, and imposition of hands of some of the brethren. But they did not allow the priesthood to be any distinct order, or to give any indelible character. As the vote of the brotherhood made a man a minister, and gave him authority to preach the word, and administer the sacraments among them; so the same power could discharge him from his office, and reduce him to a mere layman again. And as they maintained the bounds of a church to be no greater than what could meet together in one place, and join in one communion; so the power of their officers was prescribed within the same limits. The ministry or pastor of one church could not administer the Lord's supper to another, nor baptize the children of any but those of his own society. Any lay-brother was allowed the liberty of prophesying, or of giving a word of exhortation to the people; and it was usual for some of them, after sermon, to ask questions, and reason upon the doctrine that had been preached. In a word, every church, on the *Brownist* model, is a body-corporate, having full power to do every thing which the good of the society requires, without being accountable to any classis, synod, consistory, or other jurisdiction whatever. Most of their discipline has been adopted by the independents, a party which afterward arose from among the *Brownists*.

The laws were enacted with great severity on the *Brownists*; their books were prohibited by queen Elizabeth, and their persons imprisoned, and many of them were hanged: but the severity of committees, and the Rump-parliament, in some measure delivered them from the rigour that they exhibited to all their country. Accordingly many families retired, and settled at Amsterdam, where they formed a church, and chose Mr. Johnson their pastor; and after him Mr. Ainsworth, author of the learned commentary on the Pentateuch. Their church flourished near a hundred years. See Neal, Hist. of New Eng. vol. 1. cap. 2. p. 58. and Robinson, Apologia pro suis Brownistarum & Barrowistarum. 12mo. 1619. See INDEPENDENTS.

BROWS, or BROWNS, are two hairy arches above the orbits of the eyes, bounding out by means of some fat under the skin in this place.

That end next the nose is called the head, *caput*, the other the tail, *cauda*, or the end.

The use of the brows is partly to break the rays of light descending from above, that they may not dart too strongly into the eyes; and partly to be a screen to the eyes from sweat, dust, or other matters descending from the forehead.

BROWSE, the tops of the branches of trees, whereon beasts feed. This is sometimes also called bronce, and

brittle; probably from the French *brout*, which signifies the same.

BROWSE more properly denotes the food which deer find in young copses, commonly signifying *spring*.

BROWSE, *bois de*, or BROWSEWOOD, a denomination including all of the fallow kind, as the deer, roe-bucks, rascayes, &c.

BROWSEWOOD, the same with spray or brushwood.

BROWSING, *Bruzare*, among the *French Gardeners*, signifies nipping off the tips of the tender branches of trees, when too long in proportion to their strength.

BRUARIA *tudera*. See TARRAS.

BRUCHUS, a genus of insects of the order of coleoptera, with filiform antennæ. Linnæus enumerates three species.

BRUISE, in *Surgery*. See CONTUSION.

BRUISER, in *Mechanics*, the name of a concave iron used for grinding and polishing the specula of telescopes. It is made of brass, about a quarter of an inch thick, and hammered as near to the figure as possible. It is turned on the convex side, and made exactly round at bottom and top. This serves to reduce the figure of the glasses, when it is too convex, and to rub down any gravy matter that happens to be mixed with the putty, before the tripolum is applied to the polishers. See Phil. Trans. vol. lviii. part 1. art. 10. and Smith's Optics, book 1. cap. 2.

BRUISING, in *Pharmacy*, signifies the operation of breaking or pounding a thing coarsely, or by blows frequently pushed on roots, woods, and other hard bodies to make them yield their juice in virtue more freely than they would do whole.

BRUMALIA, or BRUMALIA, a feast of Bacchus, celebrated among the ancient Romans, during the space of thirty days; commencing on the twenty-fourth of November, and ending the twenty-fifth of December. Some say this feast was celebrated twice a year, viz. on the twelfth of the calends of March, and on the eighteenth of the calends of September.

The word comes from *bruma*, the day of the winter solstice; in regard of the time when the feast was held: though others derive it from *Brumus*, or *Bromius*, names of Bacchus.

The *Brumalia* were instituted by Romulus, who also, during this time, to entertain the senate.

During this feast indictments were taken of the felony of the remaining part of the year.

The *Brumalia* were also called *Liberalia*.

BRUNELLA. See SELFHEAL.

BRUNSFELSIA, in *Botany*, a genus of the *pentandria monogynia* class. Its characters are thefe; the flower is of one leaf, and funnel-shaped, having a long tube, but spreads open at the top: it hath five flamens of the length of the tube, which are inserted in the tube. In the centre is placed a small round germen, the supplement afterward becomes a globular berry, with one cell, including a great number of small seeds, which adhere to the side of the fruit.

We have but two species, which is a native of the sugar islands in America; but is at present very rare in the English gardens.

BRUNIA, in *Botany*, formerly reckoned a genus in the Linnæan system, but since called as a species of the *phylica*.

BRUSH, an assemblage of hairs or hogs bristles, inserted in the holes of a wooden handle or board, pierced for that purpose, and serving to cleanse divers bodies by rubbing therewith.

We fay a *round*, or *flat*, or *square brush*, *clothes-brush*, *hand-brush*, *hat-brush*, *hair-brush*, *comb-brush*, *watch-brush*, and the like.

The manner of making brushes is by folding the hair or bristle in two, and bringing it by means of a packthread, or wire, engaged in the fold, through the hole wherein it is to be fixed: the wood is pierced all over or inlayed thereon with glue, or pitch. When the holes are thus all filled, they cut the ends of the hair to make the surface even.

BRUSH, *Painter's*. See PENCIL.

BRUSH, *currier's*, is made of wire bent inwards, and serves to lay the wool as rap as shall, after shearing it for the last time.

The *fuller's* is of use in medicine, especially in cafe of rheumatisms, and certain cutaneous difeases. See FRICTION.

The *hair* is also applied to the cure of the rot of sheep; which, when hunting, to find whether they are alive or dead.

BRUSH, *sheep's*, in *Botany*. See LAMB'S FRENCH.

BRUSH, in *Electricity*, denotes the luminous appearance of the electric matter, issuing in a parcel of diverging rays, from a point. Brushes also are the appearance to the fence with which the electric fluid, going out of a point, divides the contiguous air, and paſſes through it, so that which is more remote. See Tab. *Electricity* fig. 8. 9. 10. 11. See STAR.

BROSSES, *wire*, are used by silver-smiths and gilders, for scrubbing silver, copper, or brass pieces, in order to the gilding of them.

There is a method of dying or colouring leather, performed by only rubbing the colour of the skin with a brush. This the French leather-gilders call *frotter*; being the lowest of all the sorts of dye allowed by their statutes.

BROSSE *ou fer*, among *Farriers*, signifies the dog or tail, the tip or end of which is called the chape.

BROSSE *d'ours*, signifies a kind of oars full of *brins*, or bristles.

Signifies also the hair of a bush.

BROSSE, is also used in speaking of a small thicket or coppice.

In this latter sense the word is formed from the middle age Latin *bruscia*, *brucia*, and *brucium*, of the same.

BRUCHE, or BRUCH, a small slender wood or spray. See BRANCHE.

BRUSHING. Among *Jockies*, a *brushing* gallop denotes a little more than a trot. A horse should have his *brushing* gallop in a morning before watering.

BRUTE, in a moral sense, denotes the want of the faculty and use of REASON.

In which sense, *brute* amounts to the same with BEAST. *Beasts*, or the second order of *mammalia* in the Linnæan system, the character of which is, that they have no upper or under fore-teeth; their feet have sharp hoofs, and formed for swift or nimble motion, and they multiply their kind. This order comprehends six genera, and fourteen species.

Among *brutes*, the monkey kind bear the nearest resemblance to men; and they both in the external shape and internal structure, though more in the former than the latter. In the anatomy also, the highest and the nearest approaching the likeness of man, is the ORANG-OUTANG, or *homo sylvestris*. Phil. Trans. N° 189. N° 256. p. 390.

The situation and economy of *brutes* make the object of what is called comparative ANATOMY.

Philosophers are much divided about the essential characters of *brutes*. Some define *brute* as an animal not rational, or a being incapable of laughter; others, as a mute animal, or a living thing deficient of speech; the Platonists, as an animal endowed with a sensitive power, but without a mental one. The Platonists follow reason and understanding, as well as sense, in *brutes*, though in a degree less pure and refined than in men. Lactantius allows every thing to *brutes* which men have, except a sense of religion. Some say the laws, civilized religion and virtue to *brutes*; and they say that Solomon seems to allow as much, that the souls of men have no pre-eminence over those of *brutes*. Eccles. iii. 18, 19. Lact. Inst. Div. lib. ii. cap. 10. Stanley Hist. of Phil. p. 818. chap. 23. Hudd. de Error. Stoic. Exerc. 1. 56. There are different tempers and degrees of knowledge in different species. Some have only the motion and sensitive faculties, as worms; others have also memory, and some imagination and invention, as monkeys and elephants; holding, that in the same species, some in docility and ingenuity exceed others; and that the climate, air, and food, have their influence on the *brute* kind, as on men; further, that of the same species, in different countries, are found to have different qualities, of which Swedish horses, sheep, turkies, &c. are a sufficient proof. It is their therefore in these and many other things only in the circumstance, which makes a difference, except as to the manner of acting, which likewise differs, though not exactly from those faculties of men?

They have some kinds of thought or intellectual knowledge; they have apprehension, but not reflection; are capable of remembrance, which is only a great mark of sagacity, but not of cogitation, which can only be the true test of reflection. Phil. Trans. N° 80. p. 4034, and 4071. Hobbes, Hist. of Hom. Nat. chap. v. p. 44. chap. vi. p. 54. and chap. ix. p. 68.

The chief distinction is a rational soul to judgment, by which we distinguish true from false; to which the memory and imagination are tenderment. But this cannot be declared to *brutes*, since they do not make propositions. They are incapable of silence, for want of reason and fear, whereby to manage their secret ideas. However, there is no talent peculiar to man, which we may not discover some resemblance of in *brutes*, except speech and curiosity. As for speech or communicative reason, to many it does not seem necessary, since many of the philosophers condemn it as a vain, and seldom absolute Science: in reality, supposing a man naturally dumb, does it follow, that he is void of reason? In any objection there to the reasoning of *brutes*, that they have not the use of speech, though we have explained it, they have other organs accordant for that purpose? Hudd. Annot. Phil. p. 101.

Some have pretended, that they have a jargon intelligible to one another: and Porphyry relates, that Theodas and Apollonius Tyaneus understood their language. There is at least a similitude of speech to *brutes*, for they know each other by their voices, and have their signs whereby they express anger, joy, and other passions; thus a dog affrights another from meat in another, love to another, and cries when beaten or stricken. It is true, their speech is not so copious and intricate; but perhaps not less in the use of their ears. Add to this, that they be contemplative in a high sense of that kind of the imagine of our own kind, whose laws have been instituted in it? The language of foreigners, what sense it appears to us, but a confused murmuring thing of sounds? In fine, if language be peculiar to men, we are not aware of it without being ignorant by the motion of their ears, eyes, mouths, tongue, &c. Lastly, what is to preclude us man's sufferance of futurity; but that not to this, which is to have with great men in their order as we see, &c. &c. The generality of the ancient philosophers thought that *brutes* reasoned: this, among the heathens, was the opinion of Anaxagoras, Plato, Porphyry, Celsus, Galen, Plutarch, and others. Among Christians, Lactantius, and the whole body of Manichees and Gnostics; among the moderns Valla, Sennertus, Aurelius, Tho. Campanella, Gassendus, V. Daniel, and others, affect the same. Plutarch has a dialogue under this title, that *brutes* use reason. All the sect of Pythagoras should be of the same sentiment, because the *metempsychosis* supports this human souls pass into the bodies of *brutes*. Can any person, says Lactantius, deny that *brutes* have reason, when they often outwit man himself? Inst. Div. lib. iii. cap. 20.

The Stoics, holding that as the Divine Being is diffused through all creatures, were necessitated to maintain the souls of *brutes* to be divine, and consequently that they had reason.

The Stoics paralleled *brutes* with men. Sextus, more particularly, gives a comparison between dogs and the human kind. The former excel the latter in scent; in that a quicker sight, whereby to pursue their game; in discovers them sooner by the eye, &c. in a more acute hearing. Sext. Empir. Pyrrhon. lib. i. cap. 14.

A dog is not deficient in logic, as appears from Chrysippus's famous instance, who observed that a hound coming into a road which divides into three, makes choice of the third by virtue of an induction or syllogism: for that having scented the two ways by which the beast did not pass, he runs straight upon the third without looking it: where the reasoning is obvious: the beast pursued either this way, or that way, or the other way: but he neither pursued that way, nor that way, and therefore this way. Stanley Hist. Phil. p. 760.

That a dog is possessed of what may call internal reason, appears from his choosing things convenient, flying the hurtful, pursuing his food, and running away from the wolf, and when wounded or sick, acting prudently, as the circumstances of his case, and his abilities and opportunities dictate.

Of how many moral duties, how many arts, do we owe the invention to *brutes*? It was from the *spider*, that man learned the art of weaving; from the swallow he borrowed architecture, from the gossamer-thing, from silk-worm, spinning; to note many other instances of the like kind alleged by Plutarch, Vossius, and others. Tab. Bib. Gymnas. lib. iv. cap. 26. tom. 1. Plut. de Solert. Animal. p. 974. Voss. de Orig. Idol. lib. iv. cap. 99. p. 1000.

How many actions are to be observed in *brutes*, not to be commanded for without reason and argumentation? If we say that dogs, by long habit and by force of rewards and punishments, may be taught many things; do not the scenting, docility, and remembrance of hares, against hunters, fear, and desire, which cannot fulfil without knowledge, teach, pleasure, and pain?

And if *brutes* have knowledge, it is allowed they must also have judgment and reason, and a measure of conveyance. Travers. Trav. Inst. 49. Phil. Trans. N° 256. p. 389. Charleton Exer. Phil. p. 327. &c.

Some look as if they held *brutes* to be sweet beings, and under the allegiance of the law of nature. Ulpian, and other civil lawyers, are supposed to be of this opinion; as also the Stoics, from whose school this notion is said to have been first borrowed. It is alleged on the other hand, that *brute* cannot be subject to a law, unless they have a power of knowing him that made the law, judging whether we have a right to command them, and what is contained in the law. But they may direct to answer accordingly; which does all to be things out of the reach of *brutes*. But Ulpian's definition of the law of nature, *the instinct of good nature common to animals*, when fairly interpreted, does not imply, that *brutes* have reason and reflection, but may be understood of that natural instinct common to man and *brute*, by which they are impelled to self-defence, propagation of their species, &c. Athenæus and Schmidius have collections of texts on the divine honours paid to *brutes*.

BRUTES, *mechanism of.*—The Cartesians, on the other hand, adopt that strange paradox, of the mechanism of brutes, and affirm them not only void of all reason and thought, but of all perception. This system is much older than Des Cartes; it was borrowed by him from Gomez Pereira, a Spanish physician, who employed thirty years in composing a treatise, which he entitles Antoniana Margarita, from the Christian names of his father and mother. It was published in 1554. See Vall. de Oriz. Med. lib. ult. cap. 12.

This was revived by Des Cartes, and further asserted by Le Grand, D'Aranton, and others of his followers, who were led to adopt this doctrine, from their principle of the philosophy, that the essence of the soul consists in thinking. To that, supposing knowledge and thought in brutes, they must have souls like those of men; the consequence of the Aristotelian being held by him a mere chimera. But Pereira does not appear to have been led into the investigation of this doctrine; something like it having been held by some of the ancients, as we find from Plutarch, and St. Augustin. Plut. de Plac. Phil. lib. v. cap. 20. Augustin. de Quant. Animæ. Pereir. Nov. Antiq. c. 3.

Perhaps the best arguments against the system of machines is, that it is contrary to the common sense and apprehensions of all mankind. Ought not those who adopt that brutes have souls, to be combated with the same weapons that are used against the deistical, who deny all truth and certainty; and against the materialists, who deny the existence of bodies?

Henry More, in his Enchiridion Metaphysicum, L. Daniel, in his Nouvelles Difficultez, published in 1693, and in his Voyage du Monde de Des Cartes, as also V. Perdies, in a treatise of the *Knowledge of brutes*, have justified the Cartesians herd. Perdies has also a dissertation on the souls and knowledge of brutes, and Willis a treatise of the soul of brutes, *De Anim. Brut. Exam.* 1672, 4to.

But to lay the truth, we are not much wider for the labours of these learned gentlemen. The common opinion of the sensitive and unperfected part of mankind seems to be, that we have brute, imagination, memory, and passions; that they are void of understanding and reason; that is, in the language of philosophers, they have the inferior faculties of the soul, but not the superior. For will the distinction appear reasonable to those who proved to the followers between the objects of the mind, and its acts about those objects; as also to the difference between the power of the distinct comprehension of anything. See Rudd. Chilli. Moral. vol. ii. p. 443. See INTELLECT.

BRUTIA, in the *Middle Ages of the Romans*, a word used to express the vilest and most infamous kinds of servitude, and such as was proposed for making the oil of apostle, called *sinum pessimum*.

The word *brutus* seems to have been a petition of distinction given to this kind of *servitus* by the ancients, from their common custom of naming things from the places whence they were brought. Brutus being the name of a country in the extreme parts of Italy. Vide Ilv. Ser. Cap. 2.

BRYCMOS, a kind of convulsion, affecting the lower jaw, and shutting the teeth together; such frequently observed in children affected with worms.

The word is formed from *βρυκω*, or *βρυχω* frequently used by Hippocrates for chattering of the teeth.

The *brycmos*, or clinching of the teeth, is a symptom of the ascels of an ague, or intermitting fever.

BRYON, in the *Botanical System of the Ancient Greeks*, an abbreviation of the word *βρυωνια*.

BRYONY, in *Botany*, a name usually made to take in two different genera of plants, under the names of the *white* and *black*, the *common* and *cretic* kind. Mr. Tournefort, however, has determined this word to express only what we call the *white bryony*, making *tamus* the name of the black. In the Linnæan system it is a genus of the monœcia pentandria class of plants. Its characters are these: it has male and female flowers on the same plant; the male flowers are bell-shaped, adhering to the impalement, cut into five segments, and have three short stamina; the female flowers agree in most respects with the male, and the germen is the same with that of the male; the pericarp, which succeeds the flower, afterwards becomes a smooth, globular berry, containing oval seeds adhering to the base. There are only two species.

The first grows upon dry banks under hedges, in many parts of England. The roots of this plant have been frequently mistaken, brought into a human shape, and thereby abused the weaker sex into many mistakes, to the common people's believing strange stories imputed to their greatness, as the procuring good beings thereby. The method practised was, to find a young thriving bryony plant, and opening the earth all round it, so as to cut through the lower fibres; then fastened a mould, made of wood by the sculptors of figures, round the root, filled with earth, and then filling up the earth again, left it to grow as the shape of the mould, which it will do in a summer. The leaves of the plant are also often imposed on the people in the market for those of *tamus*, though, although there is no resemblance in figure, or agreement in quality, between them.

The other kind can't be raised in a bark stove, and when they begin to spread, their branches may be trained upwards the wall or against an espalier; and when they are full of fruit, they make a pretty variety among other evergreens. The roots will sometimes much affect as a powerful purgative, especially of scammony; but are chiefly admired as an uterine evacuator; in which quality it enters the composition of an officinal wash, commonly known by the name *lixivium*, generally prescribed against hysteric ills. Mr. Boerhaave informs us, that a decoction of the roots of this plant, with the addition of honey, is a powerful purgative, and is often used with success in dropsies, and other diseases of the viscera. It is also a strong purgative, and as such has been strongly recommended in pleuritic cases. It appears, however, by Neumann, not to be entirely safe. See the chemical history of this plant, in Dr. Lewis's edition of Neumann's Works, p. 551.

But as this is apt to be too rough in its operation, the several preparations of jalap, scammony, and ialtrack, are to be preferred to it's substance.

In the whole fresh, full of an acrid and resinous matter, and its dose is an ounce, to which the wine is the best menstruum, in a dram of the dried root, or half an ounce of the green, which is almost equivalent to it. Hoffman. Med. Rat. vol. i.

BRYTIA, among the *Roman Agronomi*, denotes the most solid part of grapes, which remain after expressing the juice.

BRYON. See *Hist.* xxxii, and *Ess.* XIV. *Essays*, p. 13. Ess. xxxiv. *Ess.*, a name given by some to the spleen. See THE SPLEEN.

BUBALUS, in *Zoology*, a name given by authors in the *Augustan* age of the Cyprians to any tender creature, common in that part of the world, and also following among their cattle whatever its Indian name, which is unknown at home.

BUBALUS, the *buffalo*, a species of wild bull, a species of the *bos taurus*, very common in many parts of Europe, and in the north of Germany and Tartary for the food of the poor of the female, of which the famous cheese, called *cop of cambrick*, is made. They are also commonly employed in the affairs of husbandry, and have for this purpose a gristle or bone run quite through their nostrils, and, by means of a rope of thong or leather, put through them, they are governed at pleasure; though if once to well tamed, they scarcely keep tormenting of their nostrils themselves. They were originally brought from India into Lombardy in the reign of king Agilulf, who reigned from 591 to 616.

The Indian *buffalo* is considerably larger than the common bull; his body also is thicker, and his horns very large, growing for a great length from their base, then bending inwards, not round, but compressed, with one side sharp, and of a black colour; the roughness of his hair, of which buff leather is made, is well known.

Besides this, there are other varieties of this species: as the *wild buffalo* of the East Indies, with brittly short hair, weak like stump and thicker quite here, the left marked with dusky stripes pointing downwards, the left with two transverse stripes; and with horns compressed sideways, taper, and sharp at the point. The *American buffalo*, or the *wild cow* of Canada, has horns very closely matted at the base, standing inwards and downwards, and turning outwards at their points; they are two feet round at the base, and two feet distant at the points, and two feet long; the head and shoulders are covered with long hairs of a dark colour; the body is naked behind, the shoulders high, and the flesh tastes like that of mutt. It leaves Canada the high roads to the savages, in the interior parts of North America; it is very fierce, but capable of being tamed, and will breed with the common kind. Its weight is from 1600 to 2000lb. See *Phil. Transactions*, p. 121. See BISON.

There is also the *water buffalo*, with horns sloping at their base, round and flat at the beginning, receding in the middle, almost meeting at the points, and spanning wide. This animal is larger than a cow-buck, but less than a bull; it is compact and well made, with flaming hair of a tawny brown; short legs, black nose, elevated shoulder, and tail terminated with long hair. Pennant.

BUBBLES, Bulles, in *Physic*, little round drops or globules of any fluid filled with air, and formed either at its surface, upon the addition of more of the fluid, or

raining; or in its subſtance, upon a vigorous inteſtine commotion of its parts.

Bubbles are dilatable, or compreſſible, i. e. they take up more or leſs room, as the included air is more or leſs heated, or more or leſs preſſed, from without: and are round, becauſe the included aura acts equably from within all round. Their coat, or cover, is formed of the minute particles of the fluid, retained either by the velocity of the air, or by the brisk attraction between theſe minute parts and the air. See COLOUR.

Theſe little *bubbles*, riſing up from fluids, or hanging on their ſurface, form the white ſcum at top; and theſe ſame *bubbles* form the ſteam, or vapour, flying up from liquors in boiling, &c. the manner of which ſee under BOILING, VAPOUR, &c.

BUBBLE, in *Commerce*, is a cant name given to a ſort of projects, for the raiſing of money on imaginary grounds; very frequent in the years 1720 and 1721.

The pretended deſign of theſe undertakings was, to raiſe a ſtock, for the retrieving, ſetting on foot, or carrying on, ſome promiſing and uſeful branch of trade, manufacture, machinery, or the like. In order to which, propoſals were given out, ſhewing the advantages of the deſign, and inviting perſons into it. The ſum neceſſary to carry on the affair, together with the profits expected from it, were divided into a certain number of ſhares, or ſubſcriptions, to be purchaſed by perſons diſpoſed to adventure therein. The real deſign, in ſome, was to raiſe a ſum for the private advantage of the projectors, to be laid out by them in the South-ſea ſtock, &c. in hopes, by the riſe thereof, to be able to refund the ſubſcribers money, with profit to themſelves. In others, the deſign was abſolutely to defraud the adventurers of their ſubſcription-money, without any view to reſtitution.

There was a third kind ſomewhat different: the projectors of theſe, to proceed the more ſecurely, propoſed to have books opened, and ſubſcriptions taken at ſome time to come; and in the mean time took money, by way of *premium*, to inviſle perſons to be admitted ſubſcribers, as ſoon as the ſtock ſhould be ripe for dividing into ſhares. Several thouſand ſhares were thus very frequently beſpoke in one day; and *premiums*, from one ſhilling, to ſome pounds, paid thereupon, to the profits of the projectors.

The number of *bubbles*, and their qualities, are very extraordinary; ſome of them, too, authorized by patents; and, in others, the projectors and their proprietors formed into corporations: ſome for fiſheries, ſome for inſurances, ſome for the digging of mines, &c.

BUBBLING *waters*. See WATER.

BUBO, in *Ornithology*. See OWL.

BUBO, in *Anatomy*, is ſometimes uſed to denote that part otherwiſe called INGUEN, or *groin*.

BUBO, in *Medicine* and *Surgery*, denotes a tumor, ſometimes inflammatory, and ſometimes ſcirrhous, gathering chiefly in the glands of the *inguen* or groin.

The word comes from the Greek βουβων, *inguen*; the uſual place of ſuch tumors.

There are two kinds of *buboes*, the one called *benign*, or mild, the other *malignant*. Mild *buboes* are thoſe which are preceded or attended with no manifeſt diſeaſe in the body, and they are eaſily cured by gentle medicines, externally applied, and an occaſional purge; or by encouraging ſuppuration, and proceeding as in a common abſceſs.—Malignant *buboes* are divided into *peſtilential* and *venereal*: the former ariſe in peſtilential fevers, &c. The latter are the product of impure embraces; and frequently the forerunner of the pox.—When a *bubo* is encompaſſed with a circle of ſeveral colours, it is a ſign it is peſtilential; and it is generally mortal.

By *buboes* in *peſtilential* caſes, the writers in phyſic not only expreſs ſuch tumors as ariſe under the arms, under the ears, and in the groin; but comprehend under this term thoſe alſo which are ſituated in the neck, breaſt, arms, legs, and other fleſhy parts of the body, which ſwell and inflame in *peſtilential* fevers, and ſeem the conſequences of the endeavours of nature to throw out the peſtiferous matter which lay concealed in the body.

Peſtilential buboes are diſtinguiſhed from other tumors by their happening at a time, and in conjunction with the plague, and from their being accompanied by the ſymptoms proper to that diſeaſe. Theſe tumors appear ſometimes ſooner, ſometimes later, in the courſe of the diſeaſe; in ſome they appear before the patient knows he has the infection, and in others two or three days after or before their appearance: they are very ſeldom known to appear later than on the fourth day, and are ſometimes joined with carbuncles; but though the *buboes* frequently appear without theſe, yet the carbuncles never appear without tumors.

Perſons who have theſe tumors come on without any very bad ſymptoms, and have them maturate ſpeedily, are in general the ſooneſt freed from the diſtemper, inſomuch, that the beſt method of giving relief in this terrible diſeaſe, conſiſts in the carefully promoting and keeping up the *buboes* and tumors. All diſcutient or diſperſing medicines are carefully to be avoided, and the phyſician's buſineſs is to aſſiſt nature in the throwing out, and moſt ſpeedily bringing theſe tumors to ſuppuration.

The patient is to be confined to his bed on the firſt appearance of theſe, and with the help of internal medicines proper to haſten the ſuppuration of tumors, the parts affected are to be rubbed pretty ſtrongly with the hands or cloths, and external, maturating, and emollient cataplaſms, to be applied; of this kind is that of yeaſt, ſalt, and muſtard-ſeed, all mixed together, or of yeaſt alone: by means of theſe the tenſe parts are relaxed and ſtimulated, and the ſuppuration greatly promoted; as alſo by the cataplaſms of roaſted onions, with Venice treacle and butter; or of crumb of bread, with milk and ſaffron. Plaſters are alſo very uſeful on ſome occaſions; in theſe caſes, as the frequent renewal of the cataplaſms expoſes the patient too much to the external air, and theſe are not attended with the inconvenience. The moſt famed plaſters on theſe occaſions are that of Barbet, made of the *diachylon*, with the gum and mucilage plaſter, of each half a pound; muſtard-ſeed in powder, three ounces; baſilicon, four ounces; all mixed and made into a plaſter: and that of Dr. Hodges, made of three ounces of *oxycroceum*, an ounce of *galbanum*, the ſame quantity of *gum ammoniac*, and two ounces of black pitch, reduced to the conſiſtence of a plaſter.

This may be uſed like the former; nor is that plaſter to be eſteemed a trifle, which is made of honey, flour, and the yolks of eggs.

In ſome caſes of this terrible diſtemper, the tumor comes to ſuppuration in a few days; in others it is ſome weeks before it can be brought to it, by all that can be done. When thoroughly ſuppurated, it is to be opened with the ſcalpel, if it does not break of itſelf; and after this opening, when the matter has been diſcharged, it muſt be well cleanſed. The beſt digeſtive in this caſe is the common ointment uſed on that occaſion, mixed with a ſmall quantity of Venice treacle, and balſam of ſulphur made with oil of turpentine. At each dreſſing the matter is to be gently ſqueezed out of the abſceſs, and the ointment applied without tents, unleſs the opening prove very narrow; then applying over all a plaſter of the common diachylon, or of honey and flour, the whole may be bound on, and this dreſſing continued till it is a proper time to heal with ſome vulnerary balſam.

There has been much diſpute between the phyſicians of different ages about the proper time for opening *bubos* of this kind; ſome have been for making an immediate inciſion, and others even for extirpating the whole ſwelling, as ſoon as it appeared, by means of the knife; but the firſt of theſe methods has been found to be frequently attended with the ill conſequences of ill conditioned fiſtulæ, ſtiffneſs, and loſs of motion in the limb, and ſometimes even with mortifications and gangrene; and the other too harſh and dangerous in many parts of the body: and the preſent practice univerſally diſallows both methods, being always for bringing the ſwelling to ſuppurate. Heiſter's Surg. p. 200.

The poiſon of the matter of theſe ſores has been nicely and boldly inquired into, as to its nature and properties, by Dr. Aſpranus of Prague, in the time of the plague there in 1680. This gentleman having launced a *peſtilential* boil, collected the matter from it, and put it into a retort, luting the junctures with the receiver very cloſely and exactly, and applying by proper gradation the ſeveral degrees of fire; at firſt there came over a water, then a more fat and viſcid liquor, of an oily nature; and laſtly, there appeared in the neck of the retort, a ſalt. The fire being taken away, and the veſſels cooled, the doctor prepared himſelf for the opening of them by ſtopping his ears with cotton, his noſtrils with peſſaries, and his mouth with pieces of ſponge, all ſoaked in vinegar and Venice treacle. The moment the veſſels were opened, however, there proceeded out of them a ſtench more horrible than can be conceived, which ſtruck the doctor with an univerſal trembling, in ſpite of his defence. He proceeded, however, to break the neck of the retort, and ſeparating the fœtid ſalt from it, he ventured himſelf to taſte it, and declared Mr. Reiſel, the perſon from whom the matter was obtained, to do the ſame: it was found to have a moſt dreadfully piercing acrid taſte, which the doctor compares to that of *aqua regia*. Hence he infers, that the moſt terrible ſymptoms of this fatal diſeaſe are to be accounted for: the ſtomach, wounded by ſo acrid a juice as this mingled among the blood, nauſeates food, and is afflicted with continual vomitings; the guts, infeſted by the ſame unwelcome gueſt, are thrown into violent perturbations, whence ariſe thoſe diarrhœas which often accompany the patient to his death; and from the horribly acrid quality of this juice, it is no wonder that ſuch piercing pains are found

in the *buboes*, and such burnings in the carbuncles that attend this diſeaſe.

Hence, alſo, as he obſerves, it is, that ſudorifics are the beſt remedies, ſince they allay the acrimony, and tend to expel the venomous juices through the pores. In this ſickneſs a Pragve this gentleman obſerved, that almoſt all who ſweat plentifully recovered, whereas thoſe who did not ſweat, were moſtly taken off. Hooke's Philoſoph. Collect. N° ii. p. 18.

BUBOES, *venereal*, are tumors ariſing principally in the groin, after contracting the venereal diſeaſe, and they are ſometimes attended with the other ſymptoms of that diſorder, ſometimes they are themſelves the only ſymptoms of it. Theſe ariſe ſometimes ſooner, ſometimes later, after contracting the infection. The tumor firſt appears with hardneſs, redneſs, and pain, either in one or both the groins, and ſometimes in the arm-pits. Great care is to be taken to diſtinguiſh, in thoſe caſes, whether the *bubo* be of a benign kind, or be really from a venereal infection: for miſtakes of this matter are on both ſides very dangerous. If a benign *bubo* be miſtaken for a venereal one, the patient is uſually treated in too harſh a method, and has more trouble and pain than are neceſſary; and, on the other hand, if a venereal *bubo* be miſtaken for a benign one, he is uſually treated ſo improperly as to be brought into a confirmed lues.

The *buboes* are known to be venereal when they are the conſequences of impure embraces, or are accompanied with, or preceded, by gonorrhœas, chancres, and other ſymptoms of the venereal diſeaſe. When from theſe attendant ſymptoms, and from the patient's confeſſion, the *bubo* is found to be venereal, a cure is immediately to be ſet about; for though there is no great difficulty or danger in theſe caſes when taken in time, yet there are few in which delays are of worſe conſequence; for, from theſe, from an irregular courſe of life, or from an improper method of treatment, the cure often becomes extremely difficult, and the patient too frequently gets into a confirmed lues.

It is much diſputed whether the cure of theſe tumors by diſcuſſion be ſafe; many are of opinion, it is by no means to be allowed in theſe any more than in peſtilential *buboes*, ſince in both caſes, by that means, the poiſon is driven back into the blood. But the caſe is not parallel, and the truth is, that in theſe tumors the cure by ſuppuration is ſlow, tedious, and attended with many inconveniences, and that much better effects may be produced, and with the greateſt ſafety, by purging and mercurial medicines, with the decoctions of the woods, and other purifiers and ſweeteners of the blood.

The beſt method, whether the *bubo* be attended with a gonorrhœa or not, is to purge frequently, and give proper doſes of calomel; for *buboes* can never be ſafely cured till the body is perfectly freed from the venereal venom; and, by this means, if there be a gonorrhœa in the caſe alſo, that is cured at the ſame time. When there is a great inflammation, and the patient is of a robuſt plethoric habit, it is always neceſſary to bleed: while this method is followed, diſcutient plaſters ſhould be applied externally to the tumor, as the mercurial plaſter or the like, and the patient ſhould be kept to a regular courſe of life, and a proper diet. By this method, venereal *buboes*, which are not become inveterate, may be cured with great eaſe and ſafety.

But if the ſurgeon be called in too late, if the *bubo* will not give way to theſe methods; or if, for any other reaſon, he determines to bring it to ſuppuration, the maturation is in this caſe to be promoted as faſt as poſſible; and one great method to bring on ſuppuration with ſpeed, is to order the part to be rubbed ſtrongly, and for a conſiderable time, either with the fingers wetted with a little oil, or with linen rags, till it look very red and inflamed: and this is to be often repeated, applying after each time a plaſter of diachylon, with the gums, or ſome other of the maturating kind. While the patient is able to go abroad, violent exerciſes of all ſorts, as dancing and the like, are extremely proper, and do ſervice in haſtening a ſuppuration. When the pain will not ſuffer him to walk any longer, then it is proper to keep to the uſe of cataplaſms, inſtead of the plaſter: theſe are indeed ever much more ſerviceable to promote ſuppuration than plaſters, and the beſt on this occaſion are thoſe made of onions, roaſted under the aſhes, or of flour, honey, and yeaſt, or that of crumbs of bread boiled in milk, with the addition of a little ſaffron: theſe are to be applied warm to the parts, and frequently renewed: and it is always beſt to rub the parts, till they look very red, before the application of them. During the uſe of theſe external remedies, the patient ſhould be continually taking decoctions of the woods, and ſmall doſes of calomel: for theſe greatly attenuate the blood, drive it toward the ſkin, and correct the venereal venom. When theſe methods have brought the ſwelling to a perfect ſuppuration, the ſcalpel is to be taken in hand, to make the opening. Great caution is to be uſed in making the inciſion, not to hurt the larger blood-veſſels, which might occaſion very dangerous hæmorrhages. To avoid theſe miſchiefs, the protuberant part of the *bubo* is to be preſſed outward by the fingers, before the ſcalpel is introduced to make the inciſion. Great caution is alſo neceſſary as to the time of opening theſe tumors; for the doing this either too ſoon, or too late, are of very bad conſequence; the firſt brings on violent pains and inflammations, and other bad ſymptoms, and, by the latter, the venom has time given it to mix itſelf with the blood, and bring on a confirmed lues.

If the patient dreads the knife, the *bubo* may be opened with a cauſtic; and by whatever means it is done, it muſt be afterwards well cleanſed. The proper dreſſing on this occaſion is the common digeſtive ointment, with a ſmall quantity of Venice treacle, and a little red precipitate mixed in it; over this is to be applied a plaſter of diachylon, with the gums, or the like; by which means the lips of the *bubo* will be ſufficiently ſoftened: and when ſufficiently deterged in this manner, it may be healed by ſome vulnerary balſam applied on lint. It ſometimes happens, that the ulcerated *bubo* becomes ſo ſtubborn, that it will neither incarne nor cicatrize by the help of any medicines, but always diſcharges a copious quantity of matter. If, in this caſe, burnt alum and red precipitate prove of no ſervice, the actual cautery ought to be applied, and the lymphatics will by this means have their communications for ever cut off. Heiſter's Surg. p. 207.

BUBON, in *Botany*, *Macedonian* PARSLEY; a genus of the *pentandria digynia* claſs of plants. The characters are theſe: it hath an umbelliferous flower, and the ſmall umbels have twenty rays; the empalement of the flower is permanent; the flower is compoſed of five ſpear-ſhaped petals, which turn inward, and hath five ſtamina; the oval germen is ſituated below the flower, which afterward becomes an oval, channelled, hairy fruit, dividing in two parts, each having an oval ſeed, plain on one ſide, but convex on the other. There are four ſpecies. This plant in warm countries is biennial; but in England it ſeldom flowers until the third or fourth year: when the plant flowers it always dies. They make a pretty variety in the green-houſe.

The ſeeds of one ſpecies of this plant are ingredients in the mithridate and theriaca.

The *galbanum* of the ſhops is ſuppoſed to be procured from two other ſpecies indifferently; and upon breaking their leaves, the juice which flows from the wound hath a ſtrong odour of the *galbanum*, which is a confirmation of it.

BUBONIUM, in *Botany*, a name given by ſome authors to the *Aſter Atticus*, or golden STAR-*wort*.

BUBONIUS *lapis*, a figured ſtone, in ſhape reſembling an owl's head, of a flinty ſubſtance, black within, and cineritious without. It was thus denominated by Dr. Plot, having not been before named by naturaliſts. *Hiſt. Oxford*, chap. v. § 45.

BUBONOCELE, a tumor in the groin; occaſioned by the deſcent either of the *epiploon*, or the inteſtines, through the perforation of the *muſculus obliquus deſcendens*.

The word comes from the Greek βουβων, *inguen*, and κηλη, *tumor*.

The *bubonocele* is the ſame with what is otherwiſe alſo called *ramex* and HERNIA *inguinalis*.

It is a ſpecies of rupture; though ſurgeons call it an *incomplete* one; and is common to women, as well as men.

Some make two kinds of *bubonoceles*; the one owing to a deſcent of ſome of the *viſcera*, as the *omentum*, or inteſtines, ſtopping in the groin, and not falling ſo far as to the *ſcrotum*; the other a collection or ſtagnation of excrementitious humours in the inguinal glands; which latter is more properly called *bubo*, and differs little, except in ſeat, from the bronchocele.

BUBULCA, in *Ichthyology*, a ſmall freſh-water fiſh, called by ſome *bouvière* and *peteuſe*; it is ſmall, flat, and very ſhort, approaching to a round rather than a long ſhape, and of a fine ſilvery whiteneſs, ſeldom above two inches in length.

BUCA, in *Natural Hiſtory*, a name by which ſome authors call the *buccinum*.

BUCAO, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to a ſpecies of *ſcreech* OWL, which is of the ſize of a peacock. It is very common in thoſe iſlands, but wholly unknown to us, and is a very beautiful bird, but makes a hideous noiſe in the nights.

BUCARDITES, or BUCARDIA, in *Natural Hiſtory*, a name given by many authors to a ſtone, in ſome degree reſembling the figure of an ox's heart. See *Tab* III. *of Foſſils, Claſs* 9.

It is uſually of the ſubſtance of the coarſer ſtones, and is

EO

no other than a quantity of the matter of ſuch ſtone received while moiſt into the cavity of a large cockle, and thence aſſuming the figure of the inſide of that ſhell, the depreſſion of the head of the cockle, where the *cardo* or hinge of this ſhell is, makes a long and large dent in the formed maſs, which gives it a heart-like ſhape. Plott mentions a *bucardites*, which he found at Stretſford in Staffordſhire, which weighed twenty pounds, though broken half away, curiouſly reticulated, with a white ſpar-coloured ſtone. Nat. Hiſt. Oxf. chap v. § 145.

BUCARDIUM, in *Natural Hiſtory*, a name given by authors to a kind of HEART-SHELL, reſembling an ox's heart in ſhape; it is of the *genus* of the *cardiformes*, or heart-ſhells, and differs from the other kinds, in being of a more globular figure.

The cabinets of the curious afford us ſeven *ſpecies* of this ſhell. 1. A yellow-furrowed one. 2. A grey ſpinoſe one. 3. A white-furrowed one. 4. A thicker narrow one. 5. The thick one, with a *cardo* ſeparated from the *apex*. 6. The thick kind, with the *cardo* at the *apex*; and, 7. The baſtard Noah's ark ſhell.

BUCCA FERREA, in *Botany*, a name given by Micheli to a genus of plants, called ſince by Linnæus RUPPIA.

BUCCÆ *muſculus*, in *Anatomy*, a name given by ſome to the muſcle more uſually called the *buccinator*, and *contrahens labiorum*.

BUCCALES *glandulæ* are ſmall glands diſperſed over the inner ſide of the cheeks and lips, which ſeparate a ſpittle, uſeful in maſtication and digeſtion.

Steno, and ſome other writers, confound the *buccal* with the maxillary glands; from which they are really diſtinct. Phil. Tranſ. N° 304. p. 6.

BUCCANEERS, or BUCANEERS, a term frequent in the Weſt Indies, properly uſed for a kind of ſavages who prepare their meat on a grate, or hurdle, made of Braſil-wood, placed in the ſmoke, at a good height from the fire, and called *buccan*.

Whence, alſo, the little lodges raiſed for the preparation of their food, are called *buccans*; and the action of dreſſing it *buccaning*.

Meat *buccaned*, is ſaid to have an excellent taſte, the vermil colour of a roſe, and a charming ſmell; all which it retains many months. Oexmelin, from whom we have this, adds, that the neighbouring people ſend their ſick hither; that by eating their *buccaned* meat, they may be recovered.

The origin of the word is referred to the people of the Caribbee iſlands, who uſed to cut their priſoners of war in pieces, and lay them on hurdles with fire underneath, which they call *buccaning*, i. e. roaſting and ſmoaking together: hence our *buccaneers* took both their name, and their cuſtom; with this difference, that what the former did to men, theſe did to animals caught in hunting.

The Spaniards, Savary tells us, call the *buccaneers* in their territories *matadores*, that is, *killers*; and *monteros*, that is, *hunters*: the Engliſh call theirs, *cow-killers*.

The *buccaneers* are of two diſtinct profeſſions: the one only hunt bulls, for their ſkins; the other beaſts, for their fleſh.

The art of *buccaning*, Oexmelin deſcribes thus: the beaſt being ſlain, and the bones ſtripped out, the fleſh is cut into pieces of the length of the arm, and ſalted, and the next day laid on the *buccan*; which conſiſts of twenty or thirty bars laid acroſs, half a foot from each other: under this they raiſe a thick ſmoke, adding the ſkin and bones of the beaſt to heighten it.

This is found vaſtly better than any ſimple fuel: becauſe the volatile ſalts of thoſe parts are by this means communicated to the fleſh, and give it ſuch a reliſh, as that, after a little of this *buccaning*, the niceſt palate will eat it without further preparation.

Buccaneers are uſually confounded with freebooters, from whom, in ſtrictneſs, they ought to be diſtinguiſhed. The ancient inhabitants of Hiſpaniola, and the other Caribbee iſlands, after their conqueſt by the Europeans, conſiſted of four ranks or orders of perſons, viz. *buccaneers*, or bull-hunters, who ſcoured the woods; *freebooters*, who ſcoured the ſeas as pirates; *huſbandmen*, who tilled the lands; and *ſlaves*. Of theſe, the two firſt diſtinguiſhed themſelves moſt by their military diſpoſition, and the ravages they made, eſpecially among the Spaniards.

The name is particularly given to the French inhabitants of the iſland of St. Domingo, whoſe ſole employment is to hunt bulls, or wild boars; in order to ſell the hides of the former, and the fleſh of the latter.

Sometimes the word *buccaneer* ſignifies alſo thoſe famous adventurers of all the nations in Europe, who joined together to make war againſt the Spaniards of America: and, under that name, their hiſtory has been publiſhed in the year 1686, by Alexander Oliver Oexmelin.

The *buccaneers* ſell their meat by the bundle or pack, weighing commonly ſixty pounds, at the rate of ſix pieces of eight per pack. The palmetto leaves ſerve to pack it up in, but their *weight* is deducted; ſo that there muſt be in each pack ſixty pounds of neat fleſh. Theſe *buccaneers* have alſo a great trade of the lard of boars, which they melt and gather in large pots, which they call *potchet*. This lard, which is called *mantegna*, is alſo ſold for about eight pieces of eight per pod.

There is a great conſumption and trade of each of theſe articles in the French ſettlements of the iſlands of St. Domingo, and in thoſe of Tortuga; beſide which they ſend great quantities of them to the Antilles, and even into the continent of French America. There is alſo a great deal of it ſold for the ſupport of the crews of the ſhips that come from France for trading, or which the privateers of Tortuga fit out, for cruiſing againſt the Spaniards.

BUCCELA, or BUCCELLA, in *Medicine*, a term uſed by ſome to expreſs a fragment of any thing, and others make it the name of what we uſually call a POLYPUS of the noſe.

BUCCELLARII, an order of ſoldiery under the Greek emperors, appointed to guard and diſtribute the ammunition-bread.

The word is formed from *buccellus*, a kind of loaf, or cake of a circular figure.

The *buccellarii* were alſo called, in reſpect of their country, *Galligraci*, or *Helenogalatæ*, q. d. Greeks of Galatia; ſometimes *Maryandini*.

Authors are much divided as to the office and quality of the *buccellarii*: ſome give the denomination to paraſites in the courts of princes and great men, maintained at their table and expence. In reality, among the Viſigoths, *buccellarius* was a general name for all clients, or vaſſals, who lived at the expence of their lords. Spelman rather ſuppoſes them to anſwer to what among us are called *retainers by military ſervice*. Others repreſent the *buccellarii* as ſtationary ſoldiers in the provinces, who, when the emperor commanded, marched before and behind him as his body guard. According to others, they were men whom the emperors employed in putting perſons to death ſecretly.

BUCCELLATIO, in *Surgery*, a word uſed by ſome chirurgical writers for the ſtopping the bleeding of an artery or vein, by applying lint to it.

BUCCELLATION, in *Ancient Phyſic*, the name of a medicine, in which *ſcammony* was the principal ingredient.

BUCCELLATUM, in *Ancient Military Writers*, denotes *camp-*BREAD or BISKET baked hard and dry, both for lightneſs and keeping.

The word is formed from *buccea*, or *buccella*, a *morſel*, or *mouthful of meat*.

Soldiers always carried with them enough for a fortnight, and ſometimes much longer, during the time that military diſcipline was kept up.

BUCCINA, an ancient military, or rather muſical inſtrument, uſed in war; eſpecially for proclaiming the watches of the night, and giving notice to the ſoldiery when they were to mount, and when to quit the guard.

The word comes from *bucca*, *mouth*, and *cano*, *I ſing*; becauſe played on by the mouth: others ſuppoſe it formed from *βυκανη*, or *βυκανη*, which ſignifies the ſame; formed from *βυς*, *bullock*, and *κανω*, *I ſing*; becauſe anciently made of bullocks horns: others from the Hebrew *buk*, a *trumpet*. Varro will have it to have been originally formed by *onomatopœia*, from *boa boa*, alluding to the ſound it gives. Others, with more probability, derive it from *buccinum*, the name of a ſhell-fiſh.

The *buccina* is uſually conſidered as a ſpecies of *tuba*, or trumpet; from which however, in propriety, it appears to have differed, not only in reſpect of figure, which in the *tuba* was ſtraight, and in the *buccina* recurve, or crooked, but in ſound; that of the *buccina* being ſharper, and audible to a greater diſtance than the trumpet-ſound.

The *buccina* approached neareſt to the *cornu*, or horn: originally the two ſeem to have been the ſame; though in after-times a difference aroſe; the name *buccinum* being reſtrained to the leſſer ſorts, and the *cornu* to the largers —Some alſo take the *buccina* to have been leſs crooked than the *cornu*, which made a full ſemicircle.

Varro aſſures, that the *buccinæ* were alſo called *cornua*, *horns*; becauſe originally made of the horns of cattle, as is ſtill done among ſome people. Servius intimates, that they were at firſt made of goats or rams horns; and accordingly, in Scripture, the like inſtruments uſed both in war, and in the temple, are called *rams horns*, *keren-jobbel*, and *ſopheroth haiiobelim*, or *buccinæ* of rams.

This inſtrument was in uſe among the Jews, to proclaim their feaſt-days, new moons, jubilees, ſabbatic years, and the like. At Lacedæmon, notice was given by the *buccina* when it was ſupper-time; and the like was done at Rome, when the grandees had a *buccina* blown both before they ſat down to table, and after.

The ſound of the *buccina* was called *buccinus*, or *bucinna*, and the muſician who played on it, *buccinator*.

BUCCINA also denotes the ſpace or extent to which the ſound of the *buccina* may be heard.

BUCCINA-*auris*, in *Middle Age Writers*, denotes the *tympanum* or *drum* of the ear.

BUCCINATOR, he that ſounds or winds the *buccina*.

Among the Romans there was a public ſlave, denominated *buccinator tuminum*, whoſe office was to attend the public crier.

BUCCINATOR, in *Anatomy*, a muſcle on each ſide the face common to the lips and cheeks; making the inner ſubſtance of the latter. Its fibres run from the *proceſſus coronæ* of the lower jaw to the angle of the mouth, and adhere to the upper part of the gums of both jaws: through its middle paſs the upper *ductus ſalivales*. By this is contracted the cavity of the mouth, and the meat thruſt forward to the teeth in maſtication.

It has its name from *buccina*, *trumpet*; becauſe, when ſwelled, it enlarges the cheeks, as in blowing a trumpet. —See *Tab. Anat. (Myol.) fig.* 1. *n.* 10.

BUCCINUM, in *Botany*, a name given by ſome authors to the LARK-SPUR. Ger. Emac. Ind. 2.

BUCCINUM is alſo uſed for the TRUMPET-*ſhell*. It is a diſtinct genus of the univalve and ſpiral *teſtacea*, in the Linnæan ſyſtem. See SHELLS.

BUCCO, in *Anatomy*, a name given by Riolanus, and ſome others to the muſcle more uſually called *buccinator*, and *contrahens labiorum*.

BUCCO, in *Ornithology*, a genus of birds of the order of *picæ*.

BUCCULA, in *Anatomy*, the fleſhy part under the chin.

Some extend the name farther to the whole lower part of the face, comprehending the under part of the lower lip, with the chin and the fleſhy part under it.

BUCCULA, in *Antiquity*, denotes the umbo of a ſhield, or the part prominent in the middle thereof.

It is thus called, becauſe uſually made in the form of a mouth or face, either of a man or ſome animal. The like figures were ſometimes alſo found on other parts of armour, eſpecially on the *lorica* and *thoracas*.

BUCENTAUR, the name of a large flate-veſſel, uſed by the Venetians in the ceremony of eſpouſing the ſea, performed each aſcenſion-day with much pomp.

The word comes from βουκενταυρος; compoſed of βου, a particle of augmentation, uſed to denote an enormous greatneſs, and κενταυρος, *centaur*. Juſtiniani adds two other etymologies: the firſt from *bis*, and *taurus*, or rather *centaurus*, the name of one of Æneas's veſſels in Virgil: the other from *bucentaurus*, for *ducentaurus*, a word forged to ſignify a veſſel capable of holding two hundred men.

P. Juſtiniani gives a very preciſe deſcription of the *bucentaur*; and adds, that its origin is carried up as high as the year of Chriſt 1311, though others trace it higher, to the year 1177, when the emperor Frederic Barbaroſſa came to Venice, to make peace with the republic and the pope: at which time the pope, in conſideration of the ſervices the ſtate had done him, in ſheltering him in their city, when he had been driven out of his own, granted them ſeveral privileges; and made a preſent to the doge of a gold ring, which is the origin of that yearly caſt by the doge, from the *bucentaur*, into the ſea.

It is on Aſcenſion-day, that the doge, being advanced in the *bucentaur* a little way into the gulph, throws a gold ring into the ſea, and ſays, "We marry thee, O ſea, in "token of that true and perpetual dominion which the "republic has over thee."

The archduchefs Maria Joſepha, married to the prince of Saxony, on the day of her entry into Dreſden, was received in a magnificent galley, finely tigged, and called a *bucentaur*, becauſe built after the model of that of Venice.

BUCEPHALON, in *Botany*. See TROPHIS.

BUCEPHALUS, *horſe-ſhoe*. See HORSE.

BUCEROS, in *Ornithology*, the name of a ſpecies of raven found in the Eaſt Indies, China, and Tartary. Its head, neck, rump, and tail, are of a gloſſy black, without the leaſt tinge of any other colour. It is of the bigneſs of a well grown pullet: its head is remarkably large, as is its beak, which has a conſiderable gibboſity towards the baſe, riſing above the reſt of the ſurface.

BUCEROS, forms a genus of birds, of the order of *picæ*, in the Linnæan ſyſtem. The beak is convex, and bent backwards; the upper chap of the beak is longer than the under; the noſtrils are near the baſe of the beak; the tongue is acute and ſhort, and the feet are formed for walking.

BUCHNERA, in *Botany*, the name of a genus of the *didynamia angioſpermia* claſs of plants, the characters of which are theſe: the *perianthium* is tubular, conſiſting of one leaf, divided into five ſegments at the edge, and remaining after the flower is fallen. The flower conſiſts of one petal, which forms a very long and capillary arched tube; its verge is plain and ſhort, and is divided lightly into five ſegments, which are ſmall at the baſe, and broader, and figured like a heart at the top. The ſtamina are four very ſhort filaments; the *antheræ* are oblong and obtuſe; the germen of the piſtil is oblong and oval; the ſtyle is very ſlender, and of the length of the tube; and the ſtigma is obtuſe. The fruit is a capſule of an oblong oval figure, pointed at the end, containing two cells, and opening at the top into two parts. The ſeeds are numerous, and of an angular figure. There are four ſpecies.

BUCIDA, in *Botany*, a genus of the *decandria monogynia* claſs of plants, the calyx of which is indented in five ſegments; it has no corolla; and the fruit is a ſingle ſeeded berry. There is only one ſpecies of this *genus*.

BUCK, a male horned beaſt of venery or chace, whoſe female is denominated a *doe*.

A *buck* the firſt year is called a *fawn*, the ſecond a *pricket*, the third a *ſorel*, the fourth a *ſore*, the fifth a *buck of the firſt head*, and the ſixth a *great buck*. See DEER and HUNTING.

BUCK is alſo applied to the males of the hare and rabbit kind. Hares commonly go to *buck* in January, February, and March, and ſometimes all the warm months; ſometimes they ſeek the *buck* ſeven or eight miles from the place where they ſit.

The *buck* rabbit is ſaid to kill all the young he can come at; on which account the doe is careful to hide her offſpring in ſome remote corner, out of his way.

The doe coney goes to *buck* as ſoon as ſhe has kindled. She cannot ſuckle her young till ſhe has been with the *buck*. When he has bucked, he uſually falls backward, and lies as in a trance half dead, at which time he is eaſily taken.

BUCK-*maſt*, is uſed by ſome for the maſt or fruit of the beech-tree.

BUCK-*bean*. See TRIFOLIUM *paluſtre*.

This plant, though mentioned by ſeveral writers before Simon Pauli, yet was firſt recommended by him in ſcorbutic caſes. He ſays it is more ſubtle and penetrating than *naſturtium*, or creſſes.

It ſeems at preſent to be coming into great repute in many chronical diſtempers; and frequently preſcribed among the apothecaries.

Many have got it into uſe in their families in the form of tea, and experience its conſtant uſe to be very effectual againſt ſcrophulas, the king's evil, and obſtinate ſcorbutic diſtempers. Its taſte, at firſt, is not very grateful, but time wears off that diſlike; its uſe in ſhop compoſitions is not yet known.

Buck-bean ſerves in Hampſhire to a very remarkable uſe; the brewers uſing it in their beer in the place of *hops*. It is a good preſerver of the drink, and is a bitter of as agreeable a flavour: it has this advantage alſo, that one eighth part of the quantity is ſufficient; it is a very harmleſs plant, and is given by many as an antiſcorbutic, and by ſome in rheumatiſms, and other chronic caſes. It might be extremely worth while to try this practice in other parts, as the plant might be eaſily cultivated in any quantity, and with this advantage, that it will grow on the worſt kind of boggy land, which will produce nothing elſe.

BUCK-*ſhins*. See SKINS.

BUCK-*ſtall*, in our *Ancient Law-books*, a toil wherein to take deer.

By an ancient ſtatute, no perſon is allowed to keep a *buck-ſtall*, who has not a pack of his own. Stat. 19 Hen. VII.

BUCKET, in *Hydraulics*, a kind of veſſel or recipient chiefly of uſe for the raiſing and conveyance of water from wells, and other places.

The word is formed from the French *baquet*, a *pail* or *tub*.

In an army, *buckets* are carried with the artillery, in the fire-workers ſtores.

Town-*buckets*, for extinguiſhing fires, are made of thick leather, ſtrongly ſoaked and boiled.

One method of raiſing water, deſcribed by hydraulic writers, *is* by the means of a chain of *buckets*.

BUCKET, *ſea-gage*. See *Sea*-GAGE.

BUCKING, among *Miners*. See ORE.

BUCKING, an operation performed on linen cloth and yarn, to render them ſomewhat white, by working them with ley made of aſhes.

Bucking of cloth is the firſt ſtep or degree of whitening it. See BLEACHING.

To drive a buck of yarn, they firſt cover the bottom of the *bucking tub* with fine aſhes of the aſh-tree, then ſpread the yarn thereon, then cover it again with the aſhes, and thus *ſtratum ſuper ſtratum*, till the yarn is all in: when they cover the whole with a *bucking-cloth*, and lay on it more aſhes, and pour in warm water, till the tub be full, and let it ſtand all night. Next morning they let the ley run into another veſſel, and, as it waſtes, fill up the tub with warm water from a kettle, and, as this waſtes, fill it up with the ley that runs from the *bucking-tub*; ſtill obſerving

ferving to make the ley hotter and hotter, till it boils. Thus are both the tub and kettle to be fupplied for at leaſt four hours, which is called *driving a buck of yarn*.

BUCKLE, in *Mechanics of Trade*, a little metalline machine, whereby to retain and keep faſt certain parts of the habit, as well as of the harneſs of horſes, &c.

The word is formed from the French *boucle*, and that, according to Caſſeneuve, from the barbarous Latin *pinſtula*, which ſignified the ſame. According to Menage, from *bucula*, the *oſſa*, or handle, of a buckler.

The *buckle* is a part of modern dreſs, correſponding to the *fibula*, among the antients.

Buckles are of divers forts, as ſhoe and garter *buckles*; ſome round, others ſquare, or oval, or cut, each of which have their reſpective artificers by whom they are made.

The like may be ſaid of the great variety of *buckles* belonging to the pack and hackney-ſaddles.

BUCKLE, *girth*, among *Saddlers*, is a four ſquare hood, with a tongue, which is made ſteady, by going through a hole or leather, and faſtened with narrow thongs.

BUCKLER, a piece of defenſive armour, uſed by the antients to ſkreen their bodies from the blows of their enemies.

The word comes from the barbarous Latin *buccularium*; of *buccula*, the umbo or middle point of this weapon, which had uſually a head, or mouth, repreſented prominent thereon.

The *buckler* of Achilles is deſcribed in Homer, that of Æneas, in Virgil, that of Hercules, in Heſiod: Ajax's *buckler* was lined with ſeven bulls hides.

The *buckler* is the ſame with what we otherwiſe call ſhield or target; and by the one or the other we indifferently render what among the ancients were denominated *clypeus*, *ſcutum*, and *parma*; though the three latter were different from each other. Phil. Tranſ. N° 241. p. 206.

The ancients were particularly ſolicitous to preſerve their *bucklers* in fight: it being highly infamous, and even penal, to return without them: it was on their *bucklers* that they carried off the bodies of their ſlain, eſpecially thoſe of diſtinction. Potter. Arch. lib. iii. cap. 4. & 13.

The Spaniards ſtill retain the *ſword* and *buckler* in their night-walks.

Buckler, on medals, are either uſed to ſignify public *vows*, rendered to the gods for the ſafety of a prince; or that he is eſteemed the defender and protector of his people. Theſe were particularly called *votive bucklers*, and were hung at altars, &c.

BUCKLER *muſtard*, in *Botany*. See MUSTARD.

BUCKLER *of a caſk*, denotes a moveable head, whereby to compreſs the contents of it.

In this ſenſe we ſay, a *buckler* of PILCHARDS.

BUCKRAM, a thick ſort of linen or hempen cloth, ſtiffened with gum, chiefly uſed in the linings of cloaths, to ſuſtain and make them keep their form.

BUCKS-HORN. See PLANTAIN.

BUCKS-HORN *ceraſus*. See COCHLEARIA.

BUCKTHORN, *Rhamnus*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: it hath male and female flowers on different plants, which have no empalements according to ſome, or petals, according to others. The cover of the ſexes is funnel-ſhaped, cut into four parts at the top, which ſpread open; the male flowers have four ſtamina of the length of the tube, terminated by ſmall ſummits; the female flowers have a roundiſh germen, ſupporting a ſhort ſtyle, crowned by a quadrifid ſtigma; the germen afterward becomes a roundiſh berry, incloſing four hard ſeeds. There are nineteen ſpecies of the *rhamnus*.

The berries of *buckthorn* are larger than elder-berries, round and black, yielding a bitter purple juice, tinged with green, and holding three or four cornered ſeeds.

The tree grows in woods and hedges, having its branches ſet with long ſtiff thorns.

The ſyrup is the only preparation of thoſe berries now in phyſical uſe. See *Buck*-THORN.

It is a ſtrong purgative, and effectual in evacuating watery and flatulent humours; on which account it is eſteemed in dropſies, rheumatiſms, and even the gout.

Of *buckthorn* berries are made three ſeveral ſorts of colours; being gathered green, and kept dry, they are called *ſap-berries*; which being ſteeped in alum-water, give a fair yellow colour, uſed by painters, book-binders, and leather-dreſſers; who alſo make a green colour, called SAP-*green*, taken from the berries when they are black. Theſe being broiſed, and put into a braſs kettle, and three ſuffered to remain for three or four days, with ſome beaten alum put to them, are afterwards preſſed, and the liquor uſually put into bladders, and hung up till it be dry: this is afterwards diſſolved in water or wine, but Canary is the beſt, to preſerve the colour from ſtarving. The third is of a purpliſh colour, made of the berries ſuffered to grow upon the buſhes till the middle or end of November, when they are ready to fall of themſelves. Vide Boyle, Phil. Works abr. vol. ii. p. 76. 77.

BUCKTHORN, *ſea*, in *Botany*. See SEA *Buckthorn*.

BUCK-WHEAT. See WHEAT.

BUCOLICA, is uſed by ſome for the art of managing, feeding, and breeding cattle.

BUCOLICS, *Paſtorals*; a kind of poems relating to ſhepherds, and their flocks.

The word is derived from *βοῦς*, and *κώμη*, *cibus*, *cauſa*; hence *βουκόλος*, *a feed cattle*; and *βουκολικὸς*, *bubulcus*, *a huſbman*.

Bucolic poetry is the moſt ancient of all the kinds of poetry; and is ſuppoſed to have had its origin in Sicily, amidſt the mirth and diverſion of the ſhepherds; and to have been inſpired by love and idleneſs: by degrees, their rural gallantries were brought under rules, and became an art. The concerns of the flocks, the beauties of nature, and the pleaſures of a country life, were their principal ſubjects. Moſchus, Bion, and Theocritus, were the moſt agreeable among the ancient *bucolic* poets.

Fontenelle obſerves, that Theocritus's ſtyle is ſometimes a little too *bucolic*. Some authors attribute the invention of *bucolic poetry* to a ſhepherd called *Daphnis*; and others to *Boſcilus*, ſon of Laomedon: but this appears all fiction.

Some aſcribe the invention of *bucolic poetry* to the herdſmen of Laconia, who, not being able to hold the cuſtomary feaſt of virgins in honour of Diana Caryatis, by reaſon of the war with Xerxes, inſtituted *Bouphoneia*, or *bucolic* exerciſes, in lieu thereof.

Hence alſo the origin of a ſort of poetical champions, called *Bouphonai*, by the Latins *ludiones*, who went about the country contending for the prizes frequently propoſed for the conquerors in this kind of combat. Of which rank Daphnis was the moſt diſtinguiſhed. They not only rehearſed their verſes, but played on a kind of *fiſtula*, or pipe, called *ſyrinx*. Scal. Poet. lib. i. cap. 4. Pott. Arch. lib. ii. cap. 20. Hiſt. Acad. Inſcr. tom. iii. p. 123, & 131, &c.

Bucolic poetry is by ſome called *aſtrobic*, as being ſuppoſed to have firſt commenced among the ancient herdſmen in riding a ſort of waggons called *aſtrabes*.

It is uſually divided into *monoproſopium*, wherein only a ſingle perſon ſpeaks, and *amœbæum*, or dialogue, wherein are ſeveral interlocutors.

Theocritus's IDYLLIA, and Virgil's ECLOGUES, are the chief of the ancient *bucolics* now extant.

BUCTON, a word uſed by Severinus, and ſome others, as a name for that part of the *pudendum muliebre*, commonly called the HYMEN.

BUD primarily denotes that part of a SEED which firſt begins to ſprout or germinate.

In which ſenſe, *bud* amounts to the ſame with germ, *germen*, gem, or *gemma*.

In moſt ſeeds is found a true *bud*, conſiſting of perfect leaves, only differing in bigneſs from thoſe which grow on the ſtalk. In many ſeeds this *bud* is very apparent, in others it lies ſo deep between the lobes, as to be almoſt indiſcernible. In ſome plants the leaves of the *buds* are but two, in others four, in others ſix, and in ſome more.

BUD is alſo uſed to denote the beginning of a bloſſom, or young ſprout, whether of a branch, foliage, or flower.

The *buds* of flowers and fruits are formed at the ſame time as the branches themſelves on which they ariſe. Mem. Acad. Scienc. ann. 1711. p. 59. ſeq.

The *bud* of a branch has its origin from the inner part of the ligneous body next the pith; by which it differs from a thorn, which has its origin from the outer and leſs fruitful part, and ſo produces no leaves, being as it were only the male of a *bud*.

Every *bud*, beſides its proper leaves, wherein it is couched or folded up, is covered with divers leafy pannicles or furfoils, which ſerve as a defence to the leaves themſelves. Grew. Anat. Veget. lib. i. cap. 4. lib. iv. cap. 1. § 2. & cap. 5. § 3.

The *buds* or knots on branches ariſe from the inmoſt part of the branches, the ſtructure of the ligneous fibres and little bladders of the branch being ranged ſo nicely in this form, that, upon the putting out of the branch, the *bud*, which is compoſed of the ſame parts, may likewiſe ſhoot with it. Phil. Tranſ. N° 118. p. 404.

Leewenhoeck aſſures us, that in the *bud* of a currant-tree, even in winter, he could diſcover not only the ligneous part, but even the berries themſelves, appearing like ſmall grapes.

BUD is uſed in the country language for a weaned calf of the firſt year; ſo called, becauſe the horns are then in the *bud*.

BUDDING, in *Gardening*. See ENGRAFTING.

BUDDLE, in *Mineralogy*, a name given by the Engliſh, dreſſers of the ores of metals, to a ſort of frame made to receive the ore after its firſt ſeparation from its groſſeſt foulneſs.

The ore is firſt beaten to powder in wooden troughs, through which there runs a continual ſtream of water, which carries away ſuch of it as is fine enough to paſs a grating, which is placed at one end of the trough; this falls into a long ſquare receiver of wood, called the *launder*: the heavieſt and pureſt of the ore falling at the head of the launder, is taken out ſeparately, and requires little more care or trouble; but the other part, which ſpreads over the middle and lower end of the launder, is thrown into the *buddle*, which is a long ſquare frame of boards, about four feet deep, ſix long, and three wide; in this there ſtands a man bare-footed, with a trampling ſhovel in his hand, to caſt up the ore about an inch thick, upon a ſquare board placed before him as high as his middle; this is termed the *buddle-head*; and the man dexterouſly, with one edge of his ſhovel, cuts and divides it longwiſe, in reſpect of himſelf, about half an inch aſunder, in theſe little cuts; the water coming gently from the edge of an upper plain board, carries away the filth and lighter part of the prepared ore firſt, and then the metalline part immediately after; all falling down in the *buddle*, where, with his bare feet, he ſtrokes it and ſmooths it, that the water and other heterogeneous matter may the ſooner paſs off from it.

When the *buddle* by this means grows full, the ore is taken out; that at the head part, being the fineſt and pureſt, is taken out ſeparate from the reſt, as from the launder. The reſt is again trampled in the ſame *buddle*; but the head, or as it is called, the forehead, of this *buddle*, and of the launder, are mixed together, and carried to another *buddle*, and trampled as at firſt. The forehead of this laſt *buddle*, that is, that part of the ore which has fallen at the head, is carried to what they call a drawing *buddle*, whoſe difference from the reſt is only this, that it has no eye, but only a plain ſloping board, on which it is once more waſhed with the trampling ſhovel. The ore, when it is taken from this, is called black tin, and this is found to be compleately ready for the blowing-houſe. Phil. Tranſ. N° 69. See *Dreſſing of* ORE.

BUDDLING *of calamine*, denotes the operation of cleanſing it from filth, by waſhing and picking it, preparatory to the baking it in the oven. Phil. Tranſ. N° 198. p. 675. See CALAMINE.

BUDDLING-*diſh*, a ſmall, ſhallow veſſel, like the baſons of a pair of ſcales, for the waſhing of ores of metals by the hand.

BUDGE. See BOUCHE.

BUDGE-*barrels*, are ſmall barrels well hooped, with only one head, the other end having nailed on it a piece of leather, to draw together upon ſtrings, like a purſe.

Budge-barrels are uſed for carrying powder along with a gun or mortar: as being leſs dangerous, and alſo eaſier than whole barrels. They are alſo uſed upon batteries of mortars, for holding meal-powder.

BUDHURS, in *Ichthyology*, a name given by the Iriſh to a large ſpecies of TROUT, reſembling outwardly the red GILLAROO. See Phil. Tranſ. vol. lxiv. N° 14, and 15.

BUDDLEIA, in *Botany*, a genus of the *tetrandria monogynia* claſs of plants. Its characters are theſe: the flower is of one leaf, bell-ſhaped, and quadrifid; and hath four ſhort ſtamina, which are placed at the diviſions of the petal; the oblong germen is ſituated in the centre, which afterward becomes an oblong capſule, having two cells filled with ſmall ſeeds. There are two ſpecies, which grow naturally in gullies, or other low-ſheltered ſpots in the Weſt Indies; their branches being too tender to reſiſt the force of ſtrong winds, they are rarely ſeen in open ſituations.

BUDNÆANS, in *Eccleſiaſtical Hiſtory*, ſo called from the name of their leader, Simon Budnæus. They not only denied all kind of religious worſhip to Jeſus Chriſt, but aſſerted, that he was not begotten by any extraordinary act of divine power; being born, like other men, in a natural way. Budnæus was depoſed from his miniſterial functions in the year 1584, and publicly excommunicated, with all his diſciples; but afterwards abandoning his peculiar ſentiments, he was re-admitted to the communion of the ſocinian ſect. Cyrillus aſcribes the origin of the above opinion to Adam Neuſer. Moſh. Eccl. Hiſt. vol. iv. p. 109.

BUDUN is the name of one of the Ceyloneſe gods: he is ſuppoſed to have arrived at ſupremacy, after ſucceſſive tranſmigration from the loweſt ſtate of an inſect, through the various ſpecies of living animals. There have been three deities of this name, each of which is ſuppoſed to reign as long as a bird removes a hill of ſand, half a mile high, and ſix miles round, by a ſingle grain in a thouſand years. See SAKRADAWENDRA.

BUFETAGE, *bufetagium*; or *bufetaria*, a duty paid to the lord for the drinking, or rather ſelling, of wine in taverns.

The word is formed from *buvetage*, or *buvetarie*, of the French *boire, to drink*. Du-Cange Gloſſ. Lat. tom. i.

BUFF, in *Commerce*, a ſort of leather prepared from the ſkin of the buffalo, or BUBALUS.

The ſkin of the buffalo being dreſſed in oil, after the manner of ſhammy, or chamois, makes what we call *buff-ſkins*; anciently much uſed among the military men for a kind of coats or doublets; and ſtill retained by ſome of our grenadiers, as well as the French *gens d'armes*, on account of its exceeding thickneſs and firmneſs. It is alſo uſed for waiſte-belts, pouches, &c.

Buff-ſkins, or *buff-leather*, makes a very conſiderable article in the Engliſh, French, and Dutch commerce, at Conſtantinople, Smyrna, and along the coaſt of Africa.

The ſkins of elks, oxen, and other like animals, when dreſſed in oil, and prepared after the ſame manner as that of the buffalo, are likewiſe denominated *buff*, and uſed for the ſame purpoſes.—In France there are a good number of conſiderable manufactories employed in the preparation of ſuch ſkins; particularly at Corbeil, Paris, and Rouen: their firſt eſtabliſhment is owing to the Sieur Jabar, a native of Cologne. The manner of preparation ſee under SHAMMY.

The ſkin of the American mooſe deer, when well dreſſed, makes excellent *buff*. The Indians make their ſnow-ſhoes of them. Their way of dreſſing it, which is reckoned very good, is thus: after they have haired and grained the hide, they make a lather of the mooſe's brains in warm water, and, after they have ſoaked the hide for ſome time, they ſtretch and ſupple it. Phil. Tranſ. N° 368.

BUFF, in *Medicine*, is uſed to ſignify that fizy, viſcid, tough mafs, which forms on the upper ſurface of the blood; it is what phyſicians call the *coagulable lymph*, which Dr. Fordyce in his very excellent Elements of the Practice of Phyſic, ſays, is not ſo eaſily coagulable when the arteries of the perſon from whom the blood is drawn, act more ſtrongly than they uſually do. See BLOOD.

BUFFET. See BEAUFET.

BUFFALO, *Bubalus*, in *Zoology*. See BUBALUS.

BUFFOON, a droll, or mimic, who diverts the public by his pleaſantries and follies.

Menage, after Salmaſius derives the word from *boſſa*; a name given to thoſe who appeared on the Roman theatre with their cheeks blown up; that, receiving blows thereon, they might make the greater noiſe, and ſet the people a-laughing. Others, as Rhodiginus, makes the origin of *buffoonery* more venerable; deriving it from a feaſt inſtituted in Attica, by K. Erictheus, called BUPHONIA.

Buffoons are the ſame with what we otherwiſe find denominated *ſcurræ, geloſiani, mimiſegi, mimiſtelli, gottoli, jocuatores*, &c. whoſe chief ſcene is laid at the tables of great men.

Gallienus never ſat down to meat without a ſecond table of *buffoons* by him; Tillemont alſo renders PANTOMIMES by *buffoons*. In which ſenſe he obſerves, the ſhews of the *buffoons* were taken away by Domitian, reſtored by Nerva, and finally aboliſhed by Trajan. Hiſt. des Emper. tom. ii. p. 144.

BUFO, in *Zoology*, the name by which many authors call the common TOAD, denominated by others RUBETA.

BUFONIA, in *Botany*, a genus of the *tetragynia digynia* claſs of plants. The calyx of which is a permanent *perianthium*, conſiſting of four erect, ſubulated, carinated leaves; the corolla conſiſts of four oval, linear, entire, erect, equal petals, ſhorter than the cup; the fruit is an oval compreſſed capſule, conſiſting of two valves, and containing one cell, in which are two oval compreſſed ſeeds. There is one ſpecies.

BUFONITA, in *Natural Hiſtory*, the TOAD-*ſtone*. This is a foſſil that has been received not only among the liſt of native ſtones by the generality of authors, but even has held a place among the gems, and is ſtill worn in rings by ſome people: it is, however, as much an extraneous foſſil, as any animal remaining of that kind. There has been a ſtrong opinion in the world, that it was found in the head of an old toad; and that this animal voided it at the mouth, on being put on a red cloth. See *Tab. Foſſils, Claſs* 8.

The general colour of the *bufonitæ* is a deep, duſky brown; but it varies greatly in this reſpect in ſeveral ſpecimens, ſome of which are quite black, others of an extremely pale, ſimple brown, a cheſnut colour, liver colour, black, grey, or whiteſh.

The *bufonitæ* are uſually found immerſed in beds of ſtone; and ſo little doubt is there of what they have originally been, viz. the petrified teeth of the *lupus piſcis*, or wolf-fiſh, that part of the jaw of the fiſh has ſometimes been

been found, with the teeth petrified in it. See Gronovius.

The *bufonite* are faid to be cordial and aſtringent: many other fanciful virtues are aſcribed to them, which the preſent practice has rejected.

Dr. Kramer ſays, *pannus bufonum*, when applied by way of poultice, with barley-flour and urine, is an excellent remedy for ripening *peſtilential* buboes, but that it has no ſuch effect in *venereal*, or any other than *peſtilential* buboes.

BUG, in *Zoology*. See Chermes, and Cimex.

BUGA *marble*, in *Natural Hiſtory*, a name given by the Spaniards to a ſpecies of black marble, called by our artificers the Namur-marble, and known among the ancient Romans by the name of *marmor Luculleum*. It is common in many parts of Europe, and is uſed by the Spaniards in medicine as well as in building; the powder of it being faid to be an excellent ſtyptic, applied to freſh wounds.

BUGEE, in *Zoology*, a ſpecies of monkey, which we ſee ſometimes brought over for a ſhew. It is an Indian animal, and a very rare one even there. It is about the ſize of a beaver, and much of the ſame colour, but its tail and claws wholly of the monkey-kind.

BUGELUGEY, in *Zoology*, the name of a large ſpecies of lizard, called by Cluſius, and ſome other authors, by the indeterminate name of *Lacertus Indicus*. It grows to four feet long, and will then meaſure nine inches round; the tail is very long, and ends in an extremely ſlender point.

BUGG-*caterpillar*, in *Natural Hiſtory*, a name given by Mr. Bonnet to a ſmall ſpecies of caterpillar, which ſmells exactly like a bug. This is not the only ſpecies which yields a ſenſible ſmell, for there is one of the middle-ſized ſmooth kinds, which, at the time of the change into the chryſalis ſtate, yields a very pleaſant roſe-like ſcent; and their caſes, which are made of earth and ſilk, retain that ſmell for a long time together, even for ſeveral years. There is another, which ſmells ſtrongly of muſk. Phil. Tranſ. N° 469.

BUGGERS, *Bulgarii*, anciently ſignified a kind of heretics, otherwiſe called *Paterini*, *Cathari*, and *Albigenſes*.

The word is formed of the French *Bougres*, which ſignified the ſame, and that from *Bougria*, or *Bulgaria*, the country where they chiefly appeared.

The *Buggers* are mentioned by Matthew Paris, in the reign of Henry III. under the name of *Bugari*. *Circa dies autem illos involuit hæretica pravitas eorum qui vulgariter dicuntur* Paterini & Bugares, *de quorum erroribus multa tacere quam loqui*.

Bugger, or Buggerer, came afterwards to be uſed for a Sodomite; it being one of the imputations laid, right or wrong, on the Bulgarian heretics, that they taught, or at leaſt practiſed, this abominable crime. Caſen. Orig. p. 27. Menag. Orig. p. 112. Trev. Dict. Univ tom. i. p. 1249. voc. *Bougre*. Du-Cange, Gloſſ. Lat. tom. i. p. 637. voc. *Bulgari*.

Bugger, *Bulgarini*, is alſo a denomination given to uſurers, a vice to which the ſame heretics are ſaid to have been much addicted. Du-Cange, Gloſſ. Lat. tom. i. p. 637.

BUGGERY, in our laws, ſignifies the crime of ſodomy.

Sir Edward Coke defines *buggery*, *carnalis copula, contra naturam, & hoc per confuſionem ſpecierum* (viz. by a man's or woman's coupling with a brute beaſt) *vel ſeorſum*, by a man's having to do with a man, or a woman with a woman. Each of which is felony, without benefit of clergy. 25 Hen. VIII. cap. 6. and 5 Eliz. cap. 17. In ancient times, ſuch offenders were burnt by the common law. *Buggery* is uſually excepted out of a general pardon. The practice is ſaid to have been introduced into England by the Lombards; by whom it is uſually ſuppoſed to have been borrowed from the *Bugres*, or *Bulgarians*.

BUGLE, *Ajuga*, in *Botany*, a genus of the *didynamia gymnoſpermia* claſs. The characters are theſe: the flower is one leaf, of the lip kind, having an incurved cylindrical tube; the upper lip is very ſmall, erect, and bifid; the under lip is large, open, and divided into three ſegments. It hath four erect ſtamina, two of which are longer than the upper lip, and two ſhorter. In the centre are ſituated four *germina*, which afterward become four naked ſeeds incloſed in the empalement. There are five ſpecies.

Bugle is a noted vulnerary, much uſed in potions of that intention, and alſo in plaſters, eſpecially among the French, with whom it is a proverb, that the perſon who has *bugle* and ſanicle, has no occaſion for a ſurgeon.

It is uſed both internally and externally for all bruiſes, wounds, and contuſions; for ſores and ulcers, ſpitting of blood, and hæmorrhages from any part; alſo for the dyſentery, *fluor albus*, diſeaſes of the throat, and thruſhes in the mouth.

BUGLOSS, in *Botany*. For the characters, ſee Anchusa.

Bugloſs is uſually planted in gardens, and flowers in June and July. The leaves, flowers, and ſometimes the root are uſed.

The flowers of the common *bugloſs* ſtand recommended for the ſame virtues with thoſe of borrage; they are ſuppoſed to be cordials of the very firſt rank, and to be of great uſe in hypochondriac and melancholic caſes. But theſe virtues are not well warranted. Tournefort, Hiſt. Plant. p. 133.

Bugloss, *Viper's*, in *Botany*. See Viper's *Bugloſs*.

Bugloss, *ſmall wild*. See Asperugo.

BUGLOSSUS, in *Ichthyology*, a name uſed by many authors for the ſoul-fiſh.

BUILDING, a fabric, or place erected by art, of ſtone, or timber, either for ſhelter from the weather, or for ſecurity, magnificence, or devotion.

Building, *regular* is that whoſe plan is ſquare, its oppoſite ſides equal, and the parts diſpoſed with ſymmetry.

Building, *irregular*, is that, on the contrary, whoſe plan is not contained within equal or parallel lines, either by the nature of its ſituation, or the artifice of the *builder*; and whoſe parts have not any juſt relation to one another in the elevation.

Building, *inſulated*, is that which is not attached, joined, or contiguous to any other; but is encompaſſed with ſtreets, or ſome open ſquare, or the like; as St. Paul's, the Monument, &c.

A Building is ſaid to be *engaged*, when it is encompaſſed with others, and has no front towards any ſtreet or public place, nor any communication without, but by a back paſſage.

Building, *an interred*, or *ſunk*, is that whoſe *area* is below the adjacent ſtreet, court, or garden, &c. and whoſe loweſt courſes of ſtone are hidden.

Buildings are either public or private.

Buildings, *public*, according to Daviler, include thoſe belonging to religion, as temples, churches, hoſpitals, moſques, tombs, &c. thoſe erected for ſecurity, as walls, towers, baſtions, and other parts of fortification; thoſe ſerving for utility or convenience, as bridges, cauſeways, ports, aqueducts, courts, markets, bazars, caravanſeras; and laſtly, thoſe erected for magnificence, as triumphal arches, obeliſks, amphitheatres, porticos, &c. Phil. Tranſ. N° 200.

Buildings, *private*, thoſe intended for habitation, ſuitable to the ſtate and condition of perſons, as places, hotels, ſeats, convents, houſes of citizens, &c.

Buildings, *ruſtic* or *country*, are thoſe which compoſe farm-houſes, granges, menageries, mills, baſecourts, ſtables, &c.

Buildings, *hydraulic*, thoſe wherein are incloſed machines for the moving or raiſing of water, either for uſe or entertainment, as pumps, fountains, reſervoirs, cascades, &c.

Buildings, *marine*, thoſe wherein ſhips and other veſſels are made or preſerved; ſuch are arſenals, docks, ſtore-houſes, and the like.

Buildings, *ſubterraneous*, thoſe framed under ground, as labyrinths, grottos, caves, temples cut out of rocks, &c. Some take theſe to be of the greateſt antiquity, and to have given occaſion to the firſt erecting of ſuperterranean edifices: the primitive *buildings* ſeem rather to have been intended as ſhelter againſt the ſcorching heats of the climate and ſeaſons in Æthiopia, where the midday was ſcarce tolerable without ſome defence. Phil. Tranſ. N° 144. p. 344.

Building is alſo uſed for the art or act of conſtructing, or raiſing an edifice. In which ſenſe it comprehends, as well the expences, as the invention and execution of the deſign thereof.

In *building* there are three things chiefly in view, viz. convenience, firmneſs, and delight. To attain theſe ends, ſir Henry Wotton conſiders the whole ſubject under two heads, viz. the *ſeat* or *ſituation*, and the *work* or *ſtructure*.

Building, *for the ſituation of a*, either that of the whole is to be conſidered, or that of its parts. As to the *firſt*, regard is to be had to the quality, temperature, and ſalubrity of the air; the conveniency of water, fuel, carriage, &c. and the agreeableneſs of the proſpect.

For the *ſecond*, the chief rooms, ſtudies, libraries, &c. are to lie towards the eaſt; offices that require heat, as kitchens, diſtillatories, brew-houſes, &c. to the ſouth: thoſe that require a cool freſh air, as cellars, pantries, granaries, &c. to the north; as alſo galleries for painting, muſeums, &c. which require a ſteady light. He adds that the ancient Greeks and Romans generally ſituated the front of their houſes to the ſouth; but that the modern Italians vary from this rule. Indeed, in this matter, regard muſt ſtill be had to the country; each being obliged to provide againſt its reſpective inconveniences: ſo that a good parlour in Egypt might make a good cellar in England. The ſituation being fixed on, the next thing to be conſidered is the

BUILDING, *work, or ſtructure of the*, under which come firſt the *principal* parts, then the *acceſſories* or ornaments.—To the principals belong, firſt, the materials; then the form, or diſpoſition.

There are three ſorts of draughts or repreſentations of a *building* neceſſary to be made before the conſtruction be begun, viz. an ichnography or plan, an orthography or profile, and a ſcenography or perſpective. See ICHNOGRAPHY, ORTHOGRAPHY, and SCENOGRAPHY.

BUILDING, *the materials of a*, are either ſtone, as marble, free-ſtone, brick, for the walls, &c. or wood, as fir, cypreſs, cedar, for poſts and pillars of upright uſe; oak for beams, ſummers, and for joining and connexion.

BUILDING, *for the form or diſpoſition of a*, it muſt either be *ſimple* or *mixed*. The ſimple forms are either *circular* or *angular*: and the circular ones either *complete*, as juſt ſpheres; or deficient, as ovals.

The circular form is very commodious, of the greateſt capacity of any; ſtrong, durable beyond the reſt, and very beautiful: but then it is found of all others the moſt chargeable; much room is loſt in the bending of the walls, when it comes to be divided; beſides an ill diſtribution of light, except from the centre of the roof; on theſe conſiderations it was, that the ancients only uſed the circular form in temples and amphitheatres, which needed no compartition. Oval forms have the ſame inconveniences, without the ſame conveniences; being of leſs capacity.

As for angular figures, ſir Henry Wotton obſerves, that *building* neither loves many nor few angles; the triangle, v. gr. is condemned above all others, as wanting capacity and firmneſs; as alſo, becauſe it is incapable of being reſolved into any other regular figure in the inward partitions, beſides itſown. As for figures of five, ſix, ſeven, or more angles, they are fitter for fortifications than civil *buildings*. There is, indeed, a celebrated *building* of Vignola, at Caprarola, in form of a *pentagon*; but the architect had prodigious difficulties to encounter with, in diſpoſing the lights, and ſaving the vacuities. Such *buildings*, then, ſeem rather for curioſity than conveniency; and for this reaſon, rectangles are pitched on, as being a medium between the two extremes. But again, whether the rectangle is to be juſt a ſquare, or an oblong, is diſputed: ſir Henry Wotton prefers the latter, provided the length doth not exceed the breadth by above one third.

Mixed figures, partly circular, and partly angular, may be judged of, from the rules of the ſimple ones; only they have this particular defect, that they offend againſt uniformity. Indeed uniformity and variety may ſeem to be oppoſite to each other; but ſir Henry Wotton obſerves, that they may be reconciled; and for an inſtance, he mentions the ſtructure of the human body, where they both meet. Thus much for the firſt grand diviſion, viz. the whole of a *building*.

BUILDING, *the parts of a*, Baptiſta Alberti compriſes under five heads; viz. the *foundation*, *walls*, *apertures*, *compartition*, and *cover*.

For the foundation; to examine its firmneſs, Vitruvius orders the ground to be dug up; an apparent ſolidity not to be truſted to, unleſs the whole mould, cut through, be found ſolid: he does not indeed limit the depth of the digging; Palladio limits it to a ſixth part of the height of the *building*. This ſir Henry Wotton calls the *natural foundation*; whereon is to ſtand the ſubſtruction, or ground-work, to ſupport the walls, which he calls the *artificial foundation*: this then is to be its level; its loweſt edge, or row, of ſtone only, cloſe laid with mortar, and the broader the better; at the leaſt, twice as broad as the wall: laſtly, ſome add, that the materials below ſhould be laid juſt as they grew in the quarry; as ſuppoſing them to have the greateſt ſtrength in their natural poſture. De Lorme enforces this, by obſerving, that the breaking or yielding of a ſtone in this part, for the breadth of the back of a knife, will make a cleft of above half a foot in the fabric above. For palliſication, or piling the ground-plot, ſo much commended by Vitruvius, we ſay nothing; that being required only in a moiſt marſhy ground, which ſhould never be choſen: or, perhaps, are there any inſtances of this kind, where it was not neceſſity that drove them to it.

For the walls, they are either entire and continued, or interrupted; and the interruptions are either columns, or pilaſters. Entire, or continued walls, are variouſly diſtinguiſhed; by ſome, according to the quality of the materials, as they are either ſtone, brick, &c. others only conſider the poſition of the materials; as when they lie, or ſquare ſtones, are laid in their lengths, with ſides and heads together, or the points conjoined, like a net-work, &c.

The great laws of mutiny are, that the walls ſtand perpendicular to the ground-work; the right angle being the cauſe of all ſtability: that the maſſieſt and heavieſt materials be loweſt, as fitter to bear than be borne: that the work diminiſh in thickneſs, as it riſes: both for eaſe of weight, and expence: that certain courſes, or ledges of more ſtrength than the reſt, be interlaid like botes, to ſuſtain the fabric from total ruin, if the under parts chance to decay: and, laſtly, that the angles be firmly bound; theſe being the nerves of the whole fabric, and commonly fortified, by the Italians, on each ſide the corners, even in brick *buildings*, with ſquared ſtones; which add both beauty and ſtrength.

The intermiſſions, as before obſerved, are either columns, or pilaſters; whereof there are five orders, viz. *Tuſcan*, *Doric*, *Ionic*, *Corinthian*, *Compoſite*; each of which ſee diſtinctly conſidered under its reſpective head. See alſo COLUMN, ORDER, and PILASTER.

Columns, and pilaſters, are frequently, both for beauty and majeſty, formed arch-wiſe; the doctrine of which ſee under ARCH.

For the apertures; they are either doors, windows, ſtair-caſes, chimneys, or conduits for the ſuillage, &c. which ſee under their heads, DOOR, WINDOW, &c. Only, with regard to the laſt, it may be obſerved, that art ſhould imitate nature in theſe ignoble conveyances, and ſeparate them from ſight, where a running water is wanting, into the moſt remote, loweſt and thickeſt part of the foundation; with ſecret vents, paſſing up through the walls like tunnels to the open air; which the Italians all commend for the diſcharge of noiſome vapours. See SEWERS, &c.

For the compartition, or diſtribution of the ground-plot into apartments, &c. ſir H. Wotton lays down theſe preliminaries; that the architect never fix his fancy on a paper-draught, how exactly ſoever ſet off in perſpective; much leſs on a mere plan, without a model, or type of the whole ſtructure, and every part thereof, in paſteboard, or wood; that this model be an plain, and unadorned, as poſſible, to prevent the eye's being impoſed on; and that the bigger this model, the better.

In the compartition itſelf, there are two general views, viz. the *gracefulneſs*, and *uſefulneſs* of the diſtribution, for rooms of office, and entertainment; as fit as the capacity thereof, and the nature of the country, will allow. The gracefulneſs will conſiſt in a double analogy, or correſpondency; firſt, between the parts and the whole, whereby a large fabric ſhould have large partitions, entrances, doors, columns, and, in brief, all the members large: the ſecond, between the parts themſelves, with regard to length, breadth, and height. The ancients determined the length of their rooms, that were to be oblongs, by double their breadth; and the height by half their breadth, and length, added together. When the room was to be preciſely ſquare, they made the height half as much more as the breadth: which rules the moderns take occaſion to diſpenſe with; ſometimes ſquaring the breadth, and making the diagonal thereof the meaſure of the height; and ſometimes more. This deviation from the rules of the ancients is aſcribed to M. Angelo.

The ſecond conſideration in the compartition is, the uſefulneſs; which conſiſts in the having a ſufficient number of rooms of all kinds, with their proper communications, and without diſtraction. Here the chief difficulty will lie in the lights, and ſtair-caſes: the ancients were pretty eaſy on both theſe heads, having generally two cloiſtered open courts, one for the women's ſide, the other for the men: thus the reception of light into the body of the *building* was eaſy, which among us muſt be ſupplied, either by the open form of the *building*, or by graceful refuges or breaks, by terraſſing a ſtory in danger of darkneſs, and by abſcours, or ſky lights. For caſting the ſtair-caſes, it may be obſerved, that the Italians frequently diſtribute the kitchen, bake-houſe, buttery, &c. under ground, next above the foundation, and ſometimes level with the floor of the cellar, raiſing the firſt aſcent into the houſe fifteen feet or more: which, beſide the removing of annoyances out of the ſight, and gaining ſo much room above, does, by the elevation of the front, add a majeſty to the whole. Indeed, ſir H. Wotton obſerves, that, in England, the natural hoſpitality thereof will not allow the buttery to be ſo far out of ſight; beſides, that a more luminous kitchen, and a ſhorter diſtance between that and the dining-room is required, than that compartition will well bear.

In the diſtribution of lodging rooms, it is a popular and ancient fault, eſpecially among the Italians, to caſt the partitions ſo, that when the doors are all open, a man may ſee through the whole houſe: this is grounded on the ambition of ſhewing a ſtranger all the furniture at once; an intolerable hardſhip on all the chambers, except the inmoſt, where none can arrive but through all the reſt, unleſs the walls be extremely thick for ſecret paſſages:

passages; nor will this answer the purpose, without at least three doors to each chamber; a thing inexcusable, except in hot countries, besides its being a weakening to the *building*.

In the compartition, the architect will have occasion for frequent shifts; though many of which his own sagacity, more than any rules, must conduct him.

For the covering of the *building*; this is the laſt in the execution, but the firſt in the intention; for who would *build*, but to ſhelter? In the covering, or roof, there are two extremes to be avoided; the making of it too heavy, or too light: the firſt will preſs too much on the under-work; the latter has a more ſecret inconvenience; for the cover is not only a bare defence, but a bond, or ligature, to the whole *building*; and as ſuch requires a conſiderable weight. Indeed, of the two extremes, a ſtone top-heavy is the worſt. Care is likewiſe to be taken, that the preſſure be equal on each ſide; and Palladio wiſhes, that the whole burden might not be laid on the outward walls, but that the inner might likewiſe bear their ſhare.—The Italians are very curious in the proportion and gracefulneſs of the pentice or ſlopeneſs of the roof; dividing the whole breadth into nine parts, whereof two ſerve for the height of the higheſt top, or ridge, from the loweſt: but, in this point, regard muſt be had to the quality of the region; for, as Palladio inſinuates, thoſe climates which fear the falling of much ſnow, ought to have more inclining pentices than others.

Thus much for the principal eſſential parts of a *building*. For the *ornaments*, or *ornaments* they are derived from painting and ſculpture. As the chief things to be regarded in the firſt, are, that no room be too much, which will occaſion difficulty, except in galleries, or the like; that the beſt pieces be placed where there are the ſeveral lights; rooms with ſeveral windows are enemies to painters, nor can any pictures be ſeen in perfection, unleſs illuminated, like nature, with a ſingle light: thus in the diſpoſition regard be had to the poſture of the gueſts in viewing, which is the moſt natural for the poſture of the ſpectator; and that they be accommodated to the uſefulneſs of the room they are aſſigned in. For ſculpture, it muſt be obſerved, that it be not too abundant, eſpecially at the firſt approach of a *building*, or at the entrance, where a Doric ornament is much preferable to a Corinthian one: that the niches, if they contain figures of white ſtone, be not coloured in their concaviſy too black, but rather duſky; the light being diſpoſed with no ſudden departures from one extreme to another: that fine ſculptures have the advantage of nearneſs, and coarſer of diſtance.

As to the ſtone and bricks uſed in *buildings*, which are fleſh and white as firſt, and are commonly ſuppoſed to be diſcoloured with the air, moiſture, ſmoke, &c. the true cauſe thereof is, that they become covered with a minute ſpecies of plants, which alter their colour. A ſort of lichens, yelloweſh, brownish, or greeniſh, which commonly grow on the barks of trees, do grow alſo on ſtones, mortar, pliaiſter, and even on the faces of bricks, being propagated by little light ſeeds, diſperſed by the wind, rain, &c. The beſt preſervative known, is lime.

BUILDING, *to judge of a*, Sir H. Wotton has laid down the following rules. That before being any judgment, a perſon be informed of its age; ſince if apparent decays be found to exceed the proportion of time, it may be concluded, without further inquiſition, either that the ſituation is bad, or the materials or workmanſhip to be blamed. If it be found to look well, be from near hand, from the ornaments and things which ſtrike the eye firſt, to the more eſſential members; and to be able to form a concluſion that the work is commodious, firm, and delightful: the three conditions, in a good *building*, laid down at firſt, and agreed on by all authors.

That our window admits the beſt kind of lighting. Whether proper ſhades have been given to the ſeveral rooms; the beſt diſpoſition of which is, to have the light in the middle of a well-ſized room; whether the walls ſtand upright on a clean footing, and ſurmounted whether the *buildings* have a beautiful ſtature; whether, for the moſt part, it appears well throughout; whether the principal ornament be on the middle line of the front, or two, like to the mouths of two windows, as our eyes, ſet in equal diſtance on both ſides; the officers, like the arms, equally diſtributed, &c.

The perfection of *building* conſiſts in its adequate agreement with the intention of the founder; its duration, in the allowance of ſuch things as are proper to withſtand the aſſaults of perſons paſſing by; its ſtrength or firmneſs, in being free from the danger of coming ſhortly to ruin or decay; its utility or convenience, that diſpoſition of the whole, and each part, which renders its uſe to the owner moſt perfect; its beauty, in the true or apparent perfection of it, conſidered as ſuch.

Vitruvius gives a third method of judging; *ſumming up* the whole at once under theſe ſix heads; *ordonnance*, or ſetting the model and ſcale of the work; *diſpoſition*, the juſt diſpoſition of the firſt deſign thereof (which two, Sir H. Wotton thinks he might have ſpared, as belonging rather to the architect than the cenſure); *eurythmy*, the agreeable harmony between the length, breadth, and height of the ſeveral rooms, &c. *ſymmetry*, or the agreement between the parts and the whole; *decor*, the due relation between the *building* and the inhabitant; whence Palladio concludes, the principal entrance ought never to be limited by any rule, but the dignity and grandeur of the maſter; and laſtly, *œconomia*, the uſeful caſting of the ſeveral rooms, for offices, entertainment, or pleaſure. Theſe laſt four are ever to be run over, before a man paſs any determinate cenſures and thoſe alone, Sir Henry obſerves, are ſufficient to condemn or acquit any *building* whatever.

Dr. Fober gives us two or three good aphoriſms in *building*: 1. Let not the common rooms be ſeveral, but the ſeveral rooms common; i. e. the common rooms not to be private or retired, as the hall, galleries, &c. which are to be open; and the chambers, &c. to be retired. 2. A houſe had better be too little for a day, than too big for a year. Houſes are therefore to be proportioned to ordinary occaſions, not extraordinary. 3. Country houſes muſt be ſubſtantious, able to ſtand of themſelves; not like city *buildings*, ſupported and ſhelтered on each ſide by their neighbours. 4. Let not the front look aſquint on a ſtranger's but accoſt him right at his entrance. 5. Let the offices keep their due diſtance from the mannion houſe; thoſe are too familiar, which are of the ſame pile with it.

The method of *building* both in Barbary and the Levant, ſeems to have continued the ſame from the earlieſt ages, without the leaſt alteration or improvement.

The modern *buildings* are much more commodious, as well as beautiful, than thoſe of former times. Of old they uſed to dwell in houſes, moſt of them with a blind flair-caſe, low ceilings, and dark windows; the rooms built at random, without any thing of convenience, and often with ſteps from one to another; ſo that one would think the people of former ages were afraid of light and freſh air; whereas the preſent are for joining the two together for light flair-caſes, fine caſh-windows, and high ceilings. And ſuch has been our builder's induſtry in point of compactneſs and uniformity, that a houſe after the new way will afford, on the ſame quantity of ground, almoſt double the conveniencies which could be had from an old one.

By ats 21 Geo. I. and 3 Geo. III. for the regulation of *building* within the weekly bills of mortality, and in other places therein ſpecified, party-walls are required to be erected of brick or ſtone, which muſt be two bricks and a half thick from the cellar, two bricks thick upwards to the garret floor, &c. and other limitations are enacted reſpecting the diſpoſitions of the timbers, &c. And every *building* is to be ſurveyed; and the perſon who offends againſt the ſtatute in any of the particulars recited, is liable to a forfeit of 200*l.* to be levied by warrant of juſtices of the peace. The other principal ſtatutes relating to *building* are, 19 Car. II. c. 3. 22 Car. II. c. 11. 5 Eliz. c. 4. 35 Eliz. c. 6. 6 Ann. c. 31. 7 Ann. c. 17. 33 Geo. II. c. 30. 6 Geo. III. c. 37. 12 Geo. III. c. 73. See PARTY-*walls*.

For the method of ſecuring *buildings* from lightning, ſee CONDUCTOR.

BUILDINGS, *Judges of*. See SEWERS.

BUILDINGS, *Surveyors of*. See SURVEYORS.

BUILT, in *Sea-language*, is an epithet applied to ſhips, denoting their peculiar form and ſtructure, and diſtinguiſhing them from others of a different claſs or rank. Thus we ſay, *Engliſh-built*, *galley-built*, or *Engliſh-built*, *French-built*, &c.

BUL, in the *Hebrew Calendar*, the eighth month of the year, and ſecond of the civil year, often called eccleſiaſtical, and ſecond of the civil year, often called *Marchesvan*; anſwering to our October, and has nine and twenty days.

BULBOCASTANUM, an Engliſh name for the common Earth-nut.

BULBUS, a muſical inſtrument, much uſed by the Negroes of Guinea, &c.

It conſiſts of ſeveral pipes made of hard wood, ſet in order, which diminiſh by little and little in length, and are tied together with ſtrings of thin leather twiſted about ſmall round wands, put between each of the pipes, ſo as to form a ſmall interſtice. They play on it with ſticks, the ends of which are covered with leather, to make the ſound leſs harſh.

BULATWANA, in *Siluy*, a name by which ſome authors have called the NEREA, on both the people of the Eaſt Indies are fond of chewing.

BULB, BULBUS, in *Botany*, a thick root, nearly round, compoſed of ſeveral ſcales, or coats laid one over another;

other; sending forth from its lower part a great number of fibres. Such are the roots of the common onion, the daffodil, the hyacinth, &c.

The same denomination is sometimes also, though improperly, given to tuberous roots, composed of solid continuous substance, without any coats laid over one another. Dr. Grew observes, that in *bulbous* plants, as well as many other perennial ones, the root is annually renewed, or repaired out of the trunk or stalk itself: that is, the bulb of the stalk continually and insensibly descends below the surface of the earth, and hiding itself therein, is, both in nature, place, and office, changed into a true root. Thus, in housewort, the stalk, sinking by degrees, becomes the upper part of the root; the next year, the lower part; and the next it rots away, a fresh supply coming.

The ancients divided *bulbi* into esculent, as the onion and leek; emetic, as the narcissus; and wild, as the hermodactyl. Nothing, Pliny observes, is more prolific than the lily, a single root often producing no less than forty *bulbi*. *Nat. Hist. libr. xxi. cap. 3.*

Modern botanists distinguish two kinds of *bulbi*, *tunicated* and *squamous*.

BULBUS, *tunicated*, are those composed of several coats or tunics laid over each other; such are the roots of onion, tulip, and jonquil.

BULBUS, *squamous*, are those composed of several scales, laid in like manner over each other; such is that of the white lily. To which are added, the *solid bulb*, composed of an uniform solid substance; the *articulate bulb*, consisting of *annulæ* linked together; the *duplicate*, when there are two to each plant; and *aggregate*, when each plant has a congeries of such roots.

Some consider the *bulb* as a real plant, out of which a new stalk is yearly produced; the stalk itself withering and falling away with the flower and leaves. In reality, as the leaves which fall yearly, are not necessary to the integrity of the plant; so neither does the stalk seem to be, which springs out of the *bulb*, and withers away, the *bulb* itself still remaining entire. We may add, that the very leaves and flowers, e. gr. of a tulip, have been distinctly perceived to be contained in its *bulb*. Du Hamel, Acad. Sc. lib. ii. § 3. cap. 1.

BULBS are also taken for the round spired beards of flowers.

BULBINE, in *Botany*. See SPIDER *wort*.

BULBOCASTANUM. See PIG-*nut*.

BULBOCODIUM, in *Botany*, a genus of the *hexandria monogynia* class of plants. The flower is funnel-shaped, and composed of six petals; the fruit is a triangular acuminated capsule, with three cells, containing several angular seeds. There are two species; one of which grows naturally on the Alps, and upon Snowdon in Wales; the other is a native of Spain, and has been long cultivated in our gardens. The root of this plant, according to Lemery, is purgative: Ray says it is emetic, and hurtful to the nerves. Herman recommends the bruised leaves for an erysipelas. Linnæus mentions only one species.

Bulbocastum is also a name used by some authors for *pseudonarcissus Anglicus*, or common wild yellow daffodil.

BULBONACK, in *Botany*, the name by which several authors call the *viola tricolor*, known in our gardens by the names of *pansy* and HEARTSEASE.

BULBOUS, or BULBOSE *plants*, those which have a BULB.

BULBOUS *plants, flowering of*. See FLOWERING.

BULBUS *vegetabilis*, in the *Materia Medica*, the name used for the root of the narcissus, or bulbous plant.

BULCARD, an English name for the GALLERITA, or *cornua ammonis*, of Rondeletius; a fossil shell-fish found among the rocks on the Cornish and other shores. Woodward.

BULE, in *Botany*, a name by which some authors call the willow.

BULEPHORIUS, in the court of the eastern emperors, was the same officer with *comes refrendarius*.

BULEUTÆ, in the cities of Greece and Asia, were the same with the DECURIONES at Rome. Calc. Lex. Jur. p. 278.

The word has been sometimes also used to denote SENATORS.

BULGARIAN *language*, the same with the *lingua Illyrica*, or SCLAVONIC.

BULGOLDA *lapis*, the name of the stone taken out of the head of an animal in America, called by the natives *bulgoldaff*. We have no account of this, but that it possesses the virtues of the bezoar, as a cordial and refuter of poisons.

BULIMY, an enormous appetite, attended with fainting and coldness of the extremities.

The word is formed of *bu*, ox, and *limos*, *hunger*; as importing that the patient has the stomach of an ox; or, as others term it, sufficient to eat up an ox. Varro and Suidas derive it from the particle *bu*, which is prefixed by the Greeks to divers words, only as an intensive; and *limos*, *hunger*, q. d. *a great hunger*.

The perpetual craving of food is sometimes owing to a defect of nourishment on account of excessive evacuations, by hæmorrhage, flux of the belly, vomiting, sweating, or the like; or from too great a consumption of the alimentary substance, from various causes, whence the food is hurried out of the stomach with greater speed than it ought to be. Sometimes this affection is owing to worms consuming the chyle.

The diagnostic signs of this disorder are sufficiently evident, as well to the patient as to the attendants, who cannot but observe a depraved and excessive appetite, which compels them to receive into their stomach an immoderate quantity of victuals, which afterwards proving burdensome and oppressive to nature, are thrown up again by vomiting; in which case the distemper is the *vomer canina*; or if there be no vomiting, the patient is seized with a hypothymy, and then it is a *bulimus*.

The different causes of this distemper are distinguishable by the circumstances which are antecedent, attendant, and consequent to it. Acid eructations and vomitings, crude stools and want of thirst, are signs of an acid abounding in the stomach. In defect of nutrition, the patients are emaciated: and lastly, the signs of worms are to be taken from their proper symptoms.

As to the prognostics of this disorder, if it depends wholly on external causes, there is no danger, provided these are speedily removed: and what proceeds from worms carries but little danger in it, because the effects cease on their being destroyed. In pregnancy, where an inordinate appetite is frequent, there is no danger to be apprehended from it.

But the distemper is very dangerous, when followed by large evacuations or colliquations of the body: and especially when after receiving food, while the stomach is yet full, the patient is seized with fainting fits: for when those things which ought to give most relief, prove of none, or of ill effect, it is a sign of a great disorder in the tone of the stomach.

So also the CANINE appetite, when the vomiting or flux is obstinate, is not void of danger: for it commonly degenerates into a cachexy, dropsy, lientery, atrophy, and other fatal distempers.

For the methods of cure, while the patient is under the fainting fit, it is usual to have recourse to such things as remarkably affect the sense of smelling: as, bread sopped in wine, roasted swine's flesh, or kid, and in general all such things as have a nidorous and well-savoured smell. It is sometimes the practice likewise to compress the extremities of the patients, to prick them in every part, rub their ears, pull them by the cheeks, and by the hair. When they are come to themselves from the hypothymy, the most proper thing to give them in the first place, is wine, and after that other food. In our future management, they are to be reduced by such means, as are of good and quick nutrition, but difficult of alteration and digestion: they are also to be treated with such things as refrigerate and strengthen. By this method they are greatly benefited, and in process of time are restored to a good temperament.

Evacuation is to be performed, either by vomit or purge; and that by means of such remedies as are proper for those who labour under a want of appetite. For though these affections are contrary to each other, yet they are usually produced by the same humours, differing only in degrees of fluidity, and some very different secondary qualities which affect the stomach after a very different manner. A remedy of this kind, which is very much commended by Galen, is *hiera* made into pills.

Pure wine alone, drank in sufficient plenty, is a most powerful reliever of hunger; according to the aphorisms of Hippocrates, as also is and the spirit of wine, commonly called *aqua vitæ*, but still more powerful effect this way.

In the Philosophical Transactions, we have an account of a person affected with a *bulimus*, to such a degree that he would eat up an ordinary leg of veal at a common meal, and would feed on fine shuffle, &c. He was relieved by throwing up several worms, of the length and thickness of a tobacco-pipe.

BULLITHOS, *lapis bovinus*, a calculus or stone found in the gall-bladder, kidneys, or urinary bladder of oxen. Substances thereof are given by Bromell, the Academy Naturæ Curiosorum, and other authors: but by which it appears that Aristotle was mistaken in saying, that man alone is subject to the stone, and acquitting sedulously that the reason thereof. And Prob. § 2. 27.

BULK, *of a ship*, denotes her whole contents in the hold for stowage of goods.

BULK, *to break*. See BREAKING.

BULK-*heads*, are partitions made across a ship, or lengthways, with boards of timber, whereof one part is divided from another.

The *bulk-head afore*, is the partition between the fore-

castle and gratings in the head, and in which are the chaste ports. See *Tab. Ships, fig.* 2. *n.* 11. 24. 48. 85. 95. 99. 102. 115.

BULL, in *Ecclesiastical Writers*, denotes an instrument dispatched out of the Roman chancery, sealed with lead, containing the edicts, letters patent, and provisions of certain princes.

The word *bull* is derived from *bulla*, a *seal*; and that from *bullo*, a *drop*, or *bubble*; or according to others, from the Greek βύλλα, *council*; according to Cujacius, from the Celtic *bull*, or *bol*, a *bubble*.

We meet with four kinds of these *bulls*, or *bullæ*, golden, fleece, waxen, and leaden; all in use among the emperors and kings of the middle and barbarous ages. In some, the impression is made on the solid metal itself, in others on wax, and only inclosed in a metalline box, or case.

Sealing with metals is an illustrious privilege, belonging only to princes, though assumed also by prelates, as princes of the church. The doges of Venice durst not arrogate this honour, till leave was given them by pope Alexander III. about the year 1170, to seal their diplomata with lead.

The *leaden* is the third kind of apostolical rescript, and the most in use, both in affairs of justice, and of grace. It is wrote on parchment, by which it is distinguished from a *brief*, or simple *signature*, which is on paper. A *bull* is properly a signature enlarged: what the latter comprehends in a few words, the former dilates and amplifies. If the *bulls* be letters of grace, the lead is hung on silken threads; if they be letters of justice, and executory, the lead is hung by a hempen cord. They are all wrote in an old round Gothic letter.

The *bull*, in the form wherein it is to be dispatched, is divided into five parts, viz. the narrative of the fact; the conception; the clause; the date; and the salutation, in which the pope takes on himself the quality of *servant of the servants of God*, *servus servorum Dei*.

Properly speaking, it is the seal, or pendent lead alone that is the *bulla*, being that which gives it both the title, and authority. The lead presents on one side, the heads of St. Peter and St. Paul; on the other, the name of the pope, and the year of his pontificate.

By *bulls*, jubilees are granted; without them no bishops, in the Romish church, are allowed to be consecrated. In Spain, *bulls* are required for all kinds of benefices; but in France, &c. simple signatures are sufficient; excepting for bishoprics, abbeys, dignities, and priories conventual. According to the laws of the Roman chancery, no benefice exceeding twenty four ducats per annum, should be conferred without *bulls*: but the French would never submit to this rule, except for such benefices as are taxed in the apostolic chamber: for the rest, they reserve the right of dissembling the value, expressing it in general terms: *Cujus & alii fructus annuorum fructus ex duodecim aureis ad summum, secundum communem æstimationem, non excedunt.*

The *bulls* brought into France are limited and moderated by the laws and customs of the land, before they are registered; nor is any thing admitted till it hath been well examined, and found to contain nothing contrary to the liberties of the Gallican church: those words, *proprio motu*, in a *bull*, are sufficient to make the whole be rejected in France.

Nor do the Spaniards admit the papal *bulls* implicitly; but, having been examined by the king's council, if there appear any reason for not executing them, notice thereof is given to the pope by a dispatch sent to the *nuncio*; by this means, remains without effect, and the true method of proceeding with the court of Rome is observed by most of the other courts of Europe, in the papal communion.

To *fulminate bulls*, is to make publication thereof, by one of the three commissaries to whom they are directed; whether he be the bishop or official. This publication is sometimes appealed; but when it is, the fault is not charged on the pope who issued the *bull*, but an appeal is brought in form against the person who is supposed to make it thus the fault is laid, where it is known one is to be had, to evade affronting the pontiff.

See FULMINATION.

The *Bull in cœna Domini*, is a *Bull* read every year on Maundy-Thursday, in the pope's presence, containing various excommunications and excoriations against heresy, those who disobey the laws who usurp or oppose the exercise of ecclesiastical jurisdiction, &c.

After the death of the pope, no *bulls* are dispatched during the vacancy of the see, to prevent any abuses; the time as soon as the pope is dead, the vice-chancellor of the Roman church takes the seal of the *bulls*: and in the presence of several persons, orders the name of the deceased pope to be erased; and covers the other side, on which are the heads of St. Peter and St. Paul, with a linen cloth; sealing it up with his own seal, and giving it, thus covered, to the chamberlain, to be preserved, that no *bulls* may be sealed with it in the mean time.

By stat. 28 Hen. VIII. c. 16. all *bulls*, &c. obtained from the bishop of Rome, are void; and by 13 Eliz. c. 2. (see also 23 Eliz. c. 1.) the procuring, publishing, or using any of them, is high treason.

BULL, *golden*, is a denomination peculiarly given to an ordinance, or statute, made by the emperor Charles IV. in 1356, said to have been drawn up by that celebrated lawer, Bartolus, and still reputed the *magna charta*, or fundamental law of the empire.

It is thus called from a golden seal fixed to it, such as were used by the emperors of Constantinople, annexed to their edicts.

Till the publication of the *golden bull*, the form and ceremony of the election of an emperor were dubious, and undetermined; and the number of electors was not fixed: this solemn edict regulating the functions, rights, privileges, and pre-eminences of the electors.

The original, which is in Latin, on vellum, is kept at Frankfort. On the back-side of it there are several knots of black and yellow silk; to which hangs a *bull*, or seal of gold.

This ordinance, containing thirty articles, was approved of by all the princes of the empire, and remains still in force. The election of the empire is by it declared to belong to seven electors; three of them ecclesiastics, viz. the archbishops of Mentz, Treves, and Cologn; and four seculars, viz. the king of Bohemia, prince Palatine, duke of Saxony, and marquis of Brandenburg.

BULLA, *golden*, were in use among the eastern emperors for a considerable time, leaden ones being confined to matters of a smaller moment. Spelman mentions a *golden bull*, in a treaty of alliance between our Henry VIII. and Francis I. of France; the same author relates, that the instrument, whereby Clement VII. gave king Henry VIII. the title of Defender of the Faith, had a golden *bulla* affixed to it; and there are other instances in Du-Cange and Alsatera.

BULLA, *ivory*, were not in so frequent use, though we do not want instances of them.

BULLA, *leaden*, were sent by the emperors of Constantinople to despots, patriarchs, and princes; and the like were also used by grandees of the imperial court, as well as by the kings of France, Sicily, &c. and by bishops, patriarchs, and popes.

Polydore Virgil makes pope Stephen III. the first who used leaden *bulls*, about the year 772. But others find instances of them as early as Silvester, Leo I. and Gregory the Great. The later popes, besides their own names, strike the figures of St. Peter and St. Paul on their *bulls*; a practice first introduced by pope Paschal II.

BULLA, *woven*, are said to have been first brought into England by the Normans. They were in frequent use among the Greek emperors, who thus sealed letters to their wives, mothers, and sons. Of these there were two sorts, one red, the other green. Du-Cange Gloss. Lat. tom. i. & Gloss. Græc. Montfaucon, Palæolog. lib. 6.

BULL, a species of the *ox* or *neat*.

One *bull* suffices for fifty cows, some say fifty. His best age is about two, or from one to three, before he arrives at his full growth, when he grows heavy and sluggish. Hence that old rule among countrymen:

He that would have his calves good,
Must have an active and young bull.

From that time, being of no further use in breeding, he is usually gelt, and makes what they call a *bullock*; in the North commonly a *bullock*, or a *stot*. The better the bull is, the larger sort of beasts he begets; and the better the cow, or heifer is, that he leaps, the greater will be the increase. But of whatever sort the beast is, the *bull* should always be of the same country breed as the cow, or heifer, that he leaps, to get the best calves. The cow, or heifer, is never fruitful to well. The with the cow, or heifer, is never fruitful to well. The *bull* should be chosen of a sharp quick countenance, his forehead broad and curled, his eyes black and large, his horns long, but not lofty, his belly long and large, and hairy, his neck fleshy, his hair short and close, and like velvet; his breast should be large, but be straight and flat, his buttocks square, his thighs round, his legs straight, and his joints short. This sort of *bull* is the best for breed, and makes the best oxen for draught as well as for fattening.

The cow ought to have a broad forehead, black eyes, even clean horns, the neck long and thin, the belly large and deep, the thighs thick, the legs round, and the joints short; a white large and deep under with four teats, and large feet. The first must be proportioned to the goodness of the land.

Among the ancients, those who triumphed, sacrificed a *bull*, when they arrived at the Capitol. *Bulls* were offered to Apollo and Neptune. It was held a crime to

sacrifice

sacrifice them to Jupiter, though we do not want instances of that practice.

Bulls were ranged by the Romans in the number of military rewards.

BULL, *African*, in *Natural History*, a small wild *bull*, common in that part of the world, and supposed to be the true *bubalus* of the ancients.

BULL, *Perillus's*, was a hollow brazen engine of torture, in the shape of that quadruped; wherein persons being shut up, and fire applied, their cries imitated the roaring of a *bull*.

BULL'S *blood*, fresh drawn, is a powerful poison, as coagulating in the stomach. This is related on the authority of Pliny, xxviii. 9. and xi. 28. and many persons among the ancients, such as Æsop, Midas, Hannibal, and Themistocles, are said to have been poisoned by it. But the fact has been questioned by some, and denied by others. See Apollodorus, lib. 1. cap. 17. Strabo, lib. 1. p. 106. Plutarch in Flaminio; and Valer. Maxim. vol. vi. cap. 7.

BULL'S *gall*, is an insipid bitter, more pungent and acrimonious than that of any other animal; whence it is sometimes used to destroy worms.

BULL, *bawal*, denotes a *bull* kept by a lord, who has a right to demand all his tenants to bring their cows to be served by him. See BANNALIS.

BULL, *free*, according to Du Cange, signifies the same with *bannal bull*. Hence, *tauri liberi libertas*; which however, should rather seem to denote a privilege of keeping a *bull* independent of the lord.

BULLS, *wild*. The *wild bulls*, now so numerous on the continent of America, are said to have sprung from one *bull* and seven cows, which were carried thither by some of the first conquerors.

To the island of Hispaniola, the French buccaniers pursue *bulls* with dogs, and kill them with fire-arms. At Buenos Ayres, the Spanish rustics chase them on horseback, armed with a long lance, at the end of which is a half-moon of sharp steel. Having drawn a number of the horned kind together, they let the cows escape, but dexterously take the *bulls* with their half-moons on the hind legs, by which, disabling them from flight, they are easily dispatched.

BULL-*fighting*, a sport or exercise much in vogue among the Spaniards and Portuguese, consisting in a kind of combat of a cavalier or *torador* against a wild *bull*, either on foot or horseback, by riding at him with a lance.

The Spaniards have *bull-fights*, i. e. *bulls*, attended with shews, in honour of St. John, the Virgin Mary, &c.

This sport the Spaniards received from the Moors, among whom it was celebrated with great eclat. Some think, that the Moors might have received the custom from the Romans, and they from the Greeks. Dr. Plott is of opinion, that the *Taurokathaia ludus* amongst the Thessalians, who first instituted this game, and of whom Julius Cæsar learned and brought it to Rome, were the origin both of the Spanish and Portuguese *bull-fighting*, and of the English *bull-running*. Nat. Hist. Staff. chap. x. § 76.

The practice was prohibited by pope Pius V. under pain of excommunication, incurred *ipso facto*. But succeeding popes have granted several mitigations in behalf of the toradors.

BULL-*running*, denotes a feudal custom obtaining in the honour of Tutbury, in Staffordshire, where anciently, on the day of the Assumption of our Lady, a *bull* was turned loose by the lord to the minstrels, who, if they could catch him before he passed the river Dove, were to have him for their own; or, when taken, to receive each forty pence in consideration of which custom, they pay twenty pence yearly to the said lord. Plot. ubi supra.

BULL *and bear*. By the custom of some places, the parson is obliged to keep a *bull* and a *bear* for the use of his parishioners, in consideration of his having tithes of calves and pigs. Stra. Rep. Abr. 599. 4 Mod. 241.

BULL, in *Astronomy*, the constellation TAURUS.

BULL's *eye*, in *Architecture*. See ALDERMAN.

BULL's *eye*, in *Meteorology*, a little dark cloud, reddish in the middle, usually appearing about the Cape of Good Hope, there denominated by the Portuguese, who, on the appearance of it, instantly take down their sails, as knowing that a terrible storm of thunder, lightning, and whirlwinds, is at hand.

BULL's *eye*, in *Navigation*, denotes a sort of small pulley in the form of a ring, having a grip fixed round the outer edge of it, and a large hole in the middle for another rope to slide in. It is more commonly used by the Dutch than by English seamen.

BULL-*finch*, a species of the *loxia*. This is a very pernicious bird to gardens and orchards. They feed on the young buds of trees in spring, which occasion the loss of the summer's fruit. The black-thrush, or thoe-ster, is the great favourite of the *bull-finch*, and keeps him employed in the hedges in mild weather; but if the latter end of the winter hath been severe, and these thrushes are backward with their buds in February, he then comes into the gardens, the trees growing there being forwarder than those in the field in a cold spring; they will sometimes come in such numbers, as to take off all the buds from the currants, plums, &c. in the gardens of a whole town in a few days. Their buds are so fond, that no scare-crow, or other means that can be devised, can deter them; their great favourite is the damson-tree, and they will feed upon this while a person stands all the time up to them. It is very easy to know these birds; but the buds and young berries are usually much injured by the merchant, and the bull may seem to be in dawn over the twigs in many places with bird-lime.

The wild note of this bird is not in the least musical; but when tamed, it may be taught any tune after a pipe, or to whistle any note; and it seldom forgets what it has learned. These birds may be taught to speak, and some thus instructed are annually brought to London from Germany.

BULL-*fish*, a species of the *frog*, common in Sweden, and the northern parts of America, with four divided toes on the fore-feet, and five webbed ones on the hinder. When the limbs are extended, it measures near two feet; it is very voracious, and will frequently swallow young ducks and other fowl; its croaking is so loud, as to resemble the roaring of a *bull*; whence its name. See FROG.

BULL-*head*, the English name given to a small fish of the cottus kind, found very frequently in shallow running waters, and called by the ancients *Sarna* and *cottus*; called *dormitzer's mund*. +

BULL-*trout*, a English name for a fish of the salmon kind, caught in many of the rivers of England, and more usually called the SCHARA.

BULL-*weed*. See CHEVAGRY.

BULLA, in the *ancients*, a golden ornament, of a globular figure, and hollow within, wherein was contained some amulet, to serve as a preservative from witchcraft and envy, hung about the neck by those who triumphed among the Romans; and also by the children of the patricians, and even *negroes*, as a badge of their hereditary nobility and freedom, by which they might be animated to behave themselves worthy of their birth. Rom. Ant. p. ii. lib. v. cap. 8.

The *bulla* was not allowed to children of slaves, or even of *libertí*, who, in imitation thereof, wore a leather collar round the neck, much after the manner of the purple *thong* to which the *bulla* was hung. But the great Vestal, and the Roman ladies, wore a *bulla*; the former by way of distinction, the latter as a piece of dress. We may add, that *bullæ* were sometimes allowed to statues; whence the phrase *statuæ bullatæ*. M. Lepidus, having killed an enemy, and saved a citizen, even when a boy, had a *bullated* statue erected to him in the Capitol, in memory of the exploit. The Roman youth laid aside the *bulla* together with the *prætexta*, and conferred it to the *Lares*, when they arrived at their fifteenth year; as appears from the epistle:

Cum primum pavido custos mihi purpura cessit,
Bullaque succinctis Laribus donata pependit.
Pers. Sat. v. vers. 30. Hill. Acad. Inscr. tom. ii. Valer. Max. lib. iii. cap. 2.

BULLA was also a denomination given to divers other metalline ornaments of the after the form of *bullæ*. In which sense, *bullæ* seem to include all golden and silver ornaments of a roundish form, whether worn on the babes of men, the trappings of horses, or the like. Such were those decorations used by the ancients on their bells and discs. Virgil, speaking of Pallas's belt or girdle, fays,

Nuti fulgere in cingula bullæ
Pallantis pueri. Æneid lib. xii. ver. 942.

The *bullæ* of doors were a kind of large-headed nails followed on the doors of the rich, and kept bright with great care. The *bullæ clitinnipes* were sometimes adorned with golden *bullæ*.

BULLA also denoted a table hung up in the public courts, to distinguish which days were *fasti*, and which *nefasti*; answering in some measure to our calendar.

BULLA, in *Natural History*, a genus of worms of the order of *testacea*.

BULLACE *tree*, in *Botany*, a species of PRUNUS.

BULLARII, in the *Roman* Rome, the makers of drawers of BULLÆ or cauldrons.

BULLARY, *Bullarium*, a collection of papal BULLAS. We have extant divers tomes of *bullaries*, some containing only the bulls of particular popes; such are the *bullaries* of Innocent XII. and Clement XI. Others containing the bulls granted to particular communities; such is the *bullary* of the order of Cluny, &c.

A general *bullary* of all the papal constitutions from Gregory

Gregory VII. to Sixtus Quintus, was compiled by order of pope Sixtus Quintus, in 1586; three which have been published a great *bullary*, by Laert. Cherubin, containing the bulls of all the popes from Leo to Paul V. to 1453; since continued by Ang. Cherubin to the year 1644, and by Ang. a Lannisco and Jo. Paulus to the year 1676; and, lastly, by an anonymous writer to the time of Benedict XIII. under the title of *Bullarium magnum Romanum*. We have the taxes applied in a new method by Boucharderie; a compendium of which is begun by Vitus Ferri, and a summary of it by Novarina. Vide Bibliotheca Lat. Ital. tit. Bulla, p. 816, 822.

BULLET, an iron or leaden ball, or shot, wherewith fire-arms are loaded.

Some derive the word from the Latin *bullire*, others from the Greek βολλειν, *to throw*.

According to Montecuculi, a *bullet*, shot out of a great gun, flies 92 fathoms in a second of time, which is equal to 384 English feet; and, according to Huygenius, it would be 25 years in falling from the earth to the sun: but according to some very accurate experiments of Dr. Derham, it flies, at its first discharge, 940 yards in 822 half-seconds; or above 7 miles in a minute; allowing therefore the sun's distance 100000000 English miles, a *bullet* would however go near 14 an hour at this full speed.

Bullets are of various kinds; viz. *round bullets*, made hot in a forge, intended to fly to far places where combustible matters are heated.

BULLET *bullet*, that is made cylindrical, with an aperture and a face at one end, which giving fire to the inside, where is the powder, bursts, and has the force itself with a report.

Chain bullets, consisting of two balls, joined by a chain over or four feet asunder.

Bar-shot, two balls joined by a bar of iron five or six inches asunder.

Double-headed bullet, called also *serpent*, being two balls of a pound or more each, on a bar, or chain: these are chiefly used at sea for cutting of masts, rigging, &c.

The diameter of a leaden *bullet*, weighing 1 pound, is 1.60 inches, according to the Roman foot; and the diameter of any other *bullet* is found by dividing 1.60 inches by the subduplicate of the number, which expresses how many of those make a pound; or by subtracting the third part of the logarithm of the number of bullets in the pound from the logarithm of 1.69, and the difference will be the logarithm of the diameter required.

This may be easily found the following table, shewing the diameters of leaden *bullets*, from 1 to 99 in the pound.

1	1.60	1.27	1.09	0.97	0.88	0.81	0.75	0.71	0.67
10	0.63	0.60	0.57	0.55	0.53	0.51	0.49	0.48	0.46
19	0.45	0.44	0.43	0.42	0.41	0.40	0.39	0.38	0.37
28	0.36	0.35	0.35	0.34	0.33	0.33	0.32	0.32	0.31
37	0.31	0.30	0.30	0.29	0.29	0.28	0.28	0.27	0.27
46	0.27	0.26	0.26	0.25	0.25	0.25	0.24	0.24	0.24
55	0.23	0.23	0.23	0.23	0.22	0.22	0.22	0.21	0.21
64	0.21	0.21	0.20	0.20	0.20	0.20	0.19	0.19	0.19
73	0.19	0.18	0.18	0.18	0.18	0.17	0.17	0.17	0.17
82	0.17	0.16	0.16	0.16	0.16	0.16	0.15	0.15	0.15
91	0.15	0.15	0.14	0.14	0.14	0.14	0.14	0.13	0.13

N. B. The upper horizontal column shews the number of bullets in a pound; the second, their diameters; the third, the diameters of those of 10, 11, 12, &c. and the fourth, those of 20, 21, 22, &c. and the last, those of 30, 31, 32, &c.

The government allows 11 *bullets* to the pound for the proof of muskets; and 14.5 in the pound, or 29 in two pounds, for service; 15 for the proof of carabines, and 30 for service; and 28 in the pound for proof of pistols, and 56 for service. Cannon-*bullets* are of different diameters and weights, according to the metal of the piece. See CANNON.

BULLET, *quarter*. See QUARTER.

Bullets, that have the wonderful property of returning, after experiments concerning which were given by Mr. Caret, Vide Memoires de l'Acad. Scienc. ann. 1707, p. 377.

The greatest part of those from wounds is an opinion defended by the ancient writers. *Bullets* sometimes remain only in the wall during many ages.

BULLET, *of quicksilver*, is sometimes practised to venoms that are of a cold nature, as the plague happening in the year 1636, when the *bullet* was put into the vinegar, &c. which was afterwards used as the quotidian drink; where it lies for the space of three years, and then is taken out, and used amongst the sick with good success.

BULLET, *of wax*, is a ball of wax, wherewith to keep the fluids of a wound clean, of the fire inflamed.

BULLET-*wood*, a denomination given by some to Spanish or Jamaica bars of iron.

BULLIMENTA, is used by some Greek writers for the willings and coverings of gold and silver vessels to preserve liquors, to render them brighter.

BULLIMONY, or BULLIMONG, denotes a mixture of several sorts of grain, as oats, peale, and vetches, called also *maslin*, or *mang-corn*.

BULLION, denotes gold or silver in the mass, or billets.

Silver and gold whether coined or uncoined (though used for a common measure of other things), are no less a commodity than wine, tobacco, or cloth; and may, in many cases, be exported as much to national advantage, as any other commodity. — No nation can ever be considerable in trade, that prohibits the exportation of *bullion*. And it is more for the public advantage to export gold or silver coined, than uncoined: since, in the former, we have the advantage of the manufacture.

The word is apparently formed from the French *billon*, a mass of gold or silver before standard, which Du Cange derives further from *billa*, as being *formæ aut signum* on which the *billon*, i. e. *bars* are *conformed*.

Other names sometimes also denominated BULLION.

By the Scottish laws, the customs in the exportation of woods were to be paid in *bullion*.

BULLION is also used for the place where the king's exchange is kept, or where gold and silver are brought in the lump to be tried or exchanged.

BULLITION is used for the act of wine upon the mixture of different liquors, which causes it a quantity of bubbles, or froth.

BULLOCK'S *eye*, in *Architecture*, see EYE.

BULL'S-*eyes*, in *Botany*. See *Bon-nuelle*.

BULTEL, the bran or refuse of meal after dressing.

The word is derived from the latin LAT. *bultellus*, or *bultellum*, *a sieve*, or *bolter*.

BULTER, also denotes a bag wherein meal is dressed, called also a *bulter*, or rather *boulter*.

BULTER-*cloth*, a linen or hair cloth for bolting or sifting of meal or flour.

BULTERS, are strong lines five hundred feet long, with fifty hooks, eight feet asunder, and baited with pilchards or mackrel, which are used on the coast of Cornwall in the fishery of CONGERS. They are sunk to the ground by a stone fastened to them; and sometimes such a number of these are tied together as to reach a mile.

BULWARK, *Fortification*, in the *Modern Fortification*, amounts to much the same with BASTION in the modern. See the BASTION.

BUM-*boat*, in *Sea-language*, a small boat used to sell vegetables, &c. to ships lying at a distance from the shore.

BUMBUNNY, in *Botany*, a name given by the people of Guinea to a plant common in that place, which serves them as an emetic; they boil a few of the leaves in water, and drink this liquor, which works very easily. Phil. Trans. N° 232.

BUMGHALI, a sect of Mahometans in Africa, said to be great sorcerers: they fight against the devil, as they say; and frequently run about covered with drums and trumpets, in a great flight they sometimes counterfeit combats with him at noon-day, and in the presence of numbers of people, for the space of two hours, with drums, pistols, scimitars, &c. laying desperately about them, till they fall down on the ground opposite with blows; then rolling a mountain, they recover their spirits, and walk off.

What they really are, is not well known; but they are said to be no other than jugglers.

BUMKIN, or BOOMKIN, in *Sea-Language*, a short piece of timber, projecting from each bow of a ship, to extend the lower corner of the foresail to windward. It is fixed by a thong or pin, which confines it with a sheave.

BUN, a dry batt of sugar. See BATT.

BUNCH, a cluster or assemblage of several things, as of grapes.

BUNCH also denotes a tumour, or protuberance, natural or preternatural, either on an animal or a vegetable body. The knob growing about the GRAFT of a plant is a sort of *bunch* formed by preternaturalness.

BUNCH, in *Gardening*. See CANKER.

BUNCH, in *Surgery*, denotes an elevation of the bark, arising from an extreme luxuriancy of the nutrient thereof. The juices begin undergoing corruption a long time on the surface, whereby to loosen the ligaments, and separate by wearing an iron bodkin, which, compressing the *bunches*, by degrees drive them back, to their natural situation.

BUNCHES in horses, called also *knobs*, *warts*, and *scabs*, are defects arising from foul meat, bruises, hard labour, or the like; whereby the blood becoming putrefied and foul, occasions such excrescences.

BUNCHED *ears*, among *Florists*, are those which stand out, and wherein the seed is lodged.

BUNCHED *roots*, those round roots which have knobs or knots in them. See BULB and ROOT.

BUNG, the stopple of a cask, barrel, or the like.

The bung is a wooden pin serving to stop the little hole in the top of a vessel to be filled by. It answers to what, among the ancients, was called *epiphonema*, and in the middle age *tyrsus, the bung of a vessel*, because in those days it was usually leaded.

After running new wine, or cyder, *the bung* is usually left open for some time, that where the liquor comes to work, there may be vent for the froth or foam, and that the bung may not be in danger of being burst by the violence of the fermentation. Yet, in some cellars, they leave wines to ferment, without giving them vent by the *bung*, in order to render them more brisk and spirituous in drinking; it is necessary the cellar be floored with iron, and other precautions taken that the *bung* may not fly.

BUNIAS, in *Botany*, vide, or pulse *Pliny* reckons, a genus of the *tetradynamia siliculosa* order of plants. Its characters are the following: the flower hath four petals, placed in form of a cross, joined at their base, and erect; it hath six *stamina*, two of which are opposite, and shorter than the others; in the centre is situated an oblong germen, which afterward becomes an irregular short oval pod with four angles, one or other of which is prominent and pointed, including one or two roundish seeds. There are six species of *bunias*; or *saxifrage*, is found in gardens and flowers in April: the root is used in food, and the seeds in physic. These seeds are said to be heating, drying, deterging, aperitive, and diuretic: and to be enemies to cancers.

BUNIUM. See PIG-NUT.

BUNK, in *Botany*, a word frequently occurring in the writings of the Arabian physicians. We do not at this time certainly know what it was; but it was evidently an aromatic root used in cordial, stomachic, and carminative compositions. See LINCALASTHA.

BUNT *of a sail*, is the middle part of it purposely formed into a kind of bag or pouch, that it may catch and receive the more wind.

The *bunt* is chiefly used in topsails; for coarses are for the most part cut square, or at least with a small allowance for *bunt or* compass.—They say, *the bunt holds much wind*, when it is large, that is, it hangs too much in forward.

Seamen all agree, that a bowling or *bunting* sail carries a veſſel faſter in the windward than a ſtraight or faſt ſail: the contrary of which is aſſerted by Dr. Hooke, who has a diſcourſe on ſhew the peculiarity of ſtraight or *bunting* ſails. See Hooke's Poſthum. Works, p. 363, 8vo.

BUNTINGS, are ſmall lines made faſt to the bottom of the ſquare ſails, in the middle part of the bolt-rope to engage, and to be covered through a ſmall block, placed in the yard: theſe ſerve to top up the *bunt* of the ſail for the better furling it up.—See *Sea. Dict.* 53. to 58. 74. 91. 146.

BUNTINE, a thin woollen ſtuff, of which the colours are ſignalized in *ſtuffs not wholly made*.

BUNTING, in *Ornithology*, the common Engliſh name of the EMBERIZA *miliaria*, called by others *cruenta, ſcariſoria, ſcindens, cacaroni*, and *ortygia*, or *ortygina*.

The bill of this bird is ſingularly conſtructed; the ſides of the upper mandible form a ſharp angle bending towards the lower; and in the roof of the former is a hard knob, adapted to break corn or other ſeeds.

BUONACCORDO, a ſmall ſtringed muſical inſtrument, reſembling a ſpinet, uſed by ſcholars to learn to play on, becauſe of the diſtinctneſs of their ſtrings.

The moſt faſhionable properties denote their ſuperiors.

BUOY, in ſea, a piece of wood, or cork, ſometimes an empty cask well cloſed, ſwimming on the ſurface of the water, and faſtened by a chain to a cord, to a large ſtone, piece of iron, or the like, to ſerve to mark the dangerous places in the ocean, as rocks, ſhoals, wrecks of veſſels, anchors, &c.

In rivers, *buoys* are ſometimes pieces of wood in form of maſts, in the ſhalloweſt places; ſometimes the trees are planted in a particular manner; ſometimes bavins are uſed, or be taken in a right line, the better to keep the veſſel; for the two may appear to the eye no more than one.

Buoys is alſo uſed for a piece of wood, or a barrel at ſea, faſtened to or juſt directly over the anchor; that the mark of the place may be ſure to weigh the anchor, may eaſily be diſcovered at the anchor-head.

BUOYS are of various ſorts, differing in their conſtruction and uſe, and bearing different names. *Can-buoys*, are thoſe in the form of a cone, floating over dangerous banks and hollow places. *Boat-buoys*, are ſhaped like the middle ſection of two cones, floating upon a common baſe tapering at each end. *Spindle-buoys*, are ſmall pieces of timber, fometimes in the ſhape of a cylinder, and ſometimes of a *two-fided*. *Cask-buoys*, are common casks employed to buoy up the cable from rocky ground.

BUOY-*rope*, the rope which faſtens the *buoy* to the anchor. Its length muſt be little more than the depth of the water, where the anchor lies; and it muſt be ſtrong enough to draw up the anchor when the cable is broke.

BUOY, *firſt of*, ropes faſtened to the *buoy*, by which it is hung, and ſpliced round it in a manner reſembling the braces of a drum.

BUR, *to ſtream or*, is to let it fall from the ſhip's ſide into the water, which is always done before they let go the anchor.

BUOYANCY, denotes a thing floating or apt to float.

BURAGO, a genus of plants of the order of *aſpe*, or which there is one ſpecies in Senegal.

BURBONIA, from *Bur*, or, and *ſeta*, *daughter*, in *Antiquity*, an Athenian feaſt or ceremony, deſcribed as a ridiculous thing: therein, with ſerious inſtitution:

The *burbonia* was properly a part or appendage of the ceremony of the *buphonia*.

For the origin of the *buphonia*, we are told it was forbidden by the laws of Attica to kill an ox; but it once happened at the feaſt of the *buphonia*, that an ox got the corn, others by the cakes, which had been conſecrated for the ſacrifice. Thanſaus the prieſt, enraged at this, preſently killed him, and fled for it. On which the Athenians, hearing the inſtrument of the fact, and feigning themſelves ignorant who had committed the fact, brought the bloody axe before the judges, where it was ſolemnly arraigned, tried, found guilty and condemned, and, in memory of this event, a feaſt was inſtituted under the denomination of *burbonia*. In which it was ſtill cuſtomary for the prieſt to fly, and judgment to be given about the daughter of the ox.

BUPHTHALMUM, from βοῦς, ox, and ὀφθαλμὸς eye, in *Botany*. See OX-EYE.

BUPHTHALMUS, in *Botany*, a name given by ſome of the ancients to the common great houſe-leek, or SEMPERVIVUM, from the manner of its growing in cluſters reſembling the eyes of large animals.

BUPRESTIUM. See HARE'S-EAR.

BUPRESTIS, a ſort of ſhining cantharides, of a ſtinking ſmell, and very fevere bite. It is of the ſame nature with the common cantharides, or Spaniſh fly, and is ſaid to do great injury to the cattle, which, feeding, chance to eat it. They form, in the Linnæan ſyſtem, a genus of inſects, different from the CANTHARIDES, but belonging to the ſame order of *coleoptera*, and comprehending ſeventy ſpecies.

BURACO *de voile*, in *Architecture*, the name of a ſhip-carpenter on the coaſts of the Braſils, and more uſually known among authors by its Braſilian name, GUARAPARIM.

BURBARUS, in *Ichthyology*, a name given by Paul Jovius, and ſome other writers on fiſhes, to the common CARP. See CYPRINUS.

BURBER, an Egyptian piece of money. It is a thick piece of copper about an inch and a half in diameter, twelve of theſe make a *medine* there.

BURBOT, the Engliſh name of the *mollis fluviatilis*; a fiſh common in the Trent, and many other of our rivers, and called in other places the eel-pout: the *gadus lota* of Linnæus. See Phil. Trans. vol. liii. pt. ii. N° 18.

BURCA, among the Turks, the name of the rich covering of the door of the houſe of Mecca: it is ten feet long, and five wide; and there are ſeveral figures and Arabic letters on it, very richly embroidered in gold, on a ground of red and green. This is carried about in their ſolemn proceſſions, and is often made to ſtop, that the people may touch it.

BURDA, in ſome *Middle Age Writers*, denotes a garment made of aſhes.

BURDACK, an Egyptian veſſel, which ſerve uſually drink out of at Cairo. They are made of a peculiar ſort of earth, which is ſuppoſed to cool the water, and are always ſet out in the earth, to keep the cooler, and covered with a ſtraiter, to prevent any thing falling into the water; they are of ſo porous a ſtructure, that the water will get through them in a few days.

BURDEN, properly ſignifies a heavy weight or load.

Hauſcbergh recommends the bearing of *burdens* as the beſt ſort of exerciſe, eſpecially to phyſicians troubled with ſtone. To this end he had a grate lined with plates of lead, which he could fill at will with bars of ſteel. This load he bore to or from ſome place, either increaſing or diminiſhing it as he found occaſion; a be which means he could both vary and exerciſe at the ſame time.

BURDEN *of a cordage*, a ſure meaſure of certain commodities. A *burden of gunpowder* is 100 pounds.

BURDEN *of a ſhip*, is its content, or the number of tons it will carry.

The uſual rule whereby a ſhip's burden is eſtimated, is, that it will conſequently bear a weight equal to that of ſuch the water which would fill its capacity. But this rule is not demonſtrative, and ſome depart from it as unexact, allowing only two-fifths, or even one-third of the weight for the ſhip's burden.

To determine the burden of a ſhip, multiply the length of the keel, taken within board, by the breadth of the ſhip, within board, taken from the middle beam from plank to plank, and the product by the depth of the hold, taken from the plank below the keelſon, to the under

part

part of the upper-deck planks, and divide the last product by 94, and the quotient is the content of the tonnage required. See FREIGHT.

BURDEN, *Sport of*, denotes those of a larger and heavier sort, carrying 500 tons, or upwards.

BURDEN, or rather BURDON, in *Music*, denotes the drone or deepest sound of an organ; being that produced by the thickest pipe.

The modern *burden* referrs to the note which the Greeks called *mese* or *meson*.

BURDOCK, in botany, the *pipe* or *drinking leaf*, by which liquor is given.

Martin Paris will have the name *burden* to have been originally given this pipe, on account of its resemblance to a carpenter's tool, commonly called also *burdo*.

BURDO, in *Building*, a compound beast of burden, produced by a horse and the ass, of which it is distinguished from the MULE, which is that produced of a male ass by a mare.

The liver and testicles of the *burdo* are greatly recommended by Aldrovandus, and some other authors, as medicines, but now never used.

BURDON, or BURDOUN, in *Middle Age Writers*, denotes a pilgrim's long staff, so doing the office and that beseeling of a MULE, or other animal.

BURDOCK, *arctium*, in botany, a genus of the *syngenesia polygamia æqualis* class of plants.

The characters are these: the flower is compounded of many flowers, which are tubulous and unequal, and cut into five narrow segments at the top; the germen is figured at the bottom of the tube, which afterwards becomes a single pyramidal angular, which afterwards becomes a single pyramidal angular seed, crowned with down. There are three species; for food, cultivation, and use.

The first of which are common weeds, growing on the sides of roads and foot paths in most parts of England; to use is not admitted into gardens. The first is indeed to be esteemed for medicinal use by the college of physicians.

As these plants are seldom cultivated, it is needless to give any instructions for that purpose: but where they are troublesome weeds, it may not be amiss to mention that their roots last but two years; they may therefore be destroyed with much less trouble than seed to have abiding roots: for the plants which come up from seed do not flower until the second year, and when their seeds are perfected their roots decay.

The root of the common *burdock* is a very powerful diuretic and diaphoretic. It is given with great success, in decoction, in obstructions of the spleen, and in dropsies. It is also recommended by some in all diseases of the breast and lungs, in asthmas, in the tisane, and in the scurvy. The seed of it is esteemed by many to be one of the greatest lithontriptics known; and, by the instances that have been published of its doing service in nephritic complaints, it seems to merit a fair trial. The fresh leaves are by some recommended when broiling for old ulcers, and for burns and issatures. They are also applied by the good women to the soles of the feet, as a remedy in hysteric complaints.

The fection of a *burdock* root, viewed with a microscope, has the appearance represented in *Vol. of Microscopical Objects, Class 2.*

BURDOCK, *Water*, *Trapbella*, in *Botany*, a genus of the monœcia class of plants. Its characters are these: it has male and female flowers on the same plant; the male flowers have a common scaly empalement; they are composed of several tubulous, funnel-shaped, flowers, which are equal, and divided into five segments; the female flowers are situated under the male by pairs; they have no petals or flowers, but are surrounded by oblong seed prickly fruit, having two cells, each including one oblong seed, convex on one side and plain on the other. There are four species.

The roots of this plant are of a bitter and acrid taste, and are recommended as of great service in scrophulous cases, taken in decoction. Gladiolus gives great praise to the roots dried and powdered, and given in milk-whey, as a substitute for the lepracy; but these are now rarely used.

BURDONARII, in ecclesiastical government, a term given to pilgrims, or those who went out of devotion to the Holy Land.

The word is formed from BURDO, an appellation given to the mule whereon they rode.

BURDUNCULUS, in botany, a name given by some to the plant known among most of the botanical writers by the name of *burgundian scabious*, or *sea scabious*.

BUREFORD *public*. See SANDON.

BURGAGE, a tenure proper to boroughs and towns, whereby the inhabitants hold their lands and tenements of the king, or other lord, at a certain yearly rate. See BOROUGH *English*.

BURGAGE is sometimes used to denote the rent, or quit-rent paid to the chief lord for the burgage tenements in a town or borough.

BURGAGE also denotes in the laws of Normandy, (some imagine, that it had its first rise here, and was brought into England by William the Conqueror; others are of opinion, that Rollo, when driven out of England, carried it thence into Normandy.

BURGAGE, *free*, *Burgagium liberum*, denotes a tenure, whereby the tenant, after having paid their rent to the superior lord, were exempted from the service.

BURGAU, in *Natural History*, the name of a large species of bezoar, of the lunar or round-mottled kind. It is very commonly found with a coat, of the nature of the mother of pearl, and the artificers take this out, to use under the name of mother of pearl, though some call it after the name of the shell they take it from, *burgaudine*.

BURGAUDINE, the name given by the French artificers, to what we call mother of pearl. In their works, they do not use the common mere-shell for this, but the lining of the American bezoar. Some alone call the mother of pearl *burgaudine*, and others the *burgaudine* mother of pearl.

BURGEON, in *Gardening*, a knot or button put forth by the branch of a tree in the spring.

The word is formed from the French *bourgeon*, which signifies the same, formed from the Latin *burra*, of *surra*. *Burgeon* amounts to the same with what is otherwise called *eye*, *bud*, or *germ*.

Frosts are chiefly dangerous when the *burgeons* begin to appear.

The *burgeons* have the same shape, same pith, same ligneous body, and the same intentions as the bulb; that is, all the parts are the same in both, only more contracted in the former.

BURGESS, an inhabitant of a borough, or walled town, or one who possesses a tenement therein.

In other countries, *burgess* and citizen are confounded together, but with us they are distinguished. See BOROUGH.

The word is also applied to the magistrates of some towns; as the bailiff and *burgess* of Bewmaris.

Anciently, *burgesses* were held in great contempt; being reputed servile, base, and unfit for war; so that the gentry were not allowed to intermarry in the families, or with them; but, in less time, were to appoint champions. A *burgess*'s son was reputed of age, when he could distinctly count money, measure cloth, &c. Spelm. Gloss. Gibson's tr. cap. 6.

BURGESS, *knight of*, *Burgensis regni*, was he who, though residing in another's jurisdiction, was exempt therefrom, and only subject to the jurisdiction of the kings, unless the lord also enjoyed royal jurisdiction.

In statute 5 Rich. II. c. 4. where the several classes of persons in the commonwealth are enumerated, we meet with *esquire*, *gentleman*, *merchant*, *artificer*, *husbandman*, *labourer*, and *burgess*, or *burgh*.

BURGESS is now ordinarily used for the representative of a borough town in parliament.

The *burgesses* are supposed to represent the mercantile part or trading interest of the nation. They were formerly allowed by a rate established in the reign of Edward III. two shillings a day in wages. It is much to be regretted, that the members for boroughs have not a suitable proportion to those for counties. The right of election of *burgesses* depends on several local charters and customs; though by 2 Geo. II. c. 24. the right for the future shall be allowed according to the last determination of the house of commons concerning it; and by 3 Geo. III. c. 15. no freemen, except such as claim by birth, servitude, or marriage, shall be entitled to vote, unless he hath been admitted to his freedom twelve months before. No person is eligible as a *burgess*, who hath not a clear estate of 300*l.* a year. Stat. 9 Ann. c. 5. See PARLIAMENT.

BURGGRAVE, properly denotes the hereditary governor of a castle, or fortified town, chiefly in Germany.

The word is compounded of *burg*, *town*, and *graf*, or *grave*, *count*.

The *burggraves* were originally the same with what we otherwise call *castellans*, or *warders*, *castellani*; but their dignity was considerably advanced under Rudolph or Hapsburg; before this time they were taken only as counts, and below the princes, but under him began to be esteemed on a footing with princes.

In time even the dignity is much degenerated, especially in the Palatinate. There were formerly, according to Leti, fifteen families who enjoyed the title of *burggraves*, thirteen of which are now extinct. But this is differently represented by others.

In Bohemia, the title *burgrave* is given to the chief officer,

officer, or to him who wounds a man in quality of sheriff. In France, the *Connestable* is one of the four chief officers of the crown.

In Scotland, the *Bailiwick* of Nonegam is president of the three of the province.

BURGH, the same with a town or city.

Burgh-bote, is pillage used for an aid or contribution for fortifying or repairing a town or castle.

Burgh-bote, *brig-bote*, and *hedge-bote*, are exhibited and with or without the leave of king Athelstan, to edifice and repair town-walls or bridges, and for the same several every year, unless a man did by other service, the king himself excepted, who exempted from this service; yea, to fell wood and timber-trees from forth other men's woods, and carry them away, according to Cowel, the word *burgh-bote* seems to be chiefly used for timber for this service, but the liberty of exemption from it.

BURGH-*brech*, or *breche*, a fine inflicted on the community of a town, for the breach of peace among them.

BURGH-*mails*, were yearly payments to the crown of Scotland, introduced by Malcolm III. and resembling the *fee-farm* rents of lands in England. See MAIL.

BURGH-*master*, an officer in the city of Amsterdam, who directs and lays out the moneys for the workmen, &c. otherwise denominated a *lord* and BAILIFF-MASTER.

BURGHERMASTER, BOURGERMASTER, or BURGOMASTER, chief magistrates in the cities of Germany, Holland, and Flanders; to whom belong the giving of orders for the government, administration of justice, policy, and finances of the place, though the authority and office are not every where alike, each city having its particular laws and customs.

The word is formed from the old Flemish *maeta*, *burger*, *burgh*, or *citizen*; and *oofdt*, *oofde*, *head*, signifies in all languages, whether by custom, or the first and chief; so that *burgomaster* in Holland, answers to what is called *alderman*, and the *lord mayor* in England; *attorney* at Amsterdam, *advocate* at Antwerp, *syndic* at Liege, &c.

BURGLARY, or *burglary*, entering into another man's dwelling-house in the night, by any person, or into a church in the day-time, by night or day, to commit some felony, or to kill some person, or with intent to do the same, or to break open chests or boxes in which the same be executed, or not. The like offence by day, *see* CLERGY, *benefit of*, &c.

It is felony at common law, but within benefit of clergy: however, this is taken away from the principals by 18 Eliz. c. 7. and from all accessaries before the fact, by 3 and 4 W. and M. c. 9.

BURGMOTE, a borough-court; or court held for a town or borough. See LAW-*Days* and MOTE.

The word is also written *burgemot*, *burgemotus*, *burgemotum*, and *burgimotus*, from *burgh*, *oppidum*, and *mote*, or *gemot*, *conventus*.

The *burgemot*, by the laws of King Edgar, was to be held thrice in the year. By those of Henry I. twelve times.

BURGOMASTER, or *Gronlandt*, in *Ornithology*, a whimsical name given by the Dutch sailors to a species of *larus* or sea-gull, common on that and many other coasts. It is known among authors by the name of MAVIS-BACK.

BURGOO, or BURGOUT, a breakfasting dish, made of white oatmeal, or grits, boiled in water, and then buttered with butter. It is made in Scotland and in Wales, by making oatmeal and water, and boiling it into a moderate consistence. It is a cheap and strengthening diet.

Burgoo, otherwise called *Mash*, is held by Cockburn very proper to correct that stinking of humours and corruption to which the other diet of sailors much disposes them. Yet the Lapland Quailing is the least kind of all these provisions, because of the scanty allowance of butter to it. The same author thinks it might be worth the consideration of those to whom the care of the victualling is committed, to contrive to render this food more agreeable to them.

BURGWARD, *Burgwardus*, or *Burgwardium*, in *Middle Age Writers*, the same with BOROUGH.

The name is also common to the men, and even the country about such a fortress. It is formed from the Teutonic *burg*, *castrum*, and *ward*, *custodia*.

BURIAL, the act of interring a dead body, and depositing it in the ground.

Burial and *tithe* are accounted rights, and belong not to the parish, or rector, but to the patron.

Westminster-abbey is the burial place of most of our English kings.

The denial of burial has been frequent in most ages, and the denial of it to persons of the first and highest quality, as, yea, the Creeks appear to have declared it by a Pythian oracle to the ancients for it is by the command of Apollo to pacify to man. Post Argh. Greek. rep. in Hist. Cap. 1 Pub. Hist. Rel. the vii. Cr. Pyth. Quest.

Burial is said also to be a debt of humanity. Some points are obligations in the law of nature, others in the law of nations, and others on the divine law. It is certain it is performed by them all. One of the seven corporal works of mercy, recited by ancient writers, is *burying the dead*. The primitive Christians ventured on it at the hazard of their lives; they never omitted it either in times of persecution, or of the plague, when the greatest dangers attended it. They were always reminded of the plain duty of burying by inhumation, and could never be brought to use any other; reckoning it a great piece of humanity in their persecutors wherever they denied them this decent interment after death, as they sometimes did, either by exposing their bodies to the fury of wild beasts and birds of prey, or burning them to ashes and dispersing their doctrine of a future resurrection. They knew it to have had a particular exertion to burning; that not but was to put the body whole into the ground, or, if there was occasion for any other way of burying, they embalmed the body, and laid it in a coffin.

The heathens believed, that the souls of those, who lay unburied, remained in a wandering state during the space of a hundred years.

The invention of *burial* among the Greeks is ascribed to Pluto, who, on this account, was deified, and made to preside over the world of shades. The Rabbins record, that the first dust was taken from Judea. Adam and Eve, say they, being utterly at a loss what to do with the body of Abel killed by his brother, were relieved under this perplexity, by observing a crow to throw earth and leaves over the body of one of his dead companions. This was enough for the patriarchs: he went prudently, and did the same to his son. The Egyptians carried their dead for sepulture a certain time; for the prefect of which one Christian, a farmer under one of the Pharaohs, procured a toll to be imposed, by which he was speedily enriched. Whence arose a boat-tradition of the ferryman of hell. Cicero refers the origin of the vulgar opinion concerning hell to the ancient custom of *burying* the dead by inurnment; for from hence the earth was considered as the habitation of mankind, who were here supposed to lead a new life under-ground. Dion. Sic. lib. xxxvi. 15. Plut. Cod. Pindr. Vet. Tell. tom. i. 536. Hill. Acad. Inscript. tom. ii. p. 21 to 30.

Among the Greeks, throwing was no *burial*; for which reason, it was a custom to inflict on some part of their bodies a reward for him that should first throw up, and bury them in case they were cast ashore. Among us, however, those who die at sea are usually buried there, unless they be near land; the ceremony is *burying* the corpse being sewed up in its hammock, or quilt, it is thrown over from the starboard under the shrouds of a gun. It is a great disgrace to be thrown over the larboard.

The Arawcos, a people of Guiana, preserve the bodies of their great men and drink them in their liquor.

Some nations among the Brasilians are said to eat their dead, not out of hunger, much less delight, but affection and reverence.

As the same time that the Romans used to burn the bodies of their dead, the custom was to stand expence, to throw those of the slaves to rot in holes dug perpendicularly, called *puteoli*. Plut. Trans. No 295.

They also thought human bodies were compounded of earth, inclined to have them committed to the earth: Heraclitus and his followers, imagining fire the first principle of all things, preferred burning.

The ancients *buried* by day, as accusing the night of all enormities, on account of the evil spirits then abroad: and persons who died in the flower of their days, were *buried* in the morning before sunrise.

Among the Romans, we find two kinds of *burial*, mentioned in the Theodosian codex; one, the *burying* of whole bodies in coffins under ground; the other, *burning* the bodies and afterwards inclosing them under ground. Both appear to have been used at the same times, though interring appears to be the older practice.

Mr. Munro takes the ceremony about Rome to have been the *burial* place of the ancient Romans, before burning came into fashion; and which, on the new modes taking place, fell into disuse, till they were revived by the primitive Christians. See CATACOMBS, and Phil. Trans. No 265.

The Romans in Britain *buried* their warriors near the *via strata*, or military way, to put their bodies out of danger of infection, and to prevent the scattering of their ashes in battle, the whole army cast an heap of earth; which is the origin of many of the mounts still found about us. As it was the general endeavour to lie unburied, it was most glorious to be rewarded with a large monument, which might become a relation of the Romans acts: for those generals near public ways, that passengers might be continually adding to the heap, which it was judged a work of piety to do.

The ancient Saxons laid the bodies of their chief warriors in the field on the surface of the ground, and co-

vered

vered them with clods of earth; which were raised in proportion to their dignity. See BARROW.

Though burning was the ordinary usage among the Romans, yet some still retained the ancient one of *burying*. The family of the Cornelii constantly interred their dead till the time of Sylla the dictator, who, in his will, gave particular orders to have his body burnt, probably to avoid the indignities which might have been offered to after *burial*, by the Marian faction, in return for the violence shewn by Sylla's soldiers to the tomb and relics of Marius.

Burial was denied by the ancients to traitors, proscribed persons, suicides, and even frequently to enemies killed in war; though this was rejected, by the more moral and civilized nations, a violation of the laws of nature. Among the Greeks, spendthrifts and insolvent debtors were also refused the rights of *burial*. By the laws of the church, this penalty has been carried farther, to persons unbaptized and excommunicated, to those who could not say their creed and pater-noster, to strikers of ecclesiastics, and to those who should omit communicating at Easter. But the prohibition of *burial* is now restricted to persons excommunicate, unbaptized, and those have laid violent hands on themselves, idiots, lunatics, and, in some persons excepted, to heretics, to persons killed in duels, ties or tournaments. Potter Arch. Græc. lib. iv. cap. 1. Grot. de Jure Belli, lib. ii. cap. 19. § 2, 3. Seld. de Leg. Nat. lib. vi. cap. 16. Johns. Eccl. Law. Ann. 900. § 22. Ann. 1138. § 10. Ann. 1378. § 4.

Among the ancient Egyptians, kings themselves were to undergo a trial after their death; and, if their behaviour had been ill, were refused the privilege of Charon's boat, that is, to be carried to *burial*.

The Danes, and northern nations, in their second age, *buried* their dead under earthen hillocks. Sometimes huge pyramids of stone were raised over their bodies, many of which are still remaining in divers parts of England.

In Japan, Peru, Pegu, Mexico, Tartary, Siam, and the Great Mogul's dominions, they burn their dead. For the great ones, the fires are made with aromatic woods, gums, balsam, and oils. The like method obtained among the Jews as early as Saul's time, whose body was burnt at Jabesh, and his bones afterwards *buried*. Asa was buried in the bed which he had made for himself, filled with sweet odours, and divers kinds of spices. The ancients buried out of cities and towns: an usage which we find equally among Jews, Greeks, and Romans. Among the last, *burying* within the walls was expressly prohibited by a law of the Twelve Tables: *Hominem mortuum in urbe ne sepelito, neve urito*. The usual places of interment were in the suburbs and fields, but especially by the way-sides: partly, says Kennet, to put passengers in mind of their mortality, and partly also to save the best of their land.

Two reasons are alleged, why the ancients buried out of cities; the first, as opinion, that the touch, sight, or even neighbourhood of a corpse, defiled a man, especially a priest: whence the rule in A. Gellius, that the *flamen dialis* might not, on any account, enter a place where there was a grave: the second, to prevent the air from being corrupted by the stench of putrefied bodies; and the buildings from being endangered by the frequency of funeral fires. We have instances, however, of persons *buried* in the city. But it was a favour only allowed to a few of singular merit to the commonwealth. Plutarch says, those who had triumphed were indulged in it. Be this as it will, Val. Publicola, and C. Fabricius, are said to have had tombs in the Forum; and Cicero adds Tubertus to the number.

Lycurgus allowed his Lacedæmonians to *bury* their dead within the city, and around their temples, that the youth, being inured to such spectacles, might be the less terrified with the apprehension of death.

Burying in churches was allowed for the first three hundred years after Christ; but it was severely prohibited by the Christian emperors for many ages after. The first step towards it appears to have been the practice of erecting churches over the graves of some martyrs in the country, and transfusing the relics of others into churches, in the city: the next was, allowing kings and emperors to be buried in the atrium or church-porch. The reason alleged by Gregory the Great for *burying* in churches, or in places adjoining to them, was, that their relations and friends, remembering those whose sepulchres they beheld, might hereby be led to offer up prayers for them. And this reason was afterwards transferred into the body of the canon law. To this superstition, and the profit arising from it, we may ascribe the original of church-yards. In the eighth century, the people began to be admitted into the churches, and some princes, founders, and bishops, into the church. The practice first introduced into the Romish church by Gregory the Great, was brought over into England by Cuthbert archbishop of Canterbury, about the year 750: and the practice of erecting vaults in chancels, and under the altars, was begun by Lanfranc archbishop of Canterbury, when he had rebuilt the church in this city, about the year 1075. From that time, the matter seems to have been left to the discretion of the bishop. By our common law, no person can be *buried* within the church, without consent of the incumbent, exclusively of the bishop; because the freehold of the church belongs to him, and he is deemed the best judge who are entitled to the favour of being *buried* in the church.

Burying in any shroud, &c. that is not made of sheep's wool only, is by the English law, 30 Car. II stat. 1. c. 3. subject to a penalty of 5*l.* and an affidavit shall be made to this purpose, either to a magistrate, or the officiating minister. See CEMETERY, FUNERAL, &c.

Burying alive, was the punishment of a VESTAL who had violated her vow of virginity. The unhappy priestess was let down into a deep pit, with bread, water, milk, oil, a lamp burning, and a bed to lie on: but this provision was but show, for the moment she was at the bottom, they began to cast in the earth upon her, till the pit was filled up. Mem. Acad. Inscr. tom. iii. p. 278. Lord Bacon gives instances of the resurrection of persons who had been accidentally *buried* alive.

BURIAL, *Christian*, is often used to denote that which is performed in holy ground, and with the usual service or ceremonies of the church.

BURIAL is also used to denote the dues paid for interment, especially to the minister.

The *burial-fee* paid to the priest on opening the grave, was called by our Saxon ancestors *soul-scot*. Phil. Trans. N° 189.

BURIAL, *of an ass, asini sepultura*, an ignominious kind of *burial* out of holy ground, under the gallows, or in a highway, where several roads meet, and performed by public hangmen, or the like. Such is that of suicides, excommunicated persons, &c. sometimes denominated CANINE *burial*, or *burial* of a dog.

In the middle age we also find mention of a peculiar kind of *burial*, called IMBUCATION, practised on the bodies of persons excommunicated. Du-Cange.

BURIAL, *of the crucifix, Sepultura crucifixi*, denoted a representation of the *burial* of Christ, anciently performed annually in churches on the day of the Parasceve. Du-Cange.

BURIALS, in computations of mortality, denote deaths, and stand opposed to births.

In this sense, we have estimates of the *burials* in Brandenburg, in Francfort, Breslaw, &c. Phil. Trans. N° 261. 229. and 176.

By a statute under king Charles II. a register is to be kept in every parish, of all persons *buried* within the same, or at the common *burial*-places thereof. Stat. 30 Car. II. c. 3. See MORTALITY.

BURIAL is also used for the inclosing of vegetable or mineral bodies in the ground, for divers purposes. Lord Bacon gives divers experiments of *burying* fruits, &c. for preservation and condentation, and to give nourishment to their respective trees. Works, tom. iii. p. 80.

Some commend *burials* in the earth, others in wheat, to season TIMBER when first felled, and make it of more durable use. Chemists sometimes *bury* their cements. The Chinese are said to *bury* their porcelain, to give it the greater beauty.

BURIS, a name given by Avicenna, and some other old authors, to a scirrhous hernia, caused by a hard abscess.

BURLAW, or BYRLAW, *burlawa*, in *Saxon Age Writers*, denotes country laws, or the law concerning country affairs. Du-Cange.

BURLESQUE, a jocose kind of poetry, chiefly used in the way of drollery, either to excite laughter merely, or to provoke derision and ridicule.

F. Vavasor maintains, in his book *De Ludicra Dictione*, that *burlesque* was absolutely unknown to the ancients; against the opinion of some others, that one Raintovius, in the time of Ptolemy Lagus, turned the serious subjects of tragedy into ridicule; which, perhaps, is a better plea for the antiquity of farce than of *burlesque*.

The Italians seem to have the fullest claim to the invention of *burlesque*. The first author in this kind was Bernia; he was followed by Lalli, Caporalli, &c. From Italy it passed into France, and became there so much the mode, that in 1649 appeared a book under the title of "The Passion of our Saviour in Burlesque Verse." Thence it came into England; but the good taste of the English never adopted, or owned it, notwithstanding one or two have excelled in it.

BURLING *of cloth*. See CLOTH.

BURMANNIA, in *Botany*, a genus of the *hexandria monogynia* class of plants. The flower is small, and consists of three minute, ovated, oblong petals, situated at the mouth of the cup; the fruit is an involuted capsule, of

cylindraceo-trigonal figure, formed of three valves, with three cells, containing many small seeds. There are two species.

BURN, in a medicinal ſenſe, denotes a ſolution of the continuity of a part of the body, by the force of fire.

Of *burns*, phyſicians uſually make ſeveral degrees: the firſt when there are only a few puſtules raiſed on the ſkin, with a redneſs, and a ſeparation of the *epidermis* from the genuine ſkin. The ſecond, when the ſkin is burnt, dried, and ſhrunk, but without any cruſt, or ſcab. The third is, when the fleſh, veins, nerves, &c. are ſhrunk and form a ſcab.

Lufitanus recommends an unguent, made of the aſhes of laurel leaves burnt, with hog's fat dropped on them, for a *burn*; or, on occaſion, the *unguentum populeum*, with wine-leaves laid over it. Panarolus obſerves, that clay laid on a *burn* abates the pain; and that the brewers in Holland uſe a decoction of ivy for the cure of *burns*.

Burns are likewiſe divided into dry and humid, from the cauſes that produce them.

BURNS, *dry*, are thoſe occaſioned by the application of naked fire, or ignited body, as coals, flame, red-hot metals, gunpowder, lightning, and the like, which are attended with a corrugation or ſhriveling of the part.

BURNS, *humid*, more uſually among us called *ſcalds*, are thoſe occaſioned by fluid ſubſtances, as hot water, oil, wax, or the like.

Dry *burns* are of a worſe kind than moiſt ones. Of the dry, the worſt and moſt penetrating of all is that of lightning; the next are thoſe cauſed by melted metals and gunpowder; the next, by fats and oily ſubſtances; the ſlighteſt of all *burns* is that by hot water.

As *burns* nearly reſemble inflammatory diſorders in their ſeveral degrees, ſo they alſo do in their method of cure. In the ſlighter degree of *burns*, the beſt method is to have recourſe to emollients and aſtringents. The beſt ſlight aſtringent is either common proof ſpirit, or rectified ſpirit of wine, or, when it is neceſſary, ſpirit of wine camphorated: theſe may be applied to the part with linen rags, as may alſo oxycrate, or the pickle of cabbages, or litharge vinegar; and theſe applications muſt be repeated as there is occaſion. Oil of turpentine has alſo very good effects if applied in time, and repeated frequently. And the vulgar method of holding the injured part, when that is the hand or finger, to the fire, as long and as near as can be borne, is often attended with ſucceſs; for the ſtagnating fluids are, by this degree of heat, driven back into their proper channels, and, by that means, the veſication, and other troubleſome ſymptoms, which naturally ſucceed, are often prevented. Another remedy, however, there is, very efficacious on the ſame occaſions, though founded on a contrary intention: this is by emollient remedies which remove the tenſion of the fibres or veſſels, and reſtore the blood to its natural courſe before any bad ſymptoms come on, as the injured part may be fomented with water, made as warm as the patient can bear, till all the pain and heat entirely diſappear. Sydenham very highly, and with great reaſon, extols this method. It is eaſy, however, to add to the efficacy of it, by giving the virtues of a fomentation to the water before it is uſed, by boiling in it marſh-mallows, mallows, mullein, linſeed, fenugreek-ſeed, or quince-ſeed. Cataplaſms, made of the ſame ingredients are alſo of great ſervice, as are alſo the emollient oils of linſeed, and the like. Whatever remedies are uſed in this caſe, ſhould be very frequently repeated; and when it is the caſe that is *burnt*, they ſhould be ſpread on a linen maſk, to be kept conſtantly moiſt by the application of the ſame remedy.

When the *burn* is ſomething greater than this, and attended with veſication, or puſtules, the puſtules are by no means to be opened, which always brings on great pain; ſome of the remedies before mentioned will always prove of more ſervice, applied while the bliſters are whole; and, by the uſe of them, the heat and pain will quickly go off, and the cuticle will ſeparate from the cutis, without either deformity or pain. But if theſe remedies do not abate the pain, the part is to be ſtrewed with linſeed oil, or the litharge ointment, or the *unguentum dupleum bellicum*, or ſomething of a like kind. Theſe are to be applied either by rubbing them frequently on the part, or ſpreading them on a linen rag, and applying that, and often renewing it. After theſe, a plaſter of the *emplaſtrum de minio*, or any of a like kind, will keep the ſkin ſmooth, and forward the renovation of the cuticle. If the *burn* or ſcald, whichever it be, be very conſiderable in extent, and great part of the body be burnt, it is neceſſary to bleed plentifully, even till the patient faints, and to give a briſk purge. This method will often prevent ill conſequences, that too frequently elſe attend large *burns*: ſuch as foul ulcers, large cicatrices, and ſometimes even gangrenes. When infants are the ſubjects of theſe accidents, bleeding being not ſo convenient, the revulſion is to be made by repeated purges; and, in grown perſons, a regularity of diet is above all things to be obſerved.

In the yet greater degree of *burns*, where the burnt part is covered by a cruſt or eſchar, the cure cannot be performed without ſuppuration. When this accident happens to the face, great caution is neceſſary, to avoid making a deformed cicatrix: for this reaſon, all ointments and plaſters whatever are to be forbidden, even though they are the moſt valuable ſecrets, as there are in almoſt all families many ſuch; for the miſchief of theſe remedies is, that they all dry up the wound too faſt, and contract the fibres and the ſkin, and by ſuch means leave an uneven cicatrix. The forwarding the caſting off the eſchar, is by all means to be attempted, and the diſcharge of the matter that is contained under it. The eaſieſt and moſt ſucceſsful method of doing this, is by the repeated application of emollients. Three or four times every day the dreſſings are to be changed; and if, at any of theſe times, any part of the eſchar is found to be looſe, it muſt be raiſed with the *forceps*, and removed, if that conveniently may be; at the ſame time, the reſt of the eſchar muſt be anointed with butter, and warm fomentations, made of emollient herbs, &c. applied. Two, three, or four days employed in this manner, generally afford a ſeparation of all the cruſt or eſchar; and the next intention is then to heal the wound. It is firſt, therefore, to be thoroughly cleanſed, by means of ſome mild digeſtive mixed with honey of roſes, and afterwards healed up with any of the lead or litharge ointments. If the eſchar in theſe caſes ſhou'd not ſeparate in proper time, it will be neceſſary to make a deep inciſion through the middle of it, to let out the included ſanies. *Burns* of the moſt extreme and worſt kind, where the *burn* has penetrated ſo deep as to deſtroy all the parts quite down to the bone, can have no relief from medicines; nor is there any thing in the ſurgeon's power, but amputating the limb. Heiſter.

Burns, however, are not only diſeaſes, but in ſome caſes remedies: M. Homberg obſerves, that in the iſle of Java the natives cure themſelves of a colic, otherwiſe mortal, by burning the ſoles of their feet; and cure themſelves of a *ponaris*, by dipping their finger in boiling water ſeveral times. In the country of the Mogul, the colic is cured by an iron ring applied red-hot about the patient's navel.

Travellers relate many other caſes of other diſeaſes cured by *burning*; and we ſee the effects of it ourſelves, in horſes, hounds, birds of prey, &c.

A kind of downy matter, called *moxa*, brought from the Indies, has been likewiſe uſed for the gout; applied, by *burning* it on the part affected. Many of the Japaneſe are covered with ſcars, ariſing from the uſe of the MOXA. And among theſe people the whole art of phyſic conſiſts in the choice of proper places to be burnt; which are varied according to the nature of the diſeaſe. *Burning* has been particularly recommended in the gout, as a fever but adequate cure of that ſtubborn diſeaſe.

M. Homberg gives us inſtances of two women cured, the one of a violent diſeaſe in the head and eyes, and the other of a diſeaſe in the legs and thighs, by the accidental *burning* of thoſe parts. He adds, that *burning* may cure in three ways; either by putting the peccant humours into a greater motion, and making them take new routs; or by diſſolving and breaking their viſcidity; or by deſtroying the canals which brought them in too great quantities.

Burning pyramidal pieces of tow or cotton on the joints, is an ancient practice revived in Europe, chiefly by Fab. ab Aquapendente, and Severinus, againſt pains of the joints ariſing from cold and viſcous humours impacted in them. The operation is alſo ſpoke of by Hippocrates and Celſus; the former of whom recommends the uſe of raw flax. Severinus calls it the Arabian *burning*, becauſe moſt frequently uſed among that people, though common enough alſo among the Egyptians. Hippocr. App. ſect. libs. vi. & de Affect. Text. 30 & 32. Celſ. lib. iv. cap. 22. Alpin de Med. Egypt. lib. iii.

BURN, *Heart*. See HEART.

BURNET, BURNETA, or BURNETUS, in *Middle Age Writers*, denotes brown cloth made of dyed wool.

In which ſenſe, the word ſtands contradiſtinguiſhed from *brunus*, which was applied to the wool undyed.

BURNET, in *Botany*. See POTERIUM, and SANGUISORBA.

BURNET *ſaxifrage*. See *Burnet* SAXIFRAGE.

BURNING, the action of fire on ſome pabulum, or fuel, whereby the minute parts thereof are torn from each other and put into a violent motion; and ſome of them aſſuming the nature of fire themſelves, fly off *in ætherem*, while the reſt are diſſipated in form of vapour, or reduced to aſhes.

The appearances of *burning* ariſe ſucceſſively, and in a certain order: a heat muſt precede greater than what ſuffices to boil oil; the lighteſt and moſt volatile parts of

the body burn the firſt; the heavier are ſlower in taking fire, but burn the longeſt.

Burning is a ſeparation of the parts of bodies made by means of fire. Some conſider it as a ſpecies of ſolution, and ſuppoſe it effected by a diſſolvent power inherent in fire, which acts as a menſtruum in reſpect of the ſulphureous parts of bodies.

Dr. Hooke, conſidering the neceſſity of air to *burning*, and that heat, however great, does not alone ſuffice to burn a body, does indeed take *burning* for a ſolution of the ſulphureous parts of bodies; but ſuppoſes the menſtruum, by which it is done, to be the air, or at leaſt ſome ſubtile, ſaline, nitrous ſubſtance diffuſed in the air. See AIR, CALCINATION, CALX, FIRE, and PHLOGISTON.

BURNING is alſo applied to the action of divers things which are cold to the touch, or do not contain fire.

In this ſenſe *aqua fortis* is ſaid to burn cloth. There are certain fogs which burn or ſcorch the corn. Virgil obſerves that ſevere cold *itſelf will burn*, that is, have much the ſame effects on the parts of the body as fire itſelf, in cauſing gangrenes.

BURNING, *extraordinary caſes of.*—We have inſtances of perſons *burnt* by fire kindled within their own bodies. A woman at Paris, who uſed to drink brandy in exceſs, was one night reduced to aſhes by a fire from within, all but her head and the ends of her fingers. Novum Lumen Phoſphor. accend. Amſt. 1717.

Signora Corn. Zangari, or, as others call her, Corn. Bandi, an aged lady, of unblemiſhed life, near Ceſena in Romagna, underwent the ſame fate in March, 1731. She had retired in the evening into her chamber ſomewhat indiſpoſed, and in the morning was found in the middle of the room, reduced to aſhes, all except her face, ſkull, three fingers, and legs which remained entire, with the ſhoes and ſtockings on. The aſhes were light, and, on preſſing, between the fingers, vaniſhed, leaving a greaſy ſtaining moiſture behind, with which the floor was incaſed: the walls, and furniture of the room, being covered with a moiſt cineritious ſoot, which had not only ſtained the linen in the cheſts, but had penetrated into the cloſet, as well as into the room over-head, the walls of which were moiſtened with the ſame viſcous humour. Mem. de Trev. an. 1731. p. 1203.

Sig. Mondini, Bianchini, and Maffei, have written diſcourſes expreſs, to account for the cauſe of ſo extraordinary an event: common fire it could not be, ſince this would likewiſe have burnt the bed and the room; beſides that it would have required many hours, and a large quantity of fuel, to reduce a human body to aſhes; and, after all, a conſiderable part of the bones would have been left entire, as they were anciently found after the fierceſt funeral fires. Sign. Mondini attributes this effect to lightning. A philoſopher of Verona maintains, that ſuch a conflagration might have ariſen from the inflammable matters wherewith the human body naturally abounds. Sig. Bianchini accounts for it from an internal fire, occaſioned by ſpirit of wine camphorated, which the lady uſed by way of bath or lotion, when ſhe found herſelf out of order. Maffei's ſyſtem is a combination of the three laſt: he ſuppoſes it owing to lightning, but lightning generated in her own body; agreeable to his doctrine, which is, that lightning does not come from the clouds, but is always produced in the place where it is ſeen, and its effects perceived. The humours of her body, naturally inflammable enough, were become preternaturally ſo, by her putrid indiſpoſition; and theſe, by perſpiration, had inveloped her body with an atmoſphere of the ſame kind, replete likewiſe with mineral matters, whereby its activity was heightened. She had probably riſen in the night to uſe her lotion, and, by the friction of her hand, had helped to kindle the flame.

We have various relations of ſeveral other perſons being *burnt* to death in this unaccountable manner; as Grace Pet of Iſpſwich, in 1744; and Mary Clues of Coventry, in 1772. An attempt has been made to eſtabliſh the opinion, that theſe deſtroying internal fires are cauſed in the entrails of the body, by inflamed effluvia of the blood, by juices and fermentations in the ſtomach, by the many combuſtible matters which abound in living bodies, for the uſes of life, and, finally, by the fiery evaporations which exhale from the ſettlings of ſpirit of wine, brandies, and other hot liquors, in the *tunica villoſa* of the ſtomach, and other adipoſe or fat membranes; within which thoſe ſpirits engender a kind of camphor, which in the night-time, in ſleep, by a full reſpiration, are put in a ſtronger motion, and are more apt to be ſet on fire. See Phil. Tranſ. N° 476. p. 453, ſeq. Ibid. vol. lxiv. pt. ii. p. 340.

Others aſcribe the cauſe of ſuch perſons being ſet on fire, to lightning; and theſe *burning* ſo entirely, to the greater quantity of PHOSPHORUS, and other combuſtible matter they contained.

It is well known, that ſtaſhes of light have been often produced from the bodies of men, as well as other animals, by a brisk motion. Fortunius Licetus mentions a perſon, who, by only rubbing his body with his hand, could make fire iſſue; and Maffei relates the ſame of Signora Caſſandra Buri Rambaldo of Verona, who needed only rub her ſleeve with a linen cloth, to produce ſtaſhes of light. See ELECTRICITY, LIGHT, PHLOGISTON, PHOSPHORUS, &c.

BURNING is alſo a denomination given by phyſicians to divers diſorders, on account of a ſenſation of heat that attends them. In which ſenſe we ſay a *burning* FEVER. See CAUSUS.

Among the divers ſpecies of madneſs incident to dogs, one is called the *burning* madneſs. If a mare which has been covered, and the colt knit within her, be covered by another horſe, he is ſaid to *burn* her.

BURNING is more particularly uſed for the herpes, or *ignis ſacer*, called ERYSIPELAS and *arſura*.

BURNING, among *Surgeons*, denotes the application of an actual cautery, that is a red-hot iron inſtrument, to the part affected; otherwiſe denominated cauterization. See CAUTERY.

BURNING, in *Antiquity*, was a practice much uſed by the Greeks, Romans, and northern nations; and ſtill retained by many people in both Indies, with reſpect to their dead. Phil. Tranſ. N° 126. See BURIAL.

In this ſenſe, *burning* ſtands oppoſed to burying; though, after *burning*, the BONES remaining, and aſhes, have been uſually collected into urns, and depoſited in the earth. Phil. Tranſ. N° 285.

Kings were burnt in cloth made of the ASBESTOS ſtone, that their aſhes might be preſerved pure from any mixture with the fuel, and other matters thrown on the funeral pile. And the like uſage is ſtill retained for the princes in Tartary.

Burning is not ſo ancient among the Greeks as interring; though we find it obtained in the time of the Trojan war. Potter. Arch. lib. iv. cap. 6. tom. ii.

For the manner of *burning* among the Greeks; the body was placed upon the top of a pile, on which were alſo thrown divers animals, and even ſlaves and captives, beſides unguents and perfumes. In the funeral of Patroclus, we find a number of ſheep and oxen thrown in, then four horſes, followed by two dogs, and, laſtly, by twelve Trojan priſoners. Hom. Il. xxiii.

Euſtathius aſſigns two reaſons for the prevalency of *burning* in Greece; the firſt, that bodies being thought to be unclean after the ſouls departure, were to be purified by fire: that the ſoul, or purer part, being ſeparated by the flames, from the groſs inactive matter, might take its flight to the heavenly manſions with more freedom. This latter opinion obtained ſo much, that the Indian philoſophers had not patience to wait for *burning* till after death; they had recourſe to it in their life-time; erecting themſelves piles for the purpoſe, to looſen their ſouls from confinement. Calanus, who followed Alexander out of India, finding himſelf indiſpoſed, obtained that prince's leave to prevent the growth of his diſtemper, by committing himſelf to the flames; and Hercules, before his reception into heaven, was purified from the dregs of earth by the ſame means. Quintil. Declam. x. Potter ubi ſupra.

Soldiers uſually had their arms burnt with them. The garments worn by the living, were alſo thrown on the pile with other ornaments and preſents; a piece of extravagance, which the Athenians carried to ſo great a length, that ſome of their law-givers were forced to reſtrain them, by ſevere penalties, from defrauding the living by their liberality to the dead. *Virgil. Æn.* lib. vi. Potter. lib. cit.

Pliny aſſures us, that *burning* was firſt brought into uſe among the Romans, on occaſion of the cruel uſage which the bodies of the dead Romans underwent in enemies countries. But this muſt only be underſtood in regard of the common uſage; ſince we find mention of *burning* as practiſed by ſome even in the earlieſt ages of Rome: Numa forbad his own body to be *burned*, commanding it to be laid entire in a ſtone coffin, which ſhews that the practice of *burning* was not then unknown at Rome. Plin. Hiſt. Nat. lib viii. cap. 54. Kenn. Rom. Ant. p. ii. lib v. cap. 10.

In ſome caſes, *burning* was expreſly forbid, and looked upon as the higheſt impiety. Thus infants, who died before the breeding of teeth, were entombed unburnt, in the ground, in a particular place ſet apart for this uſe, called *ſuggrundarium*. The like was practiſed with regard to thoſe who had been ſtruck dead with lightning, who were never to be *burnt* again.

Some ſay, that *burning* was deemed to ſuicides as a puniſhment.

The manner of *burning* among the Romans, was not unlike that of the Greeks: the corpſe being brought without the

the city, if they designed to burn it, was carried directly to the place appointed for that purpose; which, if it joined to the sepulchre, was called *bustum*, if separate from it, *ustrina*, and there laid on the *rogus*, a pile of wood prepared to burn it on, built in shape of an altar, but of different height, according to the quality of the deceased. The wood used was commonly from such trees as contained moft pitch or rofin; and if any other were used, they ſplit it for the more eaſy catching fire: round the pile they ſet cypreſs trees, probably to hinder the noiſome ſmell of the corpſe. The body was not placed on the bare pile, but on the couch or bed where it lay on. This done, the next of blood performed the ceremony of lighting the pile, which they did with a torch, turning their face all the while the other way, as if it were done with reluctance. During the ceremony, decurſions and games were celebrated: after which came the *oſſilegium*, or gathering the bones and aſhes; alſo waſhing and anointing them, and depoſiting them in urns, which were common to both nations. Tibul. lib. i. Eleg. i. Virg. Æn. lib. vi. Kennet and Potter. lib. cit. It is commonly ſuppoſed the practice of *burning* ceaſed at Rome under the empire of the Antonines.

BURNING *alive*, among the Romans, a puniſhment inflicted on deſerters, betrayers of the public councils, incendiaries, coiners, and even Chriſtians: it was called *cremation*.

The Jews had two ways of *burning*; one called *burning* of the body, performed with wood and faggots; the other, *burning* of the ſoul, *combuſtio animæ*, performed by pouring ſcalding hot lead down their throats. The prieſt's daughter, who committed whoredom, he that lay with his own daughter, or grand-daughter, or his mother-in-law, were *burnt* alive. Phil. Tranſ. N° 230. Godw. Moſes and Aaron, lib. v. cap. 7.

BURNING, *Uſtio*, in *Chemiſtry*, is diſtinguiſhed from CALCINING; as the former is performed in cloſe veſſels, and terminates in charring, or reducing the body to a blackneſs; whereas the latter burns them white, being performed in the open air.

It alſo differs from ROASTING, *toſtio*, as, in *burning* the fire is applied in contact with the body; in roaſting at a diſtance from it.

A cauſtick *burning* volatilizes ſalts, as common ſalt, *ſal alkali*. *Burning* alſo produces ſomewhat of a mineral ſulphur out of tartar, &c.

BURNING, or BRENNING, in our *Ancient Cuſtoms*, denotes an infectious diſeaſe, got in the ſtews, by converſing with lewd women; ſuppoſed to be the ſame that we now call the VENEREAL *diſeaſe*. Whence that diſeaſe is argued to be much more ancient than the common epocha of the ſiege of Naples.

The chief objection againſt *burning* being the ſame with the venereal diſeaſe is, that the remedies preſcribed againſt the former, would be ineffectual in the latter: but it is not to be expected, the meaſures of the ancient phyſicians ſhould be calculated for the removing of any malignity in the maſs of blood or other juices, as in the modern practice; inaſmuch as they looked on the diſeaſe as merely local, and the whole of the cure to depend on the removal of the ſymptoms: beſides this, it is matter of frequent obſervation, that ſome diſeaſes grow more violent, and others more remiſs in courſe of time: ſo that the remedies which might have availed for the ancient *burning*, may now fail as to the modern *pox*. The proceſs for the cure, as delivered by J. Arden, chirurgeon to king Henry IV. is thus: *Contra* incendium *virgæ virili interius, a rubro & exteriatino, ſiat talis ſyringa* (i. e. *injectio*) *lenitiva. Accipe ius muſtarum maſculum nutrientis, & parum vinarium, elem. viola & pe ſume: quibus commiſtis per ſyringam infundatur.*

In an ancient MS. written about the year 1390 is a receipt for *burning of the pyntel pot men clepe the apegolle*; *gole* being an old word for a running ſore. And in another MS. written fifty years after, is a receipt for *burning in that part by a woman*. Simon Fiſh, a zealous promoter of the Reformation, in his Supplication of Beggars, preſented to king Henry VIII. 1530, ſpeaking of the Romiſh prieſts, ſays, "They catch the pocks of one "woman, and bare them to another; they be burnt with "one woman, and bare it to another; they catch the "lepry of one woman, and bare it to another." And Board, a prieſt and phyſician in the ſame reign, begins one of his chapters of his Breviary of Health, thus: "The 19th chapter doth ſhew of the *burning* of an "harlot." The ſame author adds, that if a man be *burnt* with a harlot, and do meddle with another woman within a day, he ſhall *burn* the woman he ſhall meddle withal: and, as an immediate remedy againſt the *burning*, he recommends the waſhing the *pudenda* two or three times with white wine, or elſe with ſack and water.

BURNING *of Diamonds*, is uſed among the Jewellers for putting the DIAMONDS into a fierce fire, in order to diveſt them of a yellow or brown colour.

BURNING *on the forehead, Frontis inuſtio*, was anciently the penalty of a calumniator. In the middle age, we find frequent inſtances of *burning* in the cheek; a puniſhment affected to bondmen, or villains guilty of theft.

BURNING-*glaſs, or burning mirror*, a machine whereby the ſun's rays are collected into a point, and by that means their force and effect extremely heightened, ſo as to burn objects placed therein.

Burning-glaſſes are of two kinds: the firſt convex, called *lentes cauſticæ*; which tranſmit the rays of light, and in their paſſage refract, or incline them towards the axis; having the property of lenſes, and acting according to the laws of refraction.

The ſecond, which are the more uſual, are concave; very improperly called *burning-glaſſes*, being uſually made of metal; there reflect the rays of light, and, in that reflection, incline them to a point in their axis: having the properties of *ſpecula* or MIRRORS; and acting according to the laws of REFLEXION.

The firſt, or convex kind, authors ſuppoſe to have been unknown to the ancients; but the latter they are generally allowed to have been acquainted with. Their magnifying power is taken notice of both by Seneca and Pliny; and their burning power is mentioned in a Treatiſe of Optics, aſcribed to Euclid, theorem 31. It is probable that the Romans had a method of lighting their ſacred fire by means of reflecting concave *ſpecula*. But Porta, and many others, ſuppoſe that the *burning* mirrors of the ancients were made of metal, in form of a ſection of a parabola, having the vertex cut off; it being the well-known property of this curve, to reflect all rays that fall upon it parallel to the axis into the focus. Hiſtorians tell us, that Archimedes, by means of reflecting mirrors, burnt a whole fleet; and though the effect related be very improbable, yet does it ſufficiently prove ſuch things were then known. The machines then uſed, nobody doubts, were metallic and concave, and had their focus by reflexion: it being agreed, that the ancients were unacquainted with the refracted *foci* of convex glaſſes. Yet M. de la Hire has diſcovered even theſe in the Clouds of Ariſtophanes; where Strepſiades tells Socrates of an expedient he had to pay his debts by means of a round tranſparent ſtone or glaſs, uſed in lighting of fires, by which he intended to melt the bond; which in thoſe days was written on wax. The glaſs here uſed to light the fire, and melt the wax, M. de la Hire obſerves, could not be concave; ſince a reflected *focus*, coming from below upwards, would have been exceedingly improper for that purpoſe: and the old ſcholiaſt of Ariſtophanes confirms the ſentiment. Pliny makes mention of globes of glaſs of cryſtal, which being expoſed to the ſun, burnt the cloaths and fleſh on people's backs; and Lactantius adds, that a glaſs ſphere, full of water, and held in the ſun, lighted the fire even in the coldeſt weather; which inconteſtibly proves the effects of convex glaſſes.

Indeed, there is ſome difficulty in conceiving how they ſhould know ſuch glaſſes burnt, without knowing they magnified; which it is granted they did not, till towards the cloſe of the thirteenth century, when ſpectacles were thought of. For as to thoſe paſſages in Plautus, which ſeem to intimate the knowledge of ſpectacles, M. de la Hire obſerves, they do not prove any ſuch thing: and he ſelves this by obſerving, that their *burning-glaſſes* being ſpherical, either ſolid, or full of water, their *foci* would be one fourth of their diameter diſtant from them: if then their diameter were ſuppoſed half a foot, which is the moſt we can allow, an object muſt be at an inch and a half's diſtance to perceive it magnified: thoſe at greater diſtances do not appear greater, but only more confuſed, through the glaſs than out of it. It is no wonder, therefore, the magnifying property of convex glaſſes was unknown, and their *burning* one known: it is more wonderful there ſhould be 300 years between the invention of ſpectacles and teleſcopes.

Every concave mirror, or *ſpeculum*, collects the rays diſperſed through its whole concavity, after reflexion, into a point or focus; and is therefore a *burning* mirror.

Hence, as the focus is there where the rays are the moſt cloſely contracted, if it be a ſegment of a large ſphere, its breadth muſt not ſubtend an arch above eighteen degrees: if it be a ſegment of a ſmaller ſphere, its breadth may be thirty degrees; which is verified by experiment. As the ſurface of a mirror, which is a ſegment of a larger ſphere, receives more rays than another of a leſs, if the latitude of each ſubtend an arch of eighteen degrees; or even more or leſs, provided it be equal; the effects of the greater mirror will be greater than thoſe of the leſs. And as the *focus* is contained between the fourth and fifth parts of the diameter, mirrors that are ſegments of greater ſpheres *burn* at a greater diſtance than thoſe which are ſegments of a ſmaller.

Since, laſtly, the *burning* depends on the union of the

rays, and the union of the rays on the concave spherical figure; it is no wonder, that even wooden mirrors, gilt, or their prepared of alabaster, &c. covered with gold, clay, even that those made of paper, and covered with straw, should be found to burn.

Among the ancients, the *burning* mirrors of Archimedes and Proclus are eminent; by one of which, the Roman ships besieging Syracuse, under the command of Marcellus, according to the relation of Zonaras, Tzetzes, Galen, Eutrachius, Anthemius, &c. and by the other, the navy of Vitalian besieging Byzantium, according to the same Zonaras, were burnt to ashes.

Many have questioned the fact recorded by several historians concerning the furprising effects of Archimedes's *burning* mirrors; and they have principally urged the impossibility of producing such effects by means of concave specula, the focal distance of which must have been much too small for the purpose. Des Cartes, particularly, discredited the story, as fabulous, on this account: but Kircher made many experiments with a view of vindicating its credibility. Apprehending that the concave specula of the ancients were sections of a parabola, he began with combining several of this figure; but, failing of success in this way, he tried the effect of a number of plane mirrors; and easily five mirrors of the same size, placed in a frame, he contrived to throw the rays reflected from them to the same place, at the distance of more than a hundred feet; and by their means he produced such a degree of heat, as led him to conclude that, by increasing their number, he could have fet fire to inflammable substances at a greater distance. He likewise made a voyage to Syracuse, in company with his pupil Schottus, in order to examine the place of the supposed transaction; and they were both of opinion, that the galleys of Marcellus could not have been more than thirty paces from Archimedes. M. Buffon, though ignorant of the particular teftimonies of ancient writers, relative to the invention of Archimedes, and of the attempts of Kircher above mentioned, has more lately, by a fimilar experiment, fufficiently evinced the practicability of the operation.

Dr. Wolfe, in the year 1708, after having given an account of fome parabolic mirrors, conftructed by M. Hoefen of Dresden, offers a conjecture, that thofe of Archimedes might be of this kind, fince it is not difficult to determine a parabola, whofe parameter is 1000 feet; and that rays reflected from fuch a fpeculum might be received by a lens, after having been brought to a focus, and tranfmitted parallel to any diftance; but he was not apprifed, that Kepler and Dechales had fhewn, that no rays could be conveyed parallel to one another, except thofe which proceeded from the fame points in the fun's difc. *Dutens du Miroir Ardent d'Archimede.* Paris, 1755 Phil. Tranf. vol. xlviii. p. 622, &c. Ibid. vol. lix. p. 8.

Among the moderns, the moft remarkable *burning* mirrors, are thofe of Magine, twenty inches in diameter, of Septala of Milan, which was more three feet and a half in diameter, and which burnt at the diftance of fifteen feet; of Villette, and Tichirnhaufen, and the new complex one of M. Buffon.

Villette, a French artift at Lyons, made a large mirror, which was bought by Tavernier, and preferted to the king of Perfia; a fecond, bought by the king of Denmark; a third preferted by the French king to the Royal Academy; a fourth has been in England, where it was publickly expofed.—The effects hereof, as found by Dr. Harris and Dr. Defaguliers, are that a filver farthing is melted in 7", and 3/4 a king George's halfpenny in 16", and runs with a hole in 34". Tin melts in 4", and runs in 16", fhoe in 9", a bottle fhell calcines in 3", a piece of Pompey's Pillar at Alexandria, vitrifies in the black part in 50", in the white in 34" copper orc in 8", bone calcines in 4", and vitrifies in 35". An emerald melts into a fubftance like a turquoife ftone; a diamond weighing four grains, lofes 1 of its weight; the *afbeft* vitrifies; as all other bodies will do, if kept long enough in the *focus*; but when once vitrified, the mirror can go no farther with them.—This mirror is 1944 inches wide; and is ground to a fphere of feventy-fix inches radius; fo that its focus is about thirty-eight inches from the *vertex*. Its fubftance is a compofition of tin, copper, and the glafs. Phil. Tranf. ubi fupra, p. 628.

M. Tchirnhaufen's reflecting mirror deferves next to be mentioned. The following things are noted of it in the Acta Eruditorum, for 1687, p. 52. 1. Green wood takes fire inftantaneoufly, fo that a ftring will cannot extinguifh it. 2. Water boils immediately, and eggs in it are prefently edible. 3. A mixture of tin and lead, three inches thick, drops prefently, and iron or fteel plate becomes red hot prefently, and a little after burns into holes. 4. Things not capable of melting, as ftones, bricks, &c. become foon red-hot, like iron. 5. Slate becomes firft white, then a black glafs. 6. Tiles are converted into a yellow glafs, and thofe into a blackifh yellow one. 7. A pumice-ftone omitted from a volcano, melts into white glafs; and, 8. A piece of crucible alfo vitrifies in eight minutes. 9. Bones are foon turned into an opaque glafs, and coals into a black one. It is made of copper and its fubftance is not above double the thickness of the back of a knife: this was about 4 French feet in diameter, and it burnt at the diftance of twelve feet. Every lens, whether convex, plano-convex, or concavo-convex, collects the fun's rays, difperfed over its concavity, into a point by refraction; and is therefore a *burning-glafs*. The moft confiderable of this kind known, is that made by M. de Tfchirnhaufen: the diameter of his lenfes are three and four feet; the focus is at the diftance of twelve feet, and its diameter an inch and a half. To make the focus more vivid, the rays are collected a fecond time by a fecond lens parallel to the firft; and placed in that place where the diameter of the cone of rays formed by the firft lens, is equal to the diameter of the fecond; fo that it receives them all; and the focus from an inch and a half, is contracted into the fpace of eight lines and its force increafed proportionally. It was purchafed by the duke of Orleans, who preferred it to the French Academy. Its weight was 160 pounds.

Its effects, among others, as related in the Acta Eruditorum, are, that it fufes hard wood, even moiftened with water, into a flame, inftantly; that water, in a brafs veffel, begins to boil prefently; all metals are melted; brick, pumice-ftone, delft wares and the *afbeftus* ftone, are turned into glafs; fulphur, pitch, &c. melted under water; the athes of vegetables, woods, and other matters, tranfmuted into glafs; in a word, every thing applied to its focus, is either melted, turned into eafs, or into fmoke; and the colours of jewels, and all other bodies, metals alone excepted, are changed by it. Herbs leaves, that it, fuccefs beft when the matter applied is laid on a hard charcoal, well burnt.

Though the force of the folar rays be here found fo ftupendous, yet the rays of the full moon, collected by the fame *burning-glafs*, do not exhibit the leaft increafe of heat. Farther, as the effects of a *burning* lens depend wholly on its convexity, it is no wonder that even thofe prepared of ice produce fire, &c. A LENS of that kind is eafily prepared, by putting a piece of ice into a ftuttle, or hollow fegment of a fphere, and melting it over a fire, till it accommodate itfelf to the figure thereof.

Nor will thofe ignorant of dioptrics be lefs furprifed to fee flame, and the effects thereof, produced by means of the refraction of light in a glafs bubble with water.

Wolfius tells us, that an artift of Dresden made *burning mirrors* of wood, bigger than thofe of M. Tfchirnhaufen at Villette, which had effects at leaft equal to any of them.—Trabetius teaches how to make *burning mirrors* of leaf gold, viz. by turning a concave, having its infide equally wide pitch, and covering that with figure pieces of the gold, two or three fingers broad, faftening them on, if need be, by fire. He adds, that very large mirrors may be made, of thirty, forty, or more concave pieces, artifully joined in a turned wooden dish or ftuttle; the effects of which will not be much lefs than if the furface was continuous.—Zahnius adds farther, that Newman, an engineer at Vienna, in 1699, made a mirror of paffe board, covered within-fide with ftraw glued to it; by which all kinds of metals, &c. were readily melted. Sir Ifaac Newton's *burning mirror* conftifted of feven concave glaffes, each of which was fixteen inches and a half in diameter, and fo difpofed as to have one common focus: for of them were placed round the feventh, and contiguous to it, in fuch a manner as to form the fegment of a fphere, whofe fubtenfe is about thirty-four inches and a half, the focus is about twenty-two inches and a half diftant, and about half an inch in diameter. This fpeculum vitrified brick or tile inftantaneoufly, and in about half a minute melted gold. M. Zeiher, not long fince, made fome improvement of this inftrument; and formed pieces of plain glafs into the neceffary degree of curvature, by heating them to hot in a dith made of metal, that they could all aflume the fame form. M. Buffon has conftructed furnaces for converting plain into concave mirrors: the mirrors are expofed to a degree of heat fufficient to fofren the glafs, in confequence of which it conforms itfelf to the fpherical figure of the mould on which it is placed. This method is fubject to many difficulties and accidents; however out of twenty-four mirrors treated thus, M. Buffon preferved three; two of which are thirty-feven inches in diameter, and the other forty-fix inches. The laft was ill-polifhed, and preferted to the French king; and is reprefented by the matter as the moft powerful *burning* mirror in Europe; and yet the moon's light reflected from this concave fpeculum, on a thermometer placed in the focus, produced no fenfible dilatation of the included fluid. M. Buffon

has also made attempts for constructing convex lenses of great power, by fixing two of the above mentioned concave glasses together, and filling the cavity between them with water: one of his glasses broke in the trial: but others have since undertaken to construct these water lenses. He has likewise suggested another improvement in the construction of *burning* glasses, consisting in a contrivance for diminishing the thickness of the middle or central part of the lens from three inches to one inch; whereby he proposes to prevent the diminution of light occasioned by its passing through the middle part of a lens of large diameter, and short focus, which must be proportionably thick in that part. This new kind of lens is composed of three parts ground to the same *radius*, or of two circular zones, or bands, surrounding a central or middle part. He supposes that the heat in the focus of a lens of this kind, three feet in diameter, will be about four times greater than that produced by any *burning* glass yet known.

But the most considerable improvement which M. Buffon has introduced into the optical apparatus in his machine, consisting of a number of mirrors whereby he seems to have revived the secret of Archimedes, and to have vindicated the credit of history in this point. In the year 1747 he constructed a machine, with a hundred and forty plain mirrors, each about four inches long, and three broad; these are fixed at about a quarter of an inch distance from each other, upon a large wooden frame of about six feet square. Each of them has three moveable screws, which are so contrived, that the mirror can be inclined to any angle, and in any direction that meets the sun; and by this means, the solar image of each mirror is made to coincide with all the rest. The experiment was first tried with twenty-four mirrors, which readily fired a combustible matter, prepared of pitch and tow, and laid on a deal board, at the distance of forty-six French feet.

He then further pursued the attempt, and put together a kind of polyhedron, consisting of 168 pieces of plane looking glass, each being six inches square; and by means of thin boards of beech-wood were set on fire, at the distance of a hundred and fifty feet, in the month of March, and a silver plate was melted at the distance of fifty feet. This machine, besides other advantages, may be easily moved, so as to burn downwards or horizontally, and it burns either in its distant focus, or in any nearer interval, which our common *burning* glasses cannot do, because their focus is wholly fixed and determined. This machine, in the next stage of its improvement, contained three hundred and fifty plain mirrors, each eight inches long, and six broad, mounted on a frame eight feet high, and seven feet broad. With twelve of these mirrors, light combustible matters were kindled at the distance of twenty feet; at the same distance, a large tea-kettle was melted with forty-five of them; and a silver piece of silver with a hundred and seventeen. When the whole machine was employed, all the metals and metallic minerals were melted at the distance of twenty-five and forty feet; wood was kindled in a clear sky at the distance of two hundred and ten feet. The focus, at the distance of fifty feet, is about seven inches broad; and at the distance of two hundred and forty feet, it becomes two feet in diameter. Mr. Buffon afterwards constructed a machine, which contained four hundred mirrors, each half a foot square, with which he could melt lead and tin at the distance of a hundred and forty feet. Phil. Trans. vol. xliv. p. 293, 460. M. de Buffon, Histoire Naturelle, &c. Supplem. vol. i. Montucci, *Histoire des Mathematiques*, vol. i. p. 216.

There is no solid substance that resists the efficacy of modern *burning glasses*. Messrs. Macquer and Beaume have succeeded in melting small portions of PLATINA, by means of a concave glass, twenty-one inches in diameter, and of twenty-eight inches focus; though this metal is not fusible by the strongest fire that can be excited in furnaces, or inflamed by any chemical apparatus. Yet it was long ago observed by the Academicians del Cimento, that spirit of wine could not be fired by any *burning-glass* which they used; and notwithstanding the great improvements which these optical instruments have since received, M. Noller has not been able, by the most powerful *burning* mirrors, to set fire to any inflammable bodies whatever. *See* LENS, MIRROR, &c.

BURNING *of metals*, called also *burn-beating*, and vulgarly DENSHIRING, from Devonshire, a county in which it has been long practised, is a method of preparing and fertilizing lands barren, sour, heathy, and rushy, for corn; by paring off the turf, and drying and burning it on the ground. — The same method also obtains for meadows and pasture ground, moss, or sedge, or rushes, to improve the hay.

BURNING *in Law*. See ARSON, BARNING, TREASON, &c.

BURNING *of metals, ores metallorum*, is either performed by fire, or by corrosive salts; which latter is also denominated CEMENTATION.

The first preparation of most ores is by *burning* them, whereby to dispose them for fusion. This is usually performed by exposing them, without admixture, to a naked fire; sometimes fixed alkalies, or nitrous salts are added, to hinder the evolution of the sulphureous particles. Some hold *burning* in the slight of the sulphureous gross; others *burning* in the mass. See ORE, § 109. The baser metals, tin and lead, are *burned* in order to fit them for plates to adhere. For gold and silver, the *burning* is needless.

BURNING, *mountains*. See VOLCANO, EARTHQUAKE, MOUNTAIN, &c.

The authors describe a mountain in the island of Timor, in the form of a *burning* boiler, *ardens cacabus*. Plin. Nat. hist. lib. cap. 34. Mem. Acad. Infer. tom. [illegible] p. 75.

Travellers into Italy describe a *burning* spot of ground at Pietramala, in the Appennines, out of which a crackling flame, continually issues, yet without any clefts to it to issue out at. Hales supposes the flame which the place yields, to be a kind of native *phosphorus ardens*, which takes fire on their coming in contact with the air.

BURNING, among *Painters*—several of the primary colours require *burning*, to fit them for use, as lamp-black, umber, ivory, &c.

The *burning*, or rather drying, of lamp-black, is performed by setting it over the fire in an iron ladle, or crucible, till no smoke arises from it. To *burn* umber, they put it in large lumps into a naked fire, where it is let till thoroughly reddish. Ivory must be *burnt*, to make a black, in an crucible, luted, covered with steele.

BURNING, in *Enamel painting*. See ENAMELLING.

BURNING is also an operation in *Pharmacy*. Simples are frequently *burnt* in earthen vessels, either to reduce them to ashes, as in the preparation of vegetable salts, or in order to dry them, that they may be more conveniently powdered, as is practised in regard of hartshorn, &c.

BURNING *phosphorus*. See PHOSPHORUS.

BURNING *plant, Euphorbia*. See SPURGE.

BURNING *spring*, in *Natural History*. See SPRING.

BURNT *zone*, in *Geography*. See TORRID ZONE.

BURNISHED *gold and silver*, denote those metals laid on any work or leaves, and afterwards polished over with a burnisher to heighten their lustre.

BURNISHER, a round polished piece of steel, serving to smooth and give a lustre to metals.

Of these there are various kinds, of various figures; straight, crooked, &c.—Half *burnishers* are used to voluting silver, as well as to give a lustre.

Burnishers for gold and silver are commonly made of a dog's or wolf's tooth, set in the end of an iron or wooden handle. Of late, agates and pebbles have been introduced, which many prefer to the dog's tooth.

The *burnishers* used by engravers in copper, usually serve with one end to burnish, and with the other to scrape.

BURNISHING, the act or art of smoothing, and polishing a metalline body by briskly *rubbing* it with a *burnisher*.

Bookbinders *burnish* the edges of their books by rubbing them with a dog's tooth. Gold and silver are *burnished* with a wolf's tooth, a dog's tooth, or the blood stone, or by *stipple*, a piece of white wood, emery, and the like.

Deer are said to BURNISH *their heads*, when rubbing off a white slimy film from their horns against a tree, they thrust them, as is said, into a reddish earth, to give them a new colour and lustre.

BURNT *clay*. See MARCHING.

BURNT-*grass*. See SMUT.

BURNT-*alum*. See ALUM.

BURNT-*lead*. See LEAD.

BURNT, in speaking of medicines, imports as much as imperfectly calcined. See CALCINATION.

Burnt bodies are generally dry and astringent. The other medicinal qualities belonging to bodies are frequently destroyed, at least impaired, by the *burning*.

BURNT *planet*.—A planet is said to be *burnt*, *combustus*, when it is in conjunction, or nearly so, with the sun. Thus Saturn is said to be *burnt*, when not above five degrees distant from the sun, Jupiter, when six, &c. Planets, in this situation, are supposed by astrologers to be much weakened, or enfeebled in their influences.

BURNT *tag*, *tache du vin*, among *Heralds*, that part of the garter from the beginning of Libra to the middle of Scorpio; or, according to others, from the middle of Libra, to the end of Scorpio, containing 45 degrees; a space supposed very unfortunate, and in which the planets are much enfeebled in their virtues, especially the moon. Vital Lex. Math. p. 118.

BURNT-*wine*. See WINE.

BURR-PUMP, or HIT-NOT-PUMP, a kind of PUMP so called, because it holds much water.

BURR, a round knob of a horn next a deer's head.

BURRAS-*pipe*, an instrument used by goldsmiths, consisting of a copper box with a spout, having teeth like a saw; sometimes also used by surgeons for the application of certain fluid medicines by inspersion.

BURREL-*fly*, in *Angling*. See WHIRLE-TAIL.

BURROCK, a small weir or dam, where wheels are laid in a river for taking of fish.

BURROUGH. See BOROUGH.

BURSTARD-*head*, in *Zoology*, a common English name for the *tarentula*.

BURROW, holes in a WARREN, serving as a covert for rabbits.

A queen's counsel has *burrow barrow*, is called *bolting*. To catch conies, they sometimes by purse-nets over the *burrows*, then put in a ferret close muzzled, which making the creatures bolt, are so caught in the net.

BURROW, or BARROW. See BARROW.

BURSA, *Purse*, originally signifies a purse.

BURSA, *prædalis pes*, in the Norman *Laws*, is a right belonging to the next akin, to redeem or purchase back, within a year and a day, a fee or tenement alienated by his kinsman, on paying the price it had been sold at. Du-Cange.

BURSA is more particularly used, in *Middle Age Writers*, for a little college or hall in an university, for the residence of students; called *bursal*, or *bursarii*.

BURSA, *Burse* or *Bourse*, in the French universities, still denotes a foundation for the maintenance of poor scholars in their studies.

The nomination of *burses* is in the hands of the patrons and founders thereof. The *burses* of colleges are not benefices, but mere others assigned to certain countries and persons. A *burse* becomes vacant by the scholar's being promoted to a cure, as being incompatible. In the college of cardinal Moline at Paris, there are two sorts of *burses*, either for young scholars who can only enjoy them six years, that is, from their first admission to the degree of master of arts; and *regents*, which may be held nine years, or till the students obtain the degree of doctor.

BURSA *pastoris*. See SHEPHERD'S *Purse*.

BURSA *pudendi mulieris*. See DARTOS.

BURSALIS *musculus*, in *Anatomy*, a name given by Cowper and others to a muscle of the thigh, called also *marsupialis* by the same authors. It is the *semimembranosus* of Winslow and Albinus, and is described by Veslingius under the name of *musculus tertius interioribus*, and by Spigelius under that of *triangularium tertium*, or *triangulare internum*.

BURSAR, or BURSER, *bursarius*, is used in *Middle Age Writers* for a treasurer or cash-keeper.

In this *sense* we meet with *bursars* of colleges. Conventual *bursars* were officers in monasteries, who were to deliver up their account yearly on the day after Michaelmas.

The city of Bern is commanded by four bannerets, who are the heads of the militia of the whole canton; and two *bursars*, who are the treasurers general, one for the German district, the other for the Roman or French.

The word is formed from the Latin *bursa*; whence also the English word *purse*: and hence the like officer, who in a college is called *bursar*, in a city is called PURSER.

BURSARS or BURSERS, in *Universities*, also denote those who enjoy certain benefices for defraying the expences of the education of young men of mediocrity, parts, and small fortune. In Sweden and at Paris, all such benefices are still called *bursaries*, or *bourses*. Alleins bought for the effects of a college, are entered in the name of the principal and *bursars*. See ALLEIN, 2.

BURSARIA, *Burses*, in *Middle Age Writers*, denotes the place of receiving and paying money and rents by the bursars, or officers of account, in religious houses. See BURSA and BURSAR.

BURSE, in *Matters of Commerce*. See EXCHANGE.

The first place of this kind to which the name *burse* was given, Guicciardin affirms us, was at Bruges; and it took its denomination from a house adjoining to it, built by a lord of the family *de la Bourse*, whose arms, which are three purses, are still found on the crowning over the portal of the house. Cate's account is somewhat different, viz. that the merchants of Bruges bought a house or apartment to meet in, at which was the sign of the purse. From this city the name was afterwards transferred to the like places in others, as in Antwerp, Amsterdam, Bergen in Norway, and London.

BURSE *of merchants*, *Bourse des marchands*, denotes a court or jurisdiction established in several trading cities of France, for the taking cognizance, at the first instance, of all disputes arising between merchants, bankers, negotiants, and the like, and from which no appeals lie but to the parliament.

The *burse* is a kind of consular jurisdiction, the judges whereof are also denominated *peers* and *consuls*.

The *burse* of merchants at Thoulouse was established by Henry II. in 1549, after the manner of the judges conservators of the privileges of the fairs at Lyons. The chief officers are a *prior* and two *consuls*, chosen yearly, and empowered to choose and associate, to the number of forty, several merchants to assist them, in the decision of differences. These are called judges *consulaires de la traverse*. The *burse* of Rouen, or, as it is commonly called, the *conventum* of Rouen, is of some years later standing than that of Thoulouse, having only been erected in 1566. The chief of the consular *burses* is that of Marseilles, established by Louis XIV. in 1691; whose jurisdiction extends through several of the neighbouring dioceses.

BURSERA, in the Linnæan system *of botany*, a genus of the *decandria monogynia* class. It has a three leaved cup; the flower is composed of three petals, and has three valves, and contains one seed. There is one species. Pomet botanists have called this the American turpentine-tree, and the American birch. See MASTIC-*tree*.

BURSTEN, a person ruptured, called by physicians *herniosus* in middle-age writers, *ponderosus*. See HERNIA and RUPTURE.

BURTHEN. See BURDEN.

BURTON, in the *Sea Language*, a small tackle, consisting of two single blocks, capable of being made fast any where at pleasure, for hoisting of small things in or out, and which will purchase more than a single tackle with two blocks. It is generally employed to tighten the shrouds of the top masts.

BURY, is sometimes used to denote the hole or den of some animal under ground. See BARROW.

In which sense we say, the *bury* of a mole, a toadle or the like. The *gryllotalpa*, or mole cricket, digs itself a *bury* with its fore-feet, which are made broad and strong for that purpose. Naturalists speak of a kind of urchins in the island of Mauritius, which have two conies to their *burys*, one towards the north, the other to the south, which they open and shut alternately, as the wind happens to set.

BURYING, the same with interment or BURIAL.

BUSELAPHUS, in *Zoology*, the name of an animal of the goat kind, called also *merolaphus*. It is of a sort of middle shape between the stag and ox kind. Its head and its ears are long, its legs and feet small, its tail about a foot long and of the shape of that of a hinder; its upper part reddish and very naked, its lower covered with long hairs. The hair of its whole body is of a tawney or reddish yellow colour; its horns are black, smooth at the top, and round every where else. It has two teats, and is an extremely tame and quiet animal, and naturally fond of play. It is extremely swift in running, and in small respects, except in size, greatly resembles the common KREDOSS. Ray.

BUSH, a tuft or assemblage of boughs or branches.

BOUGH, among *Rural Country*, denotes an arm or bough of a bushy tree, full of thick and long, yet smooth and straight twigs, dashed over with BIRD-LIMES, and placed in some hedge where birds frequent, used especially for the taking of phasants and heldrees.

BUSH also denotes a contracted frame of wood hung out as a sign at taverns. It takes the denomination from hence, that, anciently, signs where wine was sold were *bushes* chicky of ivy, cypress, or the like plants, which keep their verdure long. And hence the English proverb, "Good wine needs no *bush*."

BUSH. See SPUNGE.

BUSHEL, a measure of capacity for things dry; as grain, pulse, dry fruits, &c. containing four pecks, or eight gallons, or one eighth of a quarter.

Du-Cange derives the word *bushel* from *buscellus*, or *biscellus*, a diminutive of *bus*, or *bussa*, used in the corrupt Latin for the same thing: others derive it from *bussellus*, or *bus*, wherein bus were cast; which seems to be a corruption from *buscellus*.

Buscellus appears to have been first used for a liquid measure of wine, equal to eight gallons. *Octo libræ faciunt gallonem vini, & octo gallones unus sextarius* BUSSELLUS *Londoniensis, quem alibi vocant quarterium*. The word was soon after transferred to the dry measure of corn of the same quantity. *Præter alia mirarum frumenti sunt* BUSSELLUM, *de quibus alibi condidit scriptorum*.

By 22 Hen. VII. cap. 5. a *bushel* is to contain eight gallons of wheat; the gallon eight pounds of wheat, troy-weight; the pound twelve ounces troy-weight; the ounces twenty sterlings; and the sterling thirty-two grains, or corns of wheat growing in the midst of the ear.

This Standard *bushel* is kept in the Exchequer; when being filled with common spring water and the water measured before the house of commons in 1696, in a regular parallelepiped, it was found to contain 2145.6 solid inches; and the full water being weighed, amounted to 1131 ounces and 14 penny weights troy. Greaves, Orig of Weights, p. 25.

Besides the ſtandard or legal *buſhel* we have ſeveral local *buſhels*, of different dimenſions in different places. At Abingdon and Andover, a *buſhel* contains nine gallons; at Appleby and Penrith, a *buſhel* of peaſe, rye, and wheat, contains 16 gallons; of barley, oats, malt, mixt malt, and oats, 20 gallons. A *buſhel* contains at Carliſle, 24 gallons; at Cheſter, a *buſhel* of wheat, rye, &c. contains 32 gallons, and of oats 40; at Dorcheſter, a *buſhel* of malt and oats contains 10 gallons; at Falmouth, the *buſhel* of ſtricken meaſure is 16 gallons, of other things 20, and uſually 21 gallons; at Kingſton upon Thames, the *buſhel* contains eight and a half; at Newbury 9; at Wycomb and Reading, eight and three fourths; at Stamford, 16 gallons. Houghton. Collect. rom. t. 4. p. 42.

At Paris, the *buſhel* is divided into two half *buſhels*; the half *buſhel* into two quarts; the quart into two half quarts; the half quart into two litrons; and the litron into two half litrons. By a ſentence of the prevoſt of the merchants of Paris, the *buſhel* is to be eight inches two lines and a half high, and ten inches in diameter; the quart four inches nine lines high, and ſix inches nine lines wide; the half quart four inches three lines high, and five inches diameter; the litron three inches and a half high, and three inches ten lines in diameter.—Three *buſhels* make a minot, ſix a mine, twelve a ſeptier, and a hundred and forty-four a muid.

In other parts of France, the *buſhel* varies; fourteen one eighth *buſhels* of Amboiſe and Tours make the Paris ſeptier. Twenty *buſhels* of Avignon make three Paris ſeptiers. Twenty *buſhels* of Blois make one Paris ſeptier. Two *buſhels* at Bourdeaux make one Paris ſeptier. Thirty-two *buſhels* of Rochel make nineteen Paris ſeptiers. Grain are meaſured in a double proportion to other goods; ſo that twenty-four *buſhels* of oats make a ſeptier, and 248 a muid. The *buſhel* of oats is divided into four pottins; the pottin into two half quarts, or four litrons. For ſalt, four *buſhels* make one minot, and ſix a ſeptier. For coals, eight *buſhels* make one minot, fifteen a mine, and 360 a muid. For lime, three *buſhels* make a minot, and forty-eight minots a muid. See MEASURE and WEIGHT.

BUSKIN, *Cothurnus*, a kind of garment, ſomewhat in manner of a boot, covering the foot and middle leg, and tied beneath the knee; very rich and fine, and uſed principally on the ſtage by the actors in tragedy.

The *buſkin* is ſaid to have been firſt introduced by Æſchylus: it was of a quadrangular form, and might be worn indifferently on either leg. Its ſole was made ſo thick, as, by means thereof, men of ordinary ſtature might be raiſed to the pitch and elevation of the heroes they perſonated: in which it was diſtinguiſhed from the ſock, worn in comedy; which was a low, popular ſhoe.

Dempſter obſerves, that the *buſkin* was not confined to actors only, but girls likewiſe uſed it to raiſe their heights and travellers and hunters to defend themſelves from the mire, &c.

As the *buſkin* was the diſtinguiſhing mark of tragedy on the ſtage, we find it in claſſic authors frequently uſed to ſignify *tragedy itſelf*.

BUSS, in *Navigation*, a ſhip with two maſts, uſed by the Engliſh and Dutch in the HERRING-FISHING.

The word is originally Flemiſh, *buis*, or *buys*, which ſignifies the ſame.

The herring-buſs is uſually about 60 ton, and furniſhed with two ſmall cables, one at the poop, and the other at the ſtem, the former of which is uſed as a kitchen. The officers on board are the maſter or patron, his mate, and a boatſwain, who direct the fiſhermen, barrellers, &c. The only diet on a *buſs* is ſea-biſket, gruel, and the fiſh they catch.

BUSS, *Buſſis*, is alſo the name of a large ſort of veſſel of war, in uſe in the middle age, ſpoke of by antiquaries and hiſtorians under the ſeveral denominations of *buſſo*, *buſsa*, *barca*, *baza*, *bucco*, and *buſa*.

BUSSORES, by corruption from *Baſſara* in Perſia, whence they were originally brought, a name given by ſome to that ſpecies of pigeon called the CARRIER.

BUST, or BUSTO, in *Sculpture*, denotes the figure, or portrait of a perſon *in relievo*, ſhewing only the head, ſhoulders, and ſtomach, the arms being lopped off; ordinarily placed on a pedeſtal or conſole.

In ſpeaking of an antique, we ſay the head is marble, and the reſt porphyry, or bronze, that is, the ſtomach and ſhoulders. Felibien obſerves, that though in painting, one may ſay a figure appears in *buſt*, yet it is not properly called a *buſt*, that word being confined to things in *relievo*.

The *buſt* is the ſame with what the Latins called *herma*, from the Greek Hermes, Mercury, the image of that god being frequently repreſented in this manner among the Athenians.

BUST is alſo uſed, eſpecially by the Italians, for the trunk of a human body, from the neck to the hips.

BUSTA *Gallica*, was a place in ancient Rome [illegible] the bones of the Gauls, who firſt took the [illegible] ſlain by Camillus, were depoſited. It

BUSTA *Gallorum*, a place on the Appennine [illegible] reaſon of many thouſands of Gauls [illegible]

BUSTARD, OTIS, in *Zoology*, the [illegible]

The *otis* is called *tarda* and *ward* [illegible]

See *Tab.* III. *of birds*, N° 28.

In the Linnæan ſyſtem of nature [illegible] diſtinct genus of birds of the [illegible] the diſtinguiſhing characters of [illegible] have only three toes each, and [illegible] upper mandible of the bill arched [illegible] and the tongue bifid. There are four [illegible] *tarda* is of the ſize of the common [illegible] like that of the common gallinaceous [illegible] and neck are grey; its belly white, and its back variegated with tranſverſe ſtreaks of red and black; it has no hinder toe, by which, and by its ſize, it is eaſily diſtinguiſhable. The male is diſtinguiſhed from the female by being of a much larger ſize, and by a tuft of feathers about five inches long on each ſide of the lower mandible. Beſides, the males have a pouch, whoſe extenſive ſize immediately under the tongue, which is capable of holding near ſeven quarts; this ſerves them againſt drought, in thoſe dry tracts where they commonly live, and is probably filled with water, to ſupply the hen when ſitting, at the time they leave their young to fly. It feeds on herbs and grain, and eaſily wearies, and eats very greedily the leaves of dandelion, and particularly on the ſeeds of hemlock, which ſeems a very ſtrange food. It is frequent in many parts of England, where there are large heaths and plains they are very bad ſhots, and very difficult ſtate themſelves up from the ground; but they are extremely fly, and if they ſee a man at a very great diſtance, they immediately diſappear as ſoon as they can. Their fleſh is eſteemed. The leſſer *buſtard*, or *otis tetrax* of Linnæus, is about the ſize of a pheaſant.

BUSTARD, *Thick-kneed*. See *Stone*-CURLEW.

BUSTIARII, a kind of gladiators, among the ancient Romans, who fought about the buſtum, or pile, of a deceaſed perſon, in the ceremony of his obſequies.

The practice at firſt was, to ſacrifice captives on the tomb, or at the buſtum, of their warriors; inſtances of which we have in Homer, at the obſequies of Patroclus, and among the Greek tragedians. Their blood was ſuppoſed to appeaſe the infernal gods; and render them propitious to the manes of the deceaſed.

In after-ages, this cuſtom appeared too barbarous; and in lieu of theſe victims they appointed gladiators to fight; whoſe blood, it was ſuppoſed, might have the ſame effect.—According to Valerius Maximus and Florus, Marcus and Decius, ſons of Brutus, were the firſt, at Rome, who honoured the funeral of their father with this kind of ſpectacle, in the year of Rome 489. Some ſay the Romans borrowed this cuſtom from the Hetrurians; and they from the Greeks.

BUSTUARIÆ *meretrices*, a kind of public whores, who proſtituted their bodies among the *buſta* or tombs, which it ſeems were ordinarily places of reſort for actions of this kind. Others ſuppoſe that theſe were women hired to attend a funeral, and lament the loſs of the deceaſed.

BUSTUM, in *Antiquity*, denotes a pyramid or pile of wood, whereon were anciently placed the bodies of the deceaſed, in order to be burnt.

The Romans borrowed the cuſtom of BURNING their dead from the Greeks. The deceaſed, crowned with flowers, and dreſſed in his richeſt habits was laid on the *buſtum*. See BURNING.

Some authors ſay, it was only called *buſtum*, after the burning; *quod bene uſtum*: before the burning it was more properly called *pyra*; during it *rogus*; and afterwards, *buſtum*.

Where the body was only burnt there, and buried elſewhere, the place was not properly called *buſtum*, but *ſuſtrina*, or *ſuſtrinum*.

BUSTUM, in the Campus Martius, was a ſtructure wherein the emperor Auguſtus firſt, and after him, the bodies of his ſucceſſors were burnt.

It was built of white ſtone, ſurrounded with an iron paliſade, and planted within ſide with alder trees.

BUSTUM was alſo figuratively applied to denote any TOMB.

Whence theſe phraſes, *facere buſtum*, *vacare buſtum*, &c.

BUSTUM, *of an altar*, was the hearth or place where the fire was kindled.

BUTCHER. Among the ancient Romans there were three kinds of eſtabliſhed *butchers*; viz. two colleges, or companies, compoſed each of a certain number of citizens, whoſe office was to furniſh the city with the neceſſary cattle, and to take care of preparing and vending their fleſh. One of theſe communities was at firſt confined

Others are of opinion, that the *arac* or *arrac*, is a vinous spirit obtained by diffillation, in the East Indies, from rice or sugar, fermented with the juice of cocoa nuts.

The *Goa arac* is made from the *toddy*, the *Batavia arac* from rice and sugar. There is likewise a kind of shrub from which *arac* is made.

Goa and Batavia are the chief places for *arac*.—At Goa there are three sorts; single, double, and treble distilled. The double distilled, which is that commonly sent abroad, is but a weak spirit in comparison with Batavia arac; yet on account of its peculiar and agreeable flavour, is preferred to all the other *aracs* of India. This is attributed to the earthen vessels which they use at Goa to draw the spirit; whereas at Batavia they use copper stills.

The *Porto arac*, made at Madrass, and the *Calcutta*, and *Bombay arac*, at other places, being very hot spirits, are little valued by the Europeans, and therefore rarely imported; though highly prized among the natives. In the best *Goa arac*, the spirits of the cocoa juice do not make above a sixth or eighth part.

The manner of making the *Goa arac* is this. The juice of the trees is not procured in the way of tapping, as we do; but the operator provides himself with a parcel of earthen pots, with bellies and necks like our ordinary bird-bottles: he makes fast a number of these to his girdle, and any way else that he commodiously can about him. Thus equipped, he climbs up the trunk of a cocoa tree; and when he comes to the bough, he takes out his knife, and cutting off one of the small knots, or buttons, he applies the mouth of the bottle to the wound, fastening it to the bough with a bandage: in the same manner he cuts off other buttons, and fastens on his pots, till the whole number is used: this is done in the evening, and descending from the tree, he leaves them till the next morning; when he takes off the bottles which are mostly filled, and empties the juice into the proper receptacle. This is repeated every night, till a sufficient quantity is produced, and the whole being then put together, is left to ferment, which it soon does.

When the fermentation is over, and the liquor or wash is become a little sour, it is put into the still, and a fire being made, the still is suffered to work as long as that which comes over has any considerable taste of spirit.

The liquor thus procured is the low wine of *arac*, and this is so poor a liquor, that it will soon corrupt and spoil, if not distilled again; to separate some of its phlegm; they therefore immediately after pour back this low wine into the still, and rectify it to that very weak kind of proof spirit, in which state we find it. The *arac* we meet with, notwithstanding its being of a proof-till, according to the way of judging by the crown of bubbles, holds but a ſixth, and sometimes but an eighth part of alcohol, or pure spirit: whereas our other spirits, when they shew that proof, are generally esteemed to hold one half pure spirit. Shaw's Essay on Distilling.

There is a paper of observations on *arac*, in the Melanges d'Histoire Natur. tome v. p. 302. By fermenting, distilling, and rectifying the juice of the American maple, which has much the same taste as that of the cocoa, the author says, he made *arac* not in the least inferior to any that comes from the East Indies; and he thinks the juice of the sycamore and of the birch trees would equally answer the end.

Beside the common sorts of Goa and Batavia *arac*, there are two others less generally known: these are the bitter *arac*, and the black *arac*.

By stat. 12 Geo. I. c. 36. *arac* on board a ship within the limits of any port of Great Britain, may be searched for and seized, together with the package; or if found unshipping or unshipped, before entry, may be seized by the officers of excise, in like manner as by the officers of the customs.

Upon an excise officer's ſuspicion of the concealment of *arac*, and oath made of the grounds of such ſuspicion, before the commissioners, or a justice of peace, they may empower him to enter such ſuspected places, and seize the liquors, with the casks, &c. If the officers are obstructed, the penalty is 100*l*.

Arac is not to be sold but in warehouses, entered as directed in the 6th of Geo. I. c. 21. upon forfeiture, and the casks, &c. If permits are not returned which are granted for the removal of *arac*, or if the goods are not sent away within the time limited, the penalty is treble the value. If the permits are not returned, and the decrease is not found to be sufficient, the like quantity is forfeited. Permits are not to be taken out, but by direction in writing to the proprietor of the stock, or his known servant, upon forfeiture of 50*l*. or three months imprisonment.

By Statute 9 Geo. II. c. 35. if *arac* is offered to ſale without a permit, or by any hawker, pedlar, &c. with a permit, the person to whom it is offered, may ſeize and carry it to the next warehouse belonging to the customs or excise, and bring the person offering the same before any justice of the peace, to be committed to prison, and prosecuted for the penalties incurred by such offence. The person seizing such goods may profecute in his own name; and on recovery is intitled to one third part of the gross produce of the ſale: and the commissioners are, if desired, upon a certificate from the justice of the offender's being committed to prison, to abate to the ſeizer 15*s.* per gallon for the *arac* so ſeized.

Arac (except for the use of seamen, two gallons each) found in any ship or vessel arrived from foreign parts, at another, or hovering within the limits of any port, or within two leagues of the shore; and not proceeding on her voyage (unleſs in case of unavoidable necessity and distress of weather, notice whereof shall be given to the collector or chief officer of the port, upon the ship's arrival) is forfeited, with the boat, casks, or other package, or the value thereof.

ARACARI, in *Ornithology*, the name of a Brasilian bird, of the WOODPECKER kind. It is of the size of a common green woodpecker, and has a very large, sharp, and transverse hooked bill. Margrave. Ray, Pices, and *Syn.* II. *Birds*, N°. 14.

ARACHIS, in *Botany, round pease, arachindes*, and *arachidnes*. See EARTH-NUT.

ARACHNOIDES, in *Anatomy*, a fine, thin, transparent membrane, which lying between the *dura* and *pia mater*, is ſuppoſed to invest the whole ſubstance of the brain, *medulla oblongata*, and the spinal marrow.

The word is borrowed from ἀραχνη, *a ſpider*, or *ſpider's web*, and εἶδος, *form*; in regard to the fineness of the part, which is ſuppoſed to resemble that of a ſpider's web.

Many anatomists deny the existence of such a third *tunica*, or membrane; and contend, that it ought either to be regarded as the external *lamina* of the *pia mater*, which ſends its internal *lamina* between the folds of the cortical part of the brain.

ARACHNOIDES, or ARANEA *tunica*, is likewiſe uſed for a fine slender tunic, wherewith the cryſtalline humour is encompaſſed.

This, others call *cryſtalloides*, and *tunica cryſtallina*, or *capſula cryſtallina*.—Many have even doubted of its existence; which is the more extraordinary, ſome Eaſtern ſpecks of it, and compares it to a pellicle of an onion: Vesalius repreſents it as resembling fine transparent horn. —It is eaſily found in quadrupeds, eſpecially the ſheep, ox, and horſe; and though it be a little more difficult to diſcover in man, yet after a perſon has once been ſhewn it, he will readily find it.

What is ſurpriſing, Briggs ſays not a word of it; and ſo able an anatomiſt as Ruyſch, was long in ſuſpence about it; it was only by means of his injections that he diſcovered it in man; though ſo eaſy to diſcern in a ſheep.

The *arachnoides* adheres by its poſterior part to the vitreous tunic.—In man it is about twice as thick as a ſpider's web, at leaſt the fore-part of it; in an ox it is as thick again as in man; and in a horſe it is thicker than in an ox.

It has three uſes: firſt, to retain the cryſtalline in the cell of the vitreous humour, and prevent its changing ſituation: ſecondly, to ſeparate the cryſtalline from the aqueous humour, and prevents its being continually moiſtened therewith: thirdly, the lymphatics furniſh a liquor which they diſcharge into its cavity, wherewith the cryſtalline is continually refreſhed, and kept in right order: inſomuch that when this liquor is wanting, the cryſtalline loſes its juice, grows hard, and ſpoke, and may even be reduced to powder. Vide Petit, in Mem. Acad. R. Scienc. an. 1730. p. 621 ſeq.

ARACHNOIDES, in *Natural Hiſtory*, the name of one of the genera of the ECHINI marini; the diſtinguiſhing characters of which are, that it is of a circular circumference, but variouſly broken in at the edges. The mouth is ſmall, and placed in the centre of the baſe, and the aperture for the *ani* is quadrangular, and ſituated in one of the ſides, on the upper ſuperficies, but near the edge. Klein. See *Tab. of Teſtaceous and Cruſtaceous Animals*, N°. 8.

ARACUS, in *Botany, ſtrangle* TARE, or *wild* VETCH: a plant which grows in hedges, on banks, and among

corn. It is an herb in use, and has the same qualities with the other species of the vicia.

ARACUS *aromaticus*, in the *Materia Medica*, a name given by some authors to the VANILLA used in chocolate-making.

ARADOS, in *Hippocrates*, signifies that perturbation which is excited in the stomach by concocting meats of different qualities. *Aradus* also signifies any internal perturbation excited by purging medicines, vehement exercises, or other causes.

ARÆOMETER, *Aræometrum*, an instrument wherewith to measure the density or gravity of fluids.

The word is formed of ἀραιὸς, *thin*, and μέτρον, *measure*.

The *aræometer*, or water-poise, is usually made of glass; consisting of a round hollow ball, which terminates in a long slender neck, hermetically sealed at top; there being first as much running mercury put into it, as will serve to balance or keep it swimming in an erect position.

The stem is divided into degrees (as represented *Tab. Pneumatics, fig.* 18.) and by the depth of its descent into any liquor, the lightness of that liquor is concluded: for that fluid in which it sinks least, must be heaviest; and that in which it sinks lowest, lightest.

M. Homberg has invented a new *aræometer*, described in Philos. Transact. N° 262. thus: *A* (*fig.* 19.) is a glass bottle or matrass with so slender a neck, that a drop of water takes up in it about five or six lines, or half of an inch. Near that neck is a small capillary tube *D*, about six inches long, and parallel to the neck.—To fill the vessel, the liquor is poured in at the mouth *B* (which is widened to receive a funnel), till it run out at *D*; that is, till it rise in the neck to the mark *G*, by which means you have always the same bulk or quantity of liquor; and consequently, by means of the balance, can easily tell, when different liquors fill it, which weighs most, or is most intensely heavy.

Some regard, however, is to be had in these trials to the season of the year, and the degree of heat and cold in the weather: because some liquors rarefy with heat, and condense with cold, more than others; and accordingly take up more or less room.

By means of this instrument, the ingenious author has made a table, to shew the different weights of the same bulk of the most considerable chemical liquors, both in summer and winter, as follows:

	Weighed in summer.			In winter.		
The aræometer full of	oz.	dr.	gr.	oz.	dr.	gr.

The instrument itself weighed, when empty, one drachm twenty-eight grains. See HYDROMETER.

ARÆOPAGUS. See AREOPAGUS.

ARÆOPAGITIC. See AREOPAGUS.

ARÆOSTYLE, Ἀραιόστυλος, in the *Ancient Architecture*, a sort of INTERCOLUMNATION, wherein the columns were placed at the distance of eight, or, as some say, ten modules from one another. See *Tab. Archit. E. fig.* 40.

In the *æraostyle*, the columns were the widest and openest they were ever planted at; whence the name—from the Greek ἀραιὸς, *rarus*, and στύλος, *columna*.

The *æraostyle* is chiefly used in the Tuscan order; at the gates of great cities, and fortresses.

ARÆOTICS, in *Medicine*, such remedies as tend to open the pores of the skin, and render them large enough for the morbific matter's being carried off by sweat, or insensible perspiration.

To the class of *æraotics* belong diaphoretics, sudorifics, &c.

ARAF, or AL-ARAF, in the *Mahometan Theology*, a kind of separation or partition-wall between paradise and hell. Sale's Koran.

ARAHUM, or HARAHOM, in *Ancient Writers*, denotes a place consecrated or set apart for holy purposes. Du-Cange.

Hence the phrase, in *arahum jurare*, or *conjurare*, to make oath in the church; because, by the Riguarian laws, all oaths were to be taken in the church, on the relics of the saints.

ARAIGNEE, in *Fortification*, sometimes denotes a trench, return, or gallery of a mine.

ARAIRE, the name of a small plough [illegible] and Languedoc, in France.

ARAIS ACNIE, in *History*, the na[illegible] of Acnis, to the *fetes* [illegible] KERMESSES. Prosper Alpin.

ARALIA, in *History*, berry-[illegible] of *the peruvian virginia cherry*, [illegible] that it is an umbelliferous pla[illegible] having a small *involucrum* [illegible] and petals, and five short styles [illegible] turns to a roundish channelled ber[illegible] seeds, each containing one oblong kern[illegible] are three species; the Canada berry bearing *the berry-bearing angelica* with a naked stalk; and the *angelica tree*.

The inhabitants of Canada, and those of Virginia, call the first species of *aralia* by the name of *sarsaparilla*, because its roots have almost the same figure and virtues. M. Sarrazin writes from thence, that he had a patient who had been cured of an *amaurosis*, about two years before, by a drink made of these roots: and assures us that the roots of the second species, well boiled and applied by way of cataplasm, are very excellent for curing old ulcers; as also the decoction of them, with which they bathe and syringe wounds: and he does not at all doubt but the virtues of the third species are the same with those of the second. Phil. Trans. abr. vol. v.

ARALIA, in *Ancient Law Writers*, denotes arable or ploughing lands.

This is otherwise denominated *aratoria*, *araturia*.

In Domesday for Essex, we meet with *decem aeræ prati, duæ æraæ quatuor arabil.*—Where *arabil* seems to denote land fit for ploughing or tillage, by way of contradistinction to *pratum*, which was over-run with briars and thorns. Du-Cange.

ARALIASTRUM, in *Botany*, see GINSENG.

ARANEÆ, a genus of the *apteros* insects of Linnæus. See SPIDER.

ARANEA *cancer*, in *Natural History*, the name of a kind of sea-shell, of which there are several species: we call call them in English the spider-shells; they are of the family of the MURICES, and their peculiar character is the having digitated lips. The several species have different numbers of fingers, from the lip of the shell, as four, five, six, seven, or eight.

ARANEA *cancer*, see ARACHNOIDES.

ARANEUS *marinus*, the *sea-spider*, a name by which some authors have called the fish more usually known by the name of DRACO *marinus*, and supposed to have something venomous in the spines of its back-fin. Aldrovand.

ARANEA, a silver ore found only in the mines of Potosi, or in the single mine there of Catamito. It owes its name to some resemblance it bears to a cobweb, being composed of threads of pure silver, which to the sight appear like a silver lace when burned to separate the silk from it. It is the richest of all kinds of silver ore.

ARAPABACA, a name given by Plumier to the *filicula* of of Linnæus, or *adiantum*.

ARARAUNA, in *Ornithology*, the name of a Brasilian bird, of the MACAW kind. Margrave.

ARATEIA, in *Antiquity*, a yearly festival celebrated at Sicyon, on the birth-day of Aratus, wherein divers honours were paid by a priest constituted to this service, who for distinction's sake wore a ribband bespangled with white and purple spots.

The *aratcia* were solemnized with much pomp of music, the choirsters of Bacchus attending. Vitruv. Archæol. lib. ii. cap. 20.

ARATO-BAYABEN, a fixed star of the second magnitude in the head of the DRAGON.

ARATUM *terræ*, in our *Ancient Law Books*, as much land as can be yearly tilled with one plough.—*Hic mansionis sit 30 aratrorum.*

ARATURA *terræ*, an ancient service which the tenant was to do his lord, by ploughing his land.

ARBALET. See Bow, and BALLISTA.

ARBITER, in the *Civil Law*, a judge nominated by the magistrate, or chosen voluntarily by two contending parties, on whom they confer a power by compromise, of deciding their differences according to law.

The Romans sometimes submitted to a single *arbiter*; but ordinarily they chose several; and those always in an uneven number.

In matters wherein the public was concerned, as crimes, marriages, affairs of state, &c. it was not allowed to have recourse to *arbiters*.—Nor was it permitted to appeal

peal from an *arbitral* sentence; the effect of an appeal being to suspend the authority of a jurisdiction, not of a compact.

Among the ancients, there are properly divers kinds of *arbitria*, some obliged to go by the rigour of the law; and others not authorized by the contending parties to relate, or give any thing natural equity; these are properly called ARBITRARY.

ARBITRARY, in a general sense, that which is not defined, or limited by any certain, express law, or constitution, but is left solely to the judgment and discretion of another.—The punishment of such a crime is *arbitrary*.—*Arbitrary* fines or mulcts are usually called *amercements*.

The word is formed *from arbitrium, will*; whence also *arbiter, arbitrate*.

ARBITRARY POWER. See DESPOTISM, MONARCHY, &c.

ARBITRATION, or ARBITRAGE, the referring of a cause or quarrel to the decision of one or more indifferent persons, under the quality and denomination of *arbiters* or *arbitrators*.

An *arbitration* is either general, that is, including all actions, quarrels, and demands of special, which subsist one or more matters, or facts specified.

By flatutes 9 and 10 W. III. cap. 15. fect. 1. three May 25th, 1698, all merchants and others desiring to end any controversy, for which there is no remedy but by perfonal action, or fuit in equity, by *arbitration*, may agree that their fubmiffion of the fuit to the award or umpirage of any perfons, fhall be made a rule of any of his majeſty's courts of record, which the parties fhall chufe; and may inſert fuch their agreement in their fubmiffion, or the condition of the bond or promiſe; and upon producing an affidavit of fuch agreement, and upon reading and filing fuch affidavit in the court fo chofen, the fame may be entered of record in fuch court, and a rule of court fhall be thereupon made, that the parties fhall fubmit to, and finally be concluded by, fuch *arbitration* or umpirage; and in caſe of diſobedience thereto, the party neglecting or refuſing, fhall be fubject to all the penalties of contemning a rule of court, and proceſs fhall be iſſued accordingly; which fhall not be ſtopped or delayed by any order, &c. of any other court, either of law or equity, unleſs it appear on oath, that the *arbitrators* or umpire muſt have themſelves, and that ſuch award was corruptly or unduly procured.

Sec. 2. Any *arbitration* or umpirage procured by corruption or undue means ſhall be void, and fo likewiſe by any court of law or equity, fuch corruption or undue practice be complained of in the court where the rule is made for ſuch *arbitration*, before the laſt day of the next term after ſuch *arbitration* made and publiſhed to the parties.

The power of *arbitrators* is to be regulated by the compromiſe between the parties, as to what concerns the differences they are to determine; and whatever they decree beyond that, is of no effect.

ARBITRATOR, an extraordinary judge or commiſſioner, in one or more cauſes between party and party, chofen by their mutual conſent.

Among us, two *arbitrators* are uſually chofen by the contending parties: and in caſe theſe cannot agree, a third is added, and is called an *umpire*; in whoſe deciſion both ſides are bound to acquieſce.

The civilians make a difference between *arbiter* and *arbitrator*: though both ground their power on the compromiſe of the parties, yet their liberty is diverſe: for an *arbiter* is tied to proceed and judge according to the forms of law: whereas an *arbitrator* is permitted wholly to uſe his own diſcretion, without ſolemnity of proceſs, or courſe of judgment, to hear and accommodate the controverſy committed to him; ſo it be *juxta arbitrium boni viri*. See ARBITRIUM.

ARBITREMENT. See ARBITRATION.

ARBOR, in *Natural Hiſtory, Botany*, &c. See TREE.

ARBOR, in *Chemiſtry*.—ARBOR *philoſophica* is a name common to ſeveral metalline cryſtallizations; thus called from their ramifications reſembling a tree.

Of this kind, is the ARBOR *Dianæ*, ſometimes alſo called ARBOR *Lunæ*, a kind of efflorescence or cryſtallization, in which *aqua fortis* incorporated with ſilver and mercury, being put in water, expands and ſhoots itſelf into an appearance of a tree, with branches, leaves, and flowers.

The *arbor* DIANÆ is properly a precipitation of ſilver with mercury: the operation of making it belongs to the head of AMALGAMATION. It has its name from the ſilver which chemiſts call *Diana*, or the *Moon*. The experiment is generally conſidered merely as curious and amuſing.

Albertus Magnus is ſaid to have produced a tree before the king of France, while he ſat at dinner: this paſſed at that time for a *palingeneſis*, or reſuſcitation; but it may more naturally be referred to the ſpecies of germinations we are ſpeaking of.

The method of preparing the *arbor* DIANÆ, according to Lemery, is as follows. "Diſſolve an ounce of fine "ſilver in a ſufficient quantity of ſpirit of nitre, very "pure and moderately ſtrong; mix the ſolution in a "matraſs, with about twenty ounces of diſtilled water, "add two ounces of mercury, and let the whole remain "at reſt. In about forty days, a kind of ſilver tree will "be formed on the mercury, with branches reſembling "vegetable ramifications."

This proceſs is very long; the following, by Mr. Homberg, is much ſhorter. "Make an AMALGAMA without "heat, of four drams of filings of ſilver, or rather of "ſilver-leaf, and of two drams of mercury; diſſolve "this in four ounces, or a ſufficient quantity of ſpirit of "nitre, pure and moderately ſtrong; dilute this ſo"lution in about a pound and a half of diſtilled water; "ſhake the mixture, and preſerve it in a bottle with a "glaſs ſtopper. When the preparation is to be uſed, "an ounce of it is to be put in a phial together with "about the ſize of a pea of an *amalgam* of gold, or of "ſilver, which ought to be as ſoft as butter, and the "whole is to remain at reſt. Some ſmall filaments are "to be ſeen iſſuing from the ſmall *amalgam*, which "quickly increaſe, branch out on both ſides, and take "the form of ſhrubs."

Another kind of artificial vegetation may be produced, ſays Dr. Lewis, by ſprinkling a few drops of ſolution of ſilver upon a glaſs plate, and placing in the middle a ſmall piece of any of the metals that precipitate ſilver, as particularly of iron. The ſilver quickly concretes into curious ramifications all over the ſurface of the plate. Neumann's Works, p. 47.

ARBOR *Martis* is a germination of iron, reſembling a natural plant.

The *arbor Martis* is but of late invention; we owe it to the younger Lemery.

The manner of the diſcovery was this: on a diſſolution of iron filings in ſpirit of nitre contained in a glaſs, he poured oil of tartar *per deliquium*; upon this the liquor iron ſwelled very conſiderably, though with very little fermentation; and was no ſooner at reſt, than there aroſe a ſort of branches adhering to the ſurface of the glaſs, which, continuing to grow, at length covered it all over.

The form of the branches was ſo perfect, that one might even diſcover a kind of leaves and flowers thereon; ſo that this vegetation has as good a title to the appellation of *arbor* MARTIS, as the former has to that of *arbor* DIANÆ. See Hiſtoir. Acad. Royal. an. 1706.

ARBOR *genealogiæ, tree of conſanguinity*, ſignifies a lineage drawn out under the figure or reſemblance of root, ſtock, branches, &c.

ARBOR *porphyriana*, among the ſchoolmen, denotes a ſcale of beings; or a figure conſiſting of three rows or columns of words; the middlemoſt whereof contains the ſeries of genera and ſpecies, and bears ſome analogy to the trunk; and the extremes, containing the differences, to the branches of a tree.

SUBSTANCE

Thinking		Extended
	BODY	
Inanimate		Animate
	ANIMAL	
Irrational		Rational
	MAN	
This		That
	PLATO.	

The *arbor porphyriana* is otherwiſe called *ſcala prædicamentalis*.

ARBOR is alſo figuratively uſed in *Mechanics*, for the principal part of a machine, which ſerves to ſuſtain the reſt.—It is alſo uſed for a ſpindle, or axis, whereon a machine turns; thus, *arbor* of a CRANE, a MILL, a windmill, &c.

ARBOREOUS, ARBOREUS, is applied by ſome naturaliſts to ſuch excreſcences, fungules, moſſes, and other paraſites, as grow on trees; in contradiſtinction to ſuch as grow on the ground: ſuch are the *lichenoides* and *coralloides*.

ARBORESCENT, a term uſed to denote any thing that ſhoots or grows up in form of a tree.

Botaniſts ſpeak of *arborescent* ſhrubs and plants; the STECHAS *arborescens*, &c. Mineraliſts treat of *arborescent* metals, *arborescent* ſilver, *arborescent* iron, *arborescent* ſtones, &c. The *fungus marinus* is ranked by ſome in the claſs of *arborescent* foſſils; the chemiſts produce *arborescent*

horescent cryſtallizations, which they call philoſophical trees. Phil. Tranſ. N° 198. N° 111. and N° 129. Zoologiſts give inſtances of *arborescent* animals, particularly fiſhes.

The *arborescent* STAR-*fiſh*, *ſtella arborescens*, is one of the curioſities of nature found in ſeveral cabinets of natural rarities.

ARBORIBONZES, in *Modern Hiſtory*, prieſts of Japon, who live an eremitic life, and ſubſiſt on alms. They dwell in caverns, and cover their heads with bonnets made of the bark of trees.

ARBORIS *pectен*. See PECTEN.

ARBORIST, ARBORISTA, a perſon ſkilled in trees, their kinds, forms, natures, &c.

Arboriſt is an appellation of leſs extent than *botaniſt*.

ARBORIſcientia, a general diſtribution or ſcheme of ſcience or knowledge.

ARBOR *vitæ*. See CONVOLVULUS.

ARBOR *vitæ*. See THUYA.

ARBOUR, among *Gardeners*, &c. a kind of ſhady bower or cabinet, contrived to take the air in; yet to keep out the ſun and rain.

Arbours are now gone much into diſuſe; being apt to be damp and unwholſome.—They are diſtinguiſhed into *natural* and *artificial*.

ARBOURS, *natural*, are formed only of the branches of trees, interwoven artfully, and borne up by ſtrong lattice-work, poles, hoops, &c. which make galleries, halls, porticoes, and green villas, naturally covered.

The trees wherewith theſe *arbours* are formed, are uſually the female elm, or lime-tree; becauſe they eaſily yield, and by their great quantity of ſmall boughs, form a thick bruſh-wood; the lower parts are uſually filled up with horn-beam, or the like.

ARBOURS, *artificial*, and cabinets, are made of lattice-work, borne up by ſtandards, croſs-rails, circles and arches of iron. For theſe *arbours*, they make uſe of ſmall fillets of oak, which being planted, and made ſtraight, are wrought in chequers, and faſtened with wire.

ARBUSCULA is uſed by Bradley, to denote a little, or dwarf tree, above the rank of ſhrubs, but below that of trees, ſuch, e. gr. as the elder.

ARBUSTIVA, in *Botany*, an order of plants in the *Fragmenta Methodi Naturalis* of Linnæus.

ARBUSTUM implies a number or multitude of trees, planted for the fruit ſake.

Such are *alneta*, *avellanata*, *cerneta*, &c.

The word was more peculiarly applied to a place planted with trees for ſaſtening vines to, which are hence called by Columella *arbuſtiva*.

ARBUSTUM is ſometimes alſo uſed to denote an orchard, or field wherein trees are planted at ſuch diſtance, that there is room for ploughing, and growing corn between.

ARBUTUS, *in Botany*, the STRAWBERRY-*tree*; a genus of the *decandria monogynia* claſs. The characters are, that the flower has a ſmall obtuſe empalement, which is cut into five parts, upon which the *corolla* is. The flower is of one leaf, ſhaped like a pitcher; at the bottom of the flower is ſituated the globular *germen*, which afterward becomes an oval or round berry, having five cells, which are filled with hard ſeeds. There are five ſpecies.

The common ſtrawberry-tree is one of the greateſt ornaments in the months of October, November, and frequently great part of December; that being the ſeaſon when the trees are in flower, and the fruit of the former year is ripe; for the fruit is a whole year growing to perfection.

The beſt method to propagate the *arbutus*, is from ſeeds: therefore when the fruit is perfectly ripe, they ſhould be gathered and mixed with dry ſand, to preſerve them till the middle or latter end of March, which is the proper ſeaſon for ſowing them, in order to have ſtrong plants before winter. They muſt be ſown in pots, which ſhould be plunged into a moderate hot-bed, which will greatly forward their vegetation; and if they are properly managed, they will grow eight or ten inches high before winter.

Theſe trees are tolerably hardy, and are ſeldom hurt, except in extreme hard winters, which many times kill the young and tender branches, but rarely deſtroy the trees: therefore, however dead the trees may appear after a hard winter, yet they ſhould be ſuffered to remain till the ſucceeding ſummer has ſufficiently demonſtrated what are living and what are dead.

The beſt ſeaſon for tranſplanting the *arbutus* is in September, at which time the bloſſoms are beginning to appear; and at that ſeaſon, if they ſhould prove very dry, and they are kept moiſt, they will take root very ſoon: but toward the beginning of November their roots ſhould be well covered with mulch, to keep out the froſt. Miller.

ARC, ſee ARK.

The words are formed from *arcus*, a *bow*.

ARCA, in *Zoology*, a genus of the *vermes* in the Linnæan ſyſtem; comprehending [illegible] animal is a teſtæ; the ſhell bivalve [illegible] the teeth of the hinge numerous, [illegible] with other.

ARCA *cordis* is uſed by ſome [illegible] the PERICARDIUM.

ARCADE, in *Architecture*, is [illegible] ning in the wall of a building formed [illegible] *Archit. fig.* 40.

ARCADIANS, a literary ſociety [illegible] ome in 1690. See ACADEMIES.

ARCÆ *inſer*, a title one [illegible] bacon, on account of his leaving the [illegible] th's cheſt, or treaſure.

ARCANES, in the *Turkiſh* [illegible] kind of fi-nality, which ſerve as *on* [illegible] barrals and pillage the enemies frontiers.

The *Arcanes* are an order inferior to the *Janizaries*; and, when any of them diſtinguiſh themſelves, are uſually preferred in the *janizaric* order.—They have no pay, but are to ſubſiſt on their plunder.

ARCANNA, a kind of red chalk, called by phyſiologiſts *rubrica fabrilis*, as being uſed by carpenters to colour their line, for marking timber, &c.

ARCANUM literally ſignifies a *ſecret*; and is therefore very pertinently applied by quacks and impoſtors in medicine, who conceal their ignorance and fraud under a pretence of ſecrecy.—Hence a multitude of *arcana*.

There are alſo ſtanding officinal compoſitions, under the denomination of *arcana*.—Such are the

ARCANUM *duplicatum*, a preparation of red precipitate, made by diſtilling it with the ſpirit of nitre, and repeating the diſtillation again and again, till a fine white powder be procured. This powder is boiled in water, and the water poured off, and tartariſed ſpirit of wine put to the powder: two or three coholations are made; which leave a powder, much like the princes powder, and ſaid to be of good uſe in the gout, dropſy, leſſory, &c. It operates chiefly by ſtool. It is, therefore, in fact nothing elſe but *red* PRECIPITATE, on which ſpirit of wine has been two or three times burnt, with an intention of rendering it milder.

ARCANUM *duplicatum* is prepared of the *caput mortuum* of *aqua fortis*, by diſſolving it in hot water, filtrating, and evaporating it to a cuticle; and then leaving it to ſhoot. It is entirely the ſame in compoſition and effect with *vitriolated* TARTAR; and is ſometimes called *ſal ſtellatum*, and *ſal ſtellatus*.

The *arcanum duplicatum*, or *panacea antimonii*, is extolled as a diuretic, and ſudorific.—The receipt was purchaſed at the expence of 500 dollars, by that great virtuoſo the duke of Holſtein. Schroder, that prince's phyſician, writes wonders of its great uſe in hypochondriacal caſes, and in continued and intermitting fevers, dropſy, &c. Mixed with the ſpirit employed in binding books, it recures them effectually againſt all injury from that miſchievous inſect, the *book-worm*.

ARCANUM *nephriticum luſitanicum*, in *Medicine*, a name given by Wedelius to a compound medicine adminiſtered by him and others of the ſame time, with great ſucceſs, in a peſtilential fever, attended with dyſentery, which raged for many years in Germany, and yielded to well to nothing as to this medicine. It was compoſed of henbane, plantane-root, and the root of *ſcabious*. This laſt root has generally been eſteemed a poiſon of late times, though the authors of the greateſt antiquity have ſhewn ſo much greater reſpect for it, and called it the ſacred root, or *herba ſalutaris*.

ARCANUM *Jovialis* is made of an *amalgama* of mercury and tin, digeſted in ſpirit of nitre; the ſpirit being drawn off, the remaining matter is wetted with ſpirit of wine, and the ſpirit burnt away; and this for ſeveral times, till the pungent taſte is wholly gone: what remains is uſed much with the ſame intentions as the *antimonium Perſii*, and is recommended by ſome as a ſudorific.

ARCANUM *tartari*, is a neutral ſalt ſoluble in water and ſpirit of wine, formed from the combination of vinegar with fixed alkalies.

ARC-BOUTANT, in *Building*, a kind of flat arch, or part of an arch, abutting againſt the feet of an arch, or ſeat of a vault, to ſuppoſe, and prevent their giving way.

The name is French; formed of *arc* and *bouter*, to *abut*.

Arc-boutants are only arched BUTTRESSES.

ARCEUTUM is uſed in ſome *Ancient Law-Writers*, for a procuration due to a biſhop, abbot, or archdeacon, from their clergy, in time of entertainment.

ARCH, ARC, ARCUS, a part of any curve line; e. gr. of a circle, an ellipſis, or the like.

ARCH *of a circle* is a part of the circumference thereof, leſs than a half, or ſemicircle.—Such is A E D (*Geometry, fig.* 6).

The baſe or line AB, that joins the two extremes of the

arch, is called the CHORD; and AD half of the chord bifected by the diameter at right angles, is the SINE of half the faid *arch*, viz. AE.

All *angles* are meafured by *arches*.—To know their quantity, an *arch* is deſcribed, having its centre in the point of the ANGLE.

Every circle is ſuppoſed to be divided into 360 degrees; and an *arch* is eſtimated according to the number of thoſe degrees it take up. Thus an arch is ſaid to be of 30, of 80, of 100 degrees. See DEGREE.

ARCHES, *concentric*. See CONCENTRIC.

ARCHES, *equal*, are ſuch *arches* of the ſame or equal circle, as contain the ſame number of degrees.—Hence,

In the ſame or equal circles, equal chords ſubtend equal *arches*.—And hence, again, *arches* intercepted between parallel chords are equal.

A radius, CE. *fig.* 6. which biſects the chord in D, does alſo biſect the *arch* in E; and is perpendicular to the chord: and on the contrary. And hence the problem to *biſect an arch*, is ſolved, by drawing a line CE from the centre perpendicular to the chord in D.

ARCHES, *ſimilar*, are thoſe which contain the ſame number of degrees of unequal circles.—Such are the *arches* AB and DE, *fig.* 87.

Two radii being drawn from the centre of two concentric circles, the two *arches* intercepted between them bear the ſame ratio to their reſpective peripheries; and alſo the two ſectors to the areas of their reſpective circles. See ANGLE.

To find the CENTER *of gravity* of an *arch* of a circle; ſee CENTER *of gravity*, &c.

For the ſines, tangents, &c. of *arches*, ſee SINE, TANGENT, &c.

ARCH, in *Aſtronomy*.—*Diurnal* ARCH of the ſun is part of a circle parallel to the equator, deſcribed by the ſun in his courſe betwixt riſing and ſetting. See DAY, DIURNAL, &c.

His *nocturnal arch* is of the ſame kind, except that it is deſcribed betwixt his ſetting and riſing. See NIGHT, NOCTURNAL, RISING, &c.

The latitude and elevation of the pole are meaſured by an *arch* of the meridan; and the longitude, by an *arch* of a parallel circle. See ELEVATION, LATITUDE, LONGITUDE, &c.

ARCH *of progreſſion*, or *direction*, is an *arch* of the ecliptic, which a planet ſeems to paſs over, when its motion is according to the order of the ſign. See DIRECTION.

ARCH *of retrogradation* is an arch of the ecliptic deſcribed while a planet is retrograde, and moves contrary to the order of the ſign. See RETROGRADATION.

ARCH *of ſtation*. See STATION, and STATIONARY.

ARCH *between the centres* is an *arch*, as AI *Tab. Aſtronomy*, *fig.* 35. paſſing from the centre of the moon's ſhadow, A, perpendicular to her orbit OB. See ECLIPSE.

If the aggregate of the *arch* between the centres AI, and the apparent ſemidiameter of the ſhadow, be equal to the ſemidiameter of the ſhadow, the eclipſe will be total without any duration: if leſs, total with ſome duration; and if greater, yet leſs than the ſum of the ſemidiameters of the moon and the ſhadow, partial.

ARCH *of viſion* is the ſun's depth below the horizon, at which a ſtar, before hid in his *rays*, begins to appear again.

TABLE exhibiting the *Arch* of *Viſion* of the PLANETS and FIXED STARS.

Planets.	°	′

However, the quantity of this *arch* is not always the ſame; but varies with the latitude, declination, right aſcenſion or deſcenſion, and diſtance of any planet or ſtar. Ricciol. Alm. vol. i. p. 41.

See *Poetical* RISING.

ARCH, in *Architecture*, is a concave ſtructure, raiſed with a mould bent in form of the *arch*, of a curve, and ſerving as the inward ſupport of any ſuperſtructure.—See *Tab. Archit. fig.* 40. E.

An *arch*, ſays ſir Henry Wotton, is nothing but a narrow or contracted *vault*; and a VAULT is a dilated *arch*. *Arches* are uſed in large intercolumnations of ſpacious buildings; in porticos, both within and without temples; in public halls, as cielings, the courts of palaces, cloiſters, theatres, and amphitheatres.

They are alſo uſed as buttreſſes and counter-forts, to ſupport large walls laid deep in the earth, for foundations of bridges and aqueducts, for triumphal arches, gates, windows, &c.

Arches are ſuſtained by piers, impoſts, &c.

Arches are either circular, elliptical, or ſtraight.

ARCHES *circular*, are of three kinds; viz.

ARCHES, *ſemicircular*, thoſe which make an exact ſemicircle; and have their centre in the middle of the chord of the *arch*; called alſo by the French builders, *perfect arches*, and *arches en plein centre*.

ARCHES, *ſcheme*, from the Italian *ſcemo*, *imperfect*; thoſe which are leſs than a ſemicircle, and conſequently are flatter *arches*; containing, ſome 90 degrees, others 70, and others only 60; called alſo *imperfect* and *diminiſhed arches*.

ARCHES *of the third and fourth point*, as ſome of our workmen call them, though the Italians call them *di terzo* and *quarto acuto*, becauſe they always concur in an acute angle at top, conſiſt of two *arches* of a circle, meeting in an angle at the top, and are drawn from the diviſion of the chord into three or four, or more parts, at pleaſure. Of this kind are many of the *arches* in old Gothic buildings; but on account both of their weakneſs and unſightlineſs, they ought, according to ſir Henry Wotton, to be for ever excluded out of all buildings.

ARCHES, *elliptical*, conſiſt of a ſemi-ellipſis; and were formerly much uſed inſtead of mantle-trees in chimneys. Theſe have commonly a key-ſtone, and chapiters or impoſts.

ARCHES, *ſtraight*, are thoſe, whoſe upper and under edges are ſtraight; as in the others they are curved; and thoſe two edges alſo parallel, and the ends and joints all pointing towards a centre.—Theſe are principally uſed over windows, doors, &c.

The doctrine and uſe of ARCHES is well delivered by ſir Henry Wotton, in the following theorems.—Firſt;

All matter, unleſs impeded, tends to the centre of the earth in a perpendicular line.

Secondly; All ſolid materials, as bricks, ſtones, &c. in their ordinary rectangular form, if laid in numbers, one by the ſide of another, in a level row, and their extreme ones ſuſtained between two ſupporters; thoſe in the middle will neceſſary ſink, even by their own gravity, much more if preſſed down by any ſuperincumbent weight.—To make them ſtand, therefore, either their figure or their poſition muſt be altered.

Thirdly; Stones, or other materials, being figured *cuneatim*, i. e. wedge-wiſe, broader above than below, and laid in a level row, with their two extremes ſupported as in the preceding theorem, and pointing all to the ſame centre; none of them can ſink, till the ſupporters or butments give way, becauſe they want room in that ſituation to deſcend perpendicularly. But this is a weak ſtructure; becauſe the ſupporters are ſubject to too much impulſion, eſpecially where the line is long; for which reaſon the form of ſtraight *arches* is ſeldom uſed, excepting over doors and windows, where the line is ſhort.—In order to fortify the work, therefore, we muſt not only change the figure of the materials, but alſo their poſition.

Fourthly; If the materials be ſhaped wedge-wiſe, and be diſpoſed in form of a circular *arch*, and pointing to ſome centre; in this caſe, neither the pieces of the ſaid *arch* can ſink downwards, for want of room to deſcend perpendicularly; nor can the ſupporters or butments ſuffer much violence, as in the precedent platforms: for the convexity will always make the incumbent weight rather reſt upon the ſupporters than heave them outwards; whence this corollary may be fairly deduced, that the ſecureſt of all the *arches* above mentioned is the ſemicircular; and of all vaults, the hemiſpherical.

Fifthly; As ſemicircular vaults raiſed on the whole diameter, are the ſtrongeſt: ſo thoſe are the moſt beautiful, which, keeping to the ſame height, are yet diſtended one fourteenth part longer than the ſaid diameter: which addition of width will contribute greatly to their beauty, without diminiſhing any thing conſiderable of their ſtrength.

It is, however, to be obſerved, that, according to geometrical ſtrictneſs, to have the ſtrongeſt *arches*, they muſt not be portions of circles, but of another curve, called the CATENARIA, whoſe nature is ſuch, that a number of ſpheres diſpoſed in this form will ſuſtain each other, and form an *arch*.

Dr. Gregory even ſhews, that *arches*, conſtructed in other curves, only ſtand, or ſuſtain themſelves, by virtue of the *catenaria* contained in their thickneſs; ſo that were they made infinitely ſlender or thin, they muſt tumble of courſe; whereas the *catenaria*, though infinitely ſlender, muſt ſtand, becauſe no one point thereof

tends downward more than any other. See Philosoph. Transact. N° 231.—See farther of the theory of *arches* under the article VAULT.

ARCH is particularly used for the space between the two piers of a bridge.

The chief or *master-arch* is that in the middle; which is widest, and usually highest, and the water under it deepest: being intended for the passage of boats, or other vessels.—We read of bridges in the East, which consist of 300 *arches*.

ARCH-*stone*. See KEY-*stone*, and VOUSSOIR.

ARCH, *triumphal*, is a gate or passage into a city, built of stone or marble, and magnificently adorned with architecture, sculpture, inscriptions, &c. serving not only to adorn a triumph, at the return from a victorious expedition, but also to preserve the memory of the conqueror to posterity.

The most celebrated *triumphal arches*, now remaining of antiquity, are that of Titus, of Septimius Severus, and of Constantine, at Rome, of which we have figures given us by Des Godetz.—One of the gates of Orange is a *triumphal arch* of C. Marius.—The gates, Peyro at Montpelier, and of St. Denis, St. Martin, and St. Antoine, at Paris, may also be reckoned *triumphal arches* of the moderns.

ARCH, *mural*. See MURAL.

ARCH, in the scripture sense. See ARK.

ARCH, or ARCHI, is also a term without any meaning of itself, but which becomes very significant in composition with other words; as it heightens and exaggerates them; and has the force of a superlative, to shew the greatest degree, or eminence of any thing.

The word is formed of ἀρχὴ, *beginning*; whence ἄρχων, *princeps*, *chief*.

Thus we say, *arch*-treasurer, *arch*-angel, *arch*-bishop, *arch*-heretic, &c. to denote such as have a pre-eminence over others. So also *arch*-fool, *arch*-rogue, &c. to express folly, and knavery, in the utmost degree.

In English, we usually cut off the final *i*, from *archi*, though with very ill effect; as the words with which it is joined, sound much harsher on that account, than they would do, were it preserved entire, as it is in most other languages.

ARCHÆUS. See ARCHEUS.

ARCHANGEL, an intellectual substance or angel, placed in the second order among the blessed spirits which compose the celestial HIERARCHY.

The word is compounded of the Greek ἄρχων, *prince*, and ἄγγελος, *angels*.

ARCHANGEL, in *Botany*, *lamium*, a genus of the *didynamia gymnospermia* class, *dead* NETTLE. The characters are, that the flower hath a permanent empalement, which is cut into five equal segments at the top, which end in beards; the flower is of the lip kind, with one petal, twelve times the chops are compressed; the upper lip is arched, obtuse, and entire; the under is heart shaped, and indented at the end; it hath four awl-shaped stamina, two of which are longer than the other; it hath a four-cornered germen, which afterwards becomes four three-cornered seeds, sitting in the open empalement. There are several species; but as many of them are weeds, there are few who care to admit them into their gardens.

The common sort grows naturally in most parts of England, under hedges and by the sides of highways: it is also a troublesome weed in gardens; but as it stands in most dispensaries as a medicinal plant, it is therefore inserted. Its flowers are reputed sort and lubricating, and as such administered in some female weaknesses, as the whites, and difficulty of urine. A conserve of them is also made in the shops, but seldom prescribed.

ARCHANGEL, *baum-leaved*. See MELITTIS.

ARCHANGEL, *yellow*. See GALEOBDOLON.

ARCHBISHOP, ARCHIEPISCOPUS, from ἀρχὸς, and ἐπισκοπος, *overseer*, a metropolitan prelate, having several suffragan bishops under him.

Archbishops were not known in the East till about the year 320; and though there were some soon after this, who had the title, yet, that was only a personal honour, by which the bishops of considerable cities were distinguished.—It was not till of late that *archbishops* became metropolitans, and had suffragans under them.

Athanasius appears to be the first who used the title *archbishop*, which he gave occasionally to his predecessor; Gregory Nazianzen, in like manner, gave it to Athanasius: not that either of them were entitled to any jurisdiction, or even any precedence, in virtue of it.

Among the Latins, Isidore Hispalensis, is the first that speaks of *archbishops*. He distinguishes four orders of degrees in the ecclesiastical hierarchy, viz. *patriarchs*, *archbishops*, *metropolitans*, and *bishops*.

ARCHBISHOPRICK, ARCHIEPISCOPATUS, the dignity of *archbishop*; or the province under his jurisdiction.

There are now two *archbishoprics* in England, viz. of Canterbury, and York; the prelates who are called *primates*, and *metropolitans*; with this only difference, that the former is called primate of all England, and the latter simply, primate of England.

The *archbishop*, beside the inspection [illegible] inferior clergy in the province [illegible] exercises episcopal jurisdiction [illegible] is guardian of the spiritu[illegible] his province, as the king is of the [illegible] exercises ecclesiastical [illegible] entitled to present by lapse to all [illegible] livings in the disposal of his diocesan bishop, [illegible] within six months. He has likewise a [illegible] prerogative, upon consecrating a bishop, to name a chaplain to be provided for by such bishop's [illegible] living of which it is now usual to accept an OPTION. He is said to be *inthroned* when vested in the *archbishoprick*; whereas bishops are said to be *installed*.

The *archbishop* of Canterbury had anciently, viz. till the year 1152, jurisdiction over Ireland as well as England, and was styled a *patriarch*, and sometimes *alterius orbis papa*, and *orbis Britannici pontifex*. Matters were done and recorded in his name thus, *anno pontificatus nostri primo*, &c. The first *archbishop* of Canterbury was Austin, appointed by king Ethelbert, on his conversion to Christianity, about the year 598.

He was also *legatus natus*. See LEGATE.

He even enjoyed some special marks of royalty; as, to be patron of a bishoprick, which he was of Rochester; and to make knights, coin money, &c.—He is still the first peer of England, and the next to the royal family; having precedence of all dukes, and all great officers of the crown. It is his privilege, by custom, to crown the kings and queens of this kingdom. He may retain and qualify eight chaplains; whereas a duke is by statute allowed only six.

He has, by common law, the power of probate of wills and testaments, and granting letters of administration.

He has also a power to grant licences and dispensations in all cases formerly used for in the court of Rome, and not repugnant to the law of God. He accordingly issues special licences to marry, to hold two livings, &c. and he exercises the right of conferring degrees.

He is addressed with the title of *Grace*, and *Most Reverend Father in God*; and writes himself by *Divine Providence*; whereas bishops only use by *Divine Permission*.

He also holds several courts of judicature; as court of arches, court of audience, prerogative court, and court of peculiars.

The *archbishop* of York has the like rights in his province, as the *archbishop* of Canterbury. He has precedence of all dukes not of the royal blood; and of all officers of state, except the lord high chancellor. He has also the rights of a count palatine over Hexamshire.

The first *archbishop* of York was Paulinus, appointed by pope Gregory about the year 622. He had formerly jurisdiction over all the bishops of Scotland; but in the year 1470, pope Sextus IV. created the bishop of St. Andrew's archbishop and metropolitan of all Scotland.

ARCH-BUTLER, ARCHIPINCERNA, the great butler or skinker of the empire.

The king of Bohemia is *arch-butler*: and his business as such is to present the first cup at an imperial entertainment; but he is not obliged to officiate with his crown on. He has for vicar or deputy the hereditary prince of Limbourgh.

ARCH-CHAMBERLAIN, ARCHICAMERARIUS, an officer of the empire: much the same with what in England we call *great-chamberlain*.

The elector of Brandenbourg is *arch-chamberlain* of the empire, being so appointed by the golden bull; and in that quality, he bears the sceptre before the emperor, walking on the left-hand of the elector of Saxony. At some solemnities he also serves on horseback like other electors, carrying a bason with a towel in his hands: which, alighting, he lets for the emperor to wash.—He has his vicar, or sub *archichamberlain*, who is prince of Hohenzollern, of the house of Brandenbourg.

ARCH-CHANCELLOR, ARCHICANCELLARIUS, great chancellor, who anciently presided over the notaries, that is, the secretaries of a court.

This office chiefly obtained in France, under the two first races of their kings; and afterwards under the empire: as they had three several territories, Germany, Italy and Arles; they had *three arch-chancellors*: and hence the three *archi-chancellors* still subsisting in Germany, the archbishop of Mentz being *archi-chancellor* of Germany, the archbishop of Cologn of Italy, and the archbishop of Treves of Arles.

Bern. de Mallincrot, in an express treatise *de Archi-cancellariis*

cancellarii Imperii Romani, shews, that these three archbishops were *arch-chancellors* before they were electors.—We also read of *arch-chancellors* of Burgundy, &c.

ARCH-CHANTOR, ARCHICANTOR, the chief or president of the chaunters of a church.

ARCHDEACON, ARCHIDIACONUS, a church-officer vested with a jurisdiction over the laity and clergy, next after the bishop, either through the whole diocese, or only a part of it.

The *archidiaconi*, sometimes also called *arch-levitæ*, was originally the first and eldest of the deacons who attended on the bishop; whence his name.

But as the *archdeacons*, in their original institution, had no relation to the diocese, but only to the episcopal see, so it was by several steps and degrees that they attained to the power they now enjoy. At their first institution, their proper business was, to attend the bishop at the altar, to direct the deacons and other inferior officers in their several duties, for the orderly performance of divine service, to attend the bishop at ordinations, and to assist him in the management of the revenues of the church; but without any thing that could be called jurisdiction in the present sense of the word, either in the cathedral or out of it. Gibson.

An *archdeacon* was not known before the council of Nice: his function is since become a dignity; and even set above that of priest; though anciently it was quite other wise. The *archdeacon* was the bishop's chief minister for all external concerns, and particularly the administration of the temporalities. He took care that order and decency were observed in divine service; looked to the ornaments and utensils of the church; had the direction of the poor, and the inspection of the manners and behaviour of the people: for which reason he was called *the bishop's heart, and eye*; *oculus episcopi, & cor episcopi*.

These advantages soon gained him the superiority over priests, who had only spiritual functions. But he had no jurisdiction over them till the sixth century; though by that time he was become superior to the archimandrite, or rural dean.

In the tenth century, *archdeacons* were considered as having jurisdiction in their own right, or attached to their office; with a power of delegating it to others. But from that time measures were taken to lessen their power, by increasing their number.—He whose district lay in the capital city, took the quality of *great-archdeacon*.

We have sixty *archdeacons* in England: their office is to visit every two years, in three, to inquire into the reparations and moveables belonging to the church, reform abuses in ecclesiastical matters, and bring the more weighty affairs before the bishop; besides which, they have also a power to suspend, excommunicate, and in many places to prove wills, and in some to institute to benefices.

It is one part of the *archdeacon's* office to induct all clerks into their benefices within his jurisdiction; and, by the act of uniformity, he is now obliged to be in priests orders.

Many *archdeacons*, in old foundations, have, by prescription, their courts and officials, as bishops have.

Archdeaconries are commonly given by bishops, who do therefore prefer to the same by collation: but if an *archdeaconry* be in the gift of a layman, the patron doth present to the bishop, who institutes in like manner as to another benefice; and then the dean and chapter do induct him, that is, after some ceremonies, place him in a stall in the cathedral church to which he belongeth, whereby he is said to have a place in the choir.

ARCH-*fundraton*, *archisubdiaconus*, the first or chief among the subdeacons, as the archdeacon is among the deacons. In some copies of the Roman ordinal, he is called *subarchidiaconus*.

ARCH-DRUID, ARCHIDRUIDA, the chief or pontiff of the ancient DRUIDS in a nation.

ARCHDUKE, ARCHIDUX, a duke vested with some quality, pre-eminence, and authority, above other dukes.

The *archdukes* of Austria is a very ancient title. There have also formerly been *archdukes* of Lorrain and Brabant. Austria was erected into a marquisate by Otho, or Henry I. and into a duchy by Frederic I. in 1156; but we do not well know when, or why, the title *archduchy* was given it.—It is commonly held, that duke Frederic IV. first assumed the quality: others say, it was first given by the emperor Maximilian I. in 1459, and ample privileges annexed to it.

The principal privileges of this state are, that the *archduke* shall distribute justice in his own dominions, without appeal; that he shall be judged to have received the investiture of his states, after having demanded it three times; and that he cannot be deprived of his countries, even by the emperor, and the states of the empire: that no affair of the empire can be concluded without his participation; and that he have a power of creating counts, barons, and gentlemen, throughout the whole empire: which are privileges to which the other dukes of the empire are entire strangers.

ARCH-*count*, *archicomes*, a title anciently given to the earl of Flanders, on account of his great power and riches.

ARCH *monastery*, *archimonasterium*, an appellation sometimes given to the greater monasteries and abbies.

ARCH-*notary*, *archinotarius*, the *primicerius*, or chief of the notaries.

This officer is supposed by some to have differed from the *arch-chancellor*, though wherein the difference consisted does not appear.

ARCHÆOGRAPHIA, from ἀρχαιος, *ancient*, of ἀρχη and γραφω, *I describe*, the art of describing or explaining ANTIQUITIES. See ANTIQUE.

ARCHÆOTA, a keeper of ancient records.

ARCHAISM, properly denotes a phrase or diction now obsolete, and out of use, though anciently deemed good, or passable.

ARCHAISM, *etymologic. archaismus etymologicus*, is when either an obsolete word, declension, or conjugation is used.

ARCHAISM, *syntactic. archaismus syntacticus*, is an unusual and obsolete construction in discourse.

ARCHARD, in *Commerce*, a kind of green fruit, pickled in vinegar, much valued throughout the East Indies.

The best are those brought from Persia, in bottles, much like small cucumbers among us.

ARCHE, ἀρχη, is a Greek word, importing the *beginning*.

ARCHE, among *Physicians*, is the beginning or first period of a disease.

ARCHED *fountain*. See FOUNTAIN.

ARCHED *form*, or *scheme*, in *Architecture*, is used to denote a flat *arch*, less than a semicircular one.

ARCHED *legs*, is an imperfection in a horse, when being in his natural position he has his legs bent forwards; so that his whole leg makes a kind of arch or bow.

This usually arises from excessive labour, whereby the back-sinews are made to stretch up, so that the legs remain *arched*, and naturally tremble after a little riding; though the disorder is natural to some horses.

ARCHEMY, *archemia*, is used by some to denote the art of transmuting less perfect metals into the more perfect. In which sense, *archemy*, differs from *alchemy*, as a part from the whole.

ARCHENDA, in the *Ancient Physic*, a kind of powder prepared of *alcanna* and leaves of the Egyptian LIGUSTRUM, wherewith the people smeared their feet after bathing, as a preservative against sweating and stench.

ARCHERS, a kind of militia or soldiery, armed with bows and arrows.

The word is formed of *arcus*, a *bow*; whence *arcuarius*, and even *arquus*, and *arquites*, as they are also denominated in the corrupt state of the Latin tongue.

Archers were much in use in former times; but they are now laid aside, excepting in Turkey, and some of the eastern countries; where there are companies of *archers* still subsisting in their armies; and with which they did terrible execution at the battle of Lepanto.

The name *archer*, however, is still retained even where the thing is lost: thus in France, the officers who attend the lieutenants de police, and provosts, to make captures, seizures, arrests, &c. are called *archers*; though their arms be only halberts or carabines.—In this sense they say, the *archers* of the *grand vreuet de Hostel*; of the *prevot des marchands*; the city *archers*; the *archers du guet*, or of the watch, &c.—Small parties or *archers*, called also *gens des marechaussee*, are continually patrolling on the great roads, to secure them against robbers.—The carriages of Lyons, &c. are always escorted by a party of *archers*.

To the diligence of these *archers*, or marshals men, it is partly owing, that persons now travel in all parts of France in the utmost security; their being fewer robbers on the highway in that whole kingdom in a year, than about London in a week.

They have also *their archers des pauvres*, *archers of the poor*, whose office it is to seize such beggars as they find in the streets, and carry them to the hospitals.

ARCHERY, the art or exercise of shooting with bow and arrow.

Archery was greatly encouraged among our ancestors, and many statutes were made for the regulation thereof; whence it was that the English *archers* became the best in Europe. See 3 H. VIII. c. 3. 6 H. VIII. c. 2. 33 H. VIII. c. 9. 8 Eliz. c. 10.

It was forbid, by statute, to shoot at a standing mark; unless it be for a rover, where the *archer* is to change his mark at every shoot.—Any person above twenty-four years old is also forbid to shoot with any prick-shaft, or flight, at a mark of eleven score yards

or under, 33d H. VIII. c. 9.—The former was a provision for making good marksmen at fight; the latter for giving ſtrength and ſinews.

ARCHERY, in our ancient cuſtoms, a ſervice of keeping a bow for the uſe of the lord, to defend his caſtle.

ARCHES, or *Court of* ARCHES. See COURT *of Arches*.

ARCHES, among *Navigators*, is particularly uſed for the Archipelago.

ARCHETYPE, ARCHETYPUS, the firſt pattern, or model, by which any work is formed, or which is copied after to make another like it.

The word is compounded of ἀρχὴ, *beginning*, and τύπος, TYPE.

In this ſenſe the word coincides with *original*, or *prototype*; and ſtands oppoſed to *copy*.

Among minters, &c. *archetype* is peculiarly uſed for the ſtandard or original weight, by which the other weights are to be adjuſted and examined.

Philoſophers, particularly the Platoniſts, talk of an *archetypal* world; meaning, the world, ſuch as it exiſted in the Divine Mind, or in the idea of God, before the viſible creation.

ARCHIEUNUCH, ARCHIEUNUCHUS, the chief of the eunuchs.

The *archeunuch* was one of the principal officers in Conſtantinople, under the Greek emperors.

ARCHEUS, an obſcure term, uſed chiefly among the *Ancient Chemiſts*, to expreſs ſome occult principle of life and motion, the cauſe of all the effects which we obſerve in nature.

The word is derived from ἀρχὴ, *principle*.

As the chemiſts differ in their ideas of a vital cauſe, the term *archeus* becomes applied to very different things: though moſt of them conceive it of the nature of fire.

Some uſe *archeus*, to denote the fire lodged in the centre of the earth: to which they aſcribe the generation of metals and minerals, and which they believe to be the principle of life in vegetables.

Others, by the word *archeus*, mean a certain univerſal ſpirit, diffuſed throughout the whole creation, the active cauſe of all the phenomena in nature.

Others, inſtead of *archeus*, chooſe to call this the *anima mundi*; and others, the *Vulcan* or *heat* of the earth.

They add, that all bodies have their ſhare of this *archeus*; and that, when this is corrupted, it produces diſeaſes, which they call *archeal diſeaſes*.

They likewiſe attribute ideas to it; which for this reaſon they call *archeal ideas*.

Helmont is a great aſſertor of the dogma of an *archeus*. It is likewiſe uſed to ſignify that peculiar fluid among the vegetable chaſſes, which determines every particular plant to its odour, taſte, and other qualities.

The fruit of a plant is the part in which the ſeed is conceived and formed, the ſeed is the embryo of the plant, with a *plumula* or *cotyledon*, to which it is faſtened by an umbilical ſtring. The cotyledons uſually contain a balſam, which appears to be the laſt and higheſt preparation of the moiſt kind, which nature here lays up for the uſe of the offspring. In this is an oily tenacious matter, which repels all other moiſt things, defends the embryo, and, by its tenacity, retains and fetters the thin pure ſpirit, which is the ultimate bounds and object of the actions of nature in plants, and which would elſe eaſily fly away; this chemiſts call the *archeus* and *ſpiritus rector*; the oil is too groſs ever to enter the fine veſſels of the embryo. But this ſpirit being invigorated by a vegetable power, breathes, it is ſaid, a vital principle, and impreſſes the ſpecific character on the food deſtined for the embryo, by which means every thing afterwards turns to the proper nature of the plant; in this ſpirit the fragrant odour, and peculiar taſte of the plant is lodged, and even its colour has a near dependance on it. Boerhaave's Chem.

ARCHIACOLYTHUS, from ἀρχὴ, *chief*, and ἀκόλουθος, *miniſter*, an ancient dignity, in cathedral churches: the miniſters whereof were divided into four orders, or degrees, viz. *prieſts*, *deacons*, *ſubdeacons*, and *acolyths*; each of which had their chiefs. The chief of the *acolythi*, was called *archiacolythus*. Du-Cange.

ARCHIATER, ARCHIATRUS, properly denotes the chief phyſician of a prince who retains ſeveral.

The word is formed of ἀρχὴ, *principium*, *chief*; and ἰατρὸς, *medicus*, a *phyſician*.

ARCHIDAPIFER, from ἀρχὴ, and *dapifer*, *ſewer*, or chief ſewer, is a great officer of the empire.

The elector of Bavaria is *archidapifer*.—The palatine of the Rhine at one time pretended this office was annexed to his palatinate; but he has ſince deſiſted.

ARCHIEROSYNES, from ἀρχὴ, and ἱερὸς, *ſacred*, in the Grecian *Antiquity*, a high-prieſt veſted with authority over the reſt of the prieſts, and appointed to execute the more ſacred and myſterious rites of religion.

ARCHIGALLUS, in *Antiquity*, the high-prieſt of Cybele, or the chief of the eunuch-prieſts of that goddeſs, called Galli.

ARCHIGERONTES, from ἀρχὴ, and γέρων, *old*, in *Antiquity*, the chiefs or maſters of the ſeveral companies of artificers at Alexandria.

Some have miſtaken the *archigerontes* for the arch-prieſts, appointed to take the confeſſions of thoſe who are condemned to the mines.

ARCHIGUBERNUS, ARCHIGUBERNETES, or ARCHIGUBERNITES, in *Antiquity*, the commander of the imperial ſhip, or that which the emperor went aboard of.

Some have confounded the *archigubernus* compared with that of *præfectus claſſis*, or admiral, but the former was under the command of the latter.

Potter takes the proper office of the *archigubernus* to have been, to manage the marine affairs, to provide commodious harbours, and order all things relating to the ſailing of the fleet, except what related to war. Archeol. Græc. lib. iii. cap. 19.

ARCHIL, *Archilla*, *Roccella*, or *Oſſeille*, a white moſs, which grows on the rocks in many parts of the Archipelago, and in the Canary and Cape de Verd iſlands; and, according to Linnæus's account, on the weſtern coaſt of England. It belongs to the third of Dillenius's genus of *coralloides*, and to the *lichenes fruticuloſi* of Linnæus. This moſs is imported as it is gathered, and the demand for it is ſo great, that, as M. Hellot informs us no leſs than 2600 quintals, or 130 ton weight of it, is annually collected in different places. Thoſe who prepare it for the uſe of the dyer grind it betwixt ſtones, ſo as to bruiſe it thoroughly without reducing it to powder, and then moiſten it occaſionally with ſtrong ſpirit of urine, or urine itſelf mixed with quicklime. In a few days it acquires a purpliſh red, and at length a blue colour. The dyers ſeldom uſe this drug by itſelf, becauſe of its dearneſs, and the perihableneſs of its beauty; but they chiefly employ it to give a bloom to other colours, as pinks, &c. and this is done by paſſing the dyed cloth, or ſilk, through hot water lightly impregnated with the *archil*. However, the bloom thus communicated ſoon decays upon being expoſed to the air; though, M. Hellot ſays, that by adding a ſmall quantity of the ſolution of tin, the colour obtained from this drug changes towards a ſcarlet, and gives a durable dye. Prepared *orchil* will readily yield its colour to water, to volatile ſpiritis, and to ſpirit of wine; and it is accordingly uſed to colour the ſpirits of thermometers; but being confined from the air, the ſpirits loſe their colour, and, as M. l'Abbé Nollet obſerves, regain it, upon being again expoſed to the air. He repeated the experiment ſeveral times with ſucceſs. A ſolution of *archil* in water gives a durable ſtain of a beautiful violet, or purpliſh blue colour, to marble. M. du Fay informs us, that he has ſeen pieces of marbles ſtained with it, that preſerved their colour for two years, without any ſenſible change. It ſinks deep into the marble, and makes it more brittle. The dye yielded by this ſubſtance, it is ſuppoſed, was known as early as the days of Theophraſtus. Linnæus apprehends, that there are ſeveral other common moſſes, from which valuable colours might be extracted. The French dyers uſe a craſtaceous moſs growing upon rocks in Auvergne, and prepared with lime and urine, as a ſucceſſaneum to the Canary *archil*. Dr. Lewis's Ed. of Neumann's Chem. Works, p. 438. Phil. Tran vol li. p. 652. Raii Hiſt. Plant. vol. i. p. 74. Michel's Nova Plant. p. 78. See LICHEN.

ARCHILOCHIAN, a term in *Poetry*, applied to a ſort of verſes whereof *Archilochus* was the inventor.

Theſe conſiſt of ſeven feet; the four firſt whereof are ordinarily *dactyls*, though ſometimes *ſpondees*; the three laſt *trochees*: for inſtance;

Solvitur acris hyems grata vice veris & Favoni. Hor.

It is uſual to mix *iambic* verſes of ſix feet, abating a ſyllable, with *Archilochian* verſes; this Horace himſelf has done in the ODE now cited.

Theſe verſes are called *dactylic*, on account of the *dactyls* at the beginning.

ARCHI-LUTE. See ARCILEUTO.

ARCHIMAGUS, in the *Ancient Perſian Religion*, the chief prieſt or head of the order of magi.

The *archimagus* anſwered to the high-prieſt among the Jews, or the pope now among the Romaniſts, being the head of the whole religion.

The *archimagus* reſided in the fire temple, a place held in the ſame veneration among them as the temple of Mecca among the Mahometans; every perſon of the ſect being under a kind of obligation to make a pilgrimage to it once in their lives. Zoroaſter is ranked as the firſt *archimagus*.

ARCHIMANDRITE, from ἀρχὴ, and μάνδρα, *monaſtery*, the ſuperior of a monaſtery; amounting to what now we call ABBOT.

Cavarruvias obſerves, that the word literally denotes the chief or leader of a flock; in which ſenſe it may be applied to any eccleſiaſtical ſuperior; and accordingly, we

find

find the name sometimes attributed to archbishops. But among the Greeks, by whom it is chiefly used, it is always restrained to the chief of an abbey.

ARCHIMEDES's *screw*. See SCREW *of Archimedes*.

ARCHIMEDES's *burning-glass*. See BURNING-*glass*.

ARCHIMIME, ARCHIMIMUS, from ἀρχὸς, and μῖμος, *mimus*, or *actor*, the same thing, in effect, with archbuffoon, or mimic.

The *archimimes*, among the Romans, were persons who imitated the manners, gestures, and speech, both of people living, and those who were dead.

At first they were only employed on the theatre; but were afterward admitted, to their feasts, and at last to their funerals; where they walked after the corpse, counterfeiting the gestures and behaviour of the person who was carried to the funeral pile; as if he were still alive.

ARCHIPELAGO, in *Geography*, a sea interrupted by a great number of islands.

The word is formed by corruption of *Ægepelagus*, q. d. *Ægean sea*, which again is formed of Αιγαιος Πελαγος, a name originally given it by the Greeks; but for what reason is not agreed on.

The most celebrated *Archipelago*, and that to which the name is in some measure appropriated, is that between Greece, Macedonia, and Asia; wherein are the islands of the Ægean sea; which is called the *White Sea*, in contradistinction to the Euxine, which they call the *Black Sea*.

All these islands lie between the 35th and 40th degrees of north latitude. Some of them are called *Cyclades*, because they form, as it were, a crown or circle round the isle of Delos; the others are called *Sporades*, as being dispersed without any order between Asia, and the isle of Candia.

The modern geographers mention other *Archipelagos*; as that of Luzonia, near the coasts of Malabar, and Malacca; the *Archipelago* of Mexico; and that of the Caribbees, wherein are many islands; that of the Philippine, called by some, the *great Archipelago*, containing several islands; and all those of the Moluccos, or Celebes, &c.

ARCHIPHERACITÆ, ministers in the Jewish synagogues, appointed to read and interpret the Pentateuch, or titles and heads of the law, and the prophets.

The *archipheracita* was not the same with the *archisynagogus*, as Grotius, and others, have mistakenly imagined; but rather the chief or principal of those appointed to read, explain, and profess the law, in their schools.—And hence the name which is formed of ἀρχὸς, *chief*, and the Hebrew or Chaldee פרק, *division*, or *chapter*.

ARCHIPRESBYTER. See ARCH-PRIEST.

ARCHISTRATEGUS, the generalissimo, or captain-general of an army. See STRATEGUS.

ARCHISYNAGOGUS, in the *Jewish History*, the chief or ruler of the synagogue.

These are sometimes also called the angels or princes of the synagogues: the Jews called them *shatthamin*, i. e. *wise*. *Archisynagogi* were persons of authority in each synagogue, who presided in assemblies held therein, invited those to speak whom they judged capable of it, and decided all disputes relating to money, &c. They had a power to have those whipped who were convicted of acting contrary to the law; also a right of excommunicating, or casting out of the synagogue, those whom they found to merit this punishment. Their number was different according to the extent of the city, or the number of persons that came to the synagogue; in some there were seventy, in others eight or ten, and in others not above one. Vitringa de Synagog.

ARCHITECT, a person skilled in architecture, or the art of BUILDING; who forms plans and designs for edifices, conducts the work, and directs the several artificers employed in it.

The word is derived from ἀρχὸς, *primeps*, and τεκτων, *faber*, *workman*; q. d. the principal workman.

The most celebrated *architects* are Vitruvius, Palladio, Scamozzi, Serlio, Vignola, Barbaro, Cataneo, Alberti, Viola, Inigo Jones, De Lorme, Perrault, S. Le Clerc, Sir Christopher Wren, and the earl of Burlington.

Vitruvius enumerates twelve qualities requisite to constitute a good *architect*; that he be docile and ingenious; well educated; skilled in designing, in geometry, optics, arithmetic, history, philosophy, music, medicine, law, and astronomy.

Close application to the study of ancient masters, and the remaining works of the ancients, together with judgment and taste to select, and properly to apply the hints which such examples afford, joined to a peculiar genius for the study of this art, are absolutely necessary to render an *architect* eminent in his profession.

ARCHITECTOGRAPHIA, the description of ancient buildings, temples, theatres, arches, pyramids, baths, gates, aqueducts, tombs, and the like.

ARCHITECTONIC, that which builds a thing up regularly, according to its nature and intentions.

ARCHITECTURE, ARCHITECTURA, the art of BUILDING, i. e. of *erecting* edifices, proper for habitation or defence, as houses; *for domestic concerns*, as stabling, barns, and all out-offices; *for devotion*, as temples, churches, &c. for state, as public offices, halls, theatres, &c. for monuments and mausoleums, and for trade.

Architecture is scarce inferior to any of the arts in point of antiquity. Nature and necessity taught the first inhabitants of the earth to build themselves huts, tents, and cottages; from which, in course of time, they gradually advanced to more regular and stately habitations, with variety of ornaments, proportions, &c. See Vitruvius's account of the origin of *architecture*, under ORDER.

The ancient writers represent the Tyrians as the first among whom *architecture* was carried to any tolerable pitch; and hence it was that Solomon had recourse thither for workmen to build his temple.

To what a degree of magnificence the Tyrians and Egyptians carried *architecture*, before it came to the Greeks, may be learned from Isaiah xxiii. 8. and from Vitruvius's account of the Egyptian Oeci; their pyramids, obelisks, &c.

Yet, in the common account, *architecture* should be almost wholly of Grecian original: three of the regular orders or manners of building are denominated from them, viz. Corinthian, Ionic, and Doric; and there is scarce a single member, or moulding, but comes to us with a Greek name.

Be this as it will, it is certain the Romans, from whom we derive it, borrowed what they had entirely from the Greeks; among whom it was in its greatest glory under Pericles.

Under Augustus, *architecture* arrived at its highest perfection. Tiberius neglected it; as well as the other polite arts. Nero, amongst a number of horrible vices, still retained an uncommon passion for building; but luxury and dissoluteness had a greater share in it than true magnificence.—Apollodorus excelled in *architecture* under the emperor Trajan, by which he merited the favour of that prince; and it was he who raised the famous Trajan column, subsisting to this day; though robbed of its ornaments, in order to decorate the arch of Constantine.

After this, *architecture* began to decline again; and though the care and magnificence of Alexander Severus supported it for some time, yet it fell with the western empire, and sunk into a corruption, from whence it was not recovered for the space of twelve centuries.

The ravages of the Visigoths, in the fifth century, destroyed all the most beautiful monuments of antiquity; and *architecture* thence forward became so coarse and artless, that their professed architects understood nothing at all of just designing, wherein its whole beauty consists; and hence a new manner of building took its rise, which is called the *Gothic*.

Charlemagne did his utmost to restore *architecture*; and the French applied themselves to it with success, under the encouragement of H. Capet: his son Robert succeeded him in his design; till by degrees the modern *architecture* was run into as great an excess of delicacy, as the Gothic had before done into massiveness. To these may be added, the Arabesk and Mosaic, or Moresh *architecture*, which were much of a piece with the Gothic, only brought in from the south by the Moors, and Saracens, as the former was from the north by the Goths and Vandals.

The church built by Helen over the supposed sepulchre of our Saviour, is in this style, ornamented with foliage and figures of angles in the capitals, and on the imposts. This seems to have been the first corruption of the ancient architecture; and it was succeeded by the Gothic, which style of building has a fine effect in places of devotion; such are many of our cathedrals and old churches.

The architects of the 13th, 14th, and 15th century, who had some knowledge of sculpture, seemed to make perfection consist altogether in the delicacy and multitude of ornaments, which they bestowed on their buildings, with excessive care and solicitude; though frequently without any conduct or taste.

In the two last centuries, the *architects* of Italy and France were wholly bent upon retrieving the primitive simplicity and beauty of ancient *architecture*; in which they did not fail of success: insomuch that our churches, palaces, &c. are now wholly built after the antique.

The rules of *architecture* require, that in a fabrick judiciously and elegantly erected, there should be solidity, convenience, and beauty; to which, according to the taste of some of the most refined masters, are added order, disposition, proportion, decorum, and economy. These eight requisites are esteemed by the best judges, to constitute the necessary parts of *architecture*.

Solidity implies the choice of a good foundation, and good materials to work with, properly applied. Convenience consists in so disposing the various parts of a structure, that they may not crowd and embarrass each other, or appear disagreeable to the inspector. Beauty is that engaging form, and pleasing appearance, which captivates at one glance, as it were, the sight of the spectator. Order gives each part of the building a proportionate extent, adapted to the magnitude of the whole. Disposition is the due ranging, and agreeable union of

all the parts, in order to render the whole agreeable at all times, and, in general, means the proper convenient arrangement of the apartments. Proportion is the relation that the whole work has to its conſtituent parts; and which each part hath to the complex idea of the whole: for among buildings that are perfect in their kind, from any particular part we may form a judgment of the taſte of the whole. For example, the diameter of a column, or the dimenſions of a triglyph, give us a right idea of the whole with which they have connexion. To expreſs the relation which many things have to each other, as to their magnitude, and the variety of their parts, Vitruvius, the great architect, indifferently uſes the words proportion, eurythmy, and ſymmetry; the two laſt whereof are nearly ſynonymous with the firſt. *Diactum*, or decency, conſiſts in making the whole aſpect of the fabric ſo correct, that nothing ſhall appear but what is founded on the principles of geometry, and delicacy of judgment. Theſe have regard to deſign, cuſtom, and nature. Deſign induces to chuſe other diſpoſitions for a church than a palace. The regard we pay to cuſtom inclines us to decorate the elevations of ſuch houſes which are ſumptuous and magnificent within. The regard we have to the nature of places, from an inherent taſte, perhaps natural to mankind, makes us pitch upon different proſpects, for different parts of an edifice. Thus we chuſe to expoſe bed-chambers, and libraries, to the morning ſun; winter apartments to the weſt; and galleries of paintings to the north; as they require an equal light. Oeconomy inſtructs the artiſt to have regard to the expence to be made of his deſign, the quality of the materials near the place where he builds; and to take his meaſures judiciouſly for the order and diſpoſition.

Architecture is commonly divided into *civil*, *military*, and *naval*, or *marine*.

ARCHITECTURE, *civil*, is the art of deſigning edifices of every kind for the uſes of civil life in every capacity; as habitations for dwellings, churches, meetings, ſynagogues, colleges, halls, palaces, &c.

Civil architecture may be diſtinguiſhed, with regard to the ſeveral periods, or ſtates thereof, into the *antique*, *Gothic*, *modern*, &c.

Another diviſion of *civil architecture* ariſes from the different proportions which the different kinds of buildings rendered neceſſary, that we might have ſome proper for every purpoſe, according to the bulk, ſtrength, delicacy, richneſs, or ſimplicity required.

Hence aroſe five orders or manners of building, all invented by the ancients at different times, and on diſtinct occaſions, viz. *Tuſcan*, *Doric*, *Ionic*, *Corinthian*, and *Compoſite*; the hiſtory, characters, &c. of each whereof, ſee under their reſpective articles, COMPOSITE, CORINTHIAN, DORIC, IONIC, and TUSCAN.

What forms an order is, the column with its baſe and capital; ſurmounted by an entablature, conſiſting of architrave, frieze, and cornice; and laſtly on a pedeſtal.

For a general view of the elements of *architecture*, with the rules which obtain with reſpect to the manner, form, proportion, ſituation, foundation, diſtribution, covering, apertures, &c. ſee BUILDING.

For particulars, ſee CEILING, DOOR, FOUNDATION, ROOF, WALL, WINDOW, &c.

There are ſeveral arts ſubſervient to *architecture*, as carpentry, maſonry, paring, joinery, ſmithery, glazing, plumbing, plaiſtering, gilding, painting, &c. See CARPENTRY, GILDING, JOINERY, MASONRY, PAINTING, PAVING, PLUMBING, SCULPTURE, &c. See alſo BRICK, GLASS, LEAD, MORTAR, STONE, TILE, TIMBER, &c.

We have no Greek authors at this time extant on *architecture*. The firſt who wrote of it was Agatharcus the Athenian, who was ſeconded by Democritus and Theophraſtus. Among the Latins, Fuſſatius, Terentius Varro, Publius Septimius, Rufus, and Epaphroditus, all wrote De Re Architectonica.

But, of all theſe ancients, Vitruvius is the only entire author whoſe works we have; though Vegetius relates, that there were 300 architects at Rome in his time.—He lived in the reigns of Julius Cæſar, and of his ſucceſſor Auguſtus, and compoſed a complete ſyſtem of *architecture*, in ten books, which he dedicated to that prince.

M. Perrault has extracted all the rules out of Vitruvius's proſix work, and has methodized and publiſhed them in a little abridgment. Several authors have alſo endeavoured to explain the text of Vitruvius, particularly Philander, Barbaro, and Salmaſius, in notes added to their ſeveral Latin editions; Rivius and Perrault, in the notes to their German and French verſions; and Baldus, in his Lexicon Vitruvianum, enlarged by *De Laet*. The ſame M. Perrault has alſo compoſed an excellent treatiſe of the five orders, which may be eſteemed a ſupplement to Vitruvius, who left the doctrine of the orders defective.

The authors upon *architecture*, ſince Vitruvius, are, Leon Baptiſta Alberti, who, in 1512, publiſhed ten books of the art of building, in Latin, deſigned to outvie Vitruvius; in which, however, he has not ſucceeded. His work has abundance of good things; but it is deficient in the doctrine of the orders. Seb. Serlio, who wrote ſeven books of *architecture*, five of which, concerning the five orders, were made public in 1502, throughout all which he ſtrictly adheres to Vitruvius's rules; the ſeventh was ſince publiſhed in 1575; but the book concerning private buildings, has not yet appeared. Alſo, Palladio, who wrote four books of *Architecture*, containing the fundamental rules of the art, with various inſtances of all the kinds of work, publiſhed in Italian in 1575; the two firſt books are tranſlated into High Dutch, and enlarged with annotations by Joſeph Fur. Phil. de Lorme, who publiſhed three books of *Architecture* in French, in 1567; J. Barozzi de Vignola, who, in 1601, made public his rules of the five orders, in Italian; this work has been ſince *tranſlated*, with large additions, by Daviler, under the title of Cours d'*architecture*, &c. and ſince alſo in High Dutch, with notes.

To theſe are to be added Vincent Scamozzi, in his Idea of univerſal *Architecture*, publiſhed in 1615, in Italian; Car. Phil. Dieuſſart, in his Theatre of Civil *Architecture*, publiſhed in High Dutch in 1697, wherein he not only delivers the rules of *architecture*, but explains and compares the five orders, as laid down by Palladio, Vignola, Scamozzi, and others; which ſame deſign was alſo executed in French by R. Freart de Cambray, in a Parallel of the ancient *architecture* with the modern, publiſhed in French in 1650, and ſince tranſlated into Engliſh, with additions, by Mr. Evelyn. Fr. Blondel, director of the Royal Academy of *Architecture*, 1698, gave a Courſe of *Architecture*, in French; being a collection from all the celebrated writers upon the ſubject of the orders, &c. Nic. Goldman, in a treatiſe De Symmetris, publiſhed in Latin and High Dutch, in the year 1696, has done good ſervice, by reducing the rules and orders of *architecture* to a farther degree of perfection, and ſhewing, how they may be eaſily delineated by means of certain inſtruments invented by him.

Laſtly, the elements of *Architecture* are very ingeniouſly laid down by ſir H. Wotton. The ſame are alſo reduced by Sturmius, and Wolfius, to certain rules and demonſtrations: and thus is *architecture* brought into the form of a mathematical art; by the firſt, in his Matheſis Juvenilis, and by the ſecond, in his Elementa Matheſeos, tom. ii. an. 1715.

ARCHITECTURE, *counterfeit*, is that which has its projectures painted either in black or white, or coloured after the manner of marble; as is ſeen practiſed in the frontiſpieces and palaces in Italy, and in the pavilions of Marly.

This painting is done in freſco, upon plaiſtered walls; and in oil, on walls of ſtone.

Under the name of *counterfeit architecture*, which we otherwiſe called *ſcene-work*, is likewiſe comprehended that painted on ſlight boards or planks of wood, wherein the columns, pilaſters, and other parts of building, ſeem to ſtand out, with a relievo: the whole being coloured in imitation of various marbles, metal, &c. and ſerving in the decorations of theatres, triumphal arches, public entries, funeral pomps, &c.

ARCHITECTURE, *military*, is the art of ſtrengthening and fortifying places, to ſereen them from the inſults of enemies, and the violence of arms.

This we more uſually call FORTIFICATION.

The buſineſs of *military architecture* is to erect forts, caſtles, and other fortreſſes, with ramparts, baſtions, &c. Thoſe who have excelled in *military architecture*, are Cochorn, Pagan, Vauban, Scheiter, and Blondel; from whom all who have wrote ſince have chiefly derived what they have communicated to the world. See FORTIFICATION.

ARCHITECTURE, *naval*, or *Ship* BUILDING, is that which teaches the conſtruction of ſhips, galiies, and other floating veſſels for the water; with ports, moles, docks, &c. on the ſhore.

How it was eſteemed in the days of Homer, may be ſeen in his Odyſſ. v. 244. See SHIP, and the articles there referred to.

ARCHITECTURE, in PERSPECTIVE, is a ſort of building, wherein the members are of different meaſures and modules, and diminiſh in proportion to their diſtance; to make the work appear longer and larger to the view than really it is.

Such is the celebrated pontifical ſtair-caſe of the Vatican built under pope Alexander VII. by the cavalier Bernino.

ARCHITHALASSUS in *Conchyliology*, a name given by ſome authors to a very beautiful and precious ſhell of the *voluta* kind, called by us the admiral.

The curious in Holland have three ſpecies of this ſhell, which they call *architholaſſus primus*, *ſecundus*, and *auriantius*, the admiral, the vice admiral, and the orange ADMIRAL.

ARCHITRAVE, in *Building*, that part of a column, or order of column, which lies immediately upon the capital. See *Tab. Archit. fig.* 24, 25, 26, 27, 28.

The Greeks call it *epistyle*.

The *architrave* is the loweſt member of the entablature.

The *architrave* is ſuppoſed to repreſent the principal beam in timber buildings; whence the name, which is formed of ἀρχὴ, *chief*, and *trabs*, *beam*.

The *architrave* is different in the different orders. In the Tuſcan it only conſiſts of a plain face, crowned with a fillet; and is half a module in height.

In the Doric and Compoſite, it has two faces, or *faſciæ*; and three in the Ionic and Compoſite; in which laſt order it is $\frac{7}{8}$ of a module high, though but half a module in the reſt. See a table of the meaſure of the ſeveral parts of the *architrave* in the different orders, under COLUMN.

Architects, however, allow themſelves a great latitude in this part; ſome uſing more members than others; and many of them having two or three forms of *architraves*.

The proportions here laid down are taken from Vignola. *Architrave* is ſometimes alſo called the *reaſon-piece*, or *maſter-beam* in timber-buildings, as porticos, cloiſters, &c. In chimneys it is called the *mantle-piece*, and over the jaumbs of doors, or lintels of windows, the HYPERTHYRON.

ARCHITRAVE *cornice*. See CORNICHE.

ARCHITRAVE *doors*, are thoſe which have an *architrave* on the jaumbs, and over the door upon the cap-piece, if ſtraight; or on the arch, if the top be curved.

ARCHITRAVE *windows*, of timber, are commonly an OGEE raiſed out of the ſolid timber, with a liſt over it; though ſometimes the mouldings are ſtruck, and laid on; and ſometimes they are cut in brick.

The upper *faſcia* is called the *header*, or *heading architrave*; and the lower the *jack*.

ARCHITRICLINUS, in *Antiquity*, the maſter or director of a feaſt, charged with the order and œconomy of it, the covering and uncovering of the tables, the command of the ſervants and the like.

The word *architriclinus* properly imports the chief or maſter of a *triclinium*, or dining room. His office properly differed from that of *modimperator*, or *arbiter bibendi*, as the latter was appointed by the gueſts, the *architriclinus* by the perſon who gave the feaſt.

The *architriclinus* was ſometimes alſo called *ſervus triclinii-arcba*, and by the Greeks πρωτοκλίτης, i. e. *præguſtator*, or *fore-taſter*. Potter alſo takes the *architriclinus* for the ſame with the SYMPOSIARCHA.

ARCHITYPE. See ARCHETYPE.

ARCHIVAULT, in *Architecture*, the inner *couture* of an ARCH; or a band or ſtame adorned with mouldings, running over the faces of the arch-ſtones, and bearing upon the impoſts. See this repreſented in the linea that bound the arch over E. See *Tab. Archit. fig.* 40.

The word is *French*, *archivolte*; where it ſignifies the ſame thing; formed of *arcus volutus*.

It is different in the different orders.—In the Tuſcan, it has only a ſingle face; it has two faces crowned, in the Doric and Ionic; and the ſame mouldings with the ARCHITRAVE in the Corinthian and Compoſite.

ARCHIVE, or ARCHIVES, a chamber or apartment where in the records, charters, and other papers and evidences, of a ſtate, houſe, or community, are preſerved, to be conſulted occaſionally.

The word comes from *arca*, a *cheſt*; or the Greek ἀρχεῖον, which Suidas uſes in the ſame ſenſe. In ſome Latin writers we meet with *archarium*.

We ſay, the *archives* of a college, of a monaſtery, &c. The *archives* of ancient Rome were in the temple of Saturn; the *archives* of the court of chancery are in the rolls office. In the code we meet with *archivum publicum vel armarium publicum, ubi acta & libri expenduntur*. *Cod. de fid. inſtrum. autb. ad hæc.* XXX. q. 1.

ARCHIVIST, *archiviſta*, a keeper of an ARCHIVE.

Under the emperors, the *archiviſt* was an officer of great dignity, held equal to the proconſuls, veſted with the quality of a count, ſtyled *clariſſimus*, and exempted from all public offices and taxes. Among the ancient Greeks and Perſians, the truſt was committed to none but men of the firſt rank; among the Franks, the clergy, being the only men of letters, kept the office among themſelves.

Since the erection of the electoral college, the archbiſhop of Mentz has had the direction of the ARCHIVES of the empire.

ARCHIZUPANUS, a title given to the prince or deſpot of Servia.

The word is compounded of ἀρχὴ and ζυπανὸς, *governor*. In an epiſtle of pope Innocent III. he is called *Alagnus Zupanus*.

ARCH-MARSHAL, ARCHIMARISCALLUS, the grand marſhal of the empire.

The elector of Saxony is *arch-marſhal* of the empire; and in that quality he goes immediately before the emperor, bearing a naked ſword.

ARCH-MINISTER, the prime miniſter of a prince, or ſtate. Charles the Bald having declared Boſon his viceroy in Italy, under the title of duke, made him alſo his firſt miniſter under that of *arch miniſter*.

The word is derived from the Greek ἀρχὴ, and the Latin *miniſter*.

ARCHON, in *Antiquity*, the chief magiſtrate of the city and commonwealth of Athens.

The word is Greek, ἄρχων, which literally ſignifies a *commander*.

After the Athenians had abeliſhed monarchy, they created *archons*, who were obliged to render an account of their adminiſtration to the people.

Some of theſe were annual, and others perpetual. Medon, the ſon of Codrus, was the firſt of the latter, and Cleon of the former, who entered upon his charge in the third year of the twenty-fourth Olympiad. The occaſion of their inſtitution was this: Codrus, king of Athens, having devoted himſelf for the good of his people, in the war with the Heraclidæ; his ſons, Medon and Nileus, diſputed the crown betwixt them: the Athenians took this occaſion of diſſolving their monarchy, and, in lieu of kings, created perpetual governors, under the name of *archons*. Medon, ſon of Codrus, was he who firſt had this charge; and his deſcendants (from him called *Medontidæ*) enjoyed it for 287 years. But a perpetual magiſtracy ſeemed to this free people too lively an image of royalty, the very ſhadow whereof they were reſolved to aboliſh. Accordingly, the adminiſtration of an *archon*, which had before been perpetual, they reduced, in the firſt year of the ſeventh Olympiad, to ten years, and, about ſeventy years after, to one year; with a view of recovering, as oft as poſſible, the authority into their own hands, which they never transferred to the magiſtrate, but with regret. The chief magiſtrates of Athens, diſtinguiſhed by this common appellation, were nine in number; though the name *archon* belonged by way of eminence to the chief of the nine, who was alſo called *eponymus*, ἐπώνυμος, becauſe the year was denominated from him. His juriſdiction comprehended both eccleſiaſtical and civil affairs. He determined all cauſes between men and their wives, parents and children, and diſputes relating to wills, dowries, and legacies: he had the charge and direction of orphans, minors, tutors, and guardians. He was puniſhed with death if convicted of drunkenneſs, during the time of his office. The ſecond *archon* was called *βασιλεὺς*, or *king*. To him pertained the ſuperintendence of the religious ceremonies and feaſts: he had alſo ſome concern in ſecular affairs. The third was the *polemarchus*, ſo called from πολεμος, *war*, and ἀρχειν, *to command*: to him belonged the care of ſtrangers and ſojourners, and the conduct of war. The other ſix were called *theſmothetæ*, from θεσμος, *law*, and τιθημι, *I eſtabliſh*. They formed a tribunal for judging concerning ſeductions, calumnies, bribery, &c. and for ſetting diſputes between the citizens and ſtrangers, and all controverſies in trade. They ratified all contracts and leagues, directed and guarded the eſtabliſhment of laws, and formed a kind of barrier between the other magiſtrates and the people. The whole body had the power of life and death; and they were exempted from all taxes and contributions for building ſhips of war, in recompence of their ſervice. They were elected by lots, and previous to induction into their office, they underwent a twofold trial, one in the forum, and the other in the ſenate-houſe. An oath was required of them, that they would adminiſter juſtice without partiality, and never be corrupted by bribes. This cuſtom was eſtabliſhed by Solon. Potter's Arch. Græc. vol. i. p. 71.

Under the Roman emperors, ſeveral other Greek cities had two *archons*, for chief magiſtrates; which were the ſame with the *duumviri* in the colonies, and *municipia*.

ARCHON is alſo applied, by ſome authors, to divers officers, both civil and religious, under the eaſtern or Greek empire. Thus, biſhops are ſometimes called *archontes*; and the ſame may be ſaid of the lords of the emperor's court. We alſo read of the *archon of the antimenſia*, *archon of archons*, *grand archon*, *archon of churches*, *archon of the goſpel*, *archon of the ſeats*, &c.

ARCHONTICI, in *Church Hiſtory*, a ſect which aroſe towards the cloſe of the ſecond century; thus called from the Greek ἀρχοντες, q. d. *principalities* or *hierarchies of angels*; becauſe they held the world to have been created not by the Supreme God, but by certain ſubordinate powers, called *archontes*, or *angels*. The *Archontici* were a branch of VALENTINIANS.

ARCHONTIUM, ἀρχοντιον, denotes a dignity in the Greek church.

ARCHPRIEST, ARCHPRESBYTER, a prieſt, or preſbyter, eſtabliſhed in ſome dioceſe, with a pre-eminence over the reſt.

Anciently, the *arch-prieſt* was the firſt perſon after the biſhop; he was ſeated in the church next after the biſhop; and even acted as his vicar, in his abſence, as to all ſpiritual concerns.

In

In the fixth century, there were found feveral *archi-prieſts* in the ſame diocefe; from which time ſome will have them to have been called *deans*.

In the ninth century, they diſtinguiſhed two kinds of cures or pariſhes: the ſmalleſt governed by ſimple prieſts; and the baptiſmal churches, by *arch-prieſts*; who, beſide the immediate concern of the cure, had the inſpection of the other inferior prieſts, and gave an account of them to the biſhop, who governed the chief, or cathedral church, in perſon.

There are *archpreſbyters* ſtill ſubſiſting in the Greek church; veſted with moſt of the functions and privileges, of *chorepiſcopi*, or rural deans.

ARCH-PRIOR, was a name ſometimes given to the maſter of the order of TEMPLARS.

ARCH-TREASURER, *archithæſaurarius*, the great treaſurer of the German empire.

This office was created with the eighth electorate, in favour of the elector Palatine, who had loſt his former electorate, which was given to the duke of Bavaria, by the emperor Ferdinand II. who took it away from Frederick V. elector Palatine, after the battle of Prague, where he was defeated in maintaining his election to the crown of Bohemia.

The dignity of *archithæſaurer* was conteſted between the elector of Brunſwic, now king of Great Britain, who claimed it in virtue of his deſcent from the elector Frederic, and the elector Palatine.

ARCHLEUTO, ARCHILUTE, a long and large lute, having its baſs ſtrings lengthened after the manner of the theorbo, and each row doubled either with a little octave or an uniſon.—It is uſed by the Italians for playing a thorough-baſs.

ARCION, in *Botany*, a name given by ſome of the ancient writers on medicine, to the plant we call TUSSILAGO, or COLT'S FOOT.

ARCIVÆ *aves*, in *Auſpices*, birds which gave bad omens, either by their flight, noiſe, or manner of eating.

They were called *arcivæ*, ſometimes alſo *arculæ*, *quod arcebant ne quid fieret*, prevented or forbad things being done.

ARCTAPELIOTES, in *Cosmography*, the wind which blows at the 45° from the north, towards the eaſt.

In this ſenſe *arctapeliotes* amounts to the ſame with what we call the north-eaſt wind.

ARCTATIO, a ſtreightneſs; in particular, it is applied to the inteſtines conſtipated from an inflammation; and to a preternatural ſtreightneſs of the *mulebre pudendum*, or *uterus*. It is alſo called *arctitudo*.

ARCTIC, in *Aſtronomy*, an epithet given to the north pole, or the pole raiſed above our horizon.

It is called the *arctic* pole, on occaſion of the conſtellation of the *Little Bear*, in Greek called ἄρκτος, the laſt ſtar of the tail whereof nearly points out the north POLE.

ARTIC *circle* is a leſſer circle of the ſphere, parallel to the equator, and 23° 30′ diſtant from the north pole, from whence its name.

This, and its oppoſite, the *antarctic*, are called the two *polar circles*, and may be conceived to be deſcribed by the motion of the poles of the ecliptic, round the poles of the equator, or of the world.

ARCTIUM, in *Botany*. See BURDOCK.

ARCTOMYS *Palæſtinarum*, in *Zoology*, the name of an animal of the rat kind, but very large, being of a middle ſize between the rat and the rabbit: it lives in caves, and feeds on vegetables, and is a fierce and bold creature. It uſes its fore-feet as hands, and has a cuſtom of ſitting on the buttocks, and in this poſture looks very like a bear. Ray.

ARCTOPHYLAX, from ἄρκτος, *bear*, and φύλαξ, *I guard*, in *Aſtronomy*, a conſtellation, otherwiſe called BOOTES.

ARCTOPUS, in *Botany*, a genus of the *polygamia dioecia* claſs.

ARCTOTIS, or ARCTOTHECA ARBUSCULO SEMPERVIRENS, in *Botany*, belonga to the *ſyngeneſia polygamia neceſſaria* claſs.

The characters are, that the common compalement is ſcaly and ſilvery; the flower is compoſed of many female florets, which are ranged round the border; the germen afterwards become a ſingle roundiſh ſeed, covered with a ſoft down.

The middle or diſk of the flower is compoſed of hermaphrodite floretsy in each of which is placed a ſmall germen, ſupporting a ſtiliatical ſtyle with a ſingle ſtigma. Theſe flowers are abortive.

Linnæus enumerates twelve and Miller eight ſpecies.

Theſe plants are natives of the country about the Cape of Good Hope, from whence they have been brought to ſome curious gardens in Holland and England. They ſhould be frequently renewed by cuttings, becauſe the old plants are ſubject to decay in winter; therefore, if young plants are not annually raiſed, the ſpecies may ſoon be loſt.

ARCTURUM *inferius*, a ſmall ſtar of the ſeventh or eighth magnitude, to the ſouth of *arcturus*, obſerved by Mr. Flamſteed, and ſo named by him, whoſe place is not determined in the Britiſh Catalogue.

ARCTURUS, in *Aſtronomy*, a fixed ſtar of the firſt magnitude, in the conſtellation of ARCTOPHYLAX, or BOOTES.

The word is formed of ἄρκτος, and οὐρὰ, *tail*, q. d. *bear's tail*; as being very near it.

This ſtar was known to the ancients, as in the following verſe of Virgil:

Arcturum, pluviaſque Hyadas, geminoſque Triones.

See alſo Job ix. 9. xxxviii. 32.

Mr. Hornſby concludes, that *arcturus* is the pearcſt ſtar to our ſyſtem viſible in the northern hemiſphere, becauſe the variation of its place, in conſequence of a proper motion of its own, is more remarkable than that of any other of the ſtars; and by comparing a variety of obſervations reſpecting both the quantity and direction of the motion of this ſtar, he infers that the obliquity of the ecliptic decreaſes at the rate of 58″ in one hundred years; a quantity which nearly correſponds to the mean of the computation framed by Mr. Euler, and M. de la Lande, upon the principles of attraction. Phil. Tranſ. vol. lxii. p. i. N° 14.

ARCTUS, ἄρκτος, in *Aſtronomy*, a name given by the Greeks to two conſtellations of the northern hemiſphere; by the Latins called URSA *major* and *minor*, and by us the *Greater* and *Leſſer* BEAR.

ARCUALIA *oſſa*, in *Anatomy*, a name uſed by ſome for the *oſſa ſincipitis*, by others for the *oſſa temporum*.

ARCUALIS *ſutura*, among *Surgeons*, denotes the coronal SUTURE.

ARCUATION, from *arcus*, *a bow*, is uſed by ſome writers in *Surgery*, for an incurvation of the bones: ſuch as we ſee in the caſe of rickets, &c.

ARCUATION, in *Gardening*, denotes a method of raiſing trees by layers.

This, Switzer obſerves, is now the general method of raiſing ſuch trees as cannot be raiſed from ſeeds; as the *platanus*, elm, *abies*, lime, alder, willow, &c.

The firſt thing here done is, to procure large and ſtrong mother-plants called ſtools. Theſe, being planted in a trench, will throw out twenty, thirty, forty, or fifty plants a-piece; which may be begun to be laid about the Michaelmas following; at which time, if the ſtools have been carefully managed, they will have ſhot five, ſix, or more, main branches out of the root; and on every one of theſe, as many ſide or collateral branches.

Theſe main branches are be bent down to the ground; and, when thus laid quite round the ſtool, and pegged faſt down, the ſmall ones may be ſerved in the ſame manner: thus the main branches are to be covered over, all except the tops; and the ſmall, or ſide branches, to be covered over two or three inches thick upon the joints. This done, they may be trenched, to make them take root the better.

About the middle of September they may be opened: when, it is probable, they will have taken root: otherwiſe they may lie till next ſpring; and then, taking them up, they are to planted in the nurſery. Miller.

ARCUBALISTA, in the *Military Art*, a kind of *baliſta*, probably made after the faſhion of a bow.

It is mentioned by Vegetius; but the deſcription of it omitted by him, as too well known then, though now hard to be gueſſed at.

Thoſe who fought with this weapon were called *arcubaliſtarii*, ſometimes *manubaliſtarii*.

ARCUCCIO, ARCUTIO, a machine made of a board, covered with pieces of hoops, like the tilt of a waggon; uſed in Italy to prevent children from being overlaid and ſmothered by nurſes, or others.

Every nurſe in Florence is obliged to lay her child in an *arcutio*, under pain of excommunication.—See a figure and deſcription of the *arcutio*, given by Mr. St. John, in Phil. Tranſ. N° 442. Abridg. vol. vii. part. iv. p. 46.

ARDAMON, or ARDAMA, from ἄρδω, *I water*, in *Antiquity*, a veſſel of water placed at the door of a perſon deceaſed, till the time of burial, as a token that the family was in mourning, and to ſerve to ſprinkle and purify perſons as they came out of the houſe.

ARDASSES, in *Commerce*, the coarſeſt of all the ſilks of Perſia; and, as it were, the refuſe of each kind. In this ſenſe, they ſay, the *legis*, the *bouſſes*, the *chouſis*, and the *papas ardaſſes*, to ſignify the worſt of thoſe four ſorts of Perſian ſilk.

ARDASSINES, in *Commerce*, called in France *ardaſſines*; a very fine ſort of Perſian ſilks, little inferior in fineneſs to the *ſourbaſſis*, or rather *cherbaſſis*, and yet it is little uſed in the ſilk manufactures of Lyons and Tours, becauſe that kind of ſilk will bear hot water in the winding.

ARDEA, in *Ornithology*, a genus of the order of *grallæ*, belonging to the claſs of *aves*, in the Linnæan ſyſtem: its characters are, that the beak is ſtrait, acute, long, and compreſſed; and that a furrow paſſes from the noſtrils, which are lineat, to the apex. The feet have four toes. Linnæus enumerates 26 ſpecies. See CRANE, HERON, and STORK.

ARDENT, ARDENS, from *ardere*, *to burn*, ſomething hot, and as it were, burning.

ARDENT *fever*, is a violent burning FEVER, otherwiſe called CAUSUS.

ARDENT *ſpirits* are thoſe diſtilled from fermented vegetables; thus called, becauſe they will take fire, and burn.

Such

Such are brandy, spirit of wine, rum, arrack, &c.

ARDENTES, in *Middle Age Writers*, an appellation given to those afflicted with the *ignis sacer*, or ERYSIPELAS. They are thus called, as seeming to be scorched or burnt with the disease.

Hence also the abbey of St. Geneviève at Paris is called *domus ardentium*, because, as it is said, great numbers were cured of that distemper at the shrine of this saint, in the reign of Louis VI.

ARDEOLA, in *Ornithology*, the name of a very beautiful bird, of the Brasils, of the heron kind, but no larger than a pigeon.

ARDERS, fallow wings, or ploughings of grounds. See FALLOW, PLOUGHING, &c.

ARDESIA. See *Iron* SLATE.

ARDOR *ventriculi*, a heat of the stomach, usually expressed by the term HEART-*burn*, or CARDIALGY.

ARDUINA, *bastard* LYCIUM, in *Botany*, a genus of the *pentandria monogynia* class: the corolla of which has a single petal; the stigma is bifid; and the fruit is a double-celled berry with a single seed. There is one species.

ARE, or A-LA-MI-RE, one of the eight NOTES in the scale of music.

AREA, in general, denotes any plain surface, wherein we walk, &c.

The word is Latin, importing more properly a threshing-floor; and is derived from *arere, to be dry*.

AREA, in *Architecture*, denotes the space or scite of ground on which an edifice stands. It is also used for inner courts, and those portions of ground

AREA, in *Geometry*, denotes the superficial content of any FIGURE.

Thus, if a figure, e. gr. a field, be in form of a square, and its side be 40 feet long, its area is said to be 1600 square feet: or it contains 1600 little squares, each a foot every way. Hence, to find the *area* of a triangle, square, parallelogram, rectangle, trapezium, rhombus, polygon, circle, or other figure, is to find the magnitude or capacity thereof in square measure.—To do which, see the article TRIANGLE, &c. To find the area of fields, and other inclosures, they first survey or take the angles thereof, then plot them on paper, and thus cast up their contents in acres, roods, &c. after the usual manner of other plain figures.

The law by which the planets move round the sun, is this; that a line, or radius, drawn from the centre of the sun to the centre of the planet, always sweeps or describes elliptic *areas* proportional to the times. Thus, the sun being supposed in S, and a planet in A (*Tab. Astronomy, fig.* 61. N° 2.) and letting it proceed in any given time, to B; in such progress, its radius AS will have described the *area* ASB. Suppose, again, the planet to be arrived to P; then the elliptic space PSD being drawn equal to the other ASB, the planet will move through the arch PD in the same time as through the arch AB.

Sir I. Newton demonstrates, that whatever bodies do observe such law in their motions about any other body, do gravitate towards such body.

AREA is also used, in *Medicine*, for a disease which makes the hair fall.

The *area* is a general kind of depilation; and is distinguished into two species, ALOPECIA, and OPHIASIS.

AREA, in *Optics*. See FIELD.

AREE, a kind of imaginary money, used in the dominions of the great mogul.

Four *orbs* are equal to one *crou*, or 100 *lacs*; one *lac* to 100,000 *rupees*.

ARECA, or AREEK, a fruit of the East Indies, wherein they drive an incredible trade, and of which they make a prodigious consumption; there being scarce any person from the richest to the poorest, who doesnot make use of it. See *Table of Materia-tropical Objects, Class* 7.

The tree which bears the *areek*, is tall, straight, thin, and round. It is of the palm kind, and has no branches; but its leaves are beautiful to the sight, they form a round tuft on the top of the trunk, which is as straight as an arrow. It grows sometimes to the height of thirty-five feet, and is a great ornament in gardens.

The shell which contains the fruit is yellowish, smooth without, but rough and hairy within, in which it pretty much resembles the shell of the cocoa-nut. Its size is equal to that of a large walnut; its kernel is as big as a nutmeg, to which it bears a great resemblance without; and when cut, has the same whitish veins within. In the centre of the fruit, when it is soft, is contained a greyish and almost liquid substance, which grows hard, in proportion as it ripens. The fruit when ripe is astringent, but not unpalatable.

The chief use that it is made of *areek*, is to chew it with leaves of betle, mixing it with a chalk in a red paste, made of sea-shells. In order to chew it, they cut the *areek* into four quarters, and take one quarter of it, which they wrap in a leaf of betle, over which they lay a little of that chalk: afterward they tie it by twisting it round. This bit thus prepared is called *pinang*, which is a Malayan word used all over the East Indies. The *pinang* promotes spitting very much; the spittle is red, which colour the *areek* gives it. This masticatory cools the mouth, and fastens the teeth and gums. Some pretend that *areek* strengthens the stomach, when the juice of it is swallowed, and most of the Indians do swallow it.

Another property ascribed to it, is the curing, or carrying off, all that might be unwholesome or corrupt in the gums. Of this fruit the extract is made, which in our shops is called *terra Japonica*. To this extract they sometimes join that of another plant named *jatanhi*, and also calcined shells; it is generally adulterated. Geoffroy.

AREM, or AL-AREM, a vast mound or dam, which formed a stupendous reservoir above the city Saba, whose rupture caused an inundation, famous in eastern writers. Sale's Prel. Disc.

The word *arem* is Arabic, and literally signifies any mound, or dam, for the containing of water.

ARENA, among the Romans, sometimes signified the same with an *amphitheatre*; viz. a place where the GLADIATORS had their combat.

The word is Latin, and signifies *sand*; because the place was always strewed with sand, to conceal from the view of the people the blood spilt in the combat.

Properly speaking, *arena* was only the pit or space in the middle of those places where the athletæ and gladiators performed.

The *arena* was the same thing, with regard to the gladiators, that the *campus*, or field, was to soldiers and armies; viz. the place where they fought.—He who fought in the *arena*, was called *arenarius*. Nero is said to have strewed the *arena* with gold-dust.

ARENA, in *Architecture*, is the middle or body of a temple, and comprehends the whole space between the *ante*, and the extreme wall of the building.

ARENARIA, in *Botany*. See *Sea*-CHICKWEED.

ARENARIA, in *Ornithology*, the name of a bird, called in English the *sanderling*, and in some places, particularly in Cornwall, the *curwillet*.

It is a water-bird, of the long-legged, and open-footed, not webbed, kind, and is a little larger than the *tringa minor*, or *sand*-PIPER.—These birds are common about the sea-shore, and generally fly in large flocks.

ARENARIA, in *Ancient Writers*, is used for sand-pits, or ground out of which sand is dug. Vitruvius.

ARENARII, in *Antiquity*, gladiators who combated with beasts in the *arena*, or amphitheatre. The *arenarii* were slaves of the lowest rank, to that though manumitted, they were not capable of being Roman citizens. They were the same with what were otherwise called BESTIARII.

ARENARIUM, in *Ecclesiastical Writers*, denotes a cemetery or burying ground.

The *arenaria* were properly a kind of pits, or holes, under ground, wherein the ancient Christians not only buried their dead, but held their religious assemblies, in times of persecution. Baron. Annal. and Du-Cange.

ARENATION is used, by some *Physicians*, for a kind of dry bath, in which the patient only puts with his feet on hot sand.

AREOLA, or AREOLA *mamillaris*, in *Anatomy*, the coloured circle which surrounds the nipple. See BREAST.

AREOPAGUS, or AREOPAGUS, in *Antiquity*, a sovereign tribunal at Athens; famous for the justice and impartiality of its decrees: to which the gods themselves are said to have submitted their quarrels.

Authors are divided, as to the reason and origin of the name: some imagine *areopagus* the proper name of the court of justice, which was first on a hill in Athens; and that in this court the senate of that illustrious city assembled.—Others say, that *areopagus* was the name of the whole suburbs of Athens, wherein stood the hill on which the court was built; and the name *areopagus* seems to countenance this last opinion; for it signifies literally, the hill or rock of Mars; from *mars*, *hill*, and *agein*, belonging to Mars. In effect, the denomination might either arise hence, that the *areopagus* was built in a place where had been a temple of Mars: or, because the first cause pleaded there was that of this god, who was accused of killing Halirrhotius the son of Neptune, and tried here before twelve gods, and acquitted by a majority of voices; or, finally, because the Amazons, whom the poets feign to have been the daughters of Mars, when they besieged Athens, pitched their tents, and offered sacrifices to the god of war in this place.

This tribunal was in great reputation among the Greeks; and the Romans themselves had so high an opinion of it, that they trusted many of their difficult causes to its decision. Authors are not agreed about the number of the judges who composed this august court. Some reckon thirty-one, others fifty-one, and others five hundred; in effect, their number seems not to have been fixed, but to have been more or less in different years.—By an inscription quoted by Volaterranus it appears, they were then three hundred.

At firſt this tribunal only conſiſted of nine perſons, who had all diſcharged the office of archons, had acquitted themſelves with honour in that truſt, and had likewiſe given an account of their adminiſtration before the *logiſtæ*, and undergone a very rigorous examination. Their ſalary was equal, and paid out of the treaſury of the republic: they had three *obols* for each cauſe.

The *areopagites* were judges for life.—They never ſat in judgment but in the open air, and that in the night time; to the intent that their minds might be more preſent and attentive; and that no object, either of pity or averſion, might make any impreſſion upon them. However, ſome maintain, that the building in which the *areopagites* aſſembled, was not wholly uncovered; and they obſerve, that among the ruins, large ſtones have been found, whoſe joints are in the ſame angle with the pediment that muſt have been uſed for a covering.—All pleadings before them were to be in the ſimpleſt and moſt naked terms; without exordium, epilogue, or appeal to the paſſions.

At firſt they only took cognizance of criminal cauſes; but in courſe of time their juriſdiction became of greater extent.—Mr. Spon, who examined the antiquities of that illuſtrious city, found ſome remains of the *areopagus* ſtill exiſting in the middle of the temple of Theſeus, which was heretofore in the middle of the city, but is now without the walls.—The foundation of the *areopagus* is a ſemicircle, with an eſplanade of 140 paces round it, which properly made the hall of the *areopagus*. There is a tribunal cut in the middle of a rock, with ſeats on each ſide of it, where the *areopagites* ſat, expoſed to the open air.

This court is ſaid by ſome to have been inſtituted by Solon; but others carry it much higher, and aſſert it to have been eſtabliſhed by Cecrops, about the time that Aaron died; viz. in the year of the world 2553, maintaining withal, that Solon only made ſome new regulations in it, increaſed its power and privileges, and made it ſuperior to the *ephetæ*, another celebrated court inſtituted by Draco.—In effect, Demoſthenes himſelf, in his oration againſt Ceſiphon, owns himſelf at a loſs on the point: *The inſtitutors of this tribunal*, ſays he, *whatever they were, whether gods or heroes, &c.*

AREOMETER. See AROMETER.

AREOSTYLE. See ARAEOSTYLE.

AREOTICS. See ARAEOTICS.

ARES, a term framed by Paracelſus, to expreſs a hidden diſpoſer, in the three principles of things, from which each being receives its proper form and ſubſtance, and aſſumes its own ſpecific nature, not that of any other being. Paracelſus diſtinguiſhes the *ares* into *arcbæus*, which is *natural*; and *chemicus*, which is *artificial*. See ARCHÆUS.

ARETALOGI, in *Antiquity*, a ſort of philoſophers, chiefly of the Cynic or Stoic tribe, who, having no ſchool or diſciples of their own, haunted the tables of great men, and entertained them in their banquets with diſputations on virtue, vice, and other popular topics. Pitiſcus Lex.

Theſe are ſometimes alſo denominated *circulatores philoſophi*. Calvin. Lex. Jur.

ARETHUSA, in *Botany*, a genus of the *gynandria diandria* claſs; with a tubular *nectarium* within the bottom of the corolla, and a ſtyle connected with the lower lip. There are three ſpecies.

ARETIA, in *Botany*, a genus of the *pentandria monogynia* claſs, the corolla is ſhaped like a ſalver, and divided into five ſegments, with an oval tube; the ſtigma is depreſſed above, and the capſula is globular and ſingle-celled.

ARETOLOGY, ARETOLOGIA, that part of moral philoſophy which treats of virtue, its nature, and the means of arriving at it.

ARGAL, or ARGOL, the hard lees ſticking to the ſides of wine-veſſels; more frequently called TARTAR.

ARGEA, or ARGEI, in *Antiquity*, human figures made of ruſhes, thrown annually by the Veſtals into the river Tiber, on the day of the ides of May.

This ceremony we learn from Feſtus and Varro; the latter of whom, however, ſays, they were caſt by the prieſts, noiſels by *ſacerdotibus* we ſuppoſe he meant *prieſteſſes*. He adds, that the number of figures was thirty. Plutarch, in his Roman Queſtions, inquires, why they were called *argeæ*? There are two reaſons aſſigned: the firſt, that the barbarous nation, who firſt inhabited theſe parts, caſt all the Greeks they could meet with into the Tiber; for *Argians* was a common name for all Grecians; but that Hercules perſuaded them to quit ſo inhuman a practice, and to purge themſelves of the crime, by inſtituting this ſolemnity.—The ſecond, that Evander, an Arcadian, and a ſworn enemy of the *Argians*, to perpetuate that enmity to his poſterity, ordered the figures of *Argians* to be thus caſt into the river.

ARGEMON, or ARGEMA, in *Medicine*, an ulcer about the *iris* of the eye, comprehending part of the white, and part alſo of the black.

The *argemon* appears of a red colour, on the outſide of the *iris*, and white within it. When it ſpreads far, and eats deep, it ſometimes occaſions the UVEA to fall.

ARGEMONE, in *Botany*. See *Prickly* POPPY.

ARGEMONION, in *Botany*, a name given by ſome of the late Greek writers, to the plant called SARCOCOLLA by the other writers of their times.

ARGENT, in *Heraldry*, ſignifies the white colour, uſed in the coats of gentlemen, knights, and baronets.

Barons, and all nobles, have the white colour called *pearl*; and ſovereign princes have theirs called *luna*.—Without either *argent* or *or*, the heralds ſay, there can be no good armory.

Argent is expreſſed, in engraving, by the parts being left plain, without any ſtrokes from the graver.

The word is French, derived from the Latin *argentum*, SILVER; this colour being ſuppoſed the repreſentation of that metal: whence the Spaniards call this field *campo de plata*, *ſilver field*.

In the doubling of mantles, where the white is ſuppoſed to repreſent a fur, and not a metal, it may be blazoned *white*.

ARGENTARIA *creta*, *ſilver chalk*, in *Natural Hiſtory*, a name given to an earth, not properly a chalk, but a kind of TRIPELA. It is a very beautiful earth, of a looſe friable texture, and perfectly pure white. It is dug in Pruſſia, and is much eſteemed for cleaning plate. It has alſo been found in France, and of late in Ireland.

There are many white chalks of various hues, which are dug in Germany, America, Italy, and other countries.

That dug in the duchy of Mantua, in Italy, is much uſed by painters, and at Rome vulgarly called *peſſe*.

ARGENTARIUS is frequently uſed, in *Roman Writers*, for a money-changer or banker.

The *argentarii* were monied people, who made a profit either by the changing, or lending of money at intereſt. Theſe had their *tabernæ*, or offices, in the *forum Romanum*, built there as early as the reign of L. Tarquinius Priſcus. The *argentarii* and *fœneratores* were much hated, on account of their covetouſneſs and extortion. Du-Cange and Priſcus.

ARGENTARIUS, in *Writers of the Middle Age*, an officer entruſted with the cuſtody of money.

In this ſenſe *argentarius* amounts to the ſame with the Greek ἀργυροπράτης, and our *cofferer*. Du-Cange.

ARGENTARIUS *miles*, in our *Old Writers*, an officer of the exchequer, whoſe buſineſs it was to carry up the bag of money from the lower exchequer to the higher, in order to its being examined or told. Spelman.

ARGENTARII is alſo applied, in the *Civil Law*, to thoſe who adorned military arms with ſilver or gold.

In which ſenſe the word amounts to the ſame with BARBARICARII.

ARGENTATI *militet*, in *Antiquity*.—Livy, lib. vi ſpeaks of *argentati militet*, as diſtinguiſhed from *auratis*. Aquinas ſuppoſes theſe to have been ſimilar to the ARGYRASPIDES and CHRYSAPIDES; but the deſcriptions do not quadrate. Livy only repreſents the *argentati* as clothed in white linen coats. Aquin. Lex. Mil.

ARGENTEUM *os*, in *Natural Hiſtory*. See *Os argenteum*.

ARGENTICOMUS, among *Ancient Aſtrologers*, denotes a kind of ſilver-haired comet, of uncommon luſtre, ſuppoſed to be the cauſe of great changes in the planetary ſyſtem.

ARGENTIL, an old Engliſh name for the plant called *perſicaria Anglorum*; in Engliſh, PARSLEY *piert*, or PARSLEY *break-ſtone*. See APHANES.

ARGENTINA, in *Ichthyology*, the name of a genus of fiſh, of the MALACOPTERYGIOUS kind; and in the Linnæan ſyſtem, of the order of *abdominales*: the characters of which, according to Artedi, are theſe: the body is oblong and cylindric; the teeth are placed on the tongue and palate. Artedi mentions only one ſpecies of this genus; this has large eyes, and the tail is forked. It is caught about the ſhores of Italy.

Mr. Ray deſcribes the *argentina* to be a ſmall fiſh of the herring-form kind, caught in the Mediterranean, and common in the markets of Rome.

ARGENTINA, a medicinal plant, nearly reſembling CINQUEFOIL, of ſome uſe as a cooler and aſtringent.

ARGENTUM. See SILVER.

ARGENTUM *album*, mentioned in Domeſday Book, ſignifies, according to Spelman, bullion, or ſilver uncoined. In thoſe ancient days, ſuch metal paſſed as money from one to another in payment. *Sumitur pro ipſo hoc metallo priuſquam ſignatur.*

ARGENTUM *Dei*, *God's penny*, anciently ſignified *earneſt-money*, or money given to bind a bargain; in ſome places called *erles*, or *arles*, and by the civilians and canoniſts, ARRHA. *Et capit de præditis Henrico tres denarios de* argenti *Dei pro manibus.*

ARGENTUM *Muſivum*, or *muſſivum*, is an amalgam or metalline paſte, which may be eaſily bruiſed into ſilver-like flakes of powder, and is uſed for colouring plaiſter figures, and for other purpoſes, as a pigment. It conſiſts of equal parts of tin, biſmuth, and mercury, melted together.

together. The powder is mixed with white of eggs, or spirit varnish, and then applied to the intended work, which is afterwards burnished. See GILDING and SILVERING.

ARGESTES, is used by Vitruvius for the wind which blows from that quarter of the horizon, which is 75° from the south, and westward.

Riccioius uses the term to denote the wind which blows at 22° 30′ from the west towards the north, coinciding with that which is otherwise called *West-North-West*. Aft. Reform.

ARGETENAR, in *Astronomy*, a ſtar of the fourth magnitude, in the ſcxture of the conſtellation ERIDANUS.

ARGILLA, or ARGIL, *clay*, a general name for all earths uſed in pottery, brick, and tile-making, and for the like purpoſes. See CLAY.

ARGILLACEOUS *earths*, ſuch as form with water a tenacious paſte, or ſoft ſtones; they burn hard, are corroded by ſtrong coction in the concentrateſt mineral acids, but not acted upon by moderate digeſtion. They are the baſis of earthen wares. They vitrify with falts, with arſenic, with gypſum, and difficultly with lead. See Neumann's Works, and Dr. Lewis's Additions, p. 21. *ſeq.*

ARGO, in *Antiquity*, a ſhip or veſſel celebrated among the poets; being that wherein the Argonauts, of whom Jaſon was the chief, made their expedition, in queſt of the golden fleece.

The occaſion of this expedition, is thus repreſented by Greek writers. Phryxus, flying with his ſiſter Helle from the rage of their ſtepmother Ino, the daughter of Cadmus, went on board a ſhip, whoſe enſign was a *golden ram*, and ſailed to Colchis (now Mingrelia, part of Georgia.) Helle was drowned by the way, in that ſea which from her was called the Helleſpont, now the Dardanelles. This was the ground of the poetical fable, that a *ram with a golden fleece* ſwam away with them to Colchis; and that the Argonauts undertook their famed expedition, in order to find that fleece. Sir Iſaac Newton thinks that this expedition was really an embaſſy ſent by the Greeks, during the inteſtine diviſions of Egypt, in the reign of Amenophis, to perſuade the nations upon the coaſt of the Euxine and Mediterranean ſeas, to take that opportunity of ſhaking off the yoke of Egypt, which Seſoſtris had laid upon them: and that fetching the golden fleece was only a pretence to cover their true deſign.

Jaſon, having happily accompliſhed his enterprize, conſecrated the ſhip *Argo* to Neptune; or, as others ſay, to Minerva, in the iſthmus of Corinth; where, they ſay, it did not remain long, before it was tranſlated into heaven and made a conſtellation.

The generality of authors repreſent the ſhip *Argo* as of a long make, reſembling the modern galleys; and furniſhed with thirty benches of rowers. It could not however be of any great bulk, ſince the Argonauts were able to carry it on their backs from the Danube to the Adriatic ſea.

ARGO *navis*, or the *Ship*, in *Aſtronomy*, is a conſtellation of fixed ſtars, in the ſouthern hemiſphere, whoſe ſtars, in Ptolemy's catalogue, are 45 in Tycho's, 11 in the Britannic catalogue, and Sharp's Appendix, 64; the longitudes, latitudes, magnitudes, &c. whereof are as follow:

Situation of the ſtars.	Sharp's Cha.	Sing. Decan.	Longitude.		Latitude.		Magnitude.

ARGOL, the ſame with TARTAR.

ARGOL. See ARCHIL.

ARGONAUTA, a genus of worms of the *teſtacea* order: the animal is a ſepia, and the ſhell univalve, ſpiral, membranaceous, and ſingle-celled. *There are two ſpecies.*

ARGONAUTIC, ſomething belonging to the ARGONAUTS.

The *Argonautic* expedition is one of the greateſt *epochas*, or periods of hiſtory, which Sir Iſaac Newton endeavours to fettle, and from thence to rectify the ancient CHRONOLOGY. This he threw by ſeveral authorities, to have been one generation, or about thirty years earlier than the taking of Troy; and forty-three years later than the death of SOLOMON.

Dr. Bryant rejects the hiſtory of the *Argonautic* expedition as a Grecian fable, founded indeed on a tradition derived from Egypt, and ultimately referring to Noah's preſervation, &c. in the ark. Anc. Myth. vol. ii. p. 473.

ARGONAUTICA, in *Literary Hiſtory*, denotes poems on the ſubject and expedition of the ARGONAUTS. We have the *Argonautics* of Orpheus in epic verſe, publiſhed by H. Stephens; the *Argonautics* of Valerius Flaccus, in eight books of Latin heroics, in imitation of Apollonius, with reſpect to which Burman obſerves, that the imitator has often ſurpaſſed the original; the *Argonautics* of Apollonius Rhodius, an heroic poem, conſiſting of four books, epic, as Quintilian calls it, *non contemnendum*.

ARGONAUTS, in *Antiquity*, a company of fifty-one, according to Valerius Flaccus, or, according to Apollonius Rhodius, forty-four heroes, who embarked along with Jaſon, in the ſhip *Argo*, for Colchis, with a deſign to obtain the golden fleece.

Hercules, Theſeus, Caſtor, Orpheus, &c. were of the number of the *Argonauts*.

ARGONAUTS *of St. Nicholas*, was the name of a military order, inſtituted by Charles III. king of Naples, in the year 1382, for the advancement of navigation, or, as ſome ſay, merely for preſerving amity among the nobles.

They wore a collar of ſhells, enclaſped in a ſilver creſcent, whence hung a ſhip with this device, *Non credo tempori. I do not truſt time.* Hence theſe *Argonaut* knights came to be called *Knights of the Shell*. They received the order of St. Baſil, archbiſhop of Naples; and held their aſſemblies in the church of St. Nicholas, their patron.

ARGOS,

ARGOS, *agos*, from a negative, and *ergon*, *work*, or *business*; as if it were *agelas*. So *agos agoyos ie silvos not worked*; *segnis segnis*, in Hippocrates, *is crude wheat, not prepared, but such as it is taken from the floor.*

ARGUMENT, in *Rhetoric*, is some reason, or series of reasoning, by which we eſtabliſh the proof, or ſhow the probability, of ſome given propoſition.

Logicians, ſomewhat more ſcientifically, define *argument*, a *medium*, from whoſe connexion with two extremes, the connexion of the two extremes themſelves is inferred.

Arguments are termed *grammatical*, *logical*, *phyſical*, *metaphyſical*, *moral*, *mechanical*, *theological*, &c. according to the art, ſcience, or ſubject, from whence the middle term is borrowed. Thus, if we prove that no man ſhould ſteal from his neighbour, becauſe the ſcripture forbids it, this is a *theological argument*; if we prove it from the law of the land, it is *political*; but if we prove it from the principles of reaſon and equity, the *argument* is *moral*.

Arguments are either *certain* and *evident*, or *doubtful* and merely *probable*. *Probable arguments* are thoſe whoſe concluſions are proved from ſome probable medium. *Evident* and *certain arguments*, are thoſe which prove their concluſions by clear media and undoubted principles: theſe are called *demonſtrations*.

In reaſoning, Mr. Locke obſerves, that men ordinarily uſe four ſorts of *arguments*. The firſt is to alledge the opinions of men, whoſe parts and learning, eminency, power, or ſome other cauſe, have gained a name; and ſettled their reputation in the common eſteem, with ſome kind of authority: this may be called *argumentum ad verecundiam*. Secondly, another way is to require the adverſaries to admit what is alledged, as a proof; or to aſſign a better; this he calls *argumentum ad ignorantiam*. A third way, is to preſs a man with conſequences, drawn from his own principles or conceſſions: this is known by the name of *argumentum ad hominem*. Fourthly, the uſing proofs drawn from any of the foundations of knowledge or probability: this he calls *argumentum ad judicium*; and obſerves, that it is the only one of all the four, that brings true inſtruction with it; and advances us in our way to KNOWLEDGE. For, 1. it argues not another man's opinion to be right, becauſe I, out of reſpect, or any other conſideration but that of conviction, will not contradict him. 2. It proves not another man to be in the right way, not that I ought to take the ſame with him, becauſe I know not a better. 3. Nor does it follow, that another man is in the right way, becauſe he has ſhewn me that I am in the wrong: this may diſpoſe me perhaps for the reception of truth, but helps me not to it. That muſt come from proofs and arguments, and light ariſing from the nature of things themſelves; not from my ſhamefacedneſs, ignorance, or error. See REASON and REASONING.

Beſide theſe, there are other *arguments* enumerated by different writers, as the *argumentum ab amore*, which is uſed to engage the reaſon by the affections; the *argumentum ad ignoratum*, called by the Greeks αργος λογος, which always concludes in favour of inaction; the *argumentum ab invidia*, which is made uſe of to render an adverſary's opinion odious; M. le Clerc has a diſſertation on this *argument* as applied to theology; and alſo the *argumentum a tuto*, drawn from the conſideration of its being ſafer to chooſe one ſide of the queſtion than the other, when the evidence is equal on both ſides. This has been much uſed againſt atheiſts and infidels; it was firſt ſtarted by Arnobius, and adopted by ſeveral advocates for Chriſtianity, as Paſchal, Tillotſon, Gaſſrel, &c. Lord Shaftesbury and others have endeavoured to explode it: Clarke and Leibnitz only allow it a moral force. Molheim has a diſſertation on this *argument*, viz. De Vi Argumenti quod *a tuto* dicitur in Theologia. Wolfem. 1723. 4°.

Logicians divide their *arguments*, with regard to their form, into *ſyllogiſms*, *enthymemes*, *inductions*, &c.

An *argument in form*, is a *ſyllogiſm* framed according to the ſtrict rules of *logic*.—According to Ariſtotle, the *enthymeme* is the *argument* of *rhetoric*, as the *ſyllogiſm* is that of *logic*.—*Rhetoric* is defined by ſome, the art of finding *arguments* adapted to perſuade, or gain belief.

Rhetoricians divide *arguments*, with reſpect to the places they are drawn from, into *intrinſic* or *artificial*; and *extrinſic* or *inartificial*, or *remote*.

ARGUMENTS, *artificial*, or *intrinſic*, by the Greeks called ατεχνοι, by Cicero *inſita*, are the proper invention of him who ſpeaks: or they are thoſe which are taken from the ſubject treated of; of which there are ſeveral kinds; viz. genus and ſpecies, form, cauſe, and effect, &c. See each in its place, GENUS, &c.

To theſe ſome add two other places of *argument*, viz. the manners, and the paſſions.

ARGUMENTS, *inartificial*, or *extrinſic*, ατεχνοι, by Cicero called *aſſumpta*, are thoſe which are borrowed abroad, and are only applied by the orator to the point in hand; ſuch are laws, common reports, books, oaths, torture, and witneſſes.

The places, or general heads of *arguments*, with regard to their end, may be divided into, 1. Thoſe intended to perſuade or diſſuade, which are chiefly drawn from the conſiderations of profit, honour, and equity. 2. Thoſe intended to praiſe, or diſpraiſe; and, 3. Thoſe intended to accuſe and defend.

ARGUMENT, *dialectical*. See DIALECTICAL.

ARGUMENT is alſo uſed for a ſyllabus, or abridgment of the ſubject of a book, hiſtory, comedy, or the like.

We have almoſt loſt the original uſe of prologues, which was to give the *argument* of the play.

ARGUMENT, in *Aſtronomy*, is an arch whereby we ſeek another unknown arch proportional to the firſt.

Hence,

ARGUMENT *of inclination* is an arch of a planet's orbit intercepted between the aſcending node, and the place of the planet from the ſun, numbered according to the ſucceſſion of the ſigns. See INCLINATION.

ARGUMENT, *monſtrual*, or *latitude*, is the diſtance of the moon's true place from the ſun's true PLACE.

By this we find the quantity of the real obſcuration in eclipſes, or how many digits are darkened in any place. See ECLIPSE.

ARGUMENT *of the moon's monſtrual latitude*, or *Monſtrual* ARGUMENT *of the longitude*, is an arch of her eccentric, I P (*Tab. Aſtron. fig.* 32.) intercepted between her true place once equated I, and a right line P O, drawn through the centre of the eccentric B, parallel to the monſtrual line of the apſides.

The *annual argument* of longitude is repreſented by the angle D A H.

ARGUMENTATION, the act of inventing or framing *arguments*, of making inductions, and drawing concluſions. See INDUCTION, &c.

Argumentation, according to Cicero, is the delivering or unfolding of an argument.—The matter of *argumentation* is propoſitions: the form, their due diſpoſition, with regard to one another, ſo that a concluſion may be drawn from them. See ENTHYMEME, PROPOSITION, RATIOCINATION, SORITES, SYLLOGISM, &c.

ARGUS, a kind of animal full of eyes, called in Iceland *ſcolicorn*; of which Wormius has given a deſcription, and Jacobus has given an account. It is of the teſtaceous kind, of an oblong form, reſembling a crab's tail, and about two fingers breadth in length.

ARGUS, a ſpecies of pheaſant in the Chineſe Tartary.

ARGUS-*ſhell*, in *Conchyliology*, a ſpecies of porcellan-ſhell, beautifully variegated with ſpots, reſembling in ſome meaſure thoſe in a peacock's tail.

ARGUTTÆ, witty and acute ſayings, which commonly ſignify ſomething farther than what their mere words at firſt ſight ſeem to import.

Writers on rhetoric ſpeak of divers ſpecies of *argutiæ*, viz.

ARGUTIÆ *ab alieno*, when ſomething is ſaid, which ſeems repugnant either to the nature and property of a thing, or to common cuſtom, the laws, &c. which yet in reality is conſiſtent therewith; or when ſomething is given as a reaſon of another, which yet is not the reaſon of it. For inſtance, *ſi Cæſus nihil dixiſſet, arriſſet minus: ergain, earum hoc ſecundum eſt, quæ plurimus ſum uare bonas venit.*

ARGUTIÆ *ab alluſione*, thoſe wherein alluſion is made to ſome hiſtory, fable, ſentence, proverb, or the like; e. gr. *multi umbram timent & earum amittunt.*

ARGUTIÆ *a comparatis*, when two things are compared together, which yet at firſt ſight appear very different from each other, but ſo as to make a pretty kind of *ſimile*, or *diſſimile*; e. gr. *par eſt pauper ni ſapiens principi omnia habenti.*

ARGUTIÆ *a repugnantibus*, when two things meet in a ſubject, which yet regularly cannot be therein; or when two things are oppoſed to each other, yet the epithet of the one is attributed to the other; e. gr. *dum taceat clamant.*

ARGYRASPIDES, or ARGYRAOSPIDES, in *Antiquity*, perſons armed with ſilver bucklers, or BUCKLERS ſilvered.

The *argyraſpides*, according to Quintius Curtius, made the ſecond corps of Alexander's army; the firſt was the *phalanx*.

According to Juſtin's account, lib. xii. cap. 7. Alexander having penetrated into India, and extended his empire as far as the ocean; for a monument of his glory, ordered

dered the armour of his soldiers, and the housings of his horses, to be adorned with silver.—And hence commanded them to be called *argyraspides*, from the Greek *αργυρος*, *silver*, and *ασπις*, *buckler*.

By this author it should seem, that Alexander's whole army were called *argyraspides*.—After that prince's death, the *argyraspides* despised all other chiefs of the army, disdaining to obey any other, having borne arms under Alexander.

ARGYRITÆ *agonis*, in *Antiquity*, games in which money was the prize. Potter.

ARGYRITIS, in *Natural History*, a name given by the ancients to a substance resembling silver.

In this sense, *argyritis* was used to signify such litharge as was of a white colour, by way of distinguishing it from that which was yellow, which they dignified with the name *chrysitis*, as we do at present with that of litharge of gold.

The *argyritis* of late writers, seems to have been the same with the *lapis magnetis* of the ancients, mentioned by Theophrastus, and distinguished from the MAGNET.

ARGYRODAMAS, in *Natural History*, a sort of silver-coloured TALC, which bears the fire, and neither burns, melts, nor changes its hue. Plott's Hist. Staff.

Hence its denomination among the ancients of *argyrodamas, quasi argentum indomitum*.

ARGYROGONIA is used by some alchemists for a kind of argentine, or silver making seed, of a white colour, pretended to be procurable from a solution of that metal perfectly concocted.

Argyrogonia stands contradistinguished from *chrysogonia*.

ARGYROLIBANOS, in the *Materia Medica* of the *Ancient Greeks*, a word used to express the white kind of *olibanum*.

ARGYROPOEIA, in *Alchemy*, the art of making silver, out of other more imperfect metals.

The word is formed of *αργυρος*, *silver*, and *ποιεω*, *I make*.

ARIADNIA, in *Antiquity*, solemn festivals held at Naxos, in honour of *Ariadne*.

The *Ariadnia* are said to have been instituted by Theseus, in atonement for his cruelty in exposing *Ariadne*, big with child, on that coast. They were of a mournful cast: one part of the ceremony was for a young woman to lie down, and counterfeit all the agonies of a woman in labour. Plut. in Thes. and Potter's Arch.

ARIANS, followers of *Arius*, a presbyter of the church of Alexandria about the year 315; who owned Christ to be God, yet maintained him inferior to the Father even as to his deity, and his essence to be different from that of the Father, and that he was neither co-eternal nor co-equal with him: also that the Holy Ghost was not God.

The *Arians* owned that the Son was the word, but denied that word to have been eternal; asserting, that it had only been created before all other beings.—They held, that Christ had nothing of man in him, but the flesh, with which the *λογος* or *word* was joined, which supplied the rest.

The *Arians* were first condemned and anathematized by a council at Alexandria in 320, under Alexander, bishop of that city; who accused *Arius* of impiety, and caused him to be expelled from the communion of the church: and afterwards by 380 fathers in the general council of Nice, assembled by Constantine in the year 325. But, notwithstanding that, *Arianism* was not extinguished: on the contrary, it became the reigning religion, especially in the East, where it obtained much more than in the West. *Arius* was recalled from banishment by the emperor Constantine, in two or three years after the council of Nice; and the laws that had been enacted against him were repealed. In the year 335, Athanasius, his zealous opponent, was deposed and banished into Gaul; and *Arius* and his followers were reinstated in their privileges, and received into the communion of the church: in little more than a year after this, he fell a victim to the resentment of his enemies, and died a tragical death, occasioned probably by poison, or some other violence. The *Arian* party found a protector in Constantius, who succeeded his father in the empire of the East; and the zeal with which he abetted them, produced many animosities and tumults to the time of his death, in the year 362. They underwent various revolutions, persecuting and oppressed, under succeeding emperors, according to the degree of interest they had in the civil power; till, at length, Theodosius the Great exerted every possible effort to suppress and disperse them.

The *Arians* were divided into various sects, of which ancient writers give an account under the names of *Semi-Arians*, *Eusebians*, *Aetians*, *Eunomians*, *Anomians*, *Pneumatomachians*, and others. But they have been commonly distributed into three classes, viz. the genuine *Arians*, *Semi-Arians*, and *Eunomians*.

Arianism was carried in the fifth century into Africa under the Vandals; and into Asia under the Goths. Italy, the Gauls, and Spain, were also deeply infected with it: and towards the commencement of the sixth century, it was triumphant in many parts of Asia, Africa, and Europe. But it sunk almost all at once, when the Vandals were driven out of Africa, and the Goths out of Italy, by the arms of Justinian. However, it revived again in Italy under the protection of the Lombards, in the seventh century. Erasmus seems to have aimed, in some measure, to restore *Arianism*, at the beginning of the fifteenth century, in his commentaries on the New Testament: accordingly, he was reproached by his adversaries, with *Arian* interpretations and glosses, *Arian* tenets, &c. To which he made little answer, save that there was no hereſy more thoroughly extinct than that of the *Arians*: *Nullo hæresis magis extincta quam Arianorum*. But the face of things was soon changed: Servetus, a Spaniard by nation, published, in 1531, a little treatise against the Trinity: which once more set the hereſy of the *Arians* on foot in the West.—Indeed he rather shewed himself a *Photinian*, than an *Arian*; only that he made use of the same passages of scripture, and the same arguments against the divinity of our Saviour, with the proper *Arians*.

It is true, Servetus had not, properly speaking, any disciples; but he gave occasion, after his death, to the forming of a new system of *Arianism* in Geneva, much more subtil and artful than his own; and which did not a little perplex Calvin.—From Geneva, the new *Arians* removed to Poland, where they gained considerable ground; but at length became SOCINIANS.

The appellation *Arian* has been indiscriminately applied, in more modern times, to all those who consider Jesus Christ as inferior and subordinate to the Father; and whose sentiments cannot be supposed to coincide exactly with those of the ancient *Arians*. Mr. Whiston was one of the first divines, who revived this controversy in the beginning of the eighteenth century. He was followed by Dr. Clarke, who published his famous book, entitled "The Scripture Doctrine of the Trinity," &c. in consequence of which, he was reproached with the title of *Semi-Arian*. He was also threatened by the convocation, and combated by argument. Dr. Waterland, who has been charged with verging towards *Tritheism*, was one of his principal adversaries. The history of this controversy, during the present century, may be found in a pamphlet, intitled, "An Account of all the considerable Books and Pamphlets that have been wrote "on either Side, in the Controversy concerning the "Trinity, from the Year 1712; in which is also contained, an Account of the Pamphlets written this last "Year, on each Side, by the Disputants to the end of "the year 1719." Published at London, 1720.

ARIANISM, the doctrine of *Arius*, who lived in the beginning of the fourth century. See UNITARIAN.

ARIDED, in *Astronomy*, a fixed star of the second magnitude, in the extremity of the Swan's tail.

This is also called HERRETIM, ADIEGE, and ARIDEF.

ARIDELOSIS, *αριδηλωσις*, in *Rhetoric*, is sometimes used for the figure commonly called SYNONYMIA.

ARIDULLAM, in *Natural History*, the name of a fossile substance, used in the East Indies in intermittent fevers. It is of a greenish yellow colour, and coarse texture, and, when burnt, emits fumes smelling like arsenic. It is properly of the ZARNIC kind, though somewhat different from all the European kinds.

ARIDURA, in *Physic*, a dryness, or want of juice and moisture of the parts.

ARIDURA is also used by some for an *ariality*, or consumption.

ARIDURA is more particularly used to denote a hectic fever.

ARIDURA, is more frequently used, by *Modern Writers*, to denote a particular atrophy, or wasting of some single member of the body.

In which sense, it amounts to the same with what we otherwise call WITHERING.

ARIES, or the *Ram*, in *Astronomy*, the first of the twelve signs of the zodiac; from which also a twelfth part of the ecliptic takes its denomination.

The stars in the constellation *Aries*, in Ptolemy's catalogue, are 18; in Tycho's, 21; in Hevelius's, 27; in the Britannic catalogue, 66: the longitudes, latitudes, magnitudes, &c. whereof, are as follow:

Names and situations of the stars.	Sign.	Bayer's Cha.	Longitud. ° ′ ″	Latitude. North. ° ′ ″		Magnitude.
	♈		26 58 25	11 04 58 N		3.6
			26 48 15	9 01 26		3.6

ARIES alſo denotes a *battering ram*; or a military engine with an iron head, much in uſe among the ancients, to batter and beat down the walls of places beſieged.

Of this there were three kinds; the firſt rude and plain, the other artificial and compound.

The firſt ſeems to have been no more than a great beam, which the ſoldiers bore in their arms, and with one end of it, by main force, aſſailed the walls. This required a great force to work it; yet produced but a ſmall effect.

The ſecond or compound ram is deſcribed by Joſephus (De Excid. Hieroſol. 3.) thus: "The ram is a vaſt long "beam, like the maſt of a ſhip, ſtrengthened at one end "with a head of iron, ſomething reſembling that of a "ram, whence it took its name. This is hung by the "middle, with ropes, to another beam, which lies acroſs "a couple of poſts; and hanging thus equally balanced, "is, by a great number of men, violently thruſt for-"ward, and recoiled backward, and ſo ſhakes the wall "with its iron head, nor is there any tower or wall ſo "thick or ſtrong, as to reſiſt the repeated aſſaults of "this forcible machine."

The third only differed from the former, in that it was covered with a *vinea*, or ſcreen, to guard the ſoldiers, whence it is alſo called *teſtudo arietaria*.

M. Felibien deſcribes a fourth ſort of *battering ram*, which ran on wheels; and was the moſt perfect and effectual of them all. Vitruvius affirms, that the *battering ram* was firſt invented by the Carthaginians, while they laid ſiege to Cadiz: theirs was the ſimple kind firſt mentioned: Pephaſmenes, a Tyrian, afterwards contrived to ſuſpend it with ropes; and finally, Polydus, the Theſſalian, to mount it on wheels, at the ſiege of Byzantium, under Philip of Macedon. Yet Pliny aſſures us that the *ram* was invented at the ſiege of Troy; and that it was this that gave occaſion to the fable of a wooden horſe.

The *engine* oppoſed to the ram was called *lupus*, *the wolf*. —Plutarch tells us, that Mark Antony, in the Parthian war, uſed a *ram* of 80 feet long; and Vitruvius aſſures us, they were ſometimes made 106, and ſometimes 120 feet long; to this great length, perhaps, the force of the engine was in great meaſure owing.

The *ram* was managed at once by a whole century of ſoldiers; ſo that it played continually, and without intermiſſion; being uſually covered with a *vinea*, to protect it from the attempts of the enemy.

ARIETATION. See EARTHQUAKE.

ARIETUM *ſeruato*, an ancient kind of ſportive exerciſe, probably the ſame with what of later times is called *running at the quintain*.

ARILLUS, in *Botany*, the exterior coat or tunic of the ſeed, which comes off of itſelf.

ARIMANIUS, one of the chief deities of Perſia. This deity, according to the philoſophy of Zoroaſter revived by the Manichæans, is the principle of evil, which at laſt will be totally vanquiſhed by Oroſmades, the author of good.

ARINGA, in *Ichthyology*, a name given by Paulus Jovius and others to the HERRING.

ARIOLI, in *Antiquity*, a kind of prophets, or religious conjurors, who by abominable prayers, and horrid ſacrifices at the altars of idols, procured anſwers to their queſtions concerning future events. Iſid. Orig. l. viii. c. 9.

Theſe are alſo called *hariovi*, and their operation, *hariolation*.

Sometimes they were denominated *aruſpices*, or *haruſpices*. The *arioli* were diſtinguiſhed by a ſlovenly dreſs, diſorderly and matted beards, hair &c.

ARISARUM, or ARUM, in *Botany*. See WAKE *robin*.

ARISE. *Licence to* ARISE. See LICENCE.

ARISH, a Perſian long meaſure, containing 3197 Engliſh feet. Arbuth. Tab. 32.

The Perſian *ariſh*, according to Mr. Greaves, is a long meaſure equal to 38 $\frac{1}{12}$ Engliſh inches.

ARISI, *rice*, an Indian word, which does not properly ſignify the plant which produces the rice, but the ſeed itſelf, when cleanſed from its huſk, and rendered fit for uſe. The Indians call it *oriſa* in this ſtate; but in the huſk, and upon the plant, they call it *nellen*.

ARISTA, in *Ichthyology*, ſee ATHERINA.—In *Aſtronomy*, the ſame as SPICA VIRGINIS.

ARISTA, in *Botany*, a long needle-like beard, that grows out from the huſk of corn, or graſs; called alſo the *awn*.

ARISTARCHUS, in its original Greek, ſignifies *beſt prince*; but in its ordinary uſe among the learned, denotes a very ſevere *critic*; there having been a learned grammarian of that name, who criticized on the verſes of the very beſt poets, as Homer, &c.

Hence we derive the title of ſeveral books; as *Ariſtarchus ſacer*, the name of Heinſius's notes on the New Teſtament; *Ariſtarchus Anti-Bentleianus*, &c.

ARISTIDA, in *Botany*, a genus of the *triandria digynia* claſs; the calyx of which is a bivalve fubulated glume, of the length of the corolla; the corolla is a glume of one valve, opening longitudinally, hairy at the baſe, and terminated by three ſub-equal patulous *ariſtæ*; the fruit is a convivent glume, containing a naked filiform ſingle ſeed, of the length of the corolla. There are three ſpecies.

ARISTOCRACY, in *Politics*, a form of government, where the ſupreme power is lodged in the hands of the optimates,

optimates, i. e. of a council, or senate, composed of the principal persons of a state, either in respect of nobility, capacity, or probity.

The word is derived from ἀριστος, *optimus*, and ἀρχω, *impero, I govern*.

The ancient writers of politics prefer the *aristocratical* form of government to all others.—The republic of Venice is an *aristocracy*.

Aristocracy seems to coincide with *oligarchy*; which, however, is more ordinarily used to signify a corruption of an *aristocratical* state, where the administration is in the hands of too few; or where some one or two usurp the whole power.

ARISTOLOCHIA, popularly called BIRTHWORT; a medicinal plant, used as an ingredient in Venice treacle, and many other compositions.

Cicero derives its name from its inventor *Aristolochus*: others from its virtues.—These last suppose it formed from ἀριστος, *optimus*, and λοχια, *lochia*, or *purgations*, because it is found of excellent use in bringing down the lochia, or discharges of women newly delivered.

Some alexipharmic qualities are also ascribed to them; on which account they have a place in the composition of the *theriaca*, and some other medicines of the same tribe. Externally applied, they are reckoned detergent and suppurative, and, for that reason, make a part of the styptic plasters of Crollius and Paracelsus. Taken internally, they are great resolvers of viscidities, and therefore much recommended against the gout, asthma, &c. They allay the excessive pains after child-birth, and are very serviceable for the necessary purgations on that occasion. Some of the species are used in America, particularly one in Virginia, whose roots are used against the bites of venomous beasts, in malignant fevers, and the small pox. Its alexipharmic virtue has occasioned it to be called *Viperinum Virginiæ*, and *Serpentaria Virginiana*, otherwise SNAKE-root.

ARISTOPHANEUM, in the *Ancient Physic*, a name given to a kind of emollient plaster, prepared of pitch, wax, opopanax, scopoxmax, and vinegar.

ARISTOTELIA, in *Antiquity*, annual feasts, celebrated by the citizens of Stagira, in honour of *Aristotle*, who was born there; and in gratitude for his having procured from Alexander the rebuilding, and re-peopling of that city, which had been demolished by king Philip. Ammon. in Vit. *Aristot*. Stanley's Hist. of Philos. P. vi. c. 8.

ARISTOTELIAN, something that relates to the philosopher *Aristotle*.—Thus we say, an *Aristotelian* dogma, the *Aristotelian* school, &c.

The philosopher from whom the denomination arises, was the son of Nicomachus, physician of Amyntas, king of Macedonia, born in the year of the world 3566, before Christ 348, at Stagira, a town of Macedonia, or, as others say, of Thrace; whence he is also called the *Stagirite*.

At seventeen years of age he entered himself a disciple of Plato, and attended in the Academy till the death of that philosopher. Repairing afterwards to the court of king Philip, at his return he found that Xenocrates, during his absence, had put himself at the head of the Academic sect; upon which he chose the Lyceum for the future scene of his disputation.

It being his practice to philosophize walking, he got the appellation *Peripatetics*; whence his followers were also called *Peripatetics*.

In the schools, *Aristotle* is called the *Philosopher*; and the *Prince of Philosophers*. Such was the veneration paid to him, that his opinion was allowed to stand on a level with reason itself; nor was there any appeal from it admitted, the parties, in every dispute being obliged to shew, that their conclusions were no less conformable to *Aristotle*'s doctrine than to truth.

Laertius, in his life of *Aristotle*, enumerates his books, to the number of 4000; of which, scarce above 20 have survived to our age: they may be reduced to five heads; the first, relating to poetry and rhetoric; the second, to physics; the third, to ethics and politics; the fourth, to physics; and the fifth, to metaphysics. In all which, as there are many things excellent, particularly what relate to poetry, rhetoric, and the passions; so there are others which the improvements of later ages have taught us to explode and despise.

ARISTOTELIAN *philosophy*, the philosophy taught by *Aristotle*, and maintained by his followers.

The *Aristotelian* is otherwise called the *Peripatetic philosophy*; the rise and fate whereof, see under PERIPATETICS.

ARISTOTELIANS, a sect of philosophers, otherwise called *Peripatetics*.

The *Aristotelians* and their *dogmata* prevailed for a long while, in the schools and universities; even in spite of all the efforts of the Cartesians, Newtonians, and other corpuscularians. But the systems of the latter have at length gained the pre-eminence; and the Newtonian philosophy in particular is now very generally received.

The principles of *Aristotle*'s philosophy, the learned agree, are chiefly laid down in the four books *de Cœlo*: the eight books of *Physical Auscultation*, φυσικης ακροασεως, belonging rather to logics, or metaphysics, than to physics. Instead of the more ancient systems, he introduced *matter*, *form*, and *privation*, as the principles of all things; but he does not seem to have derived much benefit from them in natural philosophy. His doctrines are, for the most part, so obscurely expressed, that it has not yet been satisfactorily ascertained what were his sentiments on some of the most important subjects. He attempted to refute the Pythagorean doctrine concerning the two-fold motion of the earth; and pretended to demonstrate, that the matter of the heavens is ungenerated, incorruptible, and subject to no alteration: and he supposed that the stars were carried round the earth in loud orbs.

The reader will find a distinct and candid account of the logical part of his philosophy, by Dr. Reid, Professor of Moral Philosophy in the University of Glasgow, in the second volume of Lord Kaimes's Sketches of the History of Man. Edinb 4to. 1774. p. 165.

J. Harris, esq. has published a sensible commentary on his Categories, under the title of *Philosophical* ARRANGEMENTS.

See a more particular account of the principles of the *Aristotelian* philosophy, under the articles ACCIDENT, ANTIPERISTASIS, ELEMENT, FUGA VACUI, FORM, PRINCIPLES, QUALITY, SYMPATHY, &c.

ARISTOTELICA *testa*. See ROTA.

ARISTOTUS, in *Ichthyology* a name given by Albertus and others, to the fish which we call the SHAD, or the mother of herrings. See THRISSA and CLUPEA.

ARITHMANCY. See ARITHMOMANCY.

ARITHMETIC, ARITHMETICA, *the art of numbering*; or, that part of mathematics, which considers the powers and properties of numbers, and teaches how to compute or calculate truly, and with expedition and ease.

Some authors choose to define *arithmetic*, the science of discrete quantity.

Arithmetic consists chiefly in the four great rules or operations of ADDITION, SUBTRACTION, MULTIPLICATION, and DIVISION.

It is true, for the facilitating and expediting of computations, mercantile, astronomical, &c. divers other useful rules have been contrived; as, the rules of proportion, of alligation, of false position, extraction of square and cube roots, progression, fellowship, interest, barter, rebate, reduction, tare and tret, &c.—But these are only applications of the first four rules. See these rules under their several heads, ADDITION, &c.

We have very little intelligence about the origin and invention of *arithmetic*: history neither fixes the author, nor the time.—In all probability, however, it must have taken its rise from the introduction of commerce; and consequently it should be of Tyrian invention.

From Asia it passed into Egypt (Josephus says, by means of Abraham). Here it was greatly cultivated and improved; insomuch that a large part of the Egyptian philosophy and theology seems to have turned altogether upon numbers. Hence those wonders related by them about unity, trinity; the numbers seven, ten, four, &c. In effect, Kircher, in his Oedip. Ægypt. tom. 2. p. ii. shews, that the Egyptians explained every thing by numbers; Pythagoras himself affirming, that the nature of numbers goes through the whole universe; and that the knowledge of numbers is the knowledge of the Deity.

From Egypt *arithmetic* was transmitted to the Greeks, who handed it forward, with great improvements, which it had received by the computation of their astronomers, to the Romans; from whom it came to us.

The ancient *arithmetic*, however, fell far short of that of the moderns: most of what they did, was to consider the various divisions of numbers; as appears from the treatises of Nicomachus, written in the third century of Rome, and that of Boethius, still extant. A compendium of the ancient *arithmetic*, written in Greek, by Psellus, in the ninth century from our Saviour, was given us in Latin by Xylander, in 1556.—A more ample work of the same kind was written by Jordanus, in the year 1200, published with a comment by Faber Stapulensis in 1480. A treatise of *arithmetic* was also written by Johannes de Sacro Bosco, who died about the year 1256.

Arithmetic, under its present state, is variously divided into different kinds; *theoretical*, *practical*, *instrumental*, *logarithmical*, *numerous*, *specious*, *decimal*, *sexagesimal*, *duodecimal*, *sexagesimal*, &c.

ARITHMETIC, *theoretical*, is the science of the properties, relations, &c. of numbers, considered abstractedly; with

with the reasons and demonſtrations of the ſeveral rules. Euclid furniſhes a *theoretical* ARITHMETIC, in the ſeventh, eighth, and ninth books of his Elements.—Barlaamus Monachus has alſo given a theory for demonſtrating the common operations, both in integers and broken numbers, in his Logiſtica, publiſhed in Latin by J. Chambers, an Engliſhman, in 1600.—To which may be added, Lucas de Borgo, who in an Italian treatiſe publiſhed in 1523, gives the ſeveral diviſions of numbers from Nicomachus, and their properties from Euclid; with the algorithm, both in integers, fractions, extractions of roots, &c.

ARITHMETIC, *practical*, is the art of numbering or computing; that is, from certain numbers given, of finding certain others, whoſe relation to the former is known.

As, if a number be required equal to two given numbers 6 and 8.

The firſt entire body of *practical arithmetic*, was given by Nic. Tartaglia, a Venetian, in 1556, conſiſting of two books; the former the application of *arithmetic* to civil uſes; the latter, the grounds of algebra. Something had been done before by Stifelius, in 1544, where we have ſeveral particulars concerning the application of irrationals, coſſics, &c. no were elſe to be met with.

We omit other mere practical authors, which have come ſince, the number whereof is almoſt infinite; as Gemma Friſius, Metius, Clavius, Ramus, Buckley, Digges, Record, Wingate, Corker, Leyburn, Malcolm, &c. &c.

The *theory* of *arithmetic* is joined with the *practice*, and even improved in ſeveral parts, by Maurolycus, in his *Opuſculo Mathematica*, 1575; by Heneſchius, in his *Arithmetica Perfecta*, 1609, where the demonſtrations are all reduced into the form of ſyllogiſms; and by Tacquet, in his *Theoria & Praxis Arithmeticæ*, 1704.

ARITHMETIC, *harmonical*, is ſo much of the doctrine of numbers, as relates to the making the compariſons, reductions, &c. of muſical intervals.

ARITHMETIC, *inſtrumental*, is that where the common rules are performed by means of inſtruments contrived for eaſe and diſpatch; ſuch are ſeveral ſorts of ſcales, and ſliding-rules; ſuch, more particularly, are Napier's bones, deſcribed under their proper article: ſir Sam. Morcland's inſtrument, the deſcription whereof was publiſhed by himſelf, in 1666; that of M. Leibnitz, deſcribed in the Miſcellan. Berolin. and that of Polenus, publiſhed in the Venetian Miſcellany, 1709.

The Chineſe have little regard to any rules in their calculations; inſtead of which they uſe an inſtrument already deſcribed. See ABACUS and SWAN PAN.

To theſe may be added,

ARITHMETIC, *logarithmetical*, performed by tables of logarithms.

The beſt piece on this ſubject, is Hen. Brigg's Arithmetica Logarithmica, 1624.

To this head may alſo be added, the Univerſal Arithmetical Tables of Proſthaphæreſes, publiſhed in 1610, by Herwart ab Hohenburg; whereby multiplication is eaſily and accurately performed by addition, and diviſion by ſubtraction.

ARITHMETIC, *logiſtical*. See LOGISTICAL.

ARITHMETIC, *numerous*, is that which gives the calculus of numbers, or indeterminate quantities; and is performed by the common numeral, or Arabic characters.

ARITHMETIC, *ſpecious*, is that which gives the calculus of quantities; uſing letters of the alphabet inſtead of figures, to denote the quantities.

Specious arithmetic coincides with what we uſually call *algebra*, or *literal arithmetic*.

Dr. Wallis has joined the numeral with the literal calculus; and by means hereof, demonſtrated the rules of fractions, proportions, extractions of roots, &c. a compendium of which is given by Dr. Wells, under the title of Elementa Arithmeticæ, an. 1698.

ARITHMETIC, *decimal*, or *decadal*, is that performed by a ſeries of ten characters, ſo that the progreſſion is from 10 to 10.

Such is the common *arithmetic* among us, which makes uſe of the ten Arabic figures, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9; after which we begin 10, 11, 12, &c.

This method of computation is not very ancient, being utterly unknown to the Greeks and Romans.—It was introduced into Europe by Gerbert, who was afterwards pope, under the name of Sylveſter II. who borrowed it from the Moors of Spain.—No doubt it took its origin from the ten fingers of the hands, which were made uſe of in computations before *arithmetic* was brought into an art.

The eaſtern miſſionaries aſſure us, that to this day the Indians are very expert at computing on their fingers, without any uſe of pen and ink. Let. Edif. & Cur.—Add, that the natives of Peru, who do all by the different arrangement of grains of maize, outdo any European, both for ſureneſs and diſpatch, with all his rules.

ARITHMETIC, *decimal*, is alſo uſed for the doctrine of decimal fractions.

ARITHMETIC, *binary*, or *dyadic*, is that wherein only two figures, unity, or 1, and 0, are uſed. See BINARY *Arithmetic*.

M. Dangicourt, in the Miſcell. Berol. gives us a ſpecimen of the uſe hereof in arithmetical progreſſions; where he ſhews, that the laws of progreſſion may be more eaſily diſcovered hereby, than in any other method where more characters are uſed.

ARITHMETIC, *tetractic*, is that wherein only the figures 1, 2, 3, and 0, are uſed.

We have a treatiſe of this *arithmetic*, by Erhard Weigel; but both *binary*, and this, are little better than curioſities, eſpecially with regard to practice; inaſmuch as the numbers may be much more compendiouſly expreſſed by *decadal arithmetic* than by either of them.

ARITHMETIC, *vulgar*, is that converſant about integers and vulgar fractions.

ARITHMETIC, *ſexageſimal*, or *ſexagenary*, is that which proceeds by ſixties; or the doctrine of ſexageſimal fractions; ſuppoſed to have been invented by Ptolemy, in the ſecond century. In this notation the integral numbers from 1 to 59 were expreſſed in the common way; then *ſixty* was called a *ſexagena prima*, and marked I'; twice *ſixty*, or 120, II'; and ſo on to 59 times 60, or 3540, which is LIX'. *Sixty* times *ſixty*, or 3600, was called *ſexagena ſecunda*, and marked with two dashes, I''; twice 3600, II''; and ten times 3600, X'', &c. And in this way the notation was continued. But if a number leſs than *ſixty* was joined with any of the *ſexageſimal* integers, their proper expreſſion was annexed without the dash; e. gr. four times 60 and 25 is IV' XXV; the ſum of twice 60, ten times 3600, and 15, is X'' II' XV. &c. So near did the inventor of this method approach to the Arabic notation: inſtead of *ſexageſimal* progreſſion, he had only to ſubſtitute *decimal*; to make the ſigns of numbers from 1 to 9 ſimple characters, and to introduce a character which ſignifies nothing by itſelf, ſerving only to fill up places. The *ſexagena integrorum* were ſoon laid aſide, after the introduction of the Arabic notation; but the *ſexageſimal* fractions continued till the invention of *decimals*. See SEXAGESIMAL.

Sam. Reyher has invented a kind of ſexagenal *rods*, in imitation of Napier's bones, by means whereof the *ſexagenary arithmetic* is eaſily performed.

ARITHMETIC, *political*, is the application of *arithmetic* to political ſubjects; as, the ſtrength and revenues of princes, number of inhabitants, births, burials, &c. See POLITICAL *Arithmetic*.—To this head may be referred the doctrine of CHANCES, GAMING, &c.

ARITHMETIC *of infinites*, is the method of ſumming up a ſeries of numbers conſiſting of infinite terms; or of finding the ratios thereof.

This method was firſt invented by Dr. Wallis; as appears from his Opera Mathematica, where he ſhews its uſe in geometry, in finding the areas of ſuperficies, and the contents of ſolids, and their proportions.—But the method of FLUXIONS, which is an univerſal *arithmetic* of infinites, performs all this much more eaſily; and multitudes of other things, which the former will not reach.

ARITHMETIC *of rationals* and *irrationals*. See RATIONAL, &c.

ARITHMETICAL *complement* of a logarithm, is what the logarithm wants of 10.0000000.

Thus the *arithmetical complement* of 7.1079054, is 2.8920946, where each figure but the laſt is ſubtracted from 9, and that from 10.

It is ſometimes alſo uſed in trigonometrical calculations, when radius or 10.0000000 is the firſt term, to ſave the labour of ſubtraction. It is diſtinguiſhed by placing a point before, and another after the index; thus, .2.8920946.

ARITHMETICAL *medium* or *mean*. See MEDIUM.

ARITHMETICAL *progreſſion*. See PROGRESSION.

ARITHMETICAL *proportion*. See PROPORTION.

ARITHMETICAL *ratio*. See RATIO.

ARITHMOMANCY, a kind of divination, or method of foretelling future events, by means of numbers.

The word is compounded of ἀριθμὸς, *number*, and μαντεία, *divination*.

The GEMATRIA, which makes the firſt ſpecies of the Jewiſh CABBALA, is a ſort of *arithmomancy*.

ARK, or ARC, *arcus*, in *Geometry*, *Aſtronomy*, &c. See ARCH.

ARK, ARCA, in the ſcripture-language, denotes a kind of floating veſſel built by Noah, for the preſervation of the ſeveral ſpecies of animals from the deluge.

The *ark* has afforded several points of curious enquiry among the critics and naturalists, relating to its form, capacity, materials, time of building, place of resting, after the flood, &c.

Noah is computed to have been an hundred years in building the *ark*, viz. from the year of the world 1555, to the flood, which happened in the year 1656; at least this is the common opinion of the learned. Origen, lib. iv. Contra Cels. St. Austin, de Civit. Dei, lib. xv. c. 27. and contra Faustum, lib. xii. c. 18. and in his Quest. 5. and 23. on Gen. Rupert, lib. iv. in Gen. xx. affert as much; and are followed by Salian, Torniel, Spondeus, Pelletier, &c.

Yet Berosus affirms, that Noah only begun to build the *ark* seventy-eight years before the flood: Solomon Jarchi, on the other hand, will have it to have been an hundred and twenty years in building, Tanchuma fifty-two, and the Mahometans only two years. See the texts, Gen. vi. &c. F. Fournier, in his Hydrography, gives into the opinion of the fathers; noting, that the hands employed in it were only Noah and his three sons. To this purpose he alledges the instance of Archias of Corinth, who, with the help of three hundred workmen, built Hiero's great ship in one year. Add, that Noah's eldest son was not born till about the time when the *ark* was begun, and the younger after; so that it was a long time before they could do their father any service.—However, for so large a building, a prodigious number of trees must have been required, which would employ a great number of workmen to fell and hew, were it possible for three men to have laid them.

The wood whereof the *ark* was built, is called in scripture עֲצֵי גֹפֶר *atsè gopher, gopher wood*; and in the LXX. ξυλα τετραγωνα. *square timbers*. Onkelos and Jonathan render *gopher* by קדְרוס *kedros, cedar*; St. Jerom, in the Vulgate, by *lignis lævigatis, planed wood*; and elsewhere, *lignis dolomatis*, viz. *it, pitched wood*. Kimchi translates it, *wood and propre to float*; Vatable, *light wood*, which swims in the water without corrupting; Junius Tremellius, and Buxtorf, a kind of cedar, by the Greeks called κεδρελαιον; Avenarius and Munster, *pine*; Fuller and Bochart, *cypress*; others *fir*; Castalio, *turpentine*, &c.—Pelletier prefers the opinion of those who hold the *ark* made of cedar: his reasons are, the incorruptibility of that wood; the great plenty thereof in Asia, whence Herodotus and Theophrastus relate, that the kings of Egypt and Syria built whole fleets of it in lieu of deal; and the common tradition throughout the East imports, that the *ark* is preserved entire to this day on mount Ararat.

The dimensions of the *ark*, as delivered by Moses, are three hundred cubits in length, fifty in breadth, and thirty in height; which, compared with the great number of things it was to contain, seem to many to have been too scanty. And hence an argument has been drawn against the authority of the relation. Celsus long ago laughed at it, calling it κιβωτον αλογιστον, *the absurd ark*. To solve this difficulty, many, both of the ancient fathers, and later critics, have been put to very miserable shifts. Origen, St. Augustine, and others, maintain, that by the cubit here spoken of, we are to understand the Egyptian geometrical cubits, equal, according to them, to six vulgar cubits, or nine feet. But the truth is, it does not appear there ever was any such measure as a geometrical cubit, either among Egyptians or Jews.—Others account for it, by asserting the stature of mankind, in the first ages, to have been much greater than in our days; and, consequently, the cubit, which is taken for a part of the human body, proportionably larger. But this does not avail, since the same reason will infer an equal augmentation of the size of other animals. Others suppose the sacred cubit to be that here spoken of, which was a hand's breadth longer than the civil one: but this only affords a small supply; beside, the sacred cubit does not appear to have been ever used, except in sacred edifices, as the temple and tabernacle.

This difficulty is much better solved by Bibeo and Kircher, who, supposing the common cubit of a foot and a half, prove geometrically, that the *ark* was abundantly sufficient for all the animals supposed to be lodged therein. The capacity of the *ark* will be doubled, if we admit, with Cumberland, &c. that the Jewish cubit was 21.888 inches.—Snellius computes the *ark* to have been above half an acre in area. Cuneus, and others, have also calculated the capacity of the *ark*.—Dr. Arbuthnot computes it to have been 81062 tuns.—Father Lamy says, that it was an hundred and ten feet longer than the church of St. Mary at Paris, and sixty-four feet narrower; to which his English translator adds, that it must have been longer than St. Paul's church in London, from west to east, broader than that church is high in the inside, and about fifty-four feet in height, of our measure.

The things contained in the *ark* were, beside eight persons of Noah's family, one pair of every species of unclean animals, and seven pair of every species of clean animals, with provisions for them all, during the whole year.—The former appears, at first view, almost infinite; but if we come to a calculus, the number of species of animals will be found much smaller than is generally imagined: out of which, in this case, are to be excepted such animals as can live in the water; and bishop Wilkins imagines, that only seventy two of the quadruped kind needed a place in the *ark*.

It appears to have been divided into three stories; and it is agreed on, as most probable, that the lowest story was destined for the beasts, the middle for the food, and the upper for the birds, with Noah and his family; each story being subdivided into different apartments, stalls, &c. Though Josephus, Philo, and other commentators, add a kind of fourth story, under all the rest; being, as it were, the hold of the vessel, to contain the bilsalt, and receive the filth and faeces of so many animals.

Drexelius makes three hundred apartments; father Fournier, three hundred and thirty-three; the anonymous author of the Questions on Genesis, four hundred; Bucco, Temporarius, Arius Montanus, Wilkins, Lamy, and others, suppose as many partitions as there were different sorts of animals.—Pelletier only makes seventy-two, viz. thirty-six for the birds, and as many for the beasts: his reason is, that if we suppose a greater number, as three hundred and thirty-three, or four hundred, each of the eight persons in the *ark* must have had thirty-seven, forty one, or fifty stalls to attend and cleanse daily, which he thinks impossible. But there is not much in this; to diminish the number of stalls, without a diminution of the animals, is vain; it being, perhaps, more difficult to take care of three hundred animals in seventy-two stalls, than in three hundred.

Bucco computes, that all the animals contained in the *ark* could not be equal to five hundred horses; he even reduces the whole to the dimensions of fifty-six pair of oxen. Father Lamy enlarges it to sixty-four pair, or an hundred and twenty-eight oxen; to that supposing one ox equal to two horses, if the *ark* had room for two hundred and fifty-six horses, there must have been room for all the animals. And the same author demonstrates, that one floor of it would suffice for five hundred horses, allowing nine square feet to an horse.

As to the food in the second story, it is observed by Bucco from Columella, that thirty or forty pounds of hay ordinary suffices an ox for a day; and that a solid cubit of hay, as usually pressed down in our hay racks, weighs about forty pounds; so that a square cubit of hay is more than enough for one ox one day. Now it appears that the second story contained 150,000 solid cubits; which, divided between two hundred and six oxen, will afford each more hay by two thirds than he can eat in a year.

Bishop Wilkins computes all the carnivorous animals equivalent, as to the bulk of their bodies, and their food, to twenty-seven wolves; and all the rest to two hundred and eighty beeves. For the former he allows the sustenance of 1825 sheep, and for the latter 109,500 cubits of hay: all which will be easily contained in the two first stories, and much room to spare.—As to the third story, no body doubts of its being sufficient for the fowls, with Noah, and his sons and daughters.

Upon the whole, the learned bishop remarks, that of the two, it appears much more difficult to assign a number and bulk of necessary things to answer the capacity of the *ark*, than to find sufficient room for the several species of animals already known to have been there.—This he attributes to the imperfection of our lists of animals, especially those of the unknown parts of the earth; adding, that the most expert mathematician at this day could not assign the proportions of a vessel better accommodated to the purpose, than is here done: and hence finally concludes, that "the capacity of the "*ark*, which had been made an objection against scripture, ought to be esteemed a confirmation of its divine "authority; since, in those rude ages, men, being less "versed in arts and philosophy, were more obnoxious "to vulgar prejudices than now; so that had it been an "human invention, it would have been contrived according to those wild apprehensions which arise from a "confused and general view of things; as much too "big, as it has been represented too little."

ARK *of the Covenant*, in scripture, denotes a kind of chest, wherein, by God's command, Exod. xxv. 16. were kept the two tables of stone, wherein God had engraven the ten commandments, given to Moses on the mount, and held in high veneration among the Hebrews. It contained likewise the golden pot that had manna and Aaron's rod, and the tables of the covenant. Heb. ix. 4.

The *ark* was repoſited in the holieſt place of the tabernacle.—It was taken by the Philiſtines, and detained twenty ſome ſay forty years, at Kirjath Jearim; but the people being afflicted with emrods on account of it, returned it with divers preſents.—It was afterwards placed in the temple.

The lid, or covering of the *ark*, was called the *propitiatory*, or mercy-ſeat; over which were two figures placed, called *Cherubim*, with expanded wings of a peculiar form. Here the Schechinah reſted both in the tabernacle and temple in a viſible cloud; hence were iſſued the divine oracles by an audible voice; and the high prieſt appeared before this mercy-ſeat once every year on the great day of expiation; and the Jews, wherever they worſhipped, turned their faces towards the place where the *ark* ſtood. In the ſecond temple there was alſo an *ark*, made of the ſame ſhape and dimenſions with the firſt, and put in the ſame place, but without any of its contents and peculiar honours. It was uſed as a repoſitentative of the former, on the day of expiation, and a repoſitory of the original copy of the holy ſcriptures, collected by Ezra and the men of the great ſynagogue, after the captivity. And in imitation of this, the Jews, to this day, have a kind of *ark* in their ſynagogues, wherein their ſacred books are repoſited. This they call *aron*. Leo of Modena gives a deſcription thereof, in his account of the Cuſtoms and Ceremonies of thoſe of his Nation: "The Jews, ſays "he, in the eaſtern ſides of their ſynagogues, have an "*ark*, or armory, called *aron*; in memory of the *ark* of "the covenant. In this are preſerved the five books of "Moſes, written on vellum, with ink made on pur-"poſe." &c. Some have ſuppoſed that the figure of this *ark* is ſtill remaining on the triumphal arch of Titus at Rome; though Villalpandus and others, with greater reaſon, are of opinion, that it is the table of ſhew-bread. Prideaux's Conn. vol. i. p. 209.

Tertullian calls this *ark*, *Armarium Judaicum*; whence the phraſe, *to be in the armory of the ſynagogue*, q. d. in the number of canonical writings.

A cheſt or coffer very nearly reſembling the Jewiſh *ark*, and called the *houſe of the God*, was found in Huaheine, one of the iſlands in the ſouthern ſea. Mr. Banks could obtain no other information concerning it, than what the name imports. Hawkeſworth's Account, &c. vol. ii. p. 252.

ARK is uſed for a large cheſt, in which corn and fruit are depoſited.

ARLYNG, in *Ornithology*, a name by which the common OENANTHE is called, in many parts of England.

ARM, *brachium*, a part of the human body, terminating at one end in the ſhoulder, and at the other in the hand.

Among *Phyſicians* and *Anatomiſts*, ARM only includes that part between the ſhoulder and the elbow; the reſt, from the elbow to the wriſt, being taken into the greater HAND; by others called the *fore-arm*.

The *arm*, in this latter acceptation, has only one large bone, called the HUMERUS, or ſhoulder-bone.

It has five ſorts of motions, which are effected by five pair of muſcles; upwards, by the *deltoides*, *ſupraſpinatus*; and *coracobrachialis*; downwards, by the *teres rotundus major*, and *latiſſimus dorſi*; forwards by the *pectoralis*; backwards, by the *infraſpinatus*; and, circularly, by the *tranſverſalis*, *ſubſcapularis*, and *infraſpinatus*. See each muſcle deſcribed under its proper article.

The other part conſiſts of two bones, called FOCILS; viz. the *radius* and *cubitus*, or *ulna*.

The muſcles whereby this part is moved, are the *biceps*, *brachiæus internus*, *gemellus*, *brachiæus externus*, *anconæus*, *pronator radii teres*, and *quadratus*; *ſupinator longus*, and *brevis*.—See each in its place. The uſual ſections are in the *arm*.

We have an account of a man whoſe *arm*, with the *ſcapula*, was torn off by a mill, and who was cured without any haemorrhage. Phil. Trans. N° 449. ſec. 5.

ARM, in the *Manege*, is applied to a horſe, when he endeavours to defend himſelf againſt the bit; to prevent obeying, or being checked thereby.

A horſe is ſaid to *arm* himſelf, when he preſſes down his head, and bends his neck, ſo as to reſt the branches of the bridle upon his britket; in order to withſtand the effort of the bit, and guard his bars and his mouth.

A horſe is ſaid to *arm himſelf with the lips*, when he covers the bars with his lips, and deadens the preſſure of the bit. This frequently happens in thick-lipped horſes.—The remedy is by uſing a bit-mouth, forged with a cannon or ſcratch-mouth, broader near the bankers than at the place of its preſſure, or reſt upon the bars.

For *arming againſt the bit*, the remedy is, to have a wooden ball covered with velvet or other matter, put on his chaul; which will ſo preſs him between the jaw-bones, as to prevent his bringing his head ſo near his breaſt.

ARM, in *Geography*, is uſed for a branch of a ſea, or river. Italy and Sicily are only parted by an *arm* of the ſea.—St. George's *arm*, in the Mediterranean, is the Thracian Boſphorus.

ARM, among *Gardeners*, is ſometimes uſed in reſpect of cucumbers and melons, in the ſame ſenſe as branch, of other plants.

ARM is alſo uſed figuratively for *power*.—The ſecular *arm* is the lay or temporal authority of a ſecular judge; to which recourſe is had for the execution of the ſentences paſſed by eccleſiaſtical judges.

The church ſheds no blood: even the judges of inquiſition, after they have found the perſon guilty, ſurrender him to the ſecular *arm*.

The council of Antioch, held in 341, decrees, that recourſe be had to the ſecular *arm* to repreſs thoſe who refuſe obedience to the church: for ſecular *arm*, they here uſe exterior power.

ARM, in the *Military Art*, *heraldry*, &c. See ARMS and ARMOUR.

ARM, in *Sea-Language*.—A ſhip is ſaid to be *armed*, when fitted out, and provided, in all reſpects, for war.

Armed ſhip more peculiarly denotes a veſſel that is occaſionally taken into the ſervice of government in time of war, and employed to guard ſome particular coaſt, or attend on a fleet. All ſhips of this ſort are commanded by an officer of the navy, and are upon the ſame eſtabliſhment with the king's ſloops.

Alſo, a croſs-bar ſhot is ſaid to be *armed*, when ſome rope-yarn, or the like, is rolled round about one end of the iron bar which runs through the ſhot, both that the ſhot may be the better rammed down into the gun, and leſt the ſharp end of the bar ſhould catch into any honeycombs within the cylinder of the piece.

ARM, *yard*, See YARD.

ARM, in reſpect of the *Maguet*.—A loadſtone is ſaid to be *armed*, when it is capped, caſed, or ſet in iron or ſteel; in order to make it take up the greater weight; and alſo to diſtinguiſh readily its poles.

It is ſurpriſing, that a little iron faſtened to the poles of a MAGNET, ſhould ſo vaſtly improve its force, as to render it 150 times ſtronger than when naked. Mr. Butterfield told Dr. Lifter, that ſome load-ſtones would gain much more, and others vaſtly leſs, by *arming*, than one would expect; and he has obſerved, that there are ſome magnets, which ſeem to act more powerfully *unarmed*, than *armed*. Whether the magnetic force of ſome paſſes more eaſily through iron than that of others; or whether the effect depends on the different quality of iron, experiments have not yet aſcertained.—A ſtrong load-ſtone ought to have thick irons, and a weak one but thin ones: ſo that a ſtone may be eaſily overſhod.

The uſual armour of a LOAD-*ſtone*, in form of a right-angled *parallelepipedon*, conſiſts of two thin pieces of ſteel or iron, of a ſquare figure, and a thickneſs proportionable to the goodneſs of the ſtone: if a weak ſtone have a ſtrong armour, it will produce no effect; and if the armour of a ſtrong load-ſtone be too thin, its effect will not be ſo conſiderable as when thicker.—The proper thickneſs is found by filing it thinner and thinner, till its effect is found at the greateſt poſſible ſtrength.

The armour of a ſpherical LOAD-*ſtone*, conſiſts of two ſteel ſhells faſtened to one another by a joint, and covering a good part of the convexity of the ſtone. This alſo is to be filed away till the effect is found the greateſt.

Kircher, in his book *de Magnete*, tells us, that the beſt way to *arm* a loadſtone, is, to drill a hole through the ſtone from pole to pole, and in that, to place a ſteel rod of a moderate length; which rod, adds he, will take up more weight at the end, than the ſtone itſelf, *armed* the common way can do.

Gaſſendus and Cabæus preſcribe the ſame method of *arming* a load-ſtone: but Muſchenbrock has found, by repeated trials, that the uſual armour already mentioned is preferable to that obtained in this way: and he gives the following directions for preparing it. When the poles of the magnet have been diſcovered, by means of ſteel filings and a ſmall needle, he directs that thoſe parts where the poles lie ſhould be rubbed or ground into parallel planes, without ſhortening the polar axis; and the magnets may be afterwards ſhaped into the figures of cubes or parallelepipeds, or any other that may be found moſt convenient. Plates of the ſofteſt iron ſhould then be prepared, of the ſame length and breadth with the whole polar ſides of the propoſed magnet. The thickneſs of theſe plates, ſo as that they may admit and convey the greateſt quantity of the magnetic virtue, is to be previouſly determined by experiment, in a manner which he preſcribes for the purpoſe: a thicker piece of iron is to be annexed at right angles to theſe plates, which is called *pes armaturæ*, the foot or baſe of the armour: the plates, accurately ſmoothed and poliſhed, are to be applied and firmly tied to each of the polar ſides, whilſt the thicker part or baſe is made cloſely to touch

touch the lower part of the magnet. In this way, he fays, almoſt all the magnetic virtue iſſuing from the poles enters into the armour, is directed to the baſe, and condenſed by means of its roundneſs, ſo as to ſuſtain the greateſt weight of iron. Phyſ. Exper. and Geom. Differt. 1729. p. 131. See MAGNET *armed*.

ARMA *dare*, to give arms, in ſome ancient charters, ſignifies to dub, or make a knight.

ARMA *deponere*, to lay down arms, was a puniſhment anciently enjoined when a man had committed an offence. Leg. Hen. I.

ARMA *mutare*, q. d. to change arms, was a ceremony uſed to confirm a league or friendſhip.

ARMA *milata* were ſharp weapons: Feſta calls them *arma emiſſa*.

ARMA *reverſata*, inverted arms, was a puniſhment when a man was convicted of treaſon or felony.

ARMADA, a Spaniſh term, ſignifying a fleet of men of war. The *armada* which attempted to invade England in the time of queen Elizabeth, is famous in hiſtory; it was partly ſcattered by the wind, and partly ſubdued by the Engliſh fleet. On which occaſion a medal was ſtruck with this motto, *Afflavit Deus, et diſſipantur*.

ARMADILLA, in the Spaniſh America, denotes a ſquadron of men of war, to the number of ſix or eight, from twenty-four to fifty pieces of cannon, which the king maintains, to prevent foreigners from trading with the Spaniards and the Indians, both in time of war and peace.

The veſſels of this *armadilla* are thoſe that have been ſo much talked of, under the name of *guarda coſtas*.

They have even power to take all Spaniſh merchantſhips they meet with on the coaſts, that have not licences from the king.

The South ſea has its *armadilla* as well as the North ſea. The ordinary abode of the former are at Calao, a port of Lima; that of the latter, at Carthagena.

ARMADILLO, in *Zoology*, the name of an animal ſomewhat approaching to the *hedge-*HOG kind, and called by the Latin authors the ECHINUS *Broſiienſis*. It is alſo called *tatou*; and by Linnæus, *daſypus cingulis novem, palmis tetradactylis, plantis pentadactylis*. See TATU.

We have ſeveral ſpecies of this creature deſcribed to us; but the moſt uſual, is of the figure and ſize of a large pig, and has a bony covering, which extends over the whole body, the head and the tail. This is compoſed of a number of very elegant ſcales, which have two junctures near the hinder part of the head, by means of which the creature is able to move its neck. On the back there are ſeven diviſions, with a thick membrane between; and in all other parts of the body the ſhell is whole. The legs, ſo far as they come in ſight, are in the ſame manner defended by a bony covering. The feet are made like hands; each have five toes, and the nails are round. Its colour is a ſort of reddiſh tawney. It digs up the ground with its noſe, in the manner of a hog, but much more nimbly; the tail is thick at the inſertion, and tapers to the extremity. The creature feeds on roots and fruits, as potatoes, melons, and the like, but will eat meat alſo if it comes in its way. It is uſually found in dry places. Ray.

This creature gathers himſelf up, when he pleaſes, head, feet, and tail, within his ſhell, and becomes as round as a ball; and this he does, not only when purſued, but every time he ſleeps. He is ſo good at digging, that, unleſs ſtid up, he will make his way out under the walls of a houſe. He is extremely valued among the Braſilians, for the whiteneſs and delicacy of his fleſh, and furniſhes a principal diſh at their beſt feaſts. The places of his ſhell, powdered and given in a doſe of a dram, are eſteemed a ſudorific, and as a remedy for the *lues venerea*. See *Tab. of Quadrupeds*, N° 21.

See a deſcription and drawing of one of theſe animals, in Phil. Tranſ. vol. liv. N° 97.

ARMAMAXI, in *Antiquity*, a kind of Scythian chariots, or carriages, compoſed of two wheels, variouſly adorned with crowns, ſhields, breaſt-plates, and other ſpoils, carried in proceſſion after the images of the gods and great men. The word is compoſed of the Latin *arma*, and the Greek αμαξα, *plauſtrum*, *carriage*.

Theſe were ſometimes called *amaxi*, or *amaxæ*. Pitiſc. Lex. Ant.

ARMAMENT, a large body of forces, raiſed and provided with the furniture of war, either for land or ſea ſervice.

ARMAN, among *Farriers*, a confection of great efficacy to prevent a total loſs of appetite in horſes.

ARMARIUM *unguentum*, among *Hermetical Philoſophers*, a SYMPATHETIC ointment, or weapon-ſalve, whereby wounds are ſaid to have been cured at a diſtance, by only dreſſing the weapon.

ARMATIUM, in *Ancient Phyſic*, a deterſive kind of *collyrium*, of great value in removing aſperities of the eye-lids. Its chief ingredients were *ariſtum*, gum ammoniac, and the roots of the tree *thus*. The preparation is deſcribed by Galen, Aetius, Paulus, and Scribonius.

ARMATURE, ARMATURA, in a general ſenſe, is the ſame with what we otherwiſe call armour.

ARMATURA is more particularly uſed in the *Ancient Military Art*, for a kind of exerciſe, performed with miſſive weapons, as darts, ſpears, arrows, and the like.

In this ſenſe, *armatura* ſtands contradiſtinguiſhed from *palaria*; the latter being the exerciſe of the heavy-armed, the former of the light-armed.

The *armatura* was practiſed with great diligence among the Romans: they had their *compoſitores*, on purpoſe to inſtruct the *tyrones*, or young ſoldiers, in it. Under it were included, the throwing of the ſpear or javelin, ſhooting with bows and arrows, &c.

ARMATURA is alſo an appellation given to the ſoldiers who were light-armed.

Aquinas ſeems, without reaſon, to reſtrain *armatura* to the *tyrones*, or young ſoldiers, under diſcipline or tutorage in the exerciſe above mentioned.

ARMATURA is alſo a denomination given to the ſoldiers in the emperor's retinue. Du-Cange.

Of theſe we find two ſchools, mentioned in the *notitia imperii*, called the *armaturæ ſeniores*, and *armaturæ juniores*. Their commander was entitled TRIBUNUS *armaturarum*.

ARMED, in *Sea-Language*, &c. See ARM.

ARMED, in *Heraldry*, is uſed in reſpect of beaſts and birds of prey, when their teeth, horns, feet, beak, talons, or tuſks, are of a different colour from the reſt.—He bears a cock, or a falcon, *armed*, or, &c.

ARMENA, in *Botany*, a name given by Pliny to a kind of wild aſparagus; but the ancient Greeks have uſed the ſame word to expreſs the young ſhoots of the common aſparagus, at the time when they are eaten: and not only theſe, but the young ſprouts of the cabbage, and of all other eſculent plants.

ARMENIACA, in *Botany*; ſee APRICOT.

ARMENIAN *bole*; ſee BOLE.

ARMENIAN *ſtone*, *lapis* ARMENUS, a mineral ſtone, or earth of a blue colour, ſometimes ſpotted with green, black, and yellow. It is a very ſcarce foſſil, anciently brought only from Armenia, but is now found very pure, though in ſmall quantities, in the mines at Goſſelaer in Saxony.

The *Armenian ſtone*, in its harder ſtate, bears a near reſemblance to *lapis lazuli*, from which it ſeems only to differ in degree of maturity: they are diſtinguiſhed by this, that the *lapis armenus* is ſofter, and inſtead of ſparks of gold, is often ſpeckled with green.

Boerhaave ranks it among ſemi-metals; and ſuppoſes it compoſed of a metal and earth. Woodward ſays, it owes its colour to an admixture of copper.

Its chief uſe is in Moſaic work, though it has ſome place alſo in phyſic. It is a very valuable ſubſtance in painting, being a bright and florid blue. It was in ſo high eſteem as a paint, among the ancients, that counterfeits were continually attempted to ſerve in its place.

Both this and the *lapis lazuli* are ORES of copper.

ARMENIANS, in reſpect of religion, a diviſion among the eaſtern Chriſtians; thus called from *Armenia*, the country anciently inhabited by them.

Some have ſuppoſed, that Chriſtianity was eſtabliſhed in *Armenia* by the apoſtle St. Bartholomew; but this is certain, that in the beginning of the fourth century, the *Armenian* Chriſtians were in a very flouriſhing ſtate.

The *Armenian* church, in the ſixteenth century, was governed by three patriarchs, the chief of whom reſided in a monaſtery at Echmiazin. There were other biſhops among them, who aſſumed the title of patriarchs, without prerogatives annexed to it; though, by authority derived from the chief patriarch, they were allowed to conſecrate biſhops, and every third year to make and diſtribute the holy chriſm, or ointment, which is the privilege of the patriarchs alone.

The *Armenians*, ſince the conqueſt of their country by Scha Abbas, king of Perſia, have had no fixed place of habitation, but are diſperſed in divers parts of Perſia, Turky, and Tartary, and even ſome parts of Europe, particularly Poland.—Their chief employment is merchandize, in which they excel.—The cardinal de Richelieu, we are told, had a deſign to make an eſtabliſhment of them in France, for promoting the commerce of that country. And the chancellor Seguier granted them a printing-houſe at Marſeilles.

With regard to religion, there are two kinds of *Armenians*; the one catholics, and ſubject to the pope, having a patriarch in Perſia, and another in Poland. The other make a particular ſect, having two patriarchs in Natolia. The *Armenians* are generally accuſed of being Monophyſites, and only allowing of one nature in Jeſus Chriſt. As to the Euchariſt, they agree with the Greeks, except in this, that they mix no water with their wine, and uſe unleavened bread after the manner of the Latins.

They

They abſtain very rigorouſly from eating of blood, and meats ſtrangled, and are much addicted to faſting; inſomuch that from their diſcourſe, one would conclude that almoſt their whole religion conſiſted in faſting.

The monaſtic order is in great repute among them, ſince one of their patriarchs introduced that of St. Baſil; but part of them, which have united with the church of Rome, have changed their ancient rule, for that of the Dominicans.

ARMENIAN *bibles*; ſee BIBLES.

ARMERIUS; ſee DIANTHUS.

ARMIGER, *armour-bearer*, in *Modern Writers*, denotes a title of dignity, rendered in Engliſh by *Eſquire*.

ARMILAUSA, in *Antiquity*, a ſhort military coat, reaching down only to the knee. Aquin. and Piſiſc. Lex. Ant.

It was thus called, as being divided both before and behind, and only cloſe about the ſhoulders, *in armos tantum clauſa*, quaſi *armiclauſa*. Iſid. Orig. l. XIX. c. 22.

The word is ſometimes alſo written, *armelauſa*, *armelanſia*, *armicaſia*, and *armicaſta*.

ARMILAUSA is alſo applied, in *Eccleſiaſtical Writers*, to the ſcapular of monks and cannons; thus called on account of its hanging from the arms, or ſhoulders. Schmid Lex. Eccleſ. p. 73.

The ſame habit is vulgarly called *patience*.

ARMILLA *membranoſa* is a name given by ſome anatomiſts, to the annular ligament.

ARMILLARY, ARMILLARIS, in *Aſtronomy*, an epithet given to an artificial ſphere, compoſed of a number of metalline circles, repreſentative of the ſeveral circles of the mundane ſphere, put together in their natural order.

The word is formed of the Latin *armilla*, *a bracelet*.

Armillary ſpheres eaſe and aſſiſt the imagination to conceive the conſtitutions of the heavens, and the motions of the heavenly bodies.

Such is that repreſented *(Tab. Aſtron. fig. 21.)*—Where P and Q repreſent the poles of the world, AD the equator, EL the ecliptic and zodiac, PAGD the meridian, or the ſolſtitial colure, T the earth, FG the tropic of cancer, HI the tropic of capricorn, MN the arctic circle, OV the antarctic, N and O the poles of the ecliptic, and RS the horizon.

The *armillary* ſphere not long ſince conſtructed by Dr. Long, in Pembroke-hall, Cambridge, is eighteen feet in diameter; and more than thirty perſons may conveniently ſit in it. The lower part of the ſphere invisible in England is cut off; the whole apparatus is ſo contrived, that it may be turned round with as little labour as it takes to wind up a jack.

ARMILLARY *trigonometer*, an inſtrument firſt contrived by Mr. Mungo Murray, and improved by Mr. Ferguſon, conſiſting of five ſemicircles; viz. meridian, vertical circle, horizon, hour circle, and equator; ſo adapted to each other by joints and hinges, and ſo graduated and divided, as to ſerve for expeditiouſly reſolving many problems in aſtronomy, dialling, and ſpherical trigonometry. For the drawing, deſcription, and method of uſing it, ſee Ferguſon's Tracts, p. 80, &c.

ARMILLATI *milites*, thoſe who wore bracelets on their left arms, beſtowed on them by their generals, or emperors. Though the term is more frequently applied to ſoft and effeminate ſoldiers, who wore bracelets on their arms, not as the rewards of their proweſs, but marks of their foppery. Aquin. Lex.

ARMILUSTRIUM, in *Antiquity*, a feaſt held among the Romans; wherein they ſacrificed, armed at all points, and with the ſound of trumpets.

Some define *armiluſtrium* to have been a feaſt, wherein a general review was made of all the forces in the Campus Martius.—But this does not come up to the point; for Varro does not derive the word from the Latin *arma* and *luſtrare*, *to make a review*; but from the cuſtom of holding this feaſt in the place where the reviews were uſed to be made, or rather from their going round the place armed with bucklers.

The ſacrifice was intended for the proſperity of the arms of the people of Rome; and was celebrated on the fourteenth of the calends of November.

ARMINGS, in a ſhip, are the ſame with *waſt-clothes*, being red cloths, hung about the outſides of the ſhip's upper-works, fore and aft; and before the cubbridge-heads.

There are ſome alſo hung round the tops, and called *top-armings*. See TOP.

ARMINIANISM, the doctrine of Arminius and of his followers. See ARMINIANS.

ARMINIANS, the followers of Arminius, a celebrated miniſter of Amſterdam, and afterwards profeſſor of theology in the univerſity of Leyden. Arminius, though educated at Geneva, and having imbibed the doctrines concerning predeſtination and grace maintained by Calvin, Beza, Zanchius, &c. began to expreſs his doubts concerning them in the year 1591; and upon farther enquiry, adopted ſentiments more nearly reſembling thoſe of the Lutherans, than of the Calviniſts. After his appointment to the theological chair, at Leyden, he thought it his duty to avow and vindicate the principles which he had embraced; and the freedom with which he publiſhed and defended them, expoſed him to the reſentment of thoſe that adhered to the theological ſyſtem of Geneva, which then prevailed in Holland; but his principal opponent was Gomar, his colleague. The controverſy which was thus begun, became more general after the death of Arminius, in the year 1609, and threatened to involve the United Provinces in civil diſcord. The *Arminian* tenets gained ground under the mild and favourable treatment of the magiſtrates of Holland, and were adopted by ſeveral perſons of merit and diſtinction. The *Calviniſts*, or *Gomariſts*, as they were now called, appealed to a national ſynod; accordingly the ſynod of Dort was convened by order of the States General, in 1618, and was compoſed of eccleſiaſtical deputies from the United Provinces, as well as from the reformed churches of England, Heſſe, Bremen, Switzerland, and the Palatinate. The principal advocate in favour of the *Arminians* was Epiſcopius, who at that time was profeſſor of divinity at Leyden. It was firſt propoſed to diſcuſs the principal ſubjects in diſpute, and that the *Arminians* ſhould be allowed to ſtate and vindicate the grounds on which their opinions were founded: but ſome difference ariſing as to the proper mode of conducting the debate, the *Arminians* were excluded from the aſſembly; their caſe was tried in their abſence; and they were pronounced guilty of peſtilential errors, and condemned as corrupters of the true religion. In conſequence of this deciſion, they were treated with great ſeverity; they were deprived of all their poſts and employments; their miniſters were ſilenced, and their congregations were ſuppreſſed. However, after the death of prince Maurice, who had been a violent partizan in favour of the *Gomariſts*, in the year 1625, the *Arminian* exiles were reſtored to their former reputation and tranquility; and under the toleration of the ſtate, they erected churches, and founded a college at Amſterdam, appointing Epiſcopius to be the firſt theological profeſſor. The *Arminian* ſyſtem has very much prevailed in England ſince the time of archbiſhop Laud, and its votaries in other countries are very numerous.

The diſtinguiſhing tenets of the *Arminians* may be comprized in the following five articles; relating to predeſtination, univerſal redemption, the corruption of man, converſion, and perſeverance. With reſpect to the firſt they maintained, "That God, from all eternity, determined to beſtow ſalvation on thoſe, who he foreſaw would perſevere unto the end in their faith in Chriſt Jeſus; and to inflict everlaſting puniſhments on thoſe who ſhould continue in their unbelief, and reſiſt, unto the end, his divine ſuccours: ſo that election was conditional, and reprobation in like manner the reſult of foreſeen infidelity, and perſevering wickedneſs."

On the ſecond, the *Arminians* taught, "That Jeſus Chriſt, by his ſufferings and death, made an atonement for the ſins of all mankind in general, and of every individual in particular; that, however, none but thoſe who believe in him, can be partakers of their divine benefit."

On the third article, they held, "That true faith cannot proceed from the exerciſe of our natural faculties and powers, nor from the force and operation of free will, ſince man, in conſequence of his natural corruption, is incapable either of thinking or doing any good thing; and that therefore it is neceſſary, in order to his converſion and ſalvation, that he be regenerated and renewed by the operation of the Holy Ghoſt, which is the gift of God through Jeſus Chriſt."

Fourthly, "That this divine grace, or energy of the Holy Ghoſt, begins and perfects every thing that can be called good in man, and conſequently all good works are to be attributed to God alone; that, nevertheleſs, this grace is offered to all, and does not force men to act againſt their inclination, but may be reſiſted, and rendered ineffectual, by the perverſe will of the impenitent ſinner."—Some modern *Arminians* interpret this and the laſt article with a greater latitude.

Fifthly, "That God gives to the truly faithful, who are regenerated by his grace, the means of preſerving themſelves in this ſtate;" and though the firſt *Arminians* made ſome doubt with reſpect to the cloſing part of this article, their followers uniformly maintain, "that the regenerate may loſe true juſtifying faith, forfeit their ſtate of grace, and die in their ſins."

The modern ſyſtem of *Arminianiſm* likewiſe, founded on a comprehenſive plan projected by Arminius himſelf, as appears from a paſſage in his laſt will, extends the limits of the Chriſtian church, and relaxes the bonds of fraternal communion in ſuch a manner, that Chriſtians of all ſects and denominations, whatever their ſentiments and opinions may be, papiſts excepted, may be formed into one religious body, and live together in brotherly love and concord. But, in order to avoid the reproach of being altogether unconnected by any common principles, Epiſcopius drew up a confeſſion of faith, expreſſed for the moſt part in words and phraſes of Holy Scripture, which the *Arminians* have generally adopted, though not enjoined upon them by any authoritative obligation.

The *Arminians* are alſo called *Remonſtrants*, from an humble petition entitled their *Remonſtrance*, which, in the year 1610, they addreſſed to the ſtates of Holland. Their principal writers are, Arminius, Epiſcopius, Vorſtius, Grotius, Curcellæus, Limborch, Le Clerc, and Weſtſtein; not to mention many others, of more modern date. Brandt's Hiſt of the Reformation in the Netherlands; and Moſheim's Eccleſ. Hiſt. by Dr. Maclean, vol. v.

ARMISTICE, ARMISTITIUM, from *arma ſtare*, or *ſiſtere*, a ſhort truce, or a ceſſation of arms for a ſmall time.

ARMOISIN, in *Commerce*, a ſilk ſtuff, or kind of taffety, of an indifferent goodneſs; made at Lyons, and at ſeveral places in Italy. There are half *armoiſins*, made at Avignon, which are of inferior quality, and leſs price than the others. Some pretend that the word *armoiſin* comes from the Italian *ormoſino*; or that thoſe ſilks were thus called, becauſe there were coats of arms delineated on the cloths in which they were wrapped.

There is alſo a taffety of this name manufactured in the Eaſt Indies; but of an inferior quality to thoſe made in Europe.

ARMONIAC; ſee *Sal* AMMONIAC.

ARMONICA from *αρμονια*, *harmony*, is a name which Dr. Franklin has given to a muſical inſtrument conſtructed with drinking-glaſſes. It is well known, that a drinking-glaſs yields a ſweet tone, by paſſing a wet finger round its brim. Mr. Puckeridge, of Ireland, was the firſt who thought of playing tunes formed of theſe tones. He collected a number of glaſſes of different ſizes, fixed them near each other on a table, and tuned them by putting into them water, more or leſs, as each note required. Mr. Delaval, F. R. S. made an inſtrument in imitation of that which was contrived by Mr. Puckeridge; and from this inſtrument Dr. Franklin took the hint of conſtructing his *armonica*.

The glaſſes for this muſical inſtrument are blown as near as poſſible in the form of hemiſpheres, having each an open neck or ſocket in the middle. The thickneſs of the glaſs near the brim is about one tenth of an inch, increaſing towards the neck, which in the largeſt glaſſes is about an inch deep, and an inch and a half wide within; but theſe dimenſions leſſen, as the ſize of the glaſſes diminiſhes, only obſerving that the neck of the ſmalleſt ſhould not be ſhorter than half an inch. The diameter of the largeſt glaſs is nine inches, and that of the ſmalleſt three inches: between theſe there are twenty-three different ſizes, differing from each other a quarter of an inch in diameter. For making a ſingle inſtrument, there ſhould be at leaſt 6x glaſſes blown of each ſize, and out of theſe, thirty-ſeven glaſſes (which are ſufficient for three octaves with all the ſemitones) may be found, that will either yield the note required, or one a little ſharper, and fitting ſo well into each other, as to taper regularly from the largeſt to the ſmalleſt. The glaſſes being choſen, and the note for which each glaſs is intended being marked upon it with a diamond, they are to be tuned by diminiſhing the thickneſs of thoſe that are too ſharp, which is done by grinding them round from the neck towards the brim, comparing, by means of a well tuned harpſichord, the tone drawn from the glaſs by your finger, with the note you want, as ſounded by the correſponding ſtring of the harpſichord. The largeſt glaſs in the inſtrument is G, a little below the reach of a common voice, and the higheſt G, including three complete octaves: and they are diſtinguiſhed by painting the apparent parts of the glaſſes within ſide, every ſemitone white, and the other notes of the octave with the ſeven priſmatic colours; ſo that glaſſes of the ſame colour (the white excepted) are always octaves to each other.

When the glaſſes are tuned, they are to be fixed on a round ſpindle of hard iron, an inch in diameter at the thickeſt end, and tapering to a quarter of an inch at the ſmalleſt. For this purpoſe, the neck of each glaſs is fitted with a cork, projecting a little without the neck: theſe corks are perforated with holes of different diameters, according to the dimenſion of the ſpindle in that part of it where they are to be fixed. The glaſſes are all placed within one another; the largeſt on the biggeſt end of the ſpindle, with the neck outwards; the next in ſize is put into the other, leaving about an inch of its brim above the brim of the firſt; and the others are put on in the ſame order. From theſe expoſed parts of each glaſs, the tone is drawn, by laying a finger upon one of them, as the ſpindle and glaſſes turn round. The ſpindle thus prepared, is fixed horizontally in the middle of a box, and made to turn on braſs gudgeons at each end. A ſquare ſhank comes from its thickeſt end through the box, on which ſhank a wheel is fixed by a ſcrew: this will ſerve, like a fly, to make the motion equable, when the ſpindle is turned by the foot like a ſpinning wheel. The wheel is eighteen inches in diameter, and conceals near its circumference about twenty-five pounds of lead, and may be made of mahogany. An ivory pin is fixed in the face of the wheel, about four inches from the axis; over which is put the loop of the ſtring, that comes up from the moveable ſtep to give it motion. The box is about three feet long, eleven inches wide at the biggeſt end, and five inches at the ſmalleſt end: it is made with a lid, which opens at the middle of its height, and turns up by back-hinges. The inſtrument, thus completed, ſtands on a neat frame with four legs. This inſtrument is played upon by ſitting before it, as before the keys of a harpſichord, turning the ſpindle with the foot, and wetting the glaſſes now and then with a ſponge and clean water. The fingers ſhould be firſt ſoaked in water, and rubbed occaſionally with fine chalk, to make them catch the glaſs, and bring out the tone more readily. Different parts may be played together, by uſing both hands; and the tones are beſt drawn out, when the glaſſes turn *from* the ends of the fingers, not when they turn *to* them.

The advantages of this inſtrument, ſays Dr. Franklin, are, that its tones are incomparably ſweet beyond thoſe of any other; that they may be ſwelled and ſoftened at pleaſure, by ſtronger or weaker preſſures of the finger, and continued to any length: and when it is once well tuned, it never again wants tuning. Franklin's Letters, &c. on Philoſophical Subjects, p. 428. See GLASSES, *Muſical*.

ARMOR, or ARMOUR, a defenſive habit, wherewith to cover and ſecure the body from the attacks of an enemy. In ancient ſtatutes this is frequently called HARNESS.

Parts of *armor* are, the buckler, cuiraſs, helmet, coat of mail, gantlet, &c.

A complete *armor* anciently conſiſted of a caſque or helm, a gorget, cuiraſs, gantlets, taſſes, braſſets, cuiſhes, and covers for the legs, to which the ſpurs were faſtened.—This they called *armor cap-a-pie*; and was the wear of the cavaliers, and men at arms.

The infantry had only part of it; viz. a pot or head-piece, a cuiraſs, and taſſes; but all light.—Laſtly, the horſes themſelves had their *armor*, wherewith to cover the head and neck.

Of all this furniture of war, ſcarce any thing is now retained except the cuiraſs; the gorget or neck-piece, worn by officers, being at preſent only a badge of honour, and of no defence.

The gallantry of going to the battle naked, without any defenſive *armour*, prevailed ſo far, that the French, during the reign of Louis XIV. were obliged to be continually iſſuing ordonnances to reſtrain it; in conſequence of which, the general officers, and thoſe of the cavalry, were obliged to reſume the cuiraſs, which yet has been but ill obſerved.

ARMOR, *coat*, is the eſcutcheon of any perſon, or family, with its ſeveral charges, and other furniture: as mantling, creſt, ſupporters, motto, &c.

Thus we ſay, a gentleman of *coat-armor*; meaning one who bears arms.

ARMORACIA, in *Botany*, a name given by the ancients to a kind of RADISH. Pliny mentions it, but his account is very unſatisfactory.

ARMORIAL, ſomething that relates to arms, or heraldry. In this ſenſe we ſay an *armorial* figure, *armorial* bearing, *armorial* enſign, the *armorial* lily of France, *armorial* lion or leopard of England, &c.

ARMORIAL is alſo a title given to ſeveral books, which contain the arms of a number of perſons of quality.

In this ſenſe, we meet with the French *armorial*, the Spaniſh *armorial*, &c.

ARMORIC, or ARMORICK, ſomething that belongs to the province of Bretagne, or Britany, in France.

The name *Armorica* was anciently given to all the northern and weſtern coaſt of Gaul, from the Pyrenees to the Rhine; under which name it was even known in Cæſar's time. Cæſ. de Bell. Gall. lib. vii. cap. 14.

ARMORIC, abſolutely uſed, denotes the language in uſe among the inhabitants of Britany.

The French uſually call this language *Bas-breton*; compounded, ſays M. Menage, of *ar*, *apud*, and *mer*, *ſea*.

The *Armoric* is a dialect of the Welch, and ſiſter of the Corniſh language.

The inhabitants of Britany, of Cornwall, and of Wales, formerly underſtood each other's ſpeech; though conſiderable diverſities have crept in between theſe languages, ſince their ſeparation from each other.

The inhabitants of Britany, Mr. Lhuyd obſerves, by their intercourſe with the French, have much altered their ancient orthography; beſides that there are ſeveral words in the *Armoric* which have no affinity with the Welch; and that both the *Armoric* and Cornish contain ſeveral ancient words and phraſes which are loſt in the Welch.

Julian Maneir, a *Jeſuit*, has publiſhed an *Armoric* grammar and vocabulary, in French, which has been tranſlated into Engliſh by Mr. Williams, and publiſhed with notes by Mr. Lhuyd. In Atchaol. tit. 3. & 4. p. 280. &c. Before him Yvon Quillivere had publiſhed an *Armoric* vocabulary at Paris, 1521.

Toland has given a catalogue of ſeveral *Armoric* words, which proveto be Iriſh, alſo a vocabulary *Armoric* and Iriſh.

ARMOURER, a maker of arms, or armour.

The Roman *armaturæ* were diſpoſed in certain places in the empire, it being forbid either to ſell, or buy, or make arms elſewhere. They were exempt from all offices and taxes, and received a ſalary from the public.

When once they had taken the employment on themſelves, neither they nor their children were allowed to quit it. To prevent this, they had a kind of note, or ſtigma, impreſſed on the arm, whereby they might be known. If any of them fled, or ſecreted their ware, the reſt were obliged to anſwer for him; on account of which, the eſtate of ſuch as died without a legal heir went to the college.

There were fifteen *armamentaria*, or repoſitories of arms in the Eaſtern empire, placed near the frontiers, and nineteen in the Weſtern. Priſc. Lex. Aut.

ARMOURER *of a ſhip*, a perſon whoſe office is to take care that the arms be in a condition fit for ſervice.

ARMORY, or ARMOURY, a ſtore-houſe of arms, or a place wherein military habiliments are kept, to be ready for uſe.

There are *armories* in the Tower, and in all arſenals, citadels, caſtles, &c.

ARMORY is alſo uſed for a branch of HERALDRY; being the knowledge of coat-armors; as to their blazons, and various ordinaments.

ARM *pit*. See AXILLA.

ARMS, ARMA, in a general ſenſe, include all kinds of weapons, whether for defence, or offence.

Nicod derives the word from the Latin phraſe, *quod aperiant armos*; becauſe they cover the ſhoulders or ſides: but Vario derives *arma*, *ab arcendo, ex quod arcuant haſtes*. It is ſuppoſed, that the firſt artificial *arms* were of wood, and were only employed againſt beaſts; and that Belus, the ſon of Nimrod, was the firſt that waged war; whence, according to ſome, came the appellation *Bellum*.—Diodorus Siculus takes Belus to be the ſame with Mars, who firſt trained ſoldiers up to battle.

Arms of ſtone, and even of braſs, appear to have been uſed before they came to iron and ſteel:—Joſephus aſſures us, that the patriarch Joſeph firſt taught the uſe of iron *arms* in Egypt, arming the troops of Pharaoh with a caſque and buckler.

What contributed moſt to render the Romans maſters of the world, was, that, having ſucceſſively warred againſt all nations, they conſtantly renounced their own methods, *arms*, &c. whenever they met with better.—Thus Romulus, during his war with the Sabines, a bold and warlike nation, adopted their broad buckler, in lieu of the ſmall Argian buckler, which he had uſed till that time. Monteſq. Conſid. ſur les Cauſ. de la Grand. des Rom. chap. i. p. 2. ſeq.

The principal *arms* of the ancient Britons were hatchets, ſcythes, lances, ſwords, and bucklers: the Saxons, &c. brought in the halberd, bow, arrows, arbalets, &c.

By the ancient laws of England, every man was obliged to bear *arms*, except the judges and clergy. Under Henry VIII. it was expreſly enjoined on all perſons to be regularly inſtructed, even from their tender years, in the exerciſe of the *arms* then in uſe; viz. the long bow and arrows: and to be provided with a certain number of them. 33 H. 8.

ARMS, ARMA, in *Law*, are extended to any thing which a man takes in his hand in his wrath, to caſt at, or ſtrike another.—So Crompton.—*Arma rum appellatio non ubique ſenſu, & gladius, & galea ſignificat, ſed & haſtes & lapides*. See *Vi & Armis*.

By the common law, it is an offence for perſons to go or ride armed with dangerous weapons: but gentlemen may wear common armour, according to their quality, &c. 3d Inſt. The king may prohibit force of *arms*, and puniſh offenders according to law; and herein every ſubject is bound to be aiding. Stat. 7 Edw. I. None ſhall come with force and *arms* before the king's juſtices, nor ride armed in affray of the peace, on pain to forfeit their armour, and to ſuffer impriſonment, &c. 2 Ed. III. c. 3.

The importation of *arms* and ammunition is prohibited by 1 Jac. 2. c. 8. and by 1 W. and M. ſtat. 2. c. 2. Proteſtant ſubjects may have *arms* for their defence. So likewiſe, *arms*, &c. ſhipped after prohibition, are forfeited, by 29 Geo. I. c. 16. ſec. 2.

Arms of offence in uſe among us at preſent, are, the *ſword*, piſtol, muſket, bayonet, &c.

The *arms* of the Highlanders are, the broad ſword, target, poniard, and whinyar or dirk, &c.

There are ſeveral acts of parliament for diſarming the Highlanders; ſee 1 Geo I. cap. 54. 11 Geo. I. c. 26. 19 Geo. II. c. 39. 21 Geo. II. c. 34. 26 Geo. II. c. 22. and 29.

ARMS *of defence*. See ARMOR.

Fire-ARMS are thoſe charged with powder and ball: ſuch are cannon, mortars, and other ordnance; muſkets, carabines, piſtols, and even bombs, granadoes, carcaſſes, &c. For the rebound or reflexion of *fire-arms*, ſee REBOUND. In the Hiſtory of the Royal Academy for the year 1707, we have an account of ſome experiments made with *fire-arms* differently loaded, by M. Caſſini. Among other things he obſerves, that by loading the piece with a ball which is ſomewhat leſs than the calibre; and only laying a little gunpowder below the ball, and a good deal above it, it will yield a vehement noiſe, but have no ſenſible effect or impreſſe on the ball.

This he takes to have been all the ſecret of thoſe people who pretended to ſell the art of rendering one's ſelf invulnerable, or ſhot-proof.

ARMS, *paſs of*, was a kind of combat in uſe among the ancient cavaliers. See PASS.

ARMS, *ſtand of*.—A *ſtand of arms* ſignifies a muſket, a bayonet, ſword, belt, and cartridge-box.

ARMS *of parade*, or *courtely*, were thoſe uſed in the ancient juſts, and tournaments; which were commonly anſhod lances, ſwords without edge or point, wooden ſwords, and even canes.

ARMS denote the natural weapons, or parts of defence, of beaſts: as claws, teeth, tuſks of elephants, beaks of birds, &c.

ARMS are alſo uſed figuratively for the profeſſion of a ſoldier.—Thus we ſay, he was bred to *arms*.—See FRATERNITY, LAW, PLACE, SUSPENSION *of arms*.

ARMS, or ARMORIES, are alſo uſed, in *Heraldry*, for marks of dignity and honour, regularly compoſed of certain figures and colours, given and authorized by ſovereigns, and borne in banners, ſhields, coats, &c for the diſtinction of perſons, families, and ſtates; and paſſing by deſcent to poſterity.

They are called *arms*, in regard they are borne principally on the buckler, cuiraſs, banners, and other apparatus of war.—They are alſo called COATS *of arms*, COAT-*armor*, &c. becauſe anciently embroidered on ſur-coats, &c.

Some will have the name to have been firſt occaſioned by the ancient knights, who in their juſts and tournaments bore certain marks (which were frequently their miſtreſs's favours) in their armour, i. e. their helms or ſhield, to diſtinguiſh them from each other.

There has been a great diſpute among the learned about the origin of *arms*.—Favyn will have them to have been from the beginning of the world; Segoin, from the time of Noah; others from that of Oſiris, which is ſupported by ſome paſſages in Diodorus Siculus. Some again, from the example of the patriarch Jacob, who, when he bleſſed his ſons, gave them marks of diſtinction, which the twelve tribes bore on their enſigns; others, from the times of the Hebrews, becauſe *arms* were given to Moſes, Joſhua, the twelve tribes, David, &c.

Others will have them to have taken their riſe in the heroical age, and under the empires of the Aſſyrians, Medes, and Perſians; building upon the accounts of Polliſtratus, Xenophon, and Quintus Curtius.

Some pretend that the uſe of *arms*, and the rules of BLAZON, were regulated by Alexander.—Others will have them to have had their original under the empire of Auguſtus; others, during the inundations of the Goths; and others under the empire of Charlemagne. Chevier obſerves, that, among the ancient Gauls, each man bore a mark on his buckler, by the ſight whereof he might be known to his fellows; and hence he refers the original of the *arms* of noble families. Camden has obſerved ſomething like this of the ancient Picts, and Britons, who, going naked to the wars, painted their bodies with BLAZONS, and figures of divers colours, which he ſuppoſes to have been different in different families, as they fought divided by kindreds. Yet Spelman ſays, that the Saxons, Danes, and Normans, firſt brought *arms* from the North into England; and thence into France.

Upon the whole, it is certain, that from time immemorial, there have been ſymbolical marks in uſe among men, to diſtinguiſh them, in armies, and to ſerve as ornaments for ſhield and enſigns; but theſe marks were uſed arbitrarily as devices, emblems, hieroglyphics, &c. and

and were not regular *armories*, like our's, which are hereditary marks of the nobility of a house, regulated according to the rules of HERALDRY, and authorized by princes.

Before Marius, even the EAGLE was not the conſtant enſign of the Roman army; but they bore in their ſtandards a *wolf*, *leopard*, or *eagle*, indifferently, according to the fancy of the generals.

The ſame diverſity has been obſerved with regard to the French and Engliſh; on which account, authors are divided when they ſpeak of the ancient *arms* of thoſe countries. In effect, it appears, from all the beſt authors, that the armories of houſes, as well as the double names of families, were not known before the year 1000. And ſeveral have even endeavoured to prove, that the uſe of *arms* did not begin till the time of the firſt croiſades of the Chriſtians in the Eaſt.

The truth is, it appears that the ancient tournaments occaſioned the fixing of armories.

Henry the Fowler, who regulated the tournaments in Germany, was the firſt who introduced theſe marks of honour, which appear to be of an older ſtanding in Germany than any other part of Europe. It was then that COATS *of arms* were firſt inſtituted; which were a kind of livery compoſed of ſeveral bars, fillets, and colours; whence came the *feſs*, *bend*, *pale*, *chevron*, and *lozenge*; which were ſome of the firſt elements of ARMORIES. See BEND, CROSS, FESS, &c. Thoſe who had never been concerned in a tournament, had no *arms*, though they were gentlemen.

Such of the nobility and gentry as croſſed the ſea, in the expeditions to the Holy Land, alſo aſſumed theſe tokens of honour to diſtinguiſh themſelves.

Before theſe times, we find nothing upon ancient tombs but croſſes, with Gothic inſcriptions, and repreſentations of the perſons deceaſed. The tomb of pope Clement IV. who died in 1268, is the firſt whereon we find any *arms*; nor do they appear on any coins ſtruck before the year 1336. We meet with figures, it is true, much more ancient, both in ſtandards, and on medals: but neither cities nor princes ever had *arms* in form: nor does any author make mention of *blaſoning* before that time.

Originally, none but the nobility had a right of bearing *arms*; but king Charles V. having enobled the Pariſians, by his charter in 1370, he permitted them to bear *arms*; from whoſe example, the more eminent citizens of other places did the like.

Camden refers the original of hereditary *arms* in England, to the time of the firſt Norman kings. He ſays, their uſe was not eſtabliſhed till the reign of king Henry III. and inſtances in ſeveral of the moſt conſiderable families in England, wherein, till that time, the ſon always bore different *arms* from the father. About the ſame time it became the cuſtom here in England, for private gentlemen to bear *arms*; borrowing them from the lords of whom they held in fee, or to whom they were the moſt devoted. See BEARINGS.

ARMS, at preſent, follow the nature of titles, which being made hereditary, theſe are alſo become ſo, being the ſeveral marks for diſtinguiſhing of families and kindreds, as names are of perſons and individuals.

Arms make the object of the art of HERALDRY.

ARMS are variouſly diſtinguiſhed by the *heralds*.

ARMS *of alliance*, are thoſe which families, or private perſons, join to their own, to denote the *alliances* which they have contracted by marriage.

ARMS, *aſſumption*, are ſuch as a man has a right to aſſume of himſelf, in virtue of ſome gallant action.

As, if a man who is no gentleman of blood, nor has coat armour, takes a gentleman, lord, or prince, priſoner in any lawful war; he becomes entitled to bear the thield of ſuch priſoner, and enjoy it to him and his heirs. The foundation hereof is that principle in *Aliens Law*, that the dominion of things taken in lawful war, paſſes to the conqueror.

ARMS, *canting*, are thoſe wherein the figures bear an alluſion to the name of the family. Such are thoſe of the family of La Tour in Auvergne, who bear a tower; that of the family of Prado in Spain, whoſe field is a meadow.

Moſt authors hold theſe the moſt noble and regular, as is ſhewn by an infinity of inſtances produced by father Varenne and Menetrier. They are much debaſed, when they come to partake of the REBUS.

ARMS, *charged*, are ſuch as retain their ancient integrity and value, with the addition of ſome new honourable CHARGE or BEARING, in conſideration of ſome noble action.

ARMS *of community*, are thoſe of biſhopricks, cities, univerſities, and other bodies corporate.

ARMS *of conceſſion*, or augmentation of honour, are either *entire arms*, or elſe one or more figures given by princes, as a reward for ſome extraordinary ſervice.

ARMS *of dimidiation*, are thoſe which emperors, kings, and ſovereign ſtates bear; being annexed to the territories which they poſſeſs. Thus the three lions are the *arms* of England; the *fleurs de lys* thoſe of France, &c.

ARMS *of family*, or *paternal arms*, are ſuch as belong to a particular family, and which no other perſon has a right to aſſume.

ARMS, *full*, or *entire*, are ſuch as retain their primitive purity, integrity, or value; without any alterations, diminutions, abatements, or the like.

It is a rule, that the ſimpler and leſs diverſified the *arms*, the more noble and ancient they are. For this reaſon, Garcias Ximenes, firſt king of Navarre, and his ſucceſſors for ſeveral ages, bore only GULES, without any figure at all.

The *arms* of princes of the blood, of all younger ſons, and junior families, are not pure, and full; but diſtinguiſhed and diminiſhed by proper differences, &c. See DIFFERENCE, &c.

ARMS *of patronage*, are thoſe which governors of provinces, lords of manors, &c. add to their family *arms*, in token of their peculiar ſuperiority and juriſdiction. See PATRONAGE.

ARMS *of pretenſion*, are thoſe of ſuch kingdoms or territories to which a prince or lord has ſome claim, and which he adds to his own, though the kingdoms or territories be poſſeſſed by a foreign prince, or other lord. Thus the kings of England have quartered the *arms* of France with their own, ever ſince the claim of Edward III. to that kingdom, in 1330.

ARMS *of ſucceſſion*, are aſſumed by thoſe who inherit eſtates, manors, &c. by will, intail, or donation, and which they either impale or quarter with their own *arms*.

ARMS are alſo ſaid to be *parted*, *couped*, *quartered*, &c. See PARTY, &c.

Arms are ſaid to be *falſe* and *irregular*, when there is ſomething in them contrary to the eſtabliſhed rules of HERALDRY. As, when metal is put on metal, or colour on colour, &c.

The laws, and other affairs of *arms*, with the cognizance of offences committed therein, belong, among us, to the earl-marſhal and college of *arms*. See COLLEGE *of arms*.

ARMS, in *Falconry*, denote the legs of a hawk, from the thigh to the foot. See HAWKING.

ARMS, *king at*. See KING *at arms*.

ARMS, *herald at*. See HERALD.

ARMS, *purſuivant at*. See PURSUIVANT.

ARMY, a large body of ſoldiers, conſiſting of horſe and foot, under the command of a general, with ſeveral ranks of ſubordinate officers under him.

An *army* conſiſts of ſquadrons and battalions, and is uſually divided into three corps; which are ranged in three lines. The firſt line is called the *van-guard*; the ſecond, the *main body*; and the third, the *rear-guard*, or body of *reſerve*. The middle of each line is poſſeſſed by foot; the cavalry forms the wings on the right and left; and ſometimes they alſo place ſquadrons of horſe in the intervals between the battalions.

When the *army* is ranged in order of battle, there are five feet diſtance between the horſes, and three between the foot. But in the ſhock the file contracts, and its front leſſens almoſt to one half.

In each line the battalions are diſtant from each other about 180 feet, a diſtance about equal to the extent of their front; and the ſame holds of the ſquadrons, which are about 300 feet diſtant, the extent of their own front. Theſe intervals are left for the ſquadrons and battalions of the ſecond line, to range themſelves againſt the intervals of the firſt line; and thoſe of the third line, againſt the intervals of the ſecond; that both the one and the other may march more readily through theſe ſpaces to the enemy.

There are uſually 300 feet left between the firſt line and the ſecond, and 600 between the ſecond line and the third; that there may be room to rally when the ſquadrons and battalions are broke. Sauv. Nouv. Ecol. Milit. p. 266.

Long experience has ſhewn, that in Europe, a prince with a million of ſubjects cannot keep an *army* of above ten thouſand men, without ruining himſelf. It was otherwiſe in the ancient republics: the proportion of ſoldiers to the reſt of the people, which is now as about one to a hundred, might be then as about one to eight. The reaſon ſeems owing to that equal partition of lands, which the ancient founders of commonwealths made among their ſubjects; ſo that every man had a conſiderable property to defend, and had means to defend it with. Whereas, among us, the lands and riches of a nation being ſhared among a few, the reſt have no way of

of subſiſting, but by trades, arts, and the like: and have neither any free property to defend, nor means to enable them to go to war in defence of it, without ſtarving their families. A large part of our people are either artiſans or ſervants, and ſo only miniſters to the luxury and effeminacy of the great. While the equality of lands ſubſiſted, Rome, though only a little ſtate, being refuſed the ſuccours which the Latins were obliged to furniſh after the taking of the city in the conſulate of Camillus, preſently raiſed ten legions within their own walls: which was more, Livy aſſures us, than they were able to do in his time, though maſters of the greateſt part of the world. A full proof, adds the hiſtorian, that we are not grown ſtronger; and that what ſwells our city is only luxury, and the means and effects of it. Vide Liv. Dec. 1. lib. vii. and Conſid. ſur les Cauſ. de la Grand. des Rom. chap. iii. p. 24.

Our *armies* anciently were a ſort of militia, compoſed chiefly of the vaſſals and tenants of the lords. When each company had ſerved the number of days, or months enjoined by their *tenure*, or the cuſtoms of the fees they held, they returned home. See TENURE, FEE, &c.

The *armies* of the empire conſiſt of divers bodies of troops, furniſhed by the ſeveral circles. See EMPIRE, and CIRCLE.

The *troops* of the French *armies*, under the Merovingian race, conſiſted of infantry. Under Pepin and Charlemagne, the *armies* conſiſted almoſt equally of cavalry and foot; but ſince the declenſion of the Carlovingian line, the fees being become hereditary, the national *armies*, ſays Le Gendre, are chiefly cavalry.

The *armies* of the Grand Signior conſiſt chiefly of JANIZARIES, SPAHIS, and TIMARIOTS.

ARMY, *naval*, is a number of ſhips of war, equipped and manned with ſailors and marines, under the command of an admiral with other inferior officers under him.

ARMY *of obſervation*, is employed by beſiegers, to prevent relief being brought into a place, or the ſiege being raiſed by the enemy.

ARMY, *royal*, is an *army* marching with heavy cannon; capable of beſieging a ſtrong well-fortified city.

For the diſeaſes incident to *armies*, ſee DISEASE, CAMP, GARRISON, HOSPITAL, SOLDIER, &c.

ARNABOS, in the *Materia Medica*, a name of an aromatic drug, deſcribed by Paulus Ægineta, and other of the Greek phyſicians, and ſuppoſed to be the ſame with the *carnabo* of Avicenna, that is, with the CARPESIA of the ancient Greek writers.

This was a drug much uſed as an aromatic and cordial, and allowed in many caſes to be a good ſubſtitute for CINNAMON. It was the young ſhoots of the CUBEBtree, or ſomething of that kind.

ARNALDIA, in *Phyſic*, a flow malignant kind of diſeaſe, frequent formerly in England; the moſt diſtinguiſhing ſymptom whereof was a falling off of the hair.

Authors are much at a loſs for the nature and kind of this diſeaſe, which appears to have been peculiar to our country. From the deſcription given of it in an ancient chronicle, Mollerus concludes it to have been a ſpecies of the venereal diſeaſe, as that diſtemper appeared in thoſe days in this country.

ARNICA, in *Botany*, a genus of the *ſyngeneſia polygamia ſuperflua* claſs. Its characters are, that it hath a compound flower; the borders or rays being compoſed of many female florets, which ſpread open; the diſk or middle hath many hermaphrodite flowers, which are tubulous, and have each five ſhort *ſtamina*. In the hermaphrodite flowers, the *germen* is ſituated below the flower, which afterwards becomes a ſingle oblong ſeed, crowned with long ſlender down. There are two ſpecies; which grow on the Alps, and in the northern parts of Europe.

There is another *arnica*, which Neumann calls *ſchwedenſis*, that is, a ſpecies of the *aſter*. P. 361.

Dr. Bruckner recommends the decoction of *arnica vera*, or *montana*, in feveriſh diſorders accompanied with hæmorrhages, elleroſtentia, &c.

Neumann ſays, the flowers and leaves are emetic, or purgative; and it is ſaid, he adds, that an infuſion of them is remarkably ſervicеable for reſolving coagulated blood from falls, &c. and in obſtructions of different kinds. He gives alſo the chemical hiſtory of this ſpecies of DORONICUM. P. 346.

ARNODI, in *Antiquity*, the ſame with RHAPSODI.

The word is compounded of ἀρνὸς, *a lamb*, which was their uſual reward; and ᾠδὴ, *ſong*, or *ſinging*.

ARNOLDISTS, ARNALDISTS, in the twelfth century; ſo called from their chief, Arnold of Breſſe, who was a great declaimer againſt the wealth and vices of the clergy; and who is alſo charged with preaching againſt baptiſm and the euchariſt.

After raiſing great diſturbances at Breſſe and Rome, he was burnt at this latter place in 1155, and his aſhes caſt into the Tiber. His diſciples were alſo called *Publicani*, or *Popilicani*.

ARNOTTA, in *Botany*, a name given by the peaſants of Burgundy, and many other places, to certain roots which they frequently turn up, from five or ſix inches deep, in ploughing the ground. They carefully collect theſe, and eat them, after roaſting in the aſhes, or otherwiſe; by which ſort of cooking they acquire the taſte of a cheſnut, and are found to be a very wholeſome and nouriſhing food. They are blackiſh on the outſide, and white within, and are of the ſize of a ſmall walnut. They are common in the north of Scotland, and called *arnots*.

ARNULPHIN, *Arnulphinus*, a coin of the value of a ducat and a half, current in ſome parts of France in the 15th century. Du-Cange.

ARROBE, by ſome ſpelt and pronounced *arroba*; in Spaniſh, *arroba*; in the language of Peru, *arrouca*; a weight uſed in Spain, Portugal, Goa, Brazil, and throughout all Spaniſh America. All theſe *arobes* are ſcarcely like each other but in name, being very different in weight, and in their proportion to the weights of other countries.

The *arobe* of Madrid, and almoſt all over Spain, weighs twenty-five Spaniſh pounds.

AROLEC, the name of a weight, uſed in ſome parts of America, and in quantity equal to twenty-five pounds of our weight.

AROMA is, by ſome authors, particularly applied to denote MYRRH.

AROMA *Germanicum*, a denomination given by Platerus to ELECAMPANE.

Some writers give the title *aroma Germanicum* to JUNIPER-*berries*, on account of the great eſteem they are in among that people, for their ſpicy, warm qualities; in which reſpect they are by many preferred to ginger itſelf.

AROMA *philoſophorum*, is uſed by ſome for SAFFRON.

Others give the appellation of *aroma philoſophorum* to Paracelſus's AROPH.

AROMATIC, AROMATICUS, is underſtood of a drug, plant, or the like, which yields a brisk fragrant ſmell, and a warm ſpicy taſte.

The word is formed of ἄρωμα, which is compounded of ἀρ, *very*, and ὀδμὴ, or ὄσμη, *ſmell*.

AROMATICS, or AROMATIC *medicines*, are either *ſimple* or *compound*. To this claſs belong moſt cardiac, cephalic, and carminative remedies, with many ſtomachic ones.

Of this kind are frankincenſe, theriac, benjoin, cinnamon, mace, cloves, nutmeg, pepper, &c. Such alſo are lavender, marjoram, ſage, thyme, roſemary, &c.

The peculiar qualities of *aromatics* reſide in their eſſential oils, and reſinous parts. The more eſſential oil any vegetable affords, the weaker the oil is, and *vice verſa*. The taſte and pungency of ſome of them reſide in the oil, and of others of them in a fixt gummy reſinous matter.

Powders which have *aromatic*, or other acrid particles in them, not only abſorb liquors, but give more or leſs ſtimulus; and as the effect of all irritation is ſome degree of inflammation, which in ſores is principally removed by a ſubſequent increaſed ſuppuration, theſe powders may aſſiſt to ſeparate corrupted from ſound parts. Such of them as have balſamic particles in their compoſition encourage the ſuppuration moſt.

Several of them reſiſt the putrefaction of animal ſubſtances, and therefore may preſerve a carious bone, or the matter coming from it, from ſuch a high degree of putrefaction as they might otherwiſe attain.

Beſide theſe effects on the ſore, regard muſt always be had to their operation, if any of their particles are abſorbed by the blood-veſſels, for ſome of them produce a fever in a greater or leſs degree, others become purgatives, &c. Med. Eſſ. Edinb. vol. v. art 24.

Aromatics are of particular ſervice in cold cachectic habits, where the load of humours has been forced away by ſtrong detergents and cathartics; as they tend to ſtrengthen the fibres, and prevent a relapſe. Hence, alſo, they become of neceſſary uſe after purging, and carrying off the waters of a dropſy, or in the intervals, to ſortify the ſprings and prevent a filling again.

AROMATICUM *roſatum*, is a compound officinal powder, made of red roſes, liquorice, aloes-wood, yellow ſanders, cinnamon, cloves, mace, gum tragacanth, nutmegs, cardamoma, galangals, ſpikenard, ambergriſe, and muſk, all mixed together. It is chiefly preſcribed in cordial and cephalic boluſes and electuaries, to ſtrengthen the ſtomach and head, which all *aromatics* have a tendency to do.

AROMATICUM *vinum*. See VINUM.

AROMATICUS *calamus*. See CALAMUS.

AROMATITIS, in *Ancient Phyſiology*, a kind of bituminous ſtone, by ſome repreſented as a gem, both in ſmell and colour reſembling myrrh.

In

It is said to have been found in Arabia and Egypt, and to have been in great use among ladies, as a perfume.

ARONDE, in *Fortification*. See DOVETAIL, and QUEUE *d'Aronde*.

ARO-ORCHIS, in *Botany*. See GALANGAL.

AROPH, a term used by Paracelsus, to denote a medicine endued with a power of breaking or dissolving the stone in the human body.

In which sense, *aroph* amounts to the same with *lithontriptic*. Van Helmont assures us, that he was possessed of the *aroph*; and from his account, it seems to have been a preparation of saffron and rye-bread, digested with spirit of wine, in a horse-dung heat, and at length distilled. Vid. Choeffel. in Ephem. Acad. N. C. Dec. 1. An. 4. Obf. 109.

AROPH *Paracelsi*, is also a name given to a kind of chemical flowers, elegantly prepared by sublimation, from equal quantities of *lapis hæmatitis* and *sal ammoniac*; said to be of great efficacy in quartan agues, the *plica Polonica*, and hypochondriac diseases.
